GENERAL HISTORY
OF THE
DICH LAMYDEOUS PLANTS,
COMPRISING COMPLETE
DESCRIPTIONS OF THE DIFFERENT ORDERS;
TOGETHER WITH THE
CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES:
THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND
USES IN MEDICINE AND DOMESTIC ECONOMY;
THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS
ILLUSTRATED BY ENGRAVINGS,
AND PRECEDED BY INTRODUCTIONS TO THE LINNÆAN AND NATURAL SYSTEMS,
AND A GLOSSARY OF THE TERMS USED:
THE WHOLE
ARRANGED ACCORDING TO THE NATURAL SYSTEM.

BY GEORGE DON, F.L.S.

IN FOUR VOLUMES.
VOL. II.—CALYCIFLORÆ.

LONDON:
PRINTED FOR J. G. AND F. RIVINGTON; J. AND W. T. CLARKE; LONGMAN AND CO.; T. CADELL; J. RICHARDSON; JEFFERY
AND SON; BALDWIN AND CRADOCK; J. BOOKER; J. BOOTH; HARVEY AND DARTON; S. BAGSTER; SHERWOOD AND CO.;
HARDING AND LEPARD; J. F. SETCHEL; WHITTAKER AND CO.; SIMPKIN AND MARSHALL; AND E. HODGSON.

MDCCXXXII.
**INDEX TO THE SECOND VOLUME,**

**COMPRISING THE SYSTEMATIC AND ENGLISH GENERIC NAMES, AND THE ENGLISH AND SYSTEMATIC SYNONYMS.**

*In this Index the systematic names used, and the English names in common use, are in Roman letters; the synonyms in Italics; the names of Classes, Sub-classes, and Orders in large capitals; and the names of Sub-orders and Tribes in small capitals.*

Subclass II. CALYCIFLORAE (from calyx, and flos, a flower). D. C. prod. 2. p. 1. Calyx gamosepalous (f. 1. a.); sepals more or less connected together, especially at their base (f. 1. a.). Torus more or less adnate to the inside of the calyx at the base (f. 4. B. c.f. and A. d.). Petals and stamens inserted in the calyx (vol. I. f. 2. a. b.) or in that part of the torus adnate to the calyx (f. 4. C. c. and B. c.), and therefore rising from the calyx. Petals usually free (vol. I. f. 2. a. c.). Ovary free or adnate to the calyx. The torus or disk in Calyciflorae appears to be a dilatation of the peduncle converted into petals and stamens, it is large and adnate to the calyx, and usually bears the petals and stamens, sometimes it girds the stipe of the ovary as in Passiflorae and the most of Leguminosae. The petals and stamens in the Calyciflorae are, however, for the most part, inserted in the calyx. In the Thalamiiflorae the torus neither adheres to the calyx nor to the ovaries, which character distinguishes it from the Calyciflorae.

Calyx of 4-5 obtuse sepals (f. 1. a.) connected at the base, imbricate in the bud (f. 2. a.). Petals alternating with the sepals (f. 2. b.), oblong, flat, rather fleshy, broadest at the base, fixed under the margin of the disk, imbricate in aestivation (f. 2. a.). Stamens (f. 2. c.) equal in number with the petals, and alternate with them, inserted in the margin, middle part, or superior part of the disk. Anthers 2-celled bursting inwards. Disk large (f. 2. d.) expanded, flat, closely girding the ovary, and covering the flat part of the calyx. Ovary free, immersed in the disk, and adnate to it, 2-4-celled; cells 1-seeded (f. 1. c.). Ova fixed to the inner angle of the cells by a short narrow podosperm, ascending. Raphe interior. Fruct or capsule never adherent, 2-4-valved, 2-4-celled, with a disseminum in the middle of each valve, or a dry drupe containing a 2-celled nut; cells 1 or many-seeded. Seeds ascendent, rarely resupinate, suspended, arillate or exarillate. Endosperm fleshy. Embryo straight, with flat, thick cotyledons and a short inferior radicle. The order is composed of shrubs, having alternate or opposite, simple, rarely compound, rather coriaceous, entire, or toothed, feather-nerved, usually stipulate leaves, and axillary cymes of small whitish or greenish flowers. Several of the species are favourite ornaments of our shrubbery, as the Staphylea, the Celastrius, and the Euonymus. The fruit of Euonymus Europeus is a brisk purgative, as is also the inner bark, and in strong doses powerfully emetic. A decoction of the twigs of Maytenus Boaria is used to bathe the swellings produced by the poisonous shade of the tree Litri or Litthi, Rhūs caustica. This order is distinguished from Rhamnaceæ in the sepals being imbricate in aestivation, not valvate, and in the stamens being alternate with the petals as well as in the ovary being wholly superior and in the petals being flat. It differs from Ilicineæ in the petals being free and in the stamens being perigynous, and from Hippocra’tacœæ, to which it has been referred by R. Brown, in the stamens being free and perigynous, not as in that order hypogynous and monadelphous.

Synopsis of the genera.

Tribe I.

Staphyleææ. Seeds bony, truncate at the hilum, exarillate. Albumen wanting, or very sparing. Leaves compound, pinnate, or trifoliate.

Tribe II.

Euonýmææ. Seeds arillate, not truncate at the hilum. Embryo straight, placed in the axis of a fleshy albumen. Leaves simple.
Euo'numus. Calyx 4-6-lobed (f. 2, a.), flat, with the base covered by the petalate disk. Petals 4-6 (f. 2, b.), spreading, inserted in the disk. Stamens 4-6, inserted in rather prominent glands. Style 1. Capsule 3-5-celled, 3-5-angled (f. 2, f2); cells 1-4-seeded, with a dissepiment in the middle of each valve.

Cela'strus. Calyx small, 5-lobed. Petals 5, unguiculate. Stamens 5. Ovary immersed in the disk. Style 1, crowned by 2-3 stigmas. Capsule 2-3-valved, usually with a complete or an incomplete dissepiment in the middle of each valve, and usually with a single seed in each cell.

Catha. Calyx flat, 5-lobed. Petals 5, inserted under the margin of the disk. Stamens 5, inserted with the petals. Capsule 3-4-sidied, 3-4-celled; cells 1-seeded. Style short, crowned by a 3-parted stigma.

Pulycardia. Calyx 5-lobed. Petals 5. Stamens 5, short. Ovary depressed. Style very short, crowned by a lobed stigma. Capsule woody, 5-celled, 5-valved, or from abortion only 3-4-valved, with a dissepiment at the base of each valve. Seeds few, covered by a jagged aril.

Tribe III.

Nemopanties. Flowers dioecious or polygamous from abortion. Calyx very small. Petals 5. Stamens 5. Stigmas 3-4, sessile. Berry subglobose, 3-4-celled, 3-4-seeded.

† Genera allied to Celastrineae, but differ materially in the valvate cultivation of the petals.

Dulongia. Flowers hermaphroditic. Calyx 5-toothed, adnate to the ovary. Petals 5, valvate in cultivation, inserted round the base of the disk. Stamens 5, inserted with the petals. Stigmas 2, sessile. Fruit globose, baccate 2-celled; cells 2-3-seeded.

Tribe I.

1. Staphylea (name abridged from Staphylode'ndron, its name in ancient botany, derived from στάφυλος, staphyle, a bunch or cluster, and δέντρον, a tree; the flowers and fruit are disposed in clusters). Lam. gen. no. 374. Lam. ill. t. 210. D. C. prod. 2. p. 2.—Staphylode'ndron, Tourn. inst. 386. —Bumállda, Thumb.

Lin. syst. Pentándria, Di-Trigýnia. Calyx 5-parted (f. 1. a.), covered by an urceolate disk at the base; lobes oblong, concave, coloured. Petals 5 (f. 1. f). Stamens 5. Ovary 2-3-lobed. Styles 2-3, sometimes connected together. Capsule 2-3-celled; cells membranous (f. 1. c.), opening on the inside, few-seeded, sometimes connected together at the base, sometimes their whole length. Seeds globose.—Shrubs with impari-pinnate or trifoliate, opposite, rarely alternate leaves, bearing 2 stipulas at the base of the petioles (f. 1. b.), and at the base of the leaflets. Flowers white, disposed in racemose panicles.

Leaves trifoliate.

1. S. trifolía (Lin. spec. 386.) leaflets ovate, acuminate, regularly serrated, young ones downy beneath; styles smooth; capsules bladdery. Fl. H. Native of North America, from New York to Carolina, on rocks. Schmidt. òstr. baum. 2. t. 81. A very common shrub in the gardens.

2. S. Bumálda (D. C. prod. 2. p. 2.) leaflets oblong, acu-
minute, rather scabrous; serratures awned, protruding from the recesses of the crenae; styles villous; capsule with 2 beaks. Ș G. Native of Japan, on the mountains. Bumáda trifoliá, Thumb. fil. jap. p. 8. Flowers white.

**Leaves impari-pinnate.**

3 S. _heterophylla_ (Ruix et Pav. fl. per. 3. p. 29. t. 255. f. A.) petioles biglandular; leaflets 3-5 or 7, oblong-lanceolate, quite smooth, with callous serratures; flowers disposed in race-mose panicles; capsules coriaceous, not bladdery. Ș H. Native of Peru, in groves. Flowers white.

*Variable-leaved Bladder-nut.* Shrub 12 feet.

4 S. _pinnata_ (Lin. spec. 386.) petioles without glands; leaflets 3 to 7, oblong-lanceolate, quite smooth, serrated; flowers racemose; styles 2; capsule membranous, bladdery. Ș H. Native of Europe, in hedges and thickets. In England, about Pontefract and other parts of Yorkshire; about Ashford, Kent. Smith, engl. bot. t. 1560. Staphylodendron pinnatum, Ray. syn. 463. Duh. arb. 2. t. 77. A smooth branching shrub with foliage resembling some kind of ash. Flowers white or of a pale greenish-yellow, bell-shaped, pendulous, inedorous. Haller says children eat the kernels, but according to Gerarde their first sweetness is succeeded by a nauseous taste, and an emetic effect. The nuts being hard and smooth, are strung for beads by the Roman Catholics in some countries. Singularity rather than beauty procures this plant a place in gardens.

*Cult.* These shrubs possess very little beauty, but answer very well to mix with other shrubs for variety. They will grow in any common soil, and are easily increased by taking the suckers from the roots, by layers, or by cuttings put in the ground in September. The _S. heterophylla_ and _S. Bumáda_ will require protection during frost.

_Lin. syst._ Polygémia, Diecéia, or Diecéa, Petándria. Flowers polygynous or dioecious. Calyx 5-parted, permanent, with coloured edges. Petals 5, inserted in the disk, alternating with the sepals. Stamens 5, inserted in a 10-cenate disk, alternating with the petals. Ovary trigonal. Styles 3 joined in one, or distinct. Berry trigonal, 3-celled; cells 2-3-seeded.—Trees with the habit of Staphylinia, with smooth, opposite, impari-pinnate leaves, and stalked, ovate, acuminate, serrated leaflets. Flowers white, disposed in panicles.

1 _T. paniculata_ (Vent. choix. 1803. p. and t. 31.) upper branches of panicle alternate. Ș S. Native of St. Domingo on the mountains, as well as of Mexico. Dalrymplea Domin-génia, Spreng. syst. 1. p. 771. Flowers loosely panicked. Leaflets 7, 2 inches long, edged with glandular serratures. Fruit blue, 5-furrowed, very bluntly 3-lobed.

Panicle-flowered Turpinia. Tree 25 feet.

2 _T. corymbosa_; flowers panicked, corymbosae; leaflets 5-7, oval, acuminate, bluntly sinuate-crenate, quite smooth; styles distinct. Ș S. Native of Jamaica. Staphylia corymbosa, D. C. prod. 2. p. 3. Leaflets opposite.

*Corymbosa-flowered Turpinia.* Tree 30 feet.

3 _T. occidentalis_; flowers panicked; leaves doubly pinnate; leaflets ovate, acuminate, serrated, smooth; styles distinct. Ș S. Native of Jamaica, on the mountains. Fruit about the size of a cherry. Leaflets alternate. Stipulas in pairs between the pinnae. Staphyléa occidentalis, Swartz, fl. ind. occ. 1. p. 566. exclusive of the synonyms. Flowers white.

_Western Turpinia._ Clt. 1824. Tree 30 feet.

4 _T. pomifera_ (D. C. prod. 2. p. 5.) branches of panicle all opposite; leaves ternate or pinnate, bluntly serrated. Ș S. Native of the East Indies, in Silhet and probably in Nipaul. Its vernacular name in Silhet is _junci-jam._ Dalrymplea pomífera, Roxb. cor. 3. p. 276. t. 279. Panicle spreading. Leaflets 3-7, opposite, 5-6 inches long. Fruit yellow when ripe, roundish, 3-lobed, almost smooth, size of a large medlar, very fleshy. Flowers yellowish-white.

_Cult._ These trees possess very little beauty, they are therefore hardly worth cultivating, unless in general collections. They will thrive well in a mixture of loam and peat, and cuttings will strike root in a pot of sand under a hand-glass, in heat.

III. EUONYMUS (plants agreeing with _Euonymus_ in important characters). D. C. prod. 1. p. 3. Seeds arillate, not truncate at the hilum. Embryo erect in the axis of a fleshy albumen. Cotyledons leafy.—_Shrubs and trees with simple leaves._

_Lin. syst._ Tetra-Hexárdia, Monogénia. Calyx 4 (f. 2. a.) or 5-lobed, flat, covered by the peltate disk at the base. Petals 4 (f. 2. b.) -6, spreading, inserted in the disk. Stamens 4-6, inserted above the disk in rather prominent glands, alternating with the petals (f. 2. c.). Style 1. Capsule 3-5-celled, 3-5-angled, bearing a discipent in the middle of each valve. Seeds 1-4 in each cell, enwrapped in pulp or aril. Embryo green, straight, placed in the middle of a fleshy albumen.—Shrubs with tetragonal or terete branches, and ovate, usually opposite leaves, scarcely stipulaceous. Peduncles axillary. Shrubs, feit in every part when bruised, and esteemed poisonous.

*Petals oblong, oval, or ovate._

_European._

1 _E. EUROPEUS_ (Lin. spec. 386. var. a, exclusive of the synonym of _Chus._) branches smooth; leaves ovate-lanceolate, finely serrated; peduncles usually 3-flowered; petals oblong, acute; lobes of capsule 5, blunt. Ș H. Native of Europe in hedges and thickets. Plentiful in Britain. Smith, engl. bot. t. 362. Bull. herb. t. 135. _E. vulgaris._ Mill. dict. no. 1. Flowers small, greenish-white, feticid. Capsules of a fine rose-colour, 5-celled, 5-valved; cells 1-seeded; seeds orange-coloured. From its use for skewers it has the name of _Prickwood,_ and is called by

b 2
Gerard "trick-timer. It is called also Lowe-berry, Dogwood, and Catridge-tree. In German it is named Spindelbaum; in Danish, Beenaved; in Italian, Fusaggenê; in Spanish, Boneteo; Bonete de Clerigo; in Portuguese, Barrete de Clerigo; in Russian, Mereakletiana kishanuki, Svidia, Sedalini Beresiren. The wood is said to be used by musical instrument makers. For skewers and toothpicks the branches should be cut when the shrub is in blossom, for it is tough and not easily broken in that state; it is also used by watchmakers for cleaning watches: it was formerly used to make spindles, hence the English name of the genus. According to Linnaeus, kine, goats, and sheep eat the leaves, but horses refuse it. No animal, however, seems to browse upon it but the goat. The berries are said to be fatal to sheep; they are violently emetic and purgative; powdered and sprinkled upon the hair they destroy lice. The shrub seldom attains any great size when growing wild in the hedges, but when planted singly and properly trained it will have a strong woody stem, and rise more than twenty feet high, dividing into many branches, and when in fruit it has a fine appearance, the capsules being red and the seeds yellow. First flowers pentandrous, but the others are tetrandrous.

Var. β, leucocarpus (D. C. prod. 2 p. 4.) capsules white or pale, as well as the seeds.

European or Common Spindle-tree. Fl. May. Britain. Shrubs 6 to 20 feet.

2 E. vegasæus (Scop. carn. ed. 2. no. 268.) branches warty; leaves ovate, somewhat serrated; peduncles 3-flowered; petals ovate; capsule bluntly tetragonal. H. H. Native of Europe, particularly in Austria, Hungary, and Carniola. Jacq. fl. austr. t. 49. Duh. ed. nov. 3 t. S. Schmidt, arb. t. 72. E. Europæus lepœsus, Lin. fl. suppl. 154. Petals covered with a pile consisting of very small hairs. Capsules 3-4-celled, 3-4-valved; cells 1-seeded. Stigma bladder-like. Flowers small, greenish-white or greenish-yellow, tetrandrous and pentandrous.

4 E. xanthes (Bieb. fl. taur. suppl. p. 160.) branches smooth, somewhat herbaceous; leaves lanceolate, quite entire, nearly opposite; peduncles 1-5-flowered; flowers tetrandrous, 4-petalled. H. H. Native of the north of Caucasus. A little shrub, with the appearance of Cneorum tricoleum. The fruit being unknown the genus is doubtful. Flowers whitish?

Dwarf Spindle-tree. Cl. 1825. Shrubs 2 feet.

Asian.

5 E. Hamiltonianus (Wall. in fl. ind. 2. p. 408.) branches smooth, terete; leaves lanceolate, finely serrated; peduncles dichotomous, 6-flowered; flowers tetrandrous; petals 4, lanceolate, cordate; ovary 4-lobed, 4-celled, each cell containing 2 ovules. H. H. Native of Nipanl. E. atropurpurea, Wall, in fl. ind. 2 p. 402. Trunk erect; branches spreading. Petals with revolute edges, white. Antlers brown.

Hamilton's Spindle-tree. Fl. April, May. Cl. 1825. Sh. 5 to 20 feet.

6 E. glabrum (Roxb. fl. ind. 2. p. 408.) arborescent; leaves oblong, smooth, with the anterior margin serrated; peduncles 2 or 3 times dichotomous, with a single flower in each fork; flowers pentandrous. H. F. Native of Chittagong, in the East Indies, where it flowers in May. Flowers greenish-white.

Smooth Spindle-tree. Tree 15 feet.

7 E. garrindifolius (Roxb. in fl. ind. 2. p. 408.) branches smooth, terete; leaves lanceolate, entire; petals oblong, with incurved edges, much longer than the calyx; peduncles between the leaves, sometimes solitary, 3-flowered; flowers pentandrous. H. F. Native of Silhet, in the East Indies, where it is called Mor, and at Suemba in Upper Nipaun. F. Lacner, Hamilt. in D. Don, prod. fl. nep. p. 191? Flowers small, pale-yellow. Capsule oblong, size of a small field-bean, 1-celled, 2-valved, opening from the base, containing a solitary, oval seed, covered with a thin, succulent, veined, bright scarlet aril.

Garcinia-leaved Spindle-tree. Fl. May. Cl. 1820. 12 feet.

8 E. tinens (Wall. in fl. ind. vol. 2. p. 408.) branches obscurely tetragonal, smooth; leaves leathery, ovate-lanceolate, serrulated, wrinkled above; lobes of calyx permanent; peduncles 2 or 3 times dichotomous, short, flattened, disposed in numerous approximate pairs on the young shoots, with opposite, linear, fringed bracts at each subdivision; petals veined, ovate, with short claws; capsule 5-celled. H. F. Native of the East Indies, on the summit of Shangepore, as well as on the Sewalik mountains, and on those of Shreenugur. Its Newar name is Kasoori. Trunk as thick as a man's thigh, spotted with large, ochre-coloured tubercles; branches short, thick. Both the flower and leaf-buds consist of imbricated, lanceolate, fringed scales, and here and there interspersed among the peduncles. Flowers large, tetrandrous, or pentandrous, yellowish-green, marked with purplish veins. The yellow bark is employed by the Nipaulese for the purpose of marking the forehead with the ilotfastam symbol, commonly called Tika. The wood is white and compact. Capsule about the size of a gooseberry, 4-5-celled, 5-seeded.

Painting Spindle-tree. Fl. April, May. Tree 16 to 20 feet.

9 E. vimbratius (Wall. in fl. ind. 2. p. 408.) branches terete, smooth; leaves ovate, finely acuminate, fringed with long parallel toothed serratures; flowers tetrandrous, subumbellate, on long filiform peduncles; capsules with from 2-5 long, vertical tapering wings. H. F. Native of the East Indies, on the Sewalik mountains, as well as on those of Shreenugur. It is impossible to confound this with any other species, the leaves being distinctly doubly-serrate.

Fringed-leaved Spindle-tree. Tree.

10 E. argus (Wall. in fl. ind. 2. p. 408.) branches dotted; leaves subopposite, ovate, acute, bluntly and coarsely serrated on longish footstalks; peduncles twice dichotomous, with long, divergating divisions, supported by a pair of lanceolate, acute bracteas; petals oblong. H. F. Native of Nipaun, on the northward of Shangepore, flowering in June. Leaves shining, rounded at the base, elegantly reticulately beneath.

Coarse-serrated Spindle-tree. Cl. 1824. Tree 12 feet.

11 E. tetracarpus (Heyne, herb. Wall. in fl. ind. 2. p. 408.) branches terete, smooth; leaves lanceolate or ovate-lanceolate, acuminate, quite entire; peduncles 1-3-flowered; petals oval, fringed; flowers pentandrous; capsule chalice, furnished with 5 short projecting wings. H. F. Native of the East Indies. Branchlets slender, slightly quadrangular. Leaves acute at the base.

Indian Spindle-tree. Shrubs 8 feet.

12 E. pachomos (Heyne, herb. Wall. in fl. ind. 2. p. 410.) branches slightly quadrangular; leaves linear-lanceolate, acuminate at both ends, perfectly entire; peduncles fasicled, filiform, one-third shorter than the leaves, 2 or 3 times dichotomous at the apex, bearing a number of small pentandrous
flowers; petals oval, fringed; capsules lengthened, clavate, 5-lobed, retuse. $\gamma$. Native of the East Indies. Branches smooth, slender, opposite, or dichotomous.

**Forked-branched Spindle-tree.** Shrub.

13 E. microstigma (D. Don, prod. fl. nep. p. 191.) leaves elliptical, serrulate, smooth, acuminate, shining; peduncles trifid, many-flowered, one-half shorter than the leaves. $\gamma$. Native of Nipaul. E. frigida, Wall.? Petals oval.

**Small-flowered Spindle-tree.** Clt. 1820. Shrub 8 feet.

14 E. lucidus (D. Don. prod. fl. nep. p. 191.) leaves lanceolate, acuminate, sharply serrated, shining, acute at the base; umbels lateral, opposite, pedunculate. $\gamma$. F. Native of Nipaul. Petals ovate or oval?

**Shining-leaved Spindle-tree.** Clt. 1820. Shrub 6 feet.

---

* **Petals orbicular.**

**American.**

15 E. atropurpureus (Jacq. hort. ind. 2. t. 120.) branches smooth, quadrangular; leaves elliptic-lanceolate, acute, serrated, almost sessile; peduncles many-flowered, compressed; petals orbicular; capsules angulately-furrowed, smooth. $\gamma$. F. Native of North America, from New York to Carolina, on the banks of rivulets, Schmidt. arb. t. 73. E. Carolinensis, Marsh. arb. amer. no. 1. and probably latifolius, Marsh. arb. no. 2. Flowers quadrifid.

16 E. americana (Lin. spec. 286.) branches smooth, quadrangular; leaves elliptic-lanceolate, acute, serrated, almost sessile; peduncles 1-3-flowered; flowers pentandrous; petals nearly orbicular; capsules warted and echinated. $\gamma$. H. Native of North America from New England to Carolina, in hedges and shady woods, among rocks, and on the edges of swamps. Duham. arb. ed. nov. 3. i. 9.—Pluk. alm. t. 115. f. 5. Schmidt. arb. t. 75. Flowers yellow, tinged with red. Fruit scarlet, resembling those of *Arbutus Uveda* at first sight. They are a great ornament to this almost evergreen shrub. Its common name in America is *Burning-bush* on account of the colour of the fruit. E. sempervirens, Marsh. arb. amer. no. 3. E. alternifolius, Munich.

17 E. sarmentosus (Nutt. gen. amer. 1. p. 155.) branches smooth, tetragonal, sarmentose, usually rooting; leaves lanceolate, serrated, almost sessile; peduncles 1-3-flowered; flowers pentandrous; petals somewhat orbicular; capsules muri cate. $\gamma$. H. Native of North America, in Virginia and Carolina, in shady woods. E. seiendas, Hort. Flowers yellow, tinged with red? Fruit scarlet?

18 E. angustifolius (Pursh. fl. amer. sept. 1. p. 168.) branches quadrangular, smooth; leaves elongated, linear-elliptical, somewhat falcate, nearly entire, almost sessile; peduncles for the most part 1-flowered; flowers pentandrous; capsules warted. $\gamma$. H. Native of North America, in Georgia, in shady woods. Flowers yellow, tinged with red. Fruit scarlet. This species is nearly related to *E. Americana*, and keeps its distinction from seed.

19 E. obovatus (Nutt. gen. amer. 1. p. 155.) stem prostrate, rooting; branches erect, bluntly quadrangular, with the bark inflated at the apex; leaves broad, obovate, obtuse, almost sessile, acutely-serrulate; peduncles 3-flowered; calyxes in-

---

**II. Euonymus.**

20 E. grandiflorus (Wall. in fl. ind. 2. p. 404.) branches terete, smooth; leaves obovate-oblong, obtusely-acutely serrulate, with a tapering entire base; peduncles slender, flattened, nearly equalling the length of the leaves, 5-6-flowered; flowers tetrandrous; petals orbicular, flat with curled edges; capsule globular, pendulous, obscurely 4-cornered, with usually geminate, pendulous seeds. $\gamma$. H. Native of the valley of Nipaul, in forests. Branches slightly 4-cornered. Flowers white, very large, inodorous, slightly nodding. Capsule nearly globular, about the size of a cherry, 4-celled, 4-valved. Seeds oval, black, half covered by a brilliant, red, minutely lobed, warted aril. This is a very ornamental shrub, both when in flower, and when loaded with its yellow pendulous capsules, each of which is furnished with as many as 6 black pendulous seeds.

**Great-flowered Spindle-tree.** Fl. April, May. Shrub 16 ft.

21 E. japonicus (Thamb. jap. 190.) branchlets pendulous, slightly compressed; leaves obovate, sharply serrate, acuminate; peduncles flattened, crowded and panicked on the recent shoots, 2 or 3 times dichotomous, bearing several flowers; petals orbicular, fringed, twice as long as the stamens; capsule with 4 horizontal spreading wings. $\gamma$. H. Native of Nipaul, on Sheopore and Chundurigi, as well as at Shreengur and of Japan. Hemp in Est. del. op. 1. p. 84. t. 4. Banks, icon. Kempf. t. 8. Flowers small, white, tetrandrous, rarely pentandrous. Outer branches hanging down in a very elegant manner.

22 E. echinatus (Wall. in fl. ind. 2. p. 410.) stems climbing, as well as rooting; leaves ovate-lanceolate, serrated; peduncles filiform, several times dichotomous, many-flowered, with one flower in each fork; petals orbicular, crenulate; capsules armed with numerous prickles. $\gamma$, $\omega$. F. Native of the mountains of Nipaul, especially on Sheopore. Hook. bot. mag. 27:67. Branches quadrangular at the apex, climbing over trees, and rooting by means of dense capillary fibres. Flowers small, pea-green, inodorous, tetrandrous. Capsules pendulous, globular, yellow, 4-celled, 4-seeded. Seeds black, almost covered with a scarlet fleshy aril. E. secundus, Graham.

23 E. vagans (Wall. in fl. ind. 2. p. 412.) climbing; branches quadrangular at the apex; leaves ovate-lanceolate, serrated; peduncles filiform, several times dichotomous, many-flowered, with a single flower in each bifurcation; petals orbicular, crenulate; capsules globular, naked, unarmed. $\gamma$, $\omega$. F. Native of the mountainous forests of Nipaul, especially on Sheopore, and on Chesapani. A most extensive, rambling, and climbing shrub, with stem, branches, and flowers exactly like those of *E. echinatus*, but never throwing out roots from the branches and stems. Capsule 4-celled, 4-seeded. Seeds large, covered with a scarlet fleshy aril.

**Rambling Spindle-tree.** Shrub cl. 24 E. javanicus (Blum. bijdr. 1146.) leaves opposite, oblong, bluntish, smooth, remotely serrulate above; pedicels 1-flowered, in fascicles, axillary, and terminal; flowers pentandrous; petals fringed. $\gamma$. S. Native of Java, in woods.

**Java Spindle-tree.** Clt. 1824. Shrub 8 feet.

25 E. sieboldianus (Blum. bijdr. 1147.) leaves opposite, oblong-lanceolate, sharply serrulate, smooth, puberulous on the middle nerve beneath; peduncles usually 5-flowered; flowers
tetrandrous; capsule acutely tetragonal. 7. S. Native of Japan. The shape of the petals is unknown.

Siebold's Spindle-tree. Shrub 10 feet.

26 E. subtriflorus (Blum. bijdr. 1147.) spinose; leaves nearly opposite, oval-lanceolate, acuminate, sharply-serrulat ed, smooth; peduncles lateral, 3-flowered at the apex; flowers tetrandrous; capsule 4-lobed. 7. G. Native of Japan.

Somehow-three-flowered Spindle-tree. Shrub.

27 E. Thunbergianus (Blum. bijdr. 1147.) leaves nearly opposite, elliptic-oblong, tapering to both ends, sharply-serrulate, smooth; peduncles axillary, 3-flowered; flowers tetrandrous; capsule 4-lobed. 7. G. Native of Japan. Celastrus altata, Thunb. fl. jap. 98. Form of petals unknown.

Thunberg's Spindle-tree. Shrub.

† A doubtful species, which probably should be excluded from the genus.

28 E. Chinensis (Lour. fl. coch. ed. Wildl. 1. p. 194.) stem herbaceous, climbing, with tendrils; leaves cordate, toothed, rough; peduncles lateral; petals 5, oblong-ovate; berry tree, ovate, 10-angled, 1-celled, valveless; seeds many, covered with aril. 7. G. Native of China, in the suburbs of Canton. Flowers white, pentandrous.

Cult. The hardy kinds of this genus are well adapted for large shrubberies. They will thrive in any common soil, and are easily increased by seeds, which ripen in abundance; or ripened cuttings, planted in autumn, will readily strike root. Those said to be frame and greenhouse plants will no doubt turn out to be truly hardy.

IV. Celastrus (from κελατρ, ecal, the latter season; the fruit remains on the tree all winter. The Celastros of the Greeks is supposed to be Euonymus). Lin. gen. 270. Gaert. fruct. 2. t. 95. D. C. prod. 2. p. 5.—Catha, Forsk. descr. p. 63.—Euonymoides, Moench. meth. 70.

Lin. ssp. Pentandria, Monogynia. Calyx small, 5-lobed. Petals 5, unguiculate. Stamens 5. Ovary small, immersed in a 10-striped disk. Style 1. Stigma 2-3. Capsule 2-3-valved, bearing a complete or incomplete dissection in the middle of each valve. Seed 1, or fewer, more or less involved in a large fleshy aril.—Shrubs with alternate leaves, and many-flowered axillary peduncles, sometimes approximating in terminal panicles. The carpology of many of the species being unknown, the species are arranged here in an artificial manner.

* Leaves quite entire.

African.

1 C. Filiformis (Thumb. fl. cap. 2. p. 115.) climbing, smooth; leaves lanceolate, opposite branches filiform, flexuous; flowers axillary, few, almost sessile, 7. G. Native of the Cape of Good Hope. Flowers white. Stigma capitata. Filiform-branched Staff-tree. Shrub cl.

2 C. Crispus (Thumb. fl. cap. 2. p. 115.) erect, much branched; leaves obovate, obtuse, wavy, smooth; branchlets pubescent; flowers axillary, umbellate, hairy. 7. G. Native of the Cape of Good Hope. Flowers white. Curled-leaved Staff-tree. Shrub 4 feet.

3 C. obtusus (Thumb. fl. cap. 2. p. 116.) erect, smooth; leaves obovate, very blunt, with revolute edges; panicles axillary. 7. G. Native of the Cape of Good Hope. Panicle simple or dichotomous. Flowers white. Obtuse-leaved Staff-tree. Shrub 6 feet.

4 C. latifolius (Thumb. fl. cap. 2. p. 116.) erect, smooth; leaves obovate-oblong, blunt, somewhat emarginate, with the edges a little revolute; panicles axillary. 7. G. Native of the Cape of Good Hope. Style very short. Leaves 2 inches long. Flowers white.

Laurel-like Staff-tree. Fl. June, July. Clt. 1818. Shrub 2 ft. 5 C. oleoides (Lam. ill. no. 2296.) erect, smooth; leaves ovate-lanceolate, acute, stalked; pediole short, stem-clasping at the base; corymbs axillary, few-flowered, subterminal; some of them opposite the leaves, and others axillary. 7. G. Native of the Cape of Good Hope. C. oleifolia, Pers. ench. 1. p. 327. C. oleoides, Siebl. pl. ex sic. cap. no. 93. Flowers white.

Olive-like Staff-tree. Fl. May, June. Clt. 1824. Shrub 4 ft. 6 C. petiocarpos (D. C. prod. 2. p. 5.) erect, smooth; leaves ovate, somewhat emarginate; racemes short, axillary; capsules 3-valved, drawn out into 3 vertical toothed wings. 7. G. Native of the Cape of Good Hope.—Burm. afr. t. 97. f. 1. This and the two following species will probably form a distinct genus, on account of their appendiculate fruit. Flowers white.

Wing-fruited Staff-tree. Fl. July. Clt. 1824. Shrub 4 ft. 7 C. restruatus (Thumb. fl. cap. 2. p. 117.) erect, smooth; leaves oblong-ovate, unequal, bluntly acuminate; panicles or corymbs dichotomous, axillary; capsules prickly, with unarmed scales. 7. G. Native of the Cape of Good Hope. Flowers white.

Beaked-capped Staff-tree. Shrub 6 feet.

8 C. triunipatus (Lam. ill. no. 2594.) erect, smooth; leaves oblong-ovate, obtuse, smooth, on short pedioles; racemes axillary, simple, nearly the length of the leaves; fruit trigonal. 7. G. Native of the Cape of Good Hope. Cassine lavigata, Lam. dict. 1. p. 632. Olea Capensis, Buch. desc. 6. t. 3. Flowers white.

9 C. lucidus (Lin. mant. 49.) erect, smooth; leaves oval or roundish, shining, margined; pedicels axillary, crowded, very short; fruit 3-valved, naked. 7. G. Native of the Cape of Good Hope. Lher. st. p. 25. Cassine conicata, Lam. dict. 1. p. 633.—Pluk. alm. t. 280. f. 4. Flowers white.

Shining-leaved Staff-tree. Fl. April, Sept. Clt. 1728. Sh. 3 ft.

10 C. microphyllus (Thumb. fl. cap. 2. p. 110.) erect, smooth; leaves ovate, blunt, approximate; panicle terminal, dichotomous. 7. G. Native of the Cape of Good Hope. Flowers white.

Small-leaved Staff-tree. Shrub 2 feet.

11 C. diffusus; much branched, diffuse; leaves alternate, ovate, almost entire, obtuse, mucronate, glabrous; flowers axillary and terminal, sessile. 7. S. Native of Guinea. Flowers yellowish-green.

Diffuse Staff-tree. Shrub 6 feet.

12 C. ellipticus (Thumb. fl. cap. 2. p. 119.) erect, smooth; leaves elliptical, opposite; panicles simple, axillary. 7. G. Native of the Cape of Good Hope, in woods. Flowers white.

Elliptical-leaved Staff-tree. Shrub 4 feet.

Asiatic.

13 C. trifolius (Roxb. fl. ind. 2. p. 391.) erect, smooth; leaves oblong, on short petioles; flowers in small, axillary, dichotomous, round heads; nectary of 5 scales; style 3. 7. S. Native of the Moluccas. Flowers white.

Three-styled Staff-tree. Shrub.

14 C. verticillatus (Roxb. fl. ind. 2. p. 291.) arborescent, smooth; leaves scattered, broad-lanceolate, wavy; panicle terminal, umbelliferous; capsule 1-celled, 2-valved, few-seeded. 7. G. Native of Nippon, where it is known by the name of Tibiti. Trunk straight; the branches and branchlets have a strong tendency to be verticillate, as well as the leaves, which

**W**h**o**l**e**d-branched Staff-tree. Fl. April, July. Clt. Tree 20 feet.

15 **C. r**o**b**u's**t**us (Roxb. fl. ind. 2. p. 395.) erect, smooth; leaves lanceolate, entire, glossy; racemes axillary, length of leaves; capsules 1-celled, 2-valved. G. Native of Silhet, in the East Indies, where it is called Sheekkoil. It grows to be one of their largest timber trees. Racemes simple, solitary, or in pairs. Flowers numerous, small, greenish-yellow. Disk 5-lobed, girding the base of the ovary. Styles 2, terminated by capitate stigmas.

**R**o**b**u's**t**us Staff-tree. Fl. Aug. Tree 50 feet.

16 **C. o**r**o**s**i**t**us (Wall. in fl. ind. 2. p. 398.) erect, smooth, with opposite jointed branches, younger ones tetragonal; leaves opposite, lanceolate, blunt; peduncles axillary, 3-flowered. G. Probably a native of the peninsula of India. Flowers small, white? Style columnar, terminated by a bifid stigma.

**O**pposite-branched Staff-tree. Shrub 6 feet.

17 **C. b**y**a**l**a**s**i**s (Jack, in mal. misc. 1. no. 2. p. 19.) erect, smooth; leaves lanceolate, acuminate; peduncles lateral, few-flowered; capsules ovate, 2-valved, 1-seeded; corolla wanting. G. Native of the Malay Islands. Peduncles dichotomous, 5-10-flowered. Style terminated by a truncate stigma. Seeds covered with a crimson aril, which is beautifully veined.

**T**wo-valved-capsuled Staff-tree. Shrub.

### American.

18 **C. m**a**cro**c'a**r**u's (Ruiz et Pav. fl. per. 3. t. 230. f. 16.) erect, smooth; leaves oblong-lanceolate, with an emarginate acumen; pedicels axillary, very short, aggregate; capsules ovate, 2-3-valved. G. Native of Perú, in woods. Haënkia multiflora, Ruiz et Pav. fl. per. syst. p. 65. Seeds with a white pulpy aril. Flowers white. This is probably a species of *Pyralistia*, according to Nuttal.

**L**arge-fruited Staff-tree. Shrub 6 feet.

19 **C. b**u**l**l'a**t**u's (Lin. spec. 285.) climbing, smooth; leaves ovate, acute, stalked, coriaceous; pedicels terminal. G. Native of St. Domingo.—Pluk. alm. t. 23. f. 5. Capsules scarlet, elegantly wrinkled, 3-valved, each containing a hard oval seed, covered with a thin red aril. Flowers white, in loose terminal racemes. This species is said to be a native of Virginia, but notwithstanding the distinguishing researches of Mr. Pursh at the place of its supposed nativity, he has not been able to find it. He therefore strongly suspects that it is not a native of North America.

**W**rinkled-capsuled Staff-tree. Fl. July. Clt. 1759. Shrub cl. 21 **C. h**æ'f'æ'k'ë's (Spreng. syst. app. p. 88.) branches flexuous; leaves stalked, oblong-lanceolate, wavy, quite entire; racemes axillary, much exceeding the leaves; flowers bracteate. G. Native of Perú. Haënkia flexuosa, Ruiz et Pav. fl. per. 3. t. 231. Corolla monopetalous, pitcher-shaped, and the fruit a drupe. This is a very doubtful species of *Celastrus*.

**H**aënkia's Staff-tree. Shrub.

22 **C. o**v'a'tu's (Hill in hort. kew. 437. t. 16.) erect, smooth; leaves ovate, stalked, entire; flowers axillary, crowded. G. Native of the Bahama Islands.

**O**vate-leaved Staff-tree. Shrub 4 feet.

**Leaves toothed, serrated or crenate.**

23 **C. a**c'um'i'n'u's (Thumb. fl. cap. 2. p. 119.) erect, smooth; leaves elliptical, acute, crenated; flowers axillary, usually twin. G. Native of the Cape of Good Hope. C. populifolius, Lam. ill. no. 2698. according to Poir. suppl. 2. p. 144. Flowers white.

**Acuminated-leaved Staff-tree.** Shrub 6 feet.

24 **C. p**r'o**c'um'b'e**ns (Thumb. fl. cap. 2. p. 119.) decumbent, smooth; leaves ovate, toothed; flowers axillary, usually solitary; capsules 3-4-valved. G. Native of the Cape of Good Hope, in sandy places.

**P**rocumbent Staff-tree. Shrub. decumbent.

25 **C. c**y'ma'to'de's (Spreng. syst. 1. p. 775.) leaves obovate, wavy-toothed, and reticulately veined, opposite; flowers axillary, sessile. G. Native of the Cape of Good Hope.

**W**aved-toothed-leaved Staff-tree. Shrub.

26 **C. c**e'c'a'v'u's (Thumb. prod. 2. p. 42.) leaves ovate, obtuse, serrated; peduncles axillary, 1-flowered, drooping. G. Native of the Cape of Good Hope.

27 **C. u**n'd'a'v'u's (Thumb. fl. cap. 2. p. 126.) erect, smooth; leaves obovate, somewhat wedge-shaped, undulate-toothed; flowers axillary, sessile. G. Native of the Cape of Good Hope. Flowers white.

**W**aved-leaved Staff-tree. Fl. June, July. Clt. 1826. Sh. 6 ft. 28 **C. t**e'r'a'g'o'n'u's (Thumb. prod. 2. p. 42.) erect, smooth; leaves ovate, serrated, opposite; branches tetragonal; pedicel terminal. G. Native of the Cape of Good Hope. Flowers white.

**S**panish-oak-leaved Staff-tree. Clt. 1817. Shrub 4 feet.

30 **C. rh**a'mm'o'n'i'de's (Poir. suppl. 2. p. 145.) branches diffuse; leaves ovate or lanceolate, acute, sharply serrated, smooth; pedicels 1-flowered, axillary, crowded, unequal. G. Native of the Cape of Good Hope. Flowers white. It is not known whether this shrub is unarmed or spiny.

**R**hamnus-like Staff-tree. Shrub 10 feet.

31 **C. c**a'ss'i'n'o'i'de's (Lher. sert. p. 6. t. 10.) erect, smooth; leaves ovate, acute at both ends, serrated, permanent; pedicels 2-3 together, axillary, very short. G. Native of the Canary Islands. Flowers white.

**C**assine-like Staff-tree. Fl. Aug. Sept. Clt. 1779. Shrub 4 ft. 32 **C. l**y'r'o'i'de's (Broussec wilh. mss. in Schult. syst. 5. p. 427.) erect, smooth; leaves roundish-ovate, obtuse, crenate, coriaceous; pedicels axillary, very short. G. Native of the Canary Islands. Flowers white.

**L**y'g'im-u'm-like Staff-tree. Shrub 4 feet.

33 **C. e**d'ë'l'i's (Wahl. symb. 1. p. 21.) erect, smooth; leaves opposite and alternate, elliptical, bluntly serrated; cymes axillary, dichotomous. G. Native of Yemen, in Arabia, where it is cultivated in gardens along with the coffee. The green leaves of this tree are eaten with avidity by the Arabs. They possess nearly the same qualities as opium. The tree is called *cat* or *kat* in Arabic; hence Catha of Forsk. Flowers white. Capsule oblong-cylindrical, 3-valved, with one seed in each cell.

**E**atable Staff-tree. Shrub 10 feet.

34 **C. d'e'c'o'l'o'r* (Gaillaup. voy. meroe. 2. t. 64. f. 6.) leaves oval-oblong, somewhat crenate, tapering to the base; peduncles axillary, 3-6-flowered; flowers subumbellate; capsules 2-valved. G. F. Native of Upper Egypt.

**III**-coloured Staff-tree. Shrub.
33. **C. populi-folius** (Lam. ill. no. 2698.) leaves ovate, acuminate, serrate; umbels almost sessile, few-flowered. \(\varphi\). G. Native of the Cape of Good Hope.

**Poplar-leaved Staff-tree.** Shrub 6 feet.

**Asiatic.**

36. **C. paniculatus** (Willd. spec. 1. p. 1125.) climbing; leaves roundish-oval, serrate, smoothish; panicle terminal; stamens inserted in a nectarial ring. \(\varphi\). S. Native of the East Indies, on the Cicar mountains.—A large climbing shrub; the bark covered with grey scabrous specks. Flowers numerous, small, yellow. Style 1. Stigmas 3. Capsule round, size of a pea, 1-celled, 3-valved, containing from 3 to 6 seeds, surrounded by yellow aril.

**Panicle-flowered Staff-tree.** Fl. March, April. Shrub cl.

37. **C. dependens** (Wall. in fl. ind. 2. p. 389.) climbing, smooth; leaves oblong, acuminate, serrated; panicle terminal, drooping; seeds invested by a complete aril. \(\varphi\). S. Native of Mysoore. A large climbing and twining tree, with light-brown scabrous bark. Nectary a conave, 5-sided receptacle. Flowers small, greenish-white. Capsule round, size of a pea, 1-celled, 3-valved, containing 3-6 seeds each, invested by a thick, complete, fleshy, orange-coloured aril. Style scarcely any. Stigma with 3 spreading notched lobes.

**Hanging-leaved Staff-tree.** Fl. Jully. Shrub cl.

38. **C. sytans** (Roxb. fl. ind. 2. p. 390.) climbing, smooth; leaves stalked, broad-ovate, bluntly serrated; panicle racemose, terminal, drooping; seeds invested by a complete aril. \(\varphi\). S. Native of Mysoore. A large climbing and twining tree, with light-brown scabrous bark. Nectary a conave, 5-sided receptacle. Flowers small, greenish-white. Capsule round, size of a pea, 1-celled, 3-valved, containing 3-6 seeds each, invested by a thick, complete, fleshy, orange-coloured aril. Style scarcely any. Stigma with 3 spreading notched lobes.

**Nodding-panicle Staff-tree.** Cl. 1810. Shrub cl.

**Blunt-leaved Staff-tree.** Fl. May, June. Cl. 1824. Tree 20 feet.

40. **C. monopereius** (Roxb. fl. ind. 2. p. 394.) climbing, smooth; leaves oblong, glossy, serrulated; pedicles thin, linear, axillary, and terminal, longer than the leaves; capsules 3-valved, 1-seeded. \(\varphi\). S. Native of Silhet, in the East Indies, where it is called *Tara*. Climbing and twining over trees to a considerable extent. Flowers numerous, small, pale greenish-yellow. Disk flat, repand, embracing the base of the ovary. Stigma trigonal. Capsule slightly triquetrous, oblong, smooth, the size of a field bean. Seed solitary, covered with an orange-coloured or scarlet aril.

**One-seeded Staff-tree.** Fl. April, May. Shrub cl.

41. **C. Walli-chi**; climbing, smooth; leaves ovate, coriaceous, acute, serrated, glossy, and shining; racemes axillary; capsules triquetrous, 3-valved, many-seeded. \(\varphi\). S. Native of Penang, in the East Indies. C. lucida, Wall. in fl. ind. 2. p. 400. but not of Lin.

**Walllich's Staff-tree.** Shrub cl.

42. **C. fuscifolius** (Wall. in fl. ind. 2. p. 400.) erect, smooth; leaves lanceolate, acuminate, serrulated; peduncles axillary, 6-8-flowered; pistil villous; nectary 5-lobe; capsule triangularly globose, 3-valved. \(\varphi\). S. Native of Penang, in the East Indies, where it is called *Boonga* *Lavang*. Pittosporaceae serrulata, Jacc. *mss.* Flowers yellowish-green, fascicled. Ovary downy. Stigma simple. Capsule 1-celled. Seeds attached along the middle of each valve to parietal prominent placenta, 6 in number, roundish, and angular.

**Few-flowered Staff-tree.** Shrub 6 feet.

43. **C. stylaceus** (Wall. fl. ind. 2. p. 401.) climbing, smooth; leaves ovate-lanceolate, acuminate, acutely serrated; peduncles axillary, few-flowered, racemose; petals oblong; capsules globose, crowned by a long style. \(\varphi\). G. Native of Nipaul. Flowers greenish-white. Capsule yellow. Style crowned by a 3-crowned, 3-furrowed stigma.

**Long-styled Staff-tree.** Fl. May, July. Shrub cl.

44. **C. alnifolius** (D. Don, prod. fl. nep. p. 190.) leaves elliptical, acuminate, serrated, nerves, opaque on both surfaces, blunt at the base; peduncles axillary, usually solitary. \(\varphi\). G. Native of Nipaul, at Sirinagar. A smooth shrub.

**Alder-leaved Staff-tree.** Shrub.

45. **C. microcarpus** (D. Don, prod. fl. nep. p. 191.) leaves ovate, crenated, pubescent on both surfaces, as well as the branchlets, acute at the base; peduncles axillary, usually solitary, 1-flowered. \(\varphi\). G. Native of Nipaul, at Sirinagar.

**Small-fruited Staff-tree.** Shrub.

46. **C. Heynesiana** (Roth. in Schult. syst. 5. p. 421.) erect, smooth; leaves elliptical, bluntly serrulated; cymes axillary, when in fruit divaricating. \(\varphi\). S. Native of the East Indies. C. serrulatus, Roth. nov. spec. p. 155. Flowers whitish.

**Heyne's Staff-tree.** Shrub.

47. **C. alpestris** (Blum. bijdr. 1145.) leaves ovate-oblong, acuminate, glandy lar serrated, smooth; corymb axillary, dichotomous. \(\varphi\). S. Native of Java, in the higher woods.

**Alp Staff-tree.** Shrub 7 feet.

48. **C. repandus** (Blum. bijdr. p. 1145.) leaves ovate-oblong, long-acuminated, rather repand, smooth; panicle axillary, about equal in length to the leaves. \(\varphi\). S. Native of Java.

**Repaund Staff-tree.** Shrub.

49. **C. Rottsehenus** (Schult. syst. 5. p. 423.) leaves roundish-oval, acuminate, serrated, pubescent; panicle terminal, with corymbose branches. \(\varphi\). S. Native of the East Indies. C. paniculatus, Roth. mss. but not of Willd. Flowers white.

**Roth's Staff-tree.** Shrub.

50. **C. puncatus** (Thumb. fl. jap. 97.) climbing, smooth; branches dotted; leaves ovate, acuminated, serrated; flowers scattered on the branches. \(\varphi\). G. Native of Japan and China. Branches angular, rough from white dots. Flowers greenish. Seeds covered with a yellow wrinkled aril.

**Spotted-branched Staff-tree.** Clt. 1817. Shrub cl.

51. **C. striatus** (Thumb. jap. 98.) erect, smooth; branches striped, and are as well as the leaves, opposite, ovate, acuminated, serrated; peduncles scattered, 1-flowered. \(\varphi\). G. Native of Japan. Capsule 1-4-celled, or from 1-4 aggregate carpels.

**Striped-branched Staff-tree.** Shrub.

52. **C. Creuxi** (Forst. prod. no. 113.) leaves ovate, crenulate; cymes axillary. \(\varphi\). G. Native of Marquesas Islands in the Pacific ocean, as well as in the East Indies, according to Roth, which is probably the same.

**Notch-leaved Staff-tree.** Shrub.

53. **C. dilatatus** (Thumb. in Lin. trans. 2. p. 332.) erect, smooth; leaves obovate, pointed, serrated at the apex; flowers aggregate, terminal. \(\varphi\). G. Native of Japan. Berries blue aggregate.

**Dilatated-leaved Staff-tree.** Shrub.

54. **C. articulatus** (Thumb. jap. 97.) erect, smooth; leaves
roundish, serrated, acuminate; peduncles axillary, somewhat trifid. 

\[ \text{H. Native of Japan.} \]

**C. auriculatus** Lam. ill. no. 700. C. auriculatus, Vitxin. summ. p. 31. Capsules 3-valved. 

**Winged-branch ed Staff-tree.** Shrubs 7 feet. 

**American.** 

56 C. scamned (Linn. spec. 285.) climbing, smooth; leaves ovate, acuminate, serrated; racemes terminal. 

\[ \text{H. Native of North America, from Canada to Virginia, in hedges and woods among rocks. Duh. arb. 1. t. 95.} \]

57 C. meyerianus (Linn. spec. 285.) erect, smooth; leaves oblong, ovate, serrated, flowers racemose. 

**Myrtle-leaved Staff-tree.** Clt. 1810. Tree 15 feet. 

58 C. quadrangularis (Schrad. in Gott. anz. 1821. p. 716.) erect, smooth; branches angular; leaves oblong, oval, shining; peduncles axillary, crowded. 

\[ \text{H. S. Native of Brazil.} \]

**Quadrangular-branched Staff-tree.** Clt. 1820. Sh. 10 feet. 

59 C. mierophyllum (Schrad. l. c.) erect, smooth; leaves oblong, truncate, subovate, shining, above opaque beneath; peduncles axillary. 

**Holly-leaved Staff-tree.** Clt. 1814. Tree 20 feet. 

60 C. reticulatus (Poir. suppl. 2. p. 146.) erect, smooth; leaves ovate and oval, acuminate, emarginate, or retuse at the apex, serrately-crenate. 

**Reticulate-leaved Staff-tree.** Clt. 1824. Tree 20 feet. 

61 C. confertus (Ruiz et Pav. fl. per. 3. p. 6. t. 229. f. a. but not of Wilfl. C. Peruvianus, Deir. lex. 2. p. 111.) is probably a species of Maytenus according to Kunth. 

**Entire-leaved Staff-tree.** Clt. 1818. Sh. 4 feet. 

62 C. mexicanus (Moq. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 2.) erect, smooth; leaves ovate-oblong, acute, serrated; pedicels axillary, trifid, 3-flowered. 

\[ \text{H. G. Native of Mexico.} \]

**Mexican Staff-tree.** Clt. 1824. Shrub 6 feet. 

63 C. magellanicus (D. C. prod. 2. p. 28.) leaves ovate-lanceolate, acute, bluntly serrated; flowers axillary, almost sessile; fruit compressed, 2-celled, 2-seeded. 

**Entire Staff-tree.** Shrub 3 to 4 feet. 

64 C. mauritiana (Willm. herb. maup. 22.) leaves ter-

**Mauritania Staff-tree.** Shrub. 

65 C. mcranthus (Roxb. fl. ind. 2. p. 323.) climbing, somewhat armed; leaves unequally pinnate, with 7-9 opposite, oblong, entire, smooth leaves; peduncles axillary, filiform, rusty; disk saucer-shaped, bearing the stamens on its margin; style wanting. 

**Another Staff-tree.** Shrubs. 

**C. scabauda** is a plant well adapted to cover bower or trellis-work. All are easily increased by laying the young shoots or by slips of the roots. The stew, greenhouse, and frame species will thrive well in a mixture of loam, peat, and sand; and ripened cuttings, planted in mould with our hand-glass placed over them, will root freely, those of the above kinds in heat. 

**Celastrus.** 

**V. catha** (a name of Arabian origin), Foksk. descr. p. 63. LIN. SYST. **Pentandra, Monogynia.** Calyx small, flat, 5-lobed, regular. Petals 5, inserted under the margin of the disk, sessile, spreading. Stamens 5, inserted with the petals, equal. Disk large, orbicular, filling the bottom of the flower, emarginate at the origin of the stamens. Ovary half immersed in the disk, 3-celled; ovula 2, fixed to the central axis, collateral, ascending, in C. pyracanthus 5-celled, and without an axis. Style short, or nearly wanting, crowned by a 3-parted stigma. Capsules triquetrose, 3-valved, 3-celled, 3-valved. Albumen fleshy. Cotyledons leafy. Radicle pointing towards the hilum. Spiny trees and shrubs, with scattered, simple, leaves, sometimes in fascicles, with stipular ciliæ. Corymb of flowers axillary, somewhat dichotomous. Flowers stalked in fascicles, white. 

This genus being separated from Celastrus, we shall therefore retain the authorities for the species under that genus. 

* Leaves quite entire. 

1 C. excisa (Thunb. fl. cap. p. 219.) prickles recurved; leaves orbicular, cut; peduncles axillary, very short, subumbellate. 

2 C. LINEARIS (fl. cap. 219.) spines leafy; leaves linear; pedicels axillary. 

3 C. INTEGRIFOLIA (Thunb. fl. cap. 219.) spines leafy; leaves ovate, reflexed; pedicels axillary. 

4 C. integripinnata (Thunb. fl. cap. 290.) spiny, smooth; branches somewhat secund; leaves obovate, quite entire, cut; flowers axillary, sessile. 

5 C. nigida (Thunb. fl. cap. 290.) spiny, smooth; branches somewhat secund; leaves obovate, quite entire, cut; flowers axillary, sessile. 

6 C. emarginata (Willd. spec. 1. p. 1128.) spines leafy; leaves ovate, entire, smooth; flowers numerous, axillary; capsules inflated; cells 2-seeded. 

7 C. Native of the Cape of Good Hope.

**Entire Staff-tree.** Clt. 1818. Shrub 3 to 4 feet. 

**Stiff Staff-tree.** Clt. 1818. Shrub 4 feet. 

**Entire Staff-tree.** Clt. 1818. Sh. 4 feet. 

**Entire Staff-tree.** Shrub 3 to 4 feet. 

**Entire Staff-tree.** Shrub 4 feet.
rising from the centre of the fascicles of leaves. Flowers small, whitish-yellow. Disk saucer-like, crenulate, surrounding the base of the ovary. Style half 3-parted. Stigmas emarginate. Capsule inflated, 3-sided, 3-celled, 3-valved, with 2 red seeds in each cell, resting on a white fleshy receptacle. It is called CHEMNEE-chintoo in the Telinga language, and is very useful to make fences and for fuel.

Emarginate-leaved Staff-tree. Clt. 1820. Shrub 4 feet.

**Leaves toothed or serrated.**

**Aziatic.**

7 C. montana (Roth. nov. spec. 154. Roxb. fl. ind. 2. p. 387.) spines bearing leaves and flowers; leaves obovate, serrated, smooth; panicles axillary, small, dichotomous; capsules 3-sided, 3-celled, each cell containing 1 or 2 seeds. \(\frac{H}{S}\) Native of the East Indies, on mountains. Flowers small, white. Disk as in C. emarginata. Stigmas emarginate. Seeds small, nearly round, with a white aril embracing the lower part of the seed. The wood is hard and durable.

Mountain Staff-tree. Tree 20 feet.

8 C. wallisii (Wall. fl. ind. 2. p. 397.) spines bearing leaves and even flowers; stem erect, stiff; branches round, flexuous; leaves very tough, ovate-cuneated, sharply-serrulate; corymbs small, scattered among the leaves. \(\frac{H}{S}\) Native of the East Indies, at Travancore. C. rigida, Wall. fl. ind. 2. p. 396. C. buxifolius, Roxb. Leaves at first in fascicles on the spines. Flowers small, white.

Wallis's Staff-tree. Shrub 8 feet.

9 C. rupestris (Wall. fl. ind. 2. p. 397.) erect, smooth, sparingly armed with axillary short spines; leaves lanceolate, acuminate, serrulated, coriaceous; corymbs axillary, fasciolated, on capillary, coloured peduncles; capsule obovate, triangular, 3-seeded. \(\frac{H}{S}\) Native of the forests in the valley of Nipaul. A large very branchy tree. Young branches angular, of a more or less deep red colour, glaucous. Leaves with glabrous serratures. Flowers small, white. Capsules small, obovate, 3-celled, 3-seeded. Segments of calyx and petals crenulate.

Rupia Staff-tree. Fl. March, April. Tree 30 feet.

10 C. zeylanica (Roth. ms. ex Schult. syst. 6. p. 427.) spines axillary, opposite, shorter than the petioles; leaves roundish-cuneated, somewhat emarginate at the apex, obovate, crenate, shining; peduncles axillary, aggregate. \(\frac{H}{S}\) Native of the East Indies. Flowers white.

Ceylon Staff-tree. Shrub.

**African.**

11 C. senegalensis (Lam. dict. 1. p. 661.) spines bearing leaves and flowers; branches terete; leaves obovate-oblong, smooth, somewhat glaucous, unequally toothed; cymes small, few-flowered. \(\frac{H}{S}\) Native of Senegal and Gambia. C. phyllacanthus, Lahir. syst. ang. 6. n. 28. Flowers whitish-green.

Var. \(\beta\), glaucifolius (D. C. prod. 2. p. 83) leaves whitish-glaucous beneath, bluntish; cymes many-flowered, about the length of the leaves.

Senegal Staff-tree. Shrub 8 feet.

12 C. buxifolia (Lam. spec. 285.) spines large, bearing both leaves and flowers; leaves lanceolate-obovate, obtuse, serrated, smooth, coriaceous; branches angular; corymbs axillary, pedunculate, longer than the leaves. \(\frac{H}{G}\) Native of the Cape of Good Hope. Shrub to 10 feet.

Box-leaved Staff-tree. Fl. May, June. Clt. 1752. Shrub 8 to 10 feet.

13 C. cymosa (Sol. in bot. mag. t. 2070.) spines all naked; leaves obovate, obtuse, serrated, smooth, coriaceous; corymbs shorter than the leaves. \(\frac{H}{G}\) Native of the Cape of Good Hope. Flowers whitish.

14 C. multiflora (Lam. dict. 1. p. 661.) lower spines very long, those on the branches small, rather leafy; leaves obovate, rhomboid, serrated, smooth; branches rather angular; cymes axillary, few-flowered, branched, divaricating. \(\frac{H}{G}\) Native of the Cape of Good Hope. Sims, bot. mag. 1137. Mill. icon. t. 87. Flowers greenish-white. Capsule red, 3-celled, 3-seeded, but often fewer from abortion.

16 C. rioutdenfioria (Thunb. fl. cap. 221.) spines spreading; leaves stalked, roundish, oblong, oblong, toothed. \(\frac{H}{G}\) Native of the Cape of Good Hope. Flowers unknown.

Round-leaved Staff-tree. Shrub 4 feet.

17 C. flexuosa (Thunb. fl. cap. 221.) leaves filiform; branches flexuous; leaves smooth, ovate, wavy-serrate; peduncles numerous, axillary, 1-flowered. \(\frac{H}{G}\) Native of the Cape of Good Hope. Flowers whitish.

18 C. parviflora (Vahl. symb. 1. p. 31.) spines naked; leaves ovate, crenated, smooth; peduncles filiform, dichotomous, longer than the leaves. \(\frac{H}{G}\) Native of Kurma, in Arabia. Cyllo spinosa, Forsk. deser. 64. Flowers small, white.

Small-flowered Staff-tree. Shrub.

19 C. articulata (Thunb. jap. Blum. bijdr. p. 1146.) spinose; leaves roundish, oval, acute at both ends; smooth; young branches rather spinous, sarmentose; peduncles axillary, trifid. \(\frac{H}{G}\) Native of Japan.

Jointed Staff-tree. Shrub 6 feet.

Cult. The culture and propagation of the species of \(\text{Catha}\) is the same as that for the stove and greenhouse species of \(\text{Celastrus}\), p. 9.

**VI. ELECTRONIA (from \(\text{plectron}, \text{plectron}\) a thorn; shrub covered with thorns).** Lin. gen. no. 300. Schreb. gen. no. 389. Burn, prod. p. 6.

Lin. syst. Pentandria, Monogyna. Calyx obliquely 5-toothed, clothed with sinuses or 5 villous scales, permanent. Pedals 5, sessile, inserted in the throat of the calyx. Stamens 5, very short; anthers 2-celled, roundish, each covered by a calycine scale. Ovary small. Style filiform. Stigma ovate. Berry oblong, 2-celled, 2-seeded. Seeds oblong, compressed.—A tree of no beauty, with quadrangular branches, opposite, stalked, lanceolate-ovate, entire, long leaves, and branched corymbs of white flowers, which are shorter than the leaves.

1 P. venticosa (Lin. mant. 52, syst. 212.). \(\frac{H}{G}\) Native of the Cape of Good Hope. P. corymbosa, Burn, prod. 6.—Burn, afr. 251. t. 94. Celastrus ? Plectronia, D. C. prod. 2. p. 9.

Cult. For culture and propagation see greenhouse species of \(\text{Celastrus}\), p. 9.

**VII. MAYTENUS (Maiten is the name of one of the species in Chili).** Feuille. Domb. Molin. ? H. B. et Kunth, nov. gener. amer. 7. p. 64. D. C. prod. 2. p. 9.

sessile, 2-3-lobed. Capsule 1-4-valved, with a dissepiment in the middle of each valve. Seeds few, arillate, in the bottom of the cells. Embryo flat, placed in a fleshy albumen.—Small trees, natives of Chili and Peru, with alternate, simple, coriaceous, toothed, permanent leaves, and axillary, small, greenish-white flowers. Capsules usually copper-coloured inside. This genus is allied to *Senecia* from the structure of the fruit, but from the embryo is referable to *Celastrus*. According to Molina, its *Maytenus* has a 1-leaved calyx, a monopetalous corolla, 2 stamens, and a 1-seeded capsule. It may be this genus badly described, or a distinct one.

*Bag* Maytenus. Shrub 5 feet.

*Hooked Maytenus.* Shrub 6 feet.

5 M. *verticillata* (D. C. prod. 2, p. 10.) branches aggregate, whorled; leaves oblong-lanceolate, serrated; peduncles 1-3-flowered, much shorter than the leaves, rising along the branches either above or below the leaves in racemes. G. G. Native of Peru, in groves at Cuchero, Munna, &c. Leaves almost smooth, shining. Capsules 2-3-4-valved.

6 M. *Boaria* (Mol. chilli, 152.) leaves opposite or alternate, oblong, smooth, serrated; flowers scattered; seeds covered with red aril; corolla monopetalous; style 1; stamens 2; capsule 2-valved, 2-seeded, 2-seeded. G. Native of Chili. A decoction of the twigs of this shrub is used to bath the swellings produced by the poisonous shade of the Lithi, *Rhizis cactus*. Its vernacular name is *Boaria*.

*Cult.* See greenhouse species of *Celastrus* for culture and propagation.

*Cult.* Shrub 10 feet.

IX. *CRIPTERONIA* (from κριπτός, κρυπτός, hidden, and πετερ, peteron, a wing; the seeds are terminated by a narrow wing). Blum. bidr. 1145.

1 C. *paniculata* (Blum. l. c.). G. Native of Java on the mountains.

*Panicled-flowered Crypteronia.* Tree 50 feet.

*Cult.* For culture and propagation see *Polycardia*.

**XI. ELEODENDRON** (from αλος, πολύς, many, and καρπος, καρδία, a heart; in allusion to the petals being furnished with numerous heart-shaped wings). Juss. gen. 377. D. C. prod. 2. p. 10.

**Lin. syst.** *Pentändria*, Monogynia. Calyx 5-valved, permanent. Petals 5. Stamens 5, short, alternating with the petals. Ovary depressed. Style 1, very short. Stigma lobed. Capsule woody, 5-valved, 5-valved (rarely 3-4-valved from abortion) with a membranous dissepiment at the base of each valve in the middle. Seeds few in the bottom of each cell, oblong, each surrounded by a calyciform jagged aril. Flowers sessile on the middle nerves of the leaves.

1 P. *phyllanthoides* (Lam. ill. 2. p. 100. t. 132.). G. Native of Madagascar. A smooth shrub, with alternate coriaceous leaves, tapering into the footstalk, some of which are oblong, entire; others deeply emarginate, bearing 1-5 flowers in the recess. *Flora*, Nov. mss. Commersonia, Comm. mss. P. Madagascarensis, Gmel. syst. p. 407. P. epiphylla, Smith, in Rees’ cyc. vol. 28.

*Phylanthus-like Polycardia.* Shrub 6 feet.

*Cult.* Loam, peat, and sand is a good soil for this shrub, and ripened cuttings will strike root in a pot of sand under a hand-glass, in heat.
obovate-oblong, or ovate, much longer than the petioles; flowers usually pentandrous. \( \text{p.} \) S. Native of the Mauritius and Madagascar, where it is called bois d’olive. Rubentia olivina, Gmel. syst. 408. E. Indicum, Gart. fruct. 1. t. 57. Lam. ill. t. 132. "Nerves in the young leaves reddish. The nut is said to be hairy on the outside. Flowers yellowish-green.

2 E. australi (Vent. malm. t. 117.) leaves crenately-toothed, oblong-lanceolate, coriaceous, much longer than the petioles; flowers usually tetrandrous. \( \text{p.} \) G. Native of New Holland. Portenschlagia australis, Tratt. arch. t. 250. Lamarkia dentata, Hortul. Flowers small, greenish-yellow.

3 E. integrifoliun; leaves oblong-lanceolate, coriaceous, much longer than the petioles, quite entire, or with a few small glandular teeth; flowers numerous, usually tetrandrous; calyx reflexed. \( \text{p.} \) G. Native of New Holland. Portenschlagia integrifolia, Tratt. arch. t. 284. Flowers yellowish-green.

4 E. glaucus (Pers. ench. 1. p. 341.) leaves elliptical, serrated, hardly 5-times longer than the petioles; cymes loose, nearly the length of the leaves; flowers pentandrous. \( \text{p.} \) S. Native of Ceylon and Coromandel. Schrebéla álbens, Retz. obs. 6. p. 25. t. 3. Celáusrus glaucius, Vahl. symb. 2. p. 42. Mangiféra glauca, Rottb. nov. act. hafn. 2. t. 4. f. 1. Senecíá glácta, Lam. ill. no. 2714. Leaves oblong. Panicles axillary, dichotomous. Flowers small, greenish-yellow. Drupes nearly round, size of a large cherry. This plant has been introduced from Ceylon, under the name of Ceylon-tea; its leaves are like those of that plant, but much longer; their taste slightly bitter and astringent.

5 E. xylocaírum (D. C. prod. 2. p. 11.) leaves ovate, entire, or somewhat scolpided, glaucous, coriaceous, on very short petioles; coryms dichotomous, one-half shorter than the leaves; flowers pentandrous. \( \text{p.} \) S. Native of the island of St. Thomas. Cassíne xylocaírea, Vent. choix. t. 28. Cassíne sphaeroçára, hort. par. Flowers greenish-yellow. Probably this and the following will form a separate genus.

6 E. roténda'tum (D. C. prod. 2. p. 11.) leaves ovate-roundish, obtuse, quite entire, or a little toothed, coriaceous, on short stalks, usually three in a whorl; cymes crowded, one-half shorter than the leaves; flowers pentandrous, dioecious. \( \text{p.} \) S. Native of St. Thomas, in salt marshes. Flowers greenish-yellow.

† *Species hardly known.*

7 E. cróécum (D. C. prod. 2. p. 11.) leaves elliptical, coriaceous, with awned, spiny serratures. \( \text{p.} \) G. Native of the Cape of Good Hope. Flowers copper-coloured.

*Copper-coloured Olive-tree.* Shrub.

8 E.? tómentósum (Humb. ex Willd. mass. in Reen. et Schult. syst. 3. p. 345.) leaves oblong-lanceolate, downy; flowers pentandrous. \( \text{p.} \) S. Native of South America. Flowers greenish-yellow.

*Downy Olive-wood.* Tree.

9 E.? trine'rose (Hort. madr. ex Willd. l. c.) leaves ovate, cordate, 3-nerved, crenated; branches spiny. \( \text{p.} \) S. Native of?

*Three-nerved-leaved Olive-wood.* Tree?

*Cult.* See *Pteleidium* for culture and propagation.

**XIII. PTELEIDIIUM.** XIV. *TRALLIANA.* XV. *CASSINE.*

1 A. sarmentosum (Blum. bijdr. 1144.) \( \text{p.} \) S. Native of Java, where it is called *Papadjaran.*

*Sarmentose Actegeton.* Shrub straggling.

*Cult.* For culture and propagation, see next genus.

**XIII. PTELEIDIIUM (it has received this name from its similarity to *Ptelea*).** Pet. Th. gen. nov. 24. veg. austr. 1. p. 11. and 29. t. 2. D. C. prod. 5. p. 11. —Seringia, Spreng. syst. 1. p. 460. but not by Gay.

*Ovate-leaved Pteleidium.* Clt. 1818. Shrub 6 feet.

*Cult.* Loam, peat, and sand is a good mixture for this shrub, and ripened cuttings will strike root in sand under a hand-glass, in heat.

**XIV. TRALLIANA (in honour of Alexander Trallian, a celebrated physician of the sixth century: his works were published at Paris, 1548).** Lour. fl. coch. p. 157. D. C. prod. 2. p. 11.

1 T. scándens (Lour. l. c.) \( \text{p.} \) G. Native of Cochin-china. *Rhímmas* scándens, Spreng. syst. 1. p. 768.

*Climbing Tralliana.* Shrub cl.

*Cult.* A climbing shrub of no beauty. It will grow in any common soil, and ripened cuttings will root in sand under a hand-glass.

**Tribe III.**

*CASSINEÆ (plants agreeing with *Cassine* in important characters).* Petals broadest at the base. Fruit indehiscent. Embryo straight, placed in the axis of a fleshy albumen.—Trees or shrubs, with simple leaves.

*Lin. syst.* Pentándria, Monogyínia. Calyx small, 5-parted. Petals 5, spreading, broadest at the base. Stamens 5, alternat-
ing with the petals. Ovary 1. Style wanting. Stigmas 3-5. Drupes almost dry, containing a thin 3-5-celled, 3-5-seeded nut. Seeds hanging from the top of the cells.—Cape and Asiatic shrubs, with tetragonal branches, opposite, smooth, coriaceous leaves, and axillary peduncles, bearing small flowers.

1 C. **Maurocænia** (Lin. spec. 385.) leaves sessile, obovate, quite entire, convex; peduncles many, very short. h. G. Native of Ethiopia. Maurocænia frangularia, Mill. dict. no. 1.—Dill. et h. t. 121. f. 147. Flowers at first greenish-yellow, but changing at length to white. Fruit dark-purple when ripe. The specific name is in honour of the Venetian senator Franc Morosini, who had a fine garden at Padua, a catalogue of which was published by Ant. Tita.

2 C. **Capea** (Lin. mant. 220.) leaves stalked, ovate, retuse, crenate, flat; panicles axillary, shorter than the leaves. h. G. Native of the Cape of Good Hope, in woods.—Burm. afr. t. 55.—Dill. et h. t. 236. Flowers small, white.

3 C. **exceLSa** (Wall. in vol. fl. ind. 2. p. 376.) leaves alternate, ovate, acuminate, quite entire, with an acute base, rather fleshy, shining above; umbels axillary and lateral, many-flowered, rounded; stigmas 5; berry 5-celled, 5-seeded. h. G. Native of Nipaul, in all the forests of the valley and the surrounding mountains. Flowers white? Berry about the size of a currant, pulpy, yellow. Notwithstanding the rotate corolla, and the increased number of stigmas and seeds, as well as the alternate leaves, Dr. Wallich had no hesitation in referring this tree to *Cassine*.

*Wall’s Cassine.* Fl. May, June. Clt. 1820. Tree 40 feet.

4 C. **nisicolor** (Wall. in vol. fl. ind. 2. p. 278.) leaves ovate, acuminate, tapering much to the base, whitish, quite entire, coriaceous; fascicles of flowers axillary, dichotomous; stigmas 4. h. G. Native of the East Indies, on the mountains bordering on Silhet. Flowers yellowish, monopetalous.

5 C. **Colpoon** (Thunb. fl. cap. 2. p. 227.) leaves stalked, ovate, crenate, but usually quite entire; panicle axillary, length of leaves. h. G. Native of the Cape of Good Hope. *Eunymus* Colpoon, Lin. mant. 200.—Burm. afr. t. 86. Flowers white. (quadrifidi?)

† Doubtful species.

6 C. **Ethisópica** (Thunb. fl. cap. 2. p. 227.) leaves stalked, oblong, deeply crenate; panicles axillary. h. G. Native of the Cape of Good Hope. Flowers white. This is probably a variety of *C. Capensis*.

8 C. **opposítiFólia** (Mill. dict. no. 3.) leaves stalked, ovate, acute; flowers axillary, scattered. h. G. Native of? Formerly cultivated in the gardens of England under the name of *Hyson tea*. Flowers greenish-white? *Opposite-leaved Cassine.* Shrub.

*Cult.* Shrubs with large thick leaves, and small white flowers. They will grow freely in a mixture of loam and peat; and ripened cuttings will readily strike root, if planted in a pot of sand with a hand-glass placed over them.

**XVI. HARTOGIA** (in honour of J. Hartog, a Dutch naturalist and traveller at the Cape of Good Hope). *Thunb. nov. gen. 5. p. 35, with a figure, but not of Lin. D. C. prod. 2. p. 12.

*Cult.* See *Cassine* for culture and propagation.

**XVII. CURTISIA** (in honour of the late William Curtis, a celebrated English botanist, who commenced the Botanical Magazine). *Ait. hort. kew. l. c. Lam. ill. t. 71.*) h. G. Native of the Cape of Good Hope.—Burm. afr. t. 82. The Hottentots and Caffres make the shafts of their javelins or assagays from the wood of this tree. They always carry one or two of these with them on their journeys. They consist of an iron spear, hollowed out on each side, about six inches long, with or without an iron shaft, which is sometimes round and smooth, and sometimes grooved. It is fastened with thongs of leather to a slender, round stick, 5 feet long, tapering towards the end, and made of the wood of this tree. With these lances, which they throw with great dexterity to the distance of a hundred paces, the Hottentots and Caffres defend themselves, and kill buffaloes and other wild animals. The tree is called in Dutch *Assagay-hout*, *Wite-else*, and *Stink-hout*. In English *Hassagay*, or *Assagay-tree*, from its use among the natives at the Cape.

*Beech-like Hassagay-tree.* Clt. 1775. Tree 60 feet.

*Cult.* See *Cassine* for culture and propagation.

L. s. Polygónia, Dioecia. Flowers dioecious or polygamous from abortion. Calyx small, scarcely conspicuous. Petals 5, distinct, oblong-linear, deciduous. Stamens 5, alternating with the petals. Ovary hemispherical, covered with clammy juice. Style wanting. Stigmas 3-4, sessile, in the male flowers they are hardly manifest. Berry somewhat globose, 3-4-celled, 3-4-seeded.—A small deciduous shrub.

Cult. See hardy species of Prinos for culture and propagation.

XIX. SKIMMIA (from mijama-skimini, the name of the plant in Japan). Thunb. fl. jap. 62. nov. gen. 57. D. C. prod. 2. p. 18.

1 S. Japonica (Thunb. l. c.) #. G. Native of Japan. Leaves alternate, somewhat crowded in whorled, oblong, wavy, evergreen. Flowers panicked. Kæmpf. t. 5. Flex Skimmia, Spreng. syst. 1. p. 495.

Japan Skimmia. Tree 20 feet?

XX. LEPTA (from leptos, leptos; minute; flowers minute). Lour. fl. coch. p. 82. D. C. prod. 2. p. 18.
Lin. syst. Tetrandria, Monogynia. Calyx small, 4-parted, spreading. Petals 4, somewhat triangular, furrowed, inflexed. Stamens 4, inserted in the angles of the receptacle; filaments awl-shaped. Ovary roundish. Style almost none. Stigma blunt. Berry 4-lobed; lobes 1-seeded.—A much branched shrub, with ternate, lanceolate, quite entire leaves, and axillary compound racemes of small white flowers. This is a species of Skimmia according to Juss., Flex of Spreng., Flis of Smith, and Oldéa of Poir; but it is hardly known.

1 L. Thunbergiana (Lour. l. c.) #. G. Native of Cochinchina, in woods. Flex Lepta, Spreng. syst. 1. p. 496.
Three-leaved Lepta. Shrub 10 feet.

† Genera allied to Celastrinae, but differ materially in the estimation of the petals.

XXI. PERROTTETIA (in honour of Perrotet, a botanical collector, who travelled in Guiana and Madagascar). H. B. et Kunth, nov. gen. amer. 7. p. 73.

1 P. Quindiuensis (H. B. et Kunth, nov. gen. amer. 7. p. 75. t. 625.) #. S. Native of South America, on Mount Quindiu. Quindiu Perrottetia. Shrub to 6 feet.
Cult. Loam and sand is a good mixture for this shrub; and ripened cuttings will root in heat.

XXII. DULONGIA (in honour of Peter Louis Dulong, a learned physician, and member of the Academy of Sciences of Paris). H. B. et Kunth, nov. gen. amer. 7. p. 78.
Lin. syst. Pentandria, Digynia. Calyx adnate to the ovary, with a free 5-toothed limb. Petals 5, inserted round the base of the disk, sessile, ovate, valvate in estimation. Stamens 5, free, inserted with the petals. Anthers 2-celled, didymous. Ovary inferior, 2-celled, having 6 ova in one cell, and 3 in the other. Disk orbicular, rather convex. Stigmas 2, sessile, acutish. Fruit globose, baccate, pea-formed, crowned by the permanent calyx, petals and stamens half-2-celled; cells 2-3-seeded, tuberculated.—An unarmed shrub, with alternate, simple, exstipulate leaves. Peduncles rising from the middle nerve of the leaf, branched, many-flowered. Flowers stalked, minute, white.

Cult. See last genus for culture and propagation.

ORDER LXV. BREXIAEE (the order only contains the genus Bréxia). Lindl. introd. nat. syst. p. 112.
Calyx inferior, small, permanent, 5-parted, imbricate in estimation. Petals hypogynous, also imbricate in estimation. Stamens 5, hypogynous, alternating with the petals, arising from a narrow cup, which is toothed between each stamen; anthers oval, innate, 2-celled, bursting lengthwise. Style one, continuous, crowned by a simple stigma. Fruit drupaceous, 5-celled, many seeded. Seeds attached to the axis, without albumen. Embryo with ovate, obtuse cotyledons, and a cylindrical centripetal radicle.—Trees, with nearly simple stems. Leaves alternate, simple, without dots, and furnished with minute deciduous stipulas. Flowers green, in axillary umbels, surrounded by bracteas on the outside. This order differs from Celastrinae in the hypogynous insertion of the stamens, and in the numerous seeds. It agrees with Pittosporaceae in the insertion and definite number of stamens, as well as in the fruit being many seeded; but it differs in many important characters.

I. BREXIA (from brex, brexiv, rain; the leaves afford protection against rain). Pct. Th. mad. 69.—Vénâna, Lam. ill. 2. t. 99. no. 365. t. 131. dict. 8. p. 450.
Character the same as the order.

1 B. Madagascariensis (Pct. Th. gen. mad. no. 69.) leaves obovate or oblong, entire, while young minutely gland-toothed. #. S. Native of Madagascar. Ker. bot. reg. 750.

2 B. spinosa (Lindl. bot. reg. 872.) leaves lanceolate, long, spiny-toothed. #. S. Native of Madagascar.

3 B. chrysophylla (Sweet, hort. brit. p. 492.) leaves lanceolate, yellowish, entire or slightly and sparingly toothed. #. S. Native of Madagascar.

Cult. Elegant trees, with fine foliage. They will grow freely in a mixture of turfy loam and peat; and cuttings with their leaves not shortened strike readily in sand under a handheld in heat, or a leaf torn off with a bud attached will grow.

ORDER LXVI. ILICINEÆ (plants agreeing with H. lex in important characters). Brogni. mem. Rhamneæ. p. 16.
Calyx of 4-5 sepals, imbricate in estimation. Corolla sub-monopetalous (f. 3. a.), deeply divided, imbricate in estimation, inserted under the ovary (f. 3. d.). Stamens alternating with the petals (f. 3. b.), rarely opposite them, and inserted in the corolla (f. 3. b.); filaments erect. Anthers 2-celled;
ILICINÆ.

1. Myginda.

Calyx small, 4-cleft. Corolla deeply 4-cleft. Stamens 4, inserted in the base of the corolla. Style short, crowned by 4 stigmas. Drupe 1-celled, 1-seeded, probably from abortion.

5. Strombodia. Calyx small, obsolescent-crenated. Corolla 3-cleft, with a villous throat, with 3 stamens inserted in the bottom of it; these are opposite the divisions. Drupe baccate, 1-seeded from abortion. Style short, crowned by an obtuse stigma.

I. Myginda (in honour of Francis von Mygind, a German botanist). Jael. amer. p. 24. D. C. prod. 2. p. 12.—Rhaçôma, Lin. gen. no. 114.—Crossopetalum, P. Browne, jam. 145. LIN. SYST. Tetradria, Monogyaina. Calyx small, 4-cleft. Corolla deeply 4-cleft, sub-rotate. Stamens 4, alternating with the segments of the corolla, and shorter than them, and inserted in its throat. Ovary roundish. Style short or wanting. Stigmas 4, therefore sometimes at the top of the style, and sometimes sessile. Drupe ovate, 1-celled, 1-seeded, probably from abortion. Seed hanging from the top of the cell, albuminous.—Caribbean or South American shrubs, with tetragonal branches, opposite, subcoriaceous, laurel-like leaves, axillary pedicels, which are usually trifid or trichotomous, and small flowers, which are for the most part white.

* Leaves downy beneath.

1 M. microphylla (D. C. prod. 2. p. 12.) leaves obovate-oblong, blunt, quite entire, pubescent beneath, as well as the branchlets; fruit solitary, almost sessile, terminated by the filiform style. "S. Native of St. Domingo, where the Spaniards call it Mata-muger. Flex microphylla, Spreng. in herb. Balb. Small-leaved Myginda. Shrub.

2 M. rotunda (Lam. ill. no. 1546.) leaves ovate-roundish, crenate, pubescent beneath; peduncles nearly simple, few-flowered. "S. Native of the Antilles.

Rounded-leaved Myginda. Shrub.

3 M. uraëo (Jaeg. amer. t. 16. pict. t. 22.) leaves ovate or cordate, almost sessile, acuminate, serrated, pubescent; corollas twice trifid. "S. Native of South America, near Carthagena, and in the island of St. Martin, near the sea. Each division of the corolla bearing 3 flowers. Flowers small, of a dark shining red. Fruit red, soft, the size of a pea. The Spaniards call it Yerec de Manacada. At Carthagena the inhabitants use a decoction or infusion of the root as a powerful diuretic; the leaves have the same quality, but in a much smaller degree. Houtt. fl. syst. 3. p. 142. t. 19. Lam. ill. t. 76. Rhaçôma crossopetalum, Lin. and crossopetalum, P. Browne, jam. t. 17. f. 1.

* * Leaves smooth on both surfaces.

4 M. iliophylla (Lam. dict. 4. p. 396.) leaves ovate-roundish, spinous-toothed, smooth, pale beneath; peduncles axillary, towered; fruit pointed by the permanent style. "S. Native of St. Domingo. Flowers white.

Var. a, acutifolia (D. C. prod. 2. p. 13.) leaves ovate, acuminate, spinous-toothed, smooth. "S. Native of St. Domingo.

Holly-leaved Myginda. Shrub 4 feet.

5 M. myrsinoides (H. B. et Kult. nov. gen. amer. 7. p. 68. t. 620.) leaves somewhat distich, elliptical, acute, rounded at the base, serrulately smooth, on short stalks; peduncles 1-flowered, 2-3 times longer than the leaves; flowers pentandrous. "S. Native of Peru, in hot places, near Contumasa. The ovary in this and the preceding species is 2-celled, each cell containing 3 seeds. It is therefore probable that these two species may form a distinct genus.

Myrtille-like Myginda. Shrub 2 feet.

6 M. myrsinifolia (Nut. gen. 1. p. 109.) leaves oblong, blunt, serrated, smooth, with volute edges; peduncles very short, usually solitary, 1-flowered; style short, club-shaped, 4-lobe, at the apex. "S. H. Native of North America, on the western coast. Flex myrsinifolia, Pursh. fl. sept. amer. 1. p. 119. Flowers small, white. Drupe containing only one seed at maturity, dark-purple, about the size of a pea. Leaves permanent, serrate in front, and entire behind.

Myrtlo-leaved Myginda. Fl. May, Aug. Clt. 1818. Sh. 4 fl. 7 M. Vladuenn (Smith in Rees' cyc. no. 4,) leaves elliptical, very obtuse, crenate, smooth, almost sessile; peduncles bifurcate, with a flower in the fork; style 4-lobe, at the apex. "S. Native of Antigua. Flowers white? with waved petals. Leaves yellowish-green.

Pale-leaved Myginda. Shrub 4 feet.

8 M. Rhaçôma (Swartz. fl. ind. occ. p. 340.) leaves lanceolate-ovate, bluntish, crenated, on short stalks, smooth; peduncles dichotomous, cymose-umbellate, style short, filiform, 4-lobe, at the apex. "S. Native of St. Domingo and Jamaica, in the sand by the sea-side, and many other parts of South America in a like situation. Rhaçôma crossopetalum, Lin. spec.
ILICINEÆ. I. MYGINDA.

169.—P. Browne, jan. t. 17. f. 1.—Jacq. Icon. rar. t. 311. Flowers small, reddish. Drupe about the size of a red currant, containing one nut.

Rha come Myginda. Clt. 1798. Shrub 3 feet.

9 M. latifolia (Swaetz, fl. ind. occ. 1. p. 342.) leaves elliptical, crenate, smooth, on short footstalks, coriaceous; peduncles tridif, few flowered; stigmas 3-4, almost sessile. H. S. Native of the Caribbean islands. Flowers small, white. Drupe ovate, about the size of pepper, drooping.

10 M. integrifolia (Lam. dict. 4. p. 396.) leaves elliptical, blunt, entire, smooth, coriaceous, on short stalks; peduncles dichotomous, few-flowered; flowers dioecious; stigmas 4, sessile. H. S. Native of Martinique and St. Domingo. It is probably a species of L'lex, according to Kuntz, but with the true habit of Rha come. M. integrifolia Guadalupensis, Spreng. syst. 1. p. 496. Flowers white?

11 M. Brasilensis (Spreng. syst. 1. p. 496.) leaves oblong, tapering to both ends, coriaceous, quite entire, shining, reticulated; panicles axillary, shorter than the leaves. H. S. Native of Brazil. Flowers white.

Brazilian Myginda. Shrub 3 feet.

12 M. Gongôna (D. C. prod. 2. p. 13.) leaves oblong, rounded at the base, with a short acumem at the apex, marginate, remotely serrated; racemes axillary, sparingly branched; flowers sessile; branches terete. H. S. Native of Brazil in the provinces of St. Paul and Minas Geraes, where it is called Gongôna. Cassine Gongôna, Mart. in Isis. 1824. p. 589. An infuscation or decoction of the roots is a powerful diuretic; the leaves and branches possess the same quality, but in a less degree.

Gongôna Myginda. Shrub 6 feet.

Cult. A mixture of loam and peat will answer the species of Myginda, and ripened cuttings will root in sand, under a hand-glass; those of the stave species in heat.

II. LEPIONURUS. From (lêpis, a scale, and ovula, a tail; in allusion to the pendulous bracteate spikes of flowers). Blum. bijd. 1148.

1 L.Java'nicus. H. S. Native of Java.

Java Lepionurus. Shrub 6 feet.

Cult. For culture and propagation, see stave species of last genus.

III. L'LEX (this name is originally derived from aeg, a point in Celtic; the leaves of several species are prickly). Lin. gen. no. 172. D. C. prod. 2. p. 13. Aquifolium, Tourn. inst. t. 371. Genêt. fruit. 2. t. 92.

Lin. syst. Tetrândria, Tetràgynia. Calyx 4-5-toothed, permanent. Corolla 4-5-cleft, sub-rotate. Stamens 4-5, alternating with the segments of the corolla, and inserted in its tube. Ovary sessile, 4-celled; stigmas 4, almost sessile, sometimes distinct, sometimes connected in one. Berry containing 4-5 1-seeded nuts. Seeds inverted; albumen fleshy.—Evergreen shrubs or trees, with the leaves usually coriaceous. Pendulous

many-flowered. Flowers small, usually white, hermaphrodite, rarely dioecious or polygamous from abortion.

† Leaves spiny-toothed.

1 Aquifolium (Lin. spec. 181.) leaves ovate or oblong acute, shining, waved, spiny-toothed at the apex; peduncles axillary, short, many flowered; flowers subumbellate. H. H. Native of Europe, in shady places. It is to be found in many parts of Britain in woods and forests, but still it is a truly doubtful native. Smith, eng. bot. t. 496. Fl. dan. 508. Mill. fig. 46. Black. Icon. t. 205. The holly rises even to 30 feet high, and sometimes more. The flowers dirty white, hermaphrodite, dioecious, or polygamous. Berries roundish, red, crowned by the calyx, each containing 3 or 4 seeds. The holly is called also in English Hulver and Holme. It is known by the name of Hulver in Norfolk. In German it has a great variety of appellations; Stechpalme, Stecheiche, Stechbaum, Stechlaub, Holse, Hulsenbaum, Hulsenstrauch, Holst, Hulch, Holst, Hulbee, Hulfenobz, Myriendorn, Christdorn, Mausedorn, Znieseldorn, Kleesebusch, Stechsfel, Stechninde, Walddistel. In Danish Steckpalme, Marcetorn, Chirstorn, Skontisdel. In Swedish Jensen, Christorn. In French, Le Houx, le grand Houson, l'Agtron grid Pardon, et Bois Franc. In Italian, Agrifolio, Alchor spinoso. In Spanish, Acabio Agrifolio. In Portuguese, Acacbio, Agrifolio, Afilicó, Aquifolio. In Russian, Vachechoel, Ostrakof, Podsk.—The holly makes an impenetrable fence, and bears cropping well, nor is its verdure, or the beauty of its scarlet berries, ever observed to suffer from the severest of our winters. It would be preferable to the hawthorn for hedges were it not for the slowness of its growth. A holly hedge should always be cropped in May. The wood is the whitest of all hard woods, and useful for various purposes. It is used in fencing, and is sometimes stained black to imitate ebony. It is much used with box, yew, white-thorn, &c. in the small thicket, and other works carried on in and about Tunbridge, commonly called Tunbridge-ware. The bark also affords the substance called bird-lime, which is prepared by boiling it till the green part is capable of being separated from the white, then laying it in a cool cellar for a few days, afterwards pounding it till it becomes a tough paste, washing it repeatedly till it gets quite clear; then placing it in a vessel to ferment or become fine, when it will be fit for use.

There are numerous varieties of this tree, which are highly ornamental in clumps, borders, and other parts of pleasure grounds, affording much variety when judiciously intermixed. The most remarkable of these are as follows: the smooth green-leaved, the common green-leaved, the narrow-serrated green-leaved, the green-leaved yellow-berried, the box-leafed green, and the hedge-hog green, the prickly silver-striped-leaved hedge-hog, the gold-striped-leaved hedge-hog, the blotched-leaved hedge-hog, yellow and white, the smooth white-striped-leaved, the smooth yellow-white-striped-leaved, the smooth blotched-leaved, the smooth narrow-striped-leaved, the blotched-leaved yellow-berried, the cream-coloured-leaved, the copper-coloured-leaved, the white-leaved, the mottled-edged-leaved, the painted lady, the various-leaved, the thistle-leaved holly, &c.

Var. β, echinatum (Mill. dict. no. 2.) leaves full of spines on the disk, as well as the edges. H. H. Said to be originally from North America. It does not change by culture.

The leaves in young plants are always spiny-toothed, but in the adult ones they are usually entire. The plant, native of Cochin-china, is said to bear black berries; it is therefore probable that this may turn out to be a distinct species.

Prickly-leaved or common Holly. Fl. May, June. Britain. Tree 30 feet.

2 I. recu'eva (Link, enum. 1. p. 247.) leaves oblong, acu-

**Large-leaved Holly.** Tree.

12 I. macrophylla (Blum. bijdr. 1150.) leaves ovate or oval-oblong, obtuse, acute at the base, serrated, coriaceous, glabrous, shining above; racemes axillary, about equal in length to the petioles; branches smooth, striated. *G. Native of Japan.*

**Three-leaved Holly.** Tree.

13 I. triflora (Blum. bijdr. 1150.) leaves oval-lanceolate, acute at both ends, serrulated, veiny, puberulous on the middle nerve, and on the branches; fascicles of flowers axillary and lateral, usually 3-flowered. *S. Native of China.*

**Cassine-like or Broad-leaved Dahoon Holly.** Fl. Aug. Clt. 1700. Shrub 10 feet.

**Cassine-like or Broad-leaved Dahoon Holly.** Fl. Aug. Clt. 1700. Shrub 10 feet.

15 I. angustifolia (Wild. enum. 1. p. 172.) leaves linear-lanceolate, serrated at the apex, with the edges rather revolute, smooth, as well as the midrib petioles and branches; cymes lateral, stalked. *G. H. Native of North America, from Virginia to Georgia, in deep swamps. I. myrtifolia, Walt. carol. 241. I. rosarinifolia, Lam. ill. 1. p. 556. Flowers white. Berries red?*

**Narrow-leaved Holly.** Fl. June. Clt. 1806. Shrub 8 feet.

16 I. vomitoria (Ait. hort. kew. 1. p. 278.) leaves oblong or elliptical, blunt at the apex, crenate-serrated, and are, as well as the branchlets smooth; umbels lateral, nearly sessile. *G. H. Native of North America along the coast sea, from Carolina to Florida. I. Cassine vera, Walt. fl. Carol. 241. I. ligustrina, Jacq. coll. 4. p. 105. icon. rar. t. 310. Wendl. hort. t. 31. Cassine Peragua, Mill. fig. t. 83.f.2. - I. Cassinha, Michx. fl. 1. p. 229. 1. religiosa, Bart. fl. virg. 69. I. Floridana, Lam. ill. no. 1731. Flowers white. Berries red. The leaves of this handsome shrub are used by the Indians to make their black drink, so much in use among them, not only as a medicine, but also as a drink of etiquette on their councils, when matters of consequence are to be transacted. At a certain time of the year the Indians come down in droves, from a distance of some hundred miles, to the coast, for the leaves of this tree, which is not known to grow at any considerable distance from the sea shore. They make a fire on the ground, and putting a great kettle of water on it, they throw in a large quantity of these leaves, and setting themselves round the fire, from a bowl that holds about a pint they begin drinking large draughts, which in a very short time occasion them to vomit easily and freely; they thus continue drinking and vomiting for the space of two or three days, until they have sufficienty cleansed themselves, and then every one taking a bundle of the branches to carry away with him, they all retire to their habitations.*

**Emetic Holly or South-sea Tea.** Fl. June, July. Clt. 1700. Shrub 12 feet.

17 I. ovalifolia (Meyer. esseq. 91.) leaves oval, serrate-nate, coriaceous, with revolute edges, smooth; flowers racemose, axillary, and terminal; pedicels corymbose. *S. Native of South America, about Essequibo. The leaves are 8 times larger than those of I. vomitoria.* Flowers white.

**Oval-leaved Holly.** Shrub 6 feet.

18 I. elliptica (H. B. et Kuhn, nov. gen. amer. 7. p. 70. but not of D. Don,) leaves elliptical, rounded at both ends, sharply serrated towards the apex, coriaceous, quite smooth, shining above; peduncles 1-flowered, and are, as well as the

**Variable-leaved Holly.** Tree 30 feet.

**Long-leaved Holly.** Tree.

8 I. Longifolia (Neuw. bras. 2. ex flor. 1821. p. 301.) leaves oblong, spiny, with 6 recesses on both sides, wavy, tridentate at the apex, cuneate at the base. *S. Native of Brazil.*

**Long-leaved Holly.** Tree.

*Leaves toothed, serrated, or crenate, but not spiny.*

9 I. Perado (Ait. hort. kew. 1. p. 169.) leaves ovate, with an entire acumen, or having a very few teeth, shining; umbels short, axillary, few-flowered. *G. Native of Madeira. 1. Madereensis, Lam. dict. 3. p. 146. Flowers white or reddish. Berries large, red.*

10 I. Chineensis (Sims, bot. mag. t. 2045.) leaves oblong, tapering to both ends, with cartilaginous toothletted edges; teeth hardly pungent; petioles and midrib villous; corymbs lateral; pedicels dichotomous. *G. Native of China. Leaves somewhat spotted above. Flowers white.*

11 I. heterophylla; leaves opposite, stalked, oval, acute at both ends, quite entire, or spiny-toothed; peduncles crowded, axillary, I-flowered. *G. Native of Japan. I. Aquifolium var. heterophylla, Blum. bijdr. 1150.*

**Variable-leaved Holly.** Tree 30 feet.
branches, hairy; flowers 4-5-petalled. 

G. Native of Peru, in hot places, about Contumasy. Flowers white.

Elliptic-leaved Holly. Shrub.

18 I. scopulorum (H. B. et Kunth, nov. gen. amer. 7. p. 70.) leaves ovate, roundish, and obovate, rounded at the apex, obsoletely-crenate, coriaceous, smooth, shining above; peduncles 5-7-flowered, and are, as well as the branchlets, pubescent, clammy; flowers 4-5-petalled. 

G. Native of Quito, at Paramo de Alpachaca. Flowers white.

Rock Holly. Tree 20 feet.

20 I. rupicola (H. B. et Kunth, l. c.) leaves ovate-roundish, elliptical, blunt, crenate-serrate, coriaceous, quite smooth, shining on both surfaces; peduncles usually 3-flowered, and are, as well as the branches, smooth; flowers 4-petalled. 

G. Native of the province of Quito, near Loxa, in Paramo de Saragura. Flowers white.

Rock-kill Holly. Tree.

21 I. salicifolia (Jacq. coll. 5. p. 36. t. 2. f. 2.) leaves long-lanceolate, acuminate at both ends, coriaceous, smooth, toothed from the middle; eymas axillary, longer than the petioles. 

22 I. odorata (Hamilton. in D. Don, prod. fl. nep. p. 183.) leaves oval-oblong, bluntly acuminate, crenulate, stalked; umbels sessile, glomerate, equal in length to the petioles. 

H. Native of Nipaul, in the vicinity of Chittong at the town of Lahuri. Flowers white, sweet-scented.

Sweet-scented Holly. 

23 I. paltoria (Pers. ench. 1. p. 152.) leaves oval, crenate, coriaceous, smooth, crowded, hardly stalked; branches somewhat velvety; peduncles axillary, 1-3-flowered. 

G. Native of Peru and New Granadas, on the highest mountains. Branches brownish-black. Stigma large, tetragonal. Corolla usually 4-petalled, white. Paltoria ovalis, Ruiz et Pav. fl. per. 1. t. 84. 

H. G. Native of Paraguay, and in the Brazil, about Curitha, where it is called Mate, and in French Herbe du Paraguay, and in Paraguay Yerra mate. Flowers white. Berries red. This plant is that which grows in Paraguay, where the Jesuits make a great revenue from the leaves. These leaves are used in Paraguay, La Plata, Chili, Peru, and Quito at all hours of the day, by putting a handful in a kind of tea-pot called mate, and from the spout of this the hot liquor is imbibed. Some mix sugar with it, and others add a few drops of lemon juice; and by pouring fresh boiling water, the infusion may be renewed. The Creoles are very fond of it, and never travel without a supply. They drink the infusion at every meal, and never eat until they have taken some of it. It must be drunk directly, for if suffered to remain long the liquor would become as black as ink. The pipe to the mate, or tea-pot, called a bombilla, is perforated with holes at the top, to prevent swallowing the pulverized herb, which swims on the surface. The whole plant is yielded by having the mate and pipe from one to another, filling up the vase with hot water as fast as it is drunk out. The repugnance of Europeans to drink after all sorts of people in a country where syphilitic diseases are so prevalent, has occasioned the introduction of small glass pipes, with which each person is sometimes provided. About 200,000 arrobas of the leaves, equal to 5 millions lbs., are annually obtained from Paraguay, 110,000 arrobas of which go to Chili, from which Lima and Quito are supplied; the rest is expended in the vice-royalty of Buenos Ayres. The leaves when green taste something like mallow leaves; they are roasted and dried, and almost pulverized before they are packed. There are three kinds of it in its prepared state, although produced by the same plant, which go under the names of Cua-cuaus, Cua-mini, and Cua-gnauz; the first is the buds of the leaves when hardly expanded; the second is the leaves stripped off the ribs before roasting, and the third is roasted without any preparation. The Cua-cuaus does not keep, and is consequently all used in Paraguay. The aromatic bitterness which the herb possesses when prepared is partly dissipated by carriage. The principal harvest of the herb is made in the eastern part of Paraguay, and about the mountains of Maracuya, but it is also cultivated in the marshy valleys which intervene between the hills. The people boast of innumerable qualities which this herb possesses. It is certainly aperient and diuretic, but the other qualities attributed to it are rather doubtful. In the nine countries the use of this herb is more universal, from the opinion that prevails amongst the Spaniards, that the wines there are prejudicial to health. Like opium, it produces some singular effects; it gives sleep to the restless, and spirit to the torpid. Those who have once contracted the habit of taking it, do not find it an easy matter to leave it off, or even to use it in moderation, though when once to excess it brings on similar disorders to those which are produced by the immediate use of strong liquors.

The practice adopted for procuring the leaves is for the merchant to provide himself with a quantity of such goods as are best suited to the natives. After having obtained permission of the government, he goes to the quarter where the natives understand the work, and there he gives public notice of his design. The cutters collect, and having received advances in goods, he provides them with smiles, and then conducts them to whatever yerval or grove promises the best harvest. Each morning the cutters disperse on foot, and cut as many branches as they can carry, and after scouring them over the fire, they bring them to the general deposit. A hurdle of long poles is there prepared in the shape of a cylindrical vault, which they call barbaqua; on this the branches are placed, and under a large fire is made, on which they dry the leaves. This done, they remove the fire, and on a hard and hot platform, after being swept clean, they throw the leaves, which they beat and separate. The leaves being separated are put into leather bags; they are now considered as fit for use, but not considered as seasoned until they are a few months old.

Mate or Paraguay Tea. Clt. 1823. Tree 15 feet.

25 I. Gongonha Teas. (Mart. trav. engl. edit. 2. p. 100.) leaves elliptical, pungently-mucronate, spiny-toothed, rounded at the base, green and shining above; spikes usually twin, branched, densely-pubescent; flowers pentandrous; style distinct, entire. 

G. Native of Brazil, in the provinces of the Mines. The leaves of this plant afford a kind of tea, called in Brazil Gongonha or Cogonha, and which is considered by some as identical with that from Paraguay. M. M. Martius and St. Hilare appear to be of this opinion. Dr. Martius found the plant in the province of Minas Gerais, but M. Auguste St. Hilare met with his plant near Curitha, in the province of St. Paul, and it
is therefore reasonable to suppose that his plant is identical with that from Paraguay. Since the export of tea from Paraguay has been prohibited by the present Dictator, Dr. Francisco, the inhabitants of the other States, who were formerly supplied from Paraguay, are now obliged to use that from Brazil, which is found to be much inferior. Persons ignorant of the specific distinctions between the two trees have attributed the inferiority of the Brazilian kind merely to the different mode of preparing the leaves.

*Gongoba* or Brazilian Mate or Tea. Tree.

**20 I. Martini**na (Lamb. pin. append. t. 8.) leaves oval-oblong, crenated, coriaceous, shining, short-acuminated; racemes aggregate, compound, smoothish; flowers tetradrous. ́. S. Native of Guiana. Berry red, containing 4 nuts. Mr. Lambert thinks that the properties of this plant are the same as those of *Flex Paraguensis*, from the habit being similar.

*Martin's* Holly or Guiana Mate. Tree. 30 feet.

**27 I. emarginata* (Thum. jap. p. 78.) leaves obovate, emarginated, with revolute edges; flowers axillary, twin, stalked. ́. G. Native of Japan, near Nagasaki. Flowers white.

*Emarginate-leaved* Holly. Shrub 10 feet.

*Var. β, Bonariensis* (D. C. prod. 2. p. 16.) leaves ovately wedge-shaped, smooth, tricuspidate, with the middle lobe twice as long as the lateral ones. ́. G. Native of Buenos Ayres. Flowers axillary, solitary, almost sessile, surrounded by scales. Lam. dict. 3. p. 148.

*Wedge-leaved* Holly. Shrub 10 feet.

**29 I. crenata* (Thum. jap. p. 78.) leaves ovate, crenate, blunt, with revolute edges; peduncles drooping, scattered on the branches, usually 3-flowered. ́. G. Native of Japan. Flowers white.

*Crenate-leaved* Holly. Shrub.

**30 I. serrata* (Thum. jap. 78.) leaves ovate, acute, ciliately serrated; pedicels axillary, solitary, 1-flowered, drooping. ́. G. Native of Japan, in the island of Nippon. Flowers white.

**31 I. latifolia* (Thum. jap. 79.) leaves ovate, bluntish, serrated, shining above, with revolute edges; pedicels aggregate, longer than the petiole, and rising above the axil of the leaves. ́. G. Native of Japan. Flowers white.

*Broad-leaved* Holly. Tree. 20 feet.

**32 I. Myricoides* (H. B. et Kunth, nov. gen. amer. 7. p. 71.) leaves oblong, acute, cuneated at the base, somewhat coriaceous, serrulated, smooth, as well as the branches; peduncles 3-flowered, twice or thrice longer than the petioles; flowers 4-petalled. ́. G. Native of New Granada, on the mountains between Mencepes and Pasto. Flowers whitish.

*Myricoides*-like Holly. Tree. 6 feet.

**33 I. Hippocrateoides* (H. B. et Kunth, nov. gen. amer. 7. p. 71.) leaves oblong, somewhat acuminate, crenate-serrurated, veiny, coriaceous, rather shining, and are, as well as the branchlets, smooth; peduncles dichotomous, 3-7-flowered, 2 or 3 times longer than the petioles; flowers 4-petalled. ́. S. Native of South America? Flowers white.

*Hippocrateoides*-like Holly. Shrub.

**34 I. Laurina* (H. B. et Kunth, nov. gen. amer. 7. p. 71.) leaves lanceolate-oblong, acuminate, acute at the base, remotely serrurated, netted, coriaceous, and are, as well as the branches, smooth; peduncles 1-5-flowered, in crowded fascicles, length of petioles; flowers 4-petalled. ́. S. Native of South America?

*Lawrel*-like Holly. Tree. 3 feet.

*** Leaves quite entire or nearly so.

**35 I. CanarieNsis* (Poir. suppl. 3. p. 67.) leaves ovate-lanceolate, flat, somewhat acute, quite entire, shining; umbels axillary, few-flowered; peduncles longer than the petioles. ́. H. Native of the Canary Islands. Flowers white, truly dioecious. Fruit black.

**38 I. Myrtifolia* (Lam. ill. no. 1732.) leaves ovate, acute at both ends, quite entire; flowers lateral, in fascicles, dioecious. ́. S. Native of the Caribbean islands. Flowers white. This species has the habit of a *Sideroxylon*.

**39 I. Nipaulensis* (Spreng. syst. app. p. 48.) leaves elliptical, quite entire, acute at both ends; umbels globose, stalked, solitary, puberulous, shorter than the petals. ́. H. Native of Nipaul. I. elliptica, D. Don, prod. fl. nep. p. 189. but of Kunth. Flowers white.

*Nipaul* Holly. Shrub 8 feet.

**40 I. Cyusa* (Blum. bijdr. 1149.) leaves oblong, bluntly acuminate, quite entire, smooth; cymes dichotomous, axillary; berry 3-seeded. ́. S. Native of Java. Flowers dioecious.

*Cynose-flowered* Holly. Tree. 50 feet.

**41 I. spicata* (Blum. bijdr. 1149.) leaves oblong-lanceolate, quite entire, coriaceous, quite smooth, with revolute margins; spikes axillary and lateral; berry 6-8-seeded. ́. S. Native of Java, in woods on the higher mountains.

*Spike-flowered* Holly. Tree. 20 feet.

**42 I. Macocóuá* (Pers. ench. 1. p. 152.) leaves oval or somewhat ovate, sometimes tapering to an obtuse emarginate point, coriaceous, smooth, quite entire; peduncles numerous, cymose, axillary. ́. S. Native of Guiana and Cayenne, in woods, as well as of the islands of St. Domingo and Trinidad. Macocóuá Guianénsis, Aubl. guian. 1. t. 34. Flex acuminatiflora, Willd. spec. 1. p. 711. Cassine Maurocerá, Siebl. pl. exsic. trin. no. 81. Flowers white. Berries red, ovate, 2-celled. The tree is called *Macocen* in Guiana.

*Macocóuá* Holly. Tree 40 feet.

**43 I. Oboreldata* (Swartz. fil. ind. occ. 1. p. 338.) leaves obcordate, coriaceous, quite entire, shining, nerveless; stipulae small, prickly; peduncles 3-flowered, axillary, shorter than the petals. ́. S. Native of Jamaica, on the Blue Mountains. Flowers white. Style very short. Stigma blunted. Berries red, 1-celled.

*Oboredate-leaved* Holly. Shrub 6 feet.

**44 I. Asiatica* (Lin. spec. 710.) leaves broad-lanceolate, obtuse, quite entire. ́. G. Native of the East Indies.

*Asiatic* Holly. Shrub?
ILICINEÆ. III. LEX. IV. PRINOS.

45 I. INTÉGRA (Thunb. fl. jap. p. 77.) leaves oblong, blunt, quite entire; umbels axillary, sessile; pedicels 1-flowered, usually 4 together. ♀. G. Native of Japan.

Entire-leaved Holly. Shrub 6 feet.

46 I. BORUVNDA (Thunb. fl. jap. 77.) leaves broad, oval, acuminate, entire, smooth; peduncles umbelliferous, pubescent, longer than the petioles. ♂. G. Native of Japan. Branches knotted. Flowers pentandrous.

Round-leaved Holly. Shrub 6 feet.

47 I. HUMÉLOIDES (H. B. et Kunth, nov. gen. amer. 7. p. 71.) branches smooth; leaves obovate, mucronate, decurrent at the base, almost quite entire, coriaceous, shining above; peduncles 3-4 together, 1-flowered. ♀. G. Native of Peru, in the province of Quito, near Loxa. Flowers unknown. Berries 4-5-seeded.

Bomelia-like Holly. Tree 16 feet.

 Cult. All kinds of Hollies are much esteemed on account of their evergreen leaves. The hardly kinds are usually increased by budding or grafting on the common Holly, which is easily reared from seed, but they will also root freely by cuttings taken off at a joint in ripened wood, planted in sand in a shady situation, with a hand-glass placed over them. The greenhouse and stove kinds may be struck in the like manner, but those of the latter will require a little heat. The berries of all kinds of Holly should be gathered when they are ripe, mixed with sand, and turned over frequently till the October following, when they should be sown in beds covered over with mould three quarters of an inch thick, or the berries may remain on the trees till spring, when they may be sown. In general they do not vegetate till the second year.

IV. PRIMOS (πρήνος, prinos, is the Greek name of the Holly, which the present genus much resembles). Lin. gen. no. 461. D. C. prod. 2. p. 16.—Agéria, Adans. fam. 2. p. 166.

Lin. syst. Hexandria, Monogyonia, or Polygynia, Dioecia. The character is the same as Flex, but the flowers are 6-cleft, hexandrous, usually dioecious or polygamous from abortion, and the fruit contains 6 nuts.—Shrubs, with alternate, deciduous or permanent leaves, and axillary, usually 1-flowered pedicels.

1 P. décérnus (D. C. prod. 2. p. 16.) leaves deciduous, elliptic-lanceolate, tapering into the petiole, serrated, with the middle nerve villous beneath; pedicels axillary, those bearing the male flowers aggregate, and those bearing the female ones solitary. ♂. H. Native of North America, from Virginia to Georgia, on rocky shady banks of rivers. Flex primósides, Ait. hort. kew. 2. p. 278. Flex decidua, Walt. fil. car. 241. Flowers white. Berries crimson, large.

Var. β. estivális (Lam. dict. 3. p. 147.) adult leaves smooth on both surfaces. ♀. H. Native of North America. Flex estivális, Lamm. i. c. Flowers white.

2 P. AMBÉR (Michx. fil. bor. amer. 2. p. 236, but not of Pursh.) leaves deciduous, oval or elliptical, mucronate, entire, quite smooth; pedicels bearing the male flowers, crowded at the bottom of the branchlets, those bearing the female ones solitary, upon long pedicels. ♂. H. Native of Carolina. Wats. dend. brit. t. 29. Cassine Caroliniana, Walt. fil. car. p. 242. The leaves, according to Nuttall, are entire, but in De Candolle's specimen they are serrated at the apex. Perhaps distinct plants. Flowers white. Berries red.

3 P. niłius (Vahl. cel. 2. p. 26.) leaves oblong-ovate, serrated, shining, membranous; pedicels axillary, 1-flowered; flowers tetrandrous. ♂. G. Native of Montserrat. The leaves are probably deciduous. Branches angular.

Shining-leaved Winter-berry. Shrub.

4 P. novíscus (Vahl. ecl. 2. p. 25. t. 14.) leaves oblong-ovate, somewhat serrated, smooth, coriaceous; pedicels axillary, usually 1-flowered; flowers dioecious, tetrandrous. ♂. H. Native of the island of Montserrat. Flowers white. Berries red. Perhaps a species of Flex.

Dioecious Winter-berry. Shrub.

6 P. dúnus; leaves deciduous, oval, acuminate at both ends, mucronately-serrate, pubescent beneath; flowers 4-5-cleft; male ones crowded at the bottom of the branches, female ones solitary. ♂. H. Native of North America, in sandy woods, and on the borders of swamps, from New Jersey to Carolina. P. ambiguus, Pursh. fil. amer. sept. 1. p. 220. Flowers white. Berries red, larger than those of P. véricillátus.

7 P. levigá tus (Pursh. fil. sept. amer. 1. p. 220.) leaves deciduous, lanceolate, with adpressed serratures, acuminate, smooth on both surfaces, shining, hardly pubescent on the nerves beneath; flowers 6-cleft, male ones scattered; female ones axillary, solitary, almost sessile. ♂. H. Native of North America, on the Alleghany mountains, from New York to Virginia. Wats. dend. brit. t. 28. Flowers white. Berries large, dark-red.

8 P. LANCEOLÁTUS (Pursh. fil. sept. amer. 2. p. 17.) leaves deciduous, lanceolate, finely and remotely serrated, smooth on both surfaces; male flowers aggregate, triandrous; female ones usually twin, stalked, 6-cleft. ♂. H. Native of Georgia and Carolina, in the lower counties. Flowers white. Berries small, scarlet.

§ 3. Wintería (probably from the name of some botanist). Münch. meth. 74. D. C. prod. 2. p. 17. Flowers for the most part 6-cleft. Leaves permanent.

9 P. gláber (Lin. spec. 471.) branches rather pubescent; leaves evergreen, cuneate-lanceolate, coriaceous, smooth, shining, a little toothed at the apex; pedicels axillary, usually solitary, for the most part 3-flowered. ♂. H. Native of North America, from Canada to Florida, in sandy shady woods. Flowers white. Berries black, called in Jersey Ink-berries. A low and handsome shrub.

10 P. ATOMARÍUS (Nutt. gen. amer. 1. p. 213.) leaves evergreen; cuneate-oval, acute, coriaceous, somewhat serrated at the apex, bearing black atoms or dots beneath; young branches a little glabrous; pedicels lateral, 1-flowered. ♂. H. Native of Georgia, in woods on the banks of rivers. Flowers white. Berries dark.
ILICINE. IV. PRINOS. V. RHAPTOSTYLM. VI. STROMBOSIA. VII. LEUCOXYLON. RHAMNE.E.

11 P. coriaceus (Pursh, fl. sept. amer. 1. p. 221.) leaves evergreen, cuneate-lanceolate, coriaceous, smooth, shining, quite entire; corymb axillary, sessile, very short, many-flowered; flowers 6-cleft. H. H. Native of Georgia in sandy woods, near the banks of rivers. Watts. dndr. brt. t. 27. Flowers white. A handsome tall shrub, with the appearance of 

Plex Dahoon. There are two varieties of this shrub, the one with broader ovate-lanceolate leaves, the other with narrower lanceolate acute leaves.

12 P. montanus (Swartz, fl. ind. occ. 1. p. 622.) leaves evergreen, ovate, serrated all around the edges, quite smooth and shining on both surfaces; peduncles axillary, 3-flowered. H. S. Native of Jamaica among bushes on the mountains. Flowers small, white. Berries roundish, black.

Mountain Winter-berry. Tree 30 feet.

12 P. sideroxylloides (Swartz, fl. ind. occ. 1. p. 624.) leaves roundish, obtuse, quite entire, somewhat coriaceous; pedicels 4-8, axillary, crowded, 1-flowered, longer than the petals. H. S. Native of the Caribbee Islands. Flowers white. The wood is hard.

Cult. The hardly kinds of Prinos are well adapted for small shrubberies; they will grow well in any light soil, but prefer peat, and are easily increased by laying down the shoots or by seeds. The stow species will grow in a mixture of loam and peat, and ripened cuttings will root in sand under a handglass, in a moderate heat. The seeds will not germinate till the second year.

† Genera allied to Ilicinea, but differ materially in some particulars from the rest of the order.

V. STROMBOSIA (στρομβος, strombos, a turban, a top; shape of fruit). Blum. bidr. 1154.

Lin. syst. Peniculidria, Monogynea. Calyx inferior, small, flat, oblong-corneated. Petals 5, conniving, campanulate, villous in the throat. Stamens 5, short, opposite the petals and inserted in them. Anthers bursting inwards, didymous. Ovary immersed in the disk, 3-celled, cells 1-seeded; or 2-celled, cells 2-seeded. Style short, crowned by an obtuse stigma, which is obliquely toothed. Fruit baccate, turbinate, sublobate, 1-seeded from abortion.—A tall tree, with alternate, oblong, acuminate, entire, smooth, shining leaves, and axillary fascicles of greenish flowers.

1 S. Javanica (Blum. bidr. 1155). H. S. Native of Java, in mountain woods.

Java Strombosia. Tree 50 feet.

Cult. See stow species of Prinos for culture and propagation.

VI. LEUCOXYLON (from λευκος, leukos, white, ξυλον, xylon, wood; wood white). Blum. bidr. 1169.

Lin. syst. Polyglynia, Disea. Flowers polygamous from abortion. Calyx inferior, 4-parted, with the segments obtuse and imbricate. Corolla subcampanulate, 4-parted. Male flowers with about 12-14 stamens, which are partly hypogynous and partly adnate to the base of the corolla, and inclosed in it. Anthers 2-celled. Female flowers with a 4-celled ovary, each cell containing many seeds. Style 2-parted, crowned by 2 emarginate stigmas. Drupes coriaceous, 1-celled, containing 1-2 1-seeded, white nuts. Embryo inverted in cartilaginous albumen. A tall tree with spreading branches, with the branchlets and leaves distich. Leaves small, alternate, approximate, elliptic-lanceolate, coriaceous, shining above but silky-pubescent beneath as well as the branchlets. Flowers axillary, male ones crowded, female ones solitary. According to Blume, the genus has the habit of Terebinthaceae, but it is more nearly allied to Ebenaceae and Ternstroemiaceae, but we think it is still nearer to Ilicinea.

1 L. xerophorum (Blum. bidr. 1169). H. S. Native of Java, in mountain woods, where it is called Kinemak.

Box-leaved Leucoxylon. Fl. Feb. Tree 60 feet.

Cult. For culture and propagation see stow species of Prinos.

VII. RHAPTOSTYLUM (ραπτος, rhapsos, sewed together, and στυλος, stylos, a style; styles joined together). H. B. et Kuth, nov. gen. amer. 7. p. 78.

Lin. syst. Decadria, Monogynea. Calyx 5-cleft, with ovate, equal segments. Petals 5, sessile, valvate in estivation, acute, equal, longer than the calyx, hypogynous. Disk wanting. Stamens 10, hypogynous, shorter than the corolla. Filaments dilated at the base and subulate at the apex, adhering together and with the petals at the base, smooth, opposite the petals. Anthers 2-celled, bursting inwards. Ovary superior, large, conical, 3-celled; ova solitary, pendulous. Stigma sessile, 3-lobed.—An unarmed, smooth tree, with alternate, slender branches, and alternate, entire, membranous, exstipulate leaves. Flowers minute, white, in fascicles in the axils of the leaves.

Acuminated-leaved Rhaptostylum. Shrub 6 feet.

Cult. For culture and propagation see stow species of last genus.

Calyx monosepalous, 4-5-cleft (f. 4. B. a. D. c.), with the tube adhering to the base of the ovary (f. 6. C. d. B. f.); lobes valvate when in the bud. Petals 4-5 (f. 4. D. a. B. c.), cucullate (f. 7. A. h.) or convolute (f. 6. C. c.), rarely wanting, alternating with the lobes of the calyx, very often of the form of a scale, all inserted in the mouth of the calyx. Stamens 4-5, opposite the petals (f. 4. B. c.). Anthers 1-(f. 7. D. c.) 2-celled (f. 6. C. b.). Ovary free, or adhering to the calyx more or less, always immersed in the disk when there is any, 2-3 (f. 6. E. g.) rarely 4-celled, each cell containing 1 erect seed (f. 6. E. g.). Style 1-3. Stigmas 2-3 (f. 6. E. c.) Fluffy fleshy (f. 5. F. k.) indescissile or dry, trilocular (f. 6. E. g.) Seeds erect. Albumen fleshy, rarely wanting. Embryo straight, slender, about equal in length to the seed, with large, flat cotyledons, and a short inferior radicle.

—Trees or shrubs, with simple, alternate, rarely opposite leaves, usually furnished with stipulas. Flowers small, usually greenish-yellow. This order is nearly allied to Celastrineæ, but differs in the sepals or lobes of the calyx being valvate in estivation, not imbricate, and in the stamens being opposite the petals, not alternating with them, as well as in the ovary being more or less adnate to the calyx, not distinct from it. It also comes near to Byttneriaceæ in the estivation of the calyx, but is distinguished from it by the insertion of the stamens. Throughout this order there is a remarkable agreement between the inner bark and the
RHAMNEÆ.

fruit, especially in several species of Rhamnus, in which they both are purgative and emetic, and in some degree astringent. Many species of Zizyphus, however, bear wholesome and agreeable fruit. The berries of the greater number yield yellow and green dyers, under the hands of the chemist, of much importance to manufacture. The bark of Ceanothus corduléus is esteemed febrifugal in Mexico.

**Synopsis of the Genera.**

2 Zizyphus. Calyx spreading (f. 4. B. a.), 5-cleft. Petals obovate, ungueolate (f. 4. B. b.), convolute. Stamens exerted (f. 4. B. c.). Anthers 2-celled (f. 4. B. c.). Disk flat (f. 4. B. f.), pentagonal. Styles 2-3 (f. 4. B. g.). Fruit fleshy, containing a 1-2-celled nut (f. 4. B. h.).

4 Con’di’la. Calyx spreading, 5-cleft (f. 4. C. a.). Petals wanting. Anthers 2-celled (f. 4. C. e.). Disk flat, pentagonal (f. 4. C. e.). Style 1. Fruit drupaceous, containing a 1-celled nut (f. 4. C. d.).

5 Berch’a’re. Calyx tubular, 5-cleft (f. 4. E. a.). Petals convolute (f. 4. E. e.). Stamens inclosed (f. 4. E. d.). Anthers 2-celled (f. 4. E. e.). Disk annular (f. 4. E. f.), nearly flat. Style simple. Fruit dry, 2-celled (f. 4. E. g.).

7 Sagére’tia. Calyx urceolate, 5-cleft (f. 4. F. a.). Petals convolute or cucullate (f. 4. F. e.). Stamens 2-celled (f. 4. F. f.). Disk thick, cup-shaped. Ovary 3-celled (f. 4. F. d.). Style short, thick (f. 4. F. g.).

8 Rhamnus. Calyx urceolate (f. 5. A. b. C. b.), 4-5-cleft (f. 5. A. a. C. a.). Petals emarginate (f. 5. C. g.), or wanting. Anthers 2-celled (f. 5. A. d.). Disk thin (f. 5. C. e.). Styles 3-4, connected (f. 5. A. g.), or free. Fruit baccate, containing 3-4, rarely 2, little nuts (f. 5. A. j. B. f.).

10 Retanilla. Calyx urceolate, 5-cleft (f. 5. E. b. c.). Petals cucullate (f. 5. E. c. d.), sessile. Stamens inclosed (f. 5. E. c.). Anthers kidney-shaped, 1-celled. Disk covering the bottom of the calyx (f. 5. E. g.) Style simple (f. 5. E. h.). Fruit containing a 3-celled nut (f. 5. E. i.).

11 Cole’tia. Calyx campanulate (f. 5. F. f.), coloured. Petals wanting. Anthers 1-2-celled, kidney-shaped (f. 5. F. i.) or ovate. Disk cup-shaped (f. 5. F. g.). Style simple, elongated. Fruit dehiscent, containing 3 nuts (f. 5. F. h. k.).

23 Tri’choche’phalus. Calyx with a short tube and long setaceous segments (f. 7. C. b.). Petals wanting or setaceous. Anthers kidney-shaped, 1-celled (f. 7. C. c.). Disk hardly any. Style simple, short. Fruit containing 3 seeds (f. 7. C. c.).

24 Phys’lica. Calyx with a cylindrical tube and a 5-cleft limb (f. 7. B. b.). Petals cuculate (f. 7. B. d.). Stamens inclosed (f. 7. B. c.). Anthers 1-2-celled. Disk hardly evident (f. 7. B. f.). Style trifid (f. 7. B. i.). Fruit 3-seeded (f. 7. B. h. k.).

26 Gou’a’nia. Calyx with a rather spreading, 5-cleft limb.

1. P. ACULEÁTEs (Lam. ill. t. 210. Fl. Fr. ed. 3. no. 4091. Duh. ed. nov. 3. t. 17.) Branchlets pubescent; leaves ovate, serrulated, quite smooth, 3-nerved, with 2 spines at their base, one erect the other hooked; umbellules axillary, few-flowered, crowded; wing of capsule crenated. b. H. Native of sterile places about the Mediterranean sea, on both shores, and on the western coasts of Asia. P. petasus, Dum. Cours. 6. p. 266. P. australis, Gertt. fruct. 1. t. 43. f. 5. P. vulgárís, D. Don, prod. fl. nep. 189. Rhamnus Paliurús, Lin. spec. 281. Zizyphus Paliurus, Willd. spec. 1. p. 1103. Sims, bot. mag. 1893.

Flowers greenish-yellow. From the singular appearance of the fruit, resembling a head with a broad-brimmed hat on, the French call the tree Porte-chopeau. This is by many persons supposed to be the plant from which the crown of thorns, which was put upon the head of our Saviour, was composed; the truth of which is supported by many travellers of credit, who affirm that this is one of the most common shrubs in the country of Judæa, and from the pliability of its branches, which may easily be wrought into any figure, it may afford a probability. Hasselquist is of opinion that it was rather the Zizyphus spinosa-Christi.

This is the common thorn of the hedges in Asia, and forms a fence of a most impassable kind. The seeds are sold in the herb-shops of Constantinople, and the native hakima, or doctors, prescribe them in many complaints, under the name of Xallè. They are also used as a dye.

Prickly Christ's-thorn. Fl. June, July. Clt. 1596. Sh. 8 ft. 2 P. vergátus (D. Don, in bot. mag. t. 2535. fl. nep. 189.) branches smooth; leaves obliquely cordate or elliptical, 3-nerved, shining; wing of fruit entire. b. H. Native of Nipael. Leaves serrated, with 2 thorns at the base of each, the one straight, the other hooked. Flowers in axillary corimb, greenish-yellow. A beautiful shrub.

Aublétia Christ's-thorn. Shrub 8 feet.

Cult. These handsome shrubs are well fitted for shrubberies; they will grow in any common soil, and may be either increased by layers, cuttings of the roots, or seeds.

Lin. Syst. PentándriA, Di-Trigýnia. Calyx spreading, 5-cleft (f. 4. B. a.). Petals 5, obovate, angulate, convolute (f. 4. B. b. c.). Stamens 5, exerted (f. 4. B. c.). Disk flat, pentagonal (f. 4. B. d.), expanded, adhering to the tube of the calyx. Ovary 2-3-celled (f. 4. B. d.), immersed in the disk. Styles 2-3 (f. 4. B. g.). Fruit fleshy (f. 4. B. h.), containing a 2-3-celled nut (f. 4. B. h.). Seeds sessile, compressed, very smooth.—Shrubs with alternate, 3-nerved leaves, and spiny stipules. Flowers axillary, cymose. Fruit mucilaginous, edible, more or less grateful.

* Leaves smooth on both surfaces.

1. Z. vulgárís (Lam. ill. 185. f. 1.) leaves ovate, retuse, toothleted, and arc, as well as the branchlets, smooth; prickles wanting or twin, one of them recurved; drupe oblong, b. H. Native of Syria, from whence it has been introduced into Europe. Rhamnus Zizyphus, Lin. spec. 282. Pall. fl. ross. 2. t. 39. Z. sativa, Desf.arb. 2. p. 373. Duh. ed. nov. 3. t. 16. but not of Gaert. Z. júhus, Mill. diet. no. 1. but not of Lam. Flowers greenish-yellow, 2 or 3 together. Fruit blood-red or saffron-coloured, having a sweet granular pulp. This tree is cultivated for its fruit in many parts of the south of Europe, where it is called Juubbe. In Italy and Spain the fruit is served up at the table in December, during the winter-season, as a dry sweet-meat. It is sold in the markets in the towns of Italy and Spain. The tree is said to have been first introduced into Italy from Syria by Sextus Panninius, in the time of Augustus Caesar. The fruit is also sold in abundance in the markets of Constanc-
Rhamnus L. 

Dr. Shaw says that the fruit is common in the deserts, and other parts of Barbary, is still in great repute, and sold in the markets all over the southern districts of those kingdoms. Mr. Park says he discovered the lotos to abound in all the countries of Africa he traversed, flourishing most in a sandy soil, but in the greatest plenty in the kingdoms of Kaarta Ludamar, and in the northern parts of Bambara. The fruit small, farinaceous berries, of a yellow colour and delicious taste. The natives, he says, convert them into a sort of bread, by exposing them some days to the sun, and afterwards pounding them gently in a wooden mortar, until the farinaceous part is separated from the stone. This meal is then mixed with a little water, and formed into cakes, which, when dried in the sun, resemble in colour and flavour the sweetest gingerbread. The stones are afterwards put into a vessel of water, and shaken about so as to separate the farina which may still adhere to them, this communicates a sweet and agreeable taste to the water, and with the addition of a little pounded millet, forms a pleasant gruel called fondî, which is the common breakfast in many parts of Ludamar, during the months of February and March. The fruit is collected by spreading a cloth upon the ground, and beating the branches with a stick.

Mr. Browne, in his Travels in Africa, informs us that the Arabic name of the lotos is Nebbek, and that there are two sorts of it at Dar-floor, the largest of which is called Nebbek-el-Arab; the one a shrub the other a tree, both equally thorny. The latter bearing a smaller fruit than the former, of a darker colour and different flavour, which the natives eat both fresh and dry; for it dries on the tree and remains the greater part of the winter months. In that state it is formed into a paste, of not unpleasant taste, and is a portable provision on journeys.

The lotos of the Lotophagi must not be confounded with the Egyptian lotos, which is Nymphæa Lottus, nor with the lotos of Homer and Dioscorides, which is a species of Trifolium, nor with the lotos of Hippocrates, which is Celis australis, nor with the Italian lotos which is Diospyrus lotus.

Lotus of the Lotophagi or Jujube. Chlt. 1731. Shrub 2 to 4 feet.

4 Z. Mucronata (Willd. enum. 251.) leaves ovate, cordate, ovate, smooth; prickles two, one recurved; drupe somewhat globose. h. G. Native of the Cape of Good Hope, along the banks of the river Cariep. Z. bubalina, Licht, ex Schult. syst. 5. p. 334. Flowers greenish-yellow. Fruit red, edible.

Heterogeneous Jujube. Shrub.

6 Z. spis-christi (Willd. spec. 1. p. 1105.) leaves ovate, toothed, smooth, or pubescent beneath; prickles twine, spreading, one of which is straightish, the other somewhat incurved; peduncle corymbose, villously downy; drupe ovate-globose. h. H. Native of the north of Africa, in Palestine, and Ethiopia, also in date plantations, near Tozer, and in Egypt. Rhâmus spina-christi, Lin. spec. 282. Desf. fl. atl. 1. p. 201. Rhâmus Nabêca, Forsk. geogr. 204. but not of Lin. Z. Africâna, Mill. dict. no. 4. Z. Napêca, Lam. dict. 3. p. 320. Nabêca, Alp. gr. 2. t. 4. p. 10. Cinâphla spinosa, Bauch. pin. 477. Ger. emac. append. t. 1605. Branches whitish. Flowers yellowish-green. Fruit oblong, about the size of a sloe, with a pleasant taste, furnishing a very pleasant food to the inhabitants of Egypt and Arabia. Hasselquist thinks this is the tree which afforded the crown of thorns put on the head of Christ, as it is common in the East, and is very fit for the purpose, being furnished with many sharp spines well adapted to give pain. The crown might be made of the round plant branches, and what seems to be the greatest proof is, that the leaves much resemble those of ivy. But notwithstanding what Hasselquist says, we are still of opinion that the Palmaris aculeata is the true Christ’s-thorn.

Var. β, inermis (D. C. prod. 2. p. 20.) prickles wanting; leaves large, very blunt. h. H.—Clus. hist. 1. p. 27.

7 Z. Farîwîlîa (Del. voy. à Merce a fleuve blane, paris 1826,
part. bot.) prickles twin, one of which is longer than the other and recurved; leaves entire, on short petioles, ovate, acute. 

**H.** Native of Egypt, on the banks of the White river.

Small-leaved Jujube. Shrub.

8 Z. NAPÉCA (Wild. spec. 1. p. 1104.) climbing; leaves obliquely cordate, bluntish, serrate, downy beneath; prickles twin, exceedingly sharp, one recurved, the other straight; corymbs axillary, many-flowered; flowers digynous. 

**S.** Native of Ceylon and other parts of the East Indies. Rhamnus Napéca, Lin. spec. 283.—Pluk. phyt. t. 216. f. 2.—Rumph. ambl. 2. t. 42. Flowers yellowish. Fruit size of a pea, smooth, shining, black, marked round the base with a circular scar. They are eaten by the natives. The taste is very acid and astringent. Rumphius says that three berries are a strong purgative. It is seldom eaten but with salt meat, or as a sauce to fish and other food. A decoction of the bark of the root is said to promote the healing of fresh wounds. The tree is to be found in Prince of Wales' Island. At Siheut it is very common. The name is derived from nabg or nabba, the Arabic name of one of the species. 

9 Z. BACLÉ (D. C. prod. 2. p. 20.) leaves broad-ovate, acuminate, crenulate, smooth, or somewhat downy on the nerves and petioles; prickles usually twin, one of them recurved; corymbs axillary, smooth; drupe oval-globose. 

**S.** Native of Seneagal. Flowers greenish-yellow. This is probably the *Lotos* which Mr. Mungo Park saw at the Gambia. Fruit eatable.

10 Z. INCVRVA (Roxb. fl. ind. 2. p. 364.) leaves oval, smooth, serrulate, obtusely-acuminate, oblique at the base; prickles twin, one straight, the other recurved; peduncle axillary, few or many-flowered; flowers semidigynous; petioles and nerves of leaves somewhat pubescent. 

11 Z. JAVANE'SIS (Blum. bipdr. 1142.) climbing; prickles solitary, recurved; leaves 5-nerved, elliptic-oblong, bluntish, doubly serrulate, smooth; corymbs axillary, dichotomous, and are, as well as the petioles, pubescent. 

**S.** Native of Java, where it is called *Arjo Kokohoeang.*

12 Z. TIMORE'SIS (D. C. prod. 2. p. 20.) leaves ovate-oblong, acuminate, oblique at the base, smooth on both surfaces, crenately-serrulate, 3-nerved; branches unarmed; corymbs axillary, about the length of the petioles. 

**H.** Native of the island of Timor. Stigmas 2. Fruit unknown.

*Z. timore'sis.* Jujube. Tree.

13 Z. TRINE'SIS (Roxb. fl. ind. 2. p. 354.) unarmied; leaves ovate-oblong, 3-nerved, bluntly serrated, glossy; flowers in axillary fascicles; stigma 2-cleft; drupe spherical. 

**S.** Native of Mysore, in the East Indies. Flowers numerous, small, greenish-yellow. Drupes spherical, size of a cherry, polished, of a lively yellow colour, with a soft, gelatinous, sweet pulp. This is the same as *Z. sorónia,* Rœm. et Schult. syst. 5. p. 357. and trinérisia var. glabra, Rœm. nov. spec. 5. p. 387.

14 Z. PANCULÁ'TA (Roth. nov. spec. 161.) leaves oblong-oval, somewhat acuminate, serrulated, scabrous, hairy beneath at the nerves; prickles twin, recurved; branches rising as it were beneath the leaves; panicle terminal, elongated, dichotomous; nut 1-seeded. 

**H.** Native of the East Indies.

*Z. Panium-flowered Jujube. Tree.*

15 Z. NITIDA (Roxb. fl. ind. 2. p. 358.) leaves obliquely ovate-oblong, 3-nerved, obtusely-serrate, smooth; prickles twin, one recurved, the other straight; drupes subglobose; flowers few, collected on a common peduncle. 

**G.** Native of China. Flowers yellow, semidigynous. Drupe oblong, pendulous, and smooth, about an inch long; when ripe, pale-yellow; they are eaten, but to the taste they are rather insipid. Insensible suckers usually rise from the root, which run to a great distance from the parent tree, and make it a troublesome plant in a garden.

16 Z. ELIPTICA (Roxb. fl. ind. 2. p. 359.) leaves elliptical-ovate, 3-nerved, pale beneath, smooth, prickles twin, the upper one rather incurved, the under one recurved; corymbs axillary, dichotomous; flowers usually trigynous. 

**H.** Native of the East Indies, at Travancore. Flowers greenish-yellow. Young shoots slightly villous and flexuous.

17 Z. qlabera (Roxb. fl. ind. 2. p. 364.) climbing, smooth; leaves ovate, cordate, long, obtuse, pointed, serrulate, smooth, strongly marked with 3 nerves; prickles solitary, recurved; drupes oval. 

**G.** Native of Chittagong, in the East Indies. Fruit about the size of a gooseberry.

18 Z. FLEXUOSA (Wall. in fl. ind. 2. p. 365.) a smooth shrub, with spiny flexuous branches, and unarmed straight branches; prickles twin, one very long and straight, the other recurved; leaves lanceolate, obtuse, crenate, smooth; flowers axillary, usually solitary; style deeply bifid. 

**H.** Native of Nipāul, at Gossingsthon. An elegant shrub, with mahogany-coloured prickles. Flowers solitary or few in a fascicle, yellowish, rather large.

19 Z. CAJÇUTTA (Hamilt. ex Wall. in fl. ind. 2. p. 361.) leaves round, serrulate, 3-nerved, adult ones smooth, but rather villous when young; prickles twin, the under one recurved; peduncles axillary, many-flowered, very short; style 3-cleft; drupe oval, with a 3-celled nut. 

**S.** Native of the East Indies, in the southern parts of Mysore, where it is called *Karakantha* by the natives. Young branches villous. Flowers greenish-yellow. Fruit the size of a large cherry, depressed at a little both ends, smooth, dark-brown; fleshy part tough, firm, and yellowish.

** Leaves downy beneath.**

20 Z. RETICULA'TA (D. C. prod. 2. p. 20.) leaves oval, somewhat toothed, netted with veins, and downy beneath; prickles twin, straight; stigma usually 3-toothed; drupe globose. 

21 Z. RUGÓSA (Lah. dict. 3. p. 319.) leaves broad-oval, wrinkled, serrulate, sometimes smooth, sometimes downy beneath; prickles usually twin, recurved; corymbs stalked, dichotomous, downy. 

**S.** Native of the East Indies.—Pluk. alm. t. 29. f. 7. This species is said to come very near *Z. xylocaarpa.*

*Z. rugósa.* Shrub. 6 feet.

22 Z. HORRIBIDA (Roth. nov. spec. 159.) leaves ovate, blunt, crenulate, pubescent beneath at the ribs; prickles twin or solitary, recurved; corymbs dichotomous, axillary, and lateral. 

**S.** Native of the East Indies.

*Z. horríbida.* Horrid Jujube. Shrub.

23 Z. CELESI'DIFOLIA (D. C. prod. 2. p. 20.) leaves ovate, oblique at the base, upper ones acuminate, almost entire, 3-nerved, lateral nerves bifid at the base, and are, as well as the petioles and branchlets, pubescent; prickles usually solitary, recurved, quite smooth; corymbs axillary. 

**S.** Native of the island of Timor. This is very like *Z. ìnephe,* and is perhaps the *Z. glabréata* of Heyne and Roth. nov. spec. 158?

*Nettle-tree-leaved Jujube. Tree.*
§ 2. Leaves silky or downy beneath.

24 Z. GENÒPIA (Mill. dict. no. 3.) leaves unequally ovate-cordate, entire, acute, 3-nerved, covered with rusty down beneath; prickles solitary, recurved; branchlets pubescent; flowers crowded in the axils of the leaves. ɣ. G. Native of various parts of India. Rhamnus Genòpia, Lin. spec. 282.—Burm. zeyl. t. 61. Flowers minute, greenish-yellow. Fruit small, black, ovate-globose, juicy.

Jussup's Jujube. CIt. 7. Shrub 6 feet.

25 Z. Tomentosa ( Roxb. fl. ind. 2. p. 360.) leaves unequally ovate-cordate, 3-nerved, obtuse, minutely-serrulated, hairy above, and downy beneath; panicles lateral; prickles solitary, scarcely curved. ɣ. G. Native of Chittagong, in the East Indies, where it is used for fences.

Dowzy Jujube. Shrub 8 feet.

26 Z. xylòpyrus (Willd. spec. 2. p. 11.) leaves obliquely-cordate, 3-nerved, serrated, clothed with hoary down beneath, as well as the branchlets and pétioles; prickles stigmate when present, the one recurved, the other straight; corymbs axillary, many-flowered, downy. ɣ. S. Native on the coast of Coromandel, common in every forest. Rhamnus xylòpyrus, Retz. obs. 2. p. 11. Flowers greenish-yellow. Fruit the size of a large cherry, greenish, and downy, marked round the base with the remains of the nectary, containing a 5-celled, 3-valved, 3-seeded nut. Cattle eat the leaves, young shoots, and fruit. The kernels taste like filberts, and are eaten by the natives.

The wood of the largest trees is much esteemed by them, being yellowish or orange-coloured, very hard, and durable, and at the same time not very heavy.

Pearwood Jujube. CIt. 1824. Tree 20 feet?

27 Z. k'λènes (Roxb. fl. ind. 2. p. 356.) leaves obliquely-oval, serrulated, downy beneath; corymbs axillary, on long peduncles; corolla wanting; style 2-cleft; fruit drooping, smooth, white; prickles solitary, recurved. ɣ. G. Native of China. Drupe the size of a small cherry. The pulp rather mealy and sweet.

White-fruited Jujube. Fl. year. Tree 20 feet.

28 Z. latifòlia (Roxb. fl. ind. 2. p. 555.) leaves oval, serrated, 3-nerved, downy beneath, unequal at the base; prickles solitary, short, thick, recurved; corymbs panicled, terminal; corolla wanting; drupe turbinate; nut 1-2-celled. ɣ. S. Native of the East Indies, in the mountainous tracts of the Circars. Dr. Wallis of a tree so closely allied to this in Nipaul at Novokote and Silhet that he dare not separate them; he ascertained that Roth's Z. obliqua is this very species, and Z. paniculatà of the same individual to be hardly distinct. Drupe yellow, size of a small cherry, usually 1-celled and 1-seeded. Those of the Nipaul plant are eaten by the natives.

Broad-leaved Jujube. Shrub 12 feet.

29 Z. Jújuba (Lam. dict. 3. p. 318.) leaves obliquely-ovate, serrated, downy below, as well as the young branchlets, hoary; prickles twin, the one recurved, the other straight; corymbs axillary, almost sessile. ɣ. G. Native of India, and cultivated in China and Cochín-china. Rhamnus Jújuba, Lam. spec. 282.—Rumph. amb. 2. t. 36.—Rheed. mal. 4. t. 41. Flowers greenish-yellow. Drupe globular, size of a large cherry, smooth, yellow when ripe, containing a 2-celled, 1-seeded nut. There is a variety of this, or a new species, in the East Indies, which produces an excellent fruit of a long form, about the size of a hen's egg, known by the name of Naríkkellekoot in Bengal. The fruit of both varieties is eaten by all classes of persons. It is sweet and mealy. The bark of the tree is said to be used in the Moluccas in diarrhea, and to fortify the stomach, which seems to confirm the astringent properties of the bark of most of the plants of this order.

Jujube-tree. Fl. April, May. CIt. 1759. Tree 16 feet.

30 Z. soròria (Schult. syst. 5. p. 337.) leaves roundish-ovate, obtuse, mucronate, serrulated, downy beneath; prickles wanting; corymbs axillary, divaricating, dichotomous; stigma simple. ɣ. S. Native of the East Indies. Z. trînémon, var. a, Roth, nov. spec. 5. p. 337. Allied to Z. Jújuba. Fruit eatable.

Sister Jujube. Fl. CIt. 1821. Tree 16 feet.

31 Z. microphyllà (Roxb. fl. ind. 2. p. 362.) leaves roundish-ovate, 3-nerved, serrated, woolly beneath; prickles twin, one straight, the other recurved; branchlets bifarious, flexuous; flowers fascicled; stigma 2-cleft. ɣ. S. Native on the coast of Coromandel, as well as of Ceylon. Z. rotundifòlia, Lam. dict. 3. p. 310. Z. nummiílarius, Gmel. syst. 401.—Philk. alm. 193. t. 197. f. 2.—Rhamnus nummiílarius, Burm. ind. 61. Flowers greenish-yellow.

Small-leaved Jujube. Shrub 4 feet.

32 Z. orthicànthã (D. C. prod. 2. p. 21.) leaves ovate, almost entire, obtuse, covered with short hoary down beneath, as well as branchlets and pétioles; prickles twin, straight; corymbs axillary, downy. ɣ. S. Native of Senegal. Flowers greenish-yellow. Drupe reddish, round, about the size of a filbert, and is eaten by the natives of Senegal, as well as made into a sweet of drink by them, resembling that made from Z. Lótus, which see, no. 3.

Straight-serrulated Jujube. Tree 16 feet.

33 Z. obovátà (Schult. syst. 5. p. 388.) leaves cordate, orbicular, or somewhat ovate, obtuse, mucronate, downy, equally and bluntly serrulated, corymbs axillary, conglobated, dichotomous; fruit downy, containing a 3-celled nut. ɣ. S. Native of the East Indies. Z. rotundifòlia, Roth. nov. spec. 169, but not of Lam. Flowers greenish-yellow.

Orbicular-leaved Jujube. Tree.

34 Z. Poreítica; leaves ovate-roundish, sharply serrulated, downy beneath, as well as the branches, pétioles, and flowers; prickles twin, one recurved, the other straight; corolla axillary; fruit subglobose, smooth. ɣ. S. Native of St. Domingo. Z. tomentösà, Poir. suppl. 3. p. 192. but not of Roxb.

Poirêt's Jujube. Tree.

35 Z. rotundàta (D. C. prod. 2. p. 21.) leaves ovate, obtuse, rather oblique at the base, somewhat crenulated, clothed beneath with greyish-velvety down, as well as the pétioles, branchlets, and flowers; prickles twin, the one recurved, the other straight; corymbs axillary; fruit ovate, blunt, smooth. ɣ. S. Native of the Mauritius. Flowers yellowish. Resembling Z. Jújuba.

Mauritian Jujube. Fl. May. CIt. 1820. Tree 16 feet?

36 Z. Maurítiana (Lam. dict. 3. p. 310.) leaves oval, roundish, obtuse, almost entire, clothed beneath with dense white or somewhat rusdy down, as well as the pétioles, branchlets, and flowers; prickles twin, one recurved, the other straight; corymbs axillary; fruit oblong, acuminate. ɣ. S. Native of the Mauritius. Flowers yellowish. Resembling Z. Jújuba.

Mauritian Jujube. Fl. May. CIt. 1820. Tree 16 feet?

37 Z. oxycára (D. C. prod. 2. p. 21.) leaves ovate, somewhat acute, tapering to the base, and oblique, sharply serrulated, hoary-velvety beneath, as well as the pétioles and branchlets; prickles twin, the one recurved, the other straight; corymbs axillary; fruit oblong, acuminate. ɣ. S. Native of the East Indies, and in the Indian Archipelago. (Labill.) This species resembles Z. Genòpia in the leaves, but Z. Mauritiana in the fruit.

Sharp-fruited Jujube. Shrub 12 feet?

38 Z. k'èlegans (Wall. in fl. ind. 2. p. 360.) erect, nearly unarmed, with filiform pubescent branches, and bifarious, lanceolate, serrulated, bluntly-acuminate leaves, which are smooth above, and pubescent beneath. ɣ. S. Native of Singapore. The fruit and flowers of this elegant shrub are unknown.
Elegant Jujube. Shrub 6 feet?

39. Z. exsculpta (D. C. prod. 2. p. 21.) leaves ovate, serrulat- ed, downy beneath; prickles wanting; corymbs axillary; calyx with 10 glands on the inside; stamens twice or thrice longer than the petals. \( h \). S. Native of the island of Luzon, near Manila. Rhæmus trinervis, Cav. icon. t. 505. f. 1. but not of Roth. Z. trinervis, Poir. suppl. 3. p. 192. Stigmus 2, thickened. Berry ovate, 1-celled, 1-seeded.

Protruding-stamened Jujube. Shrub or Tree.

† Species not sufficiently known.

40. Z. angulata (Lam. dict. 3. p. 329.) leaves roundish-oval, a little toothed, smooth on both surfaces; prickles twin, straight; branches tetragonal, with prominent angles. \( h \). S. Native of? Flowers, as well as fruit, unknown.

Angular-stemmed Jujube. Shrub?

41. Z. Havaneænsis (H. B. et K.) nov. gen. am. 7. p. 57.) branches 5-angled, twisted, flexuous, smooth; spines stip- pular, straight; leaves roundish-ovate, unequal-sided, somewhat cordate, 3-nerved, obsolete-crenulated, coriaceous, smooth; calyxes clothed with rusty down. \( h \). S. Native of the island of Cuba, near Havannah. Anthers behind. The tree has the habit of Z. angulata, and will probably with it form the distinct genus, or form a section of Ceanothus.

Havannah Jujube. Tree 20 feet.

42. Z. Angel's (Schult. syst. 5. p. 341.) leaves oblong, quite entire, smooth; prickles twin, straight, short; flowers racemose, apetalous; drupe globose, containing a 3-celled nut. \( h \). G. Native of Cochin-china. Rhæmus agræstis, Lour. fl. coeh. 158. Stamens surrounded by hairs. Drupe globose, red, edible.

Field Jujube. Shrub 8 feet.

43. Z. Sorofira (Schult. syst. 5. p. 340.) leaves lanceolate, nerveless, quite entire; prickles scattered, straight; flowers axillary, solitary; drupe roundish, 1-seeded. \( h \). G. Native of the north of China. Rhæmus sorofira, Lour. fl. coeh. 158. According to Loureiro it comes very near to the figure in Rumph. amb. 2. t. 37 which has been considered Z. Napaea by Linnaeus. Flowers reddish. Drupe small, red. The kernel of the nut, steeped a few days, is hypnotic and paregoric, causes gentle sleep, and mitigates pain.

Sleepy Jujube. Shrub.

44. Z. Cape's (Poir. suppl. 3. p. 193.) leaves ovate-oblong, smooth; prickles twin, straight; flowers digynous; stem shrubby. \( h \). G. Native of the Cape of Good Hope.

Cape Jujube. Shrub 4 feet.

Cult. The hardy kinds will grow in any common garden soil; they are well adapted for shrubbery, and are easily increased by ripened cuttings, planted in a good soil, with a hand-glass placed over them, or by slips of the roots, planted in the same manner. The greenhouse and stove species will grow well in a mixture of loam, peat, and sand, and ripened cuttings will root, planted in a pot of sand, with a hand-glass placed over them, but those of the stove species will require to be placed in heat.

III. SPHEROCA'RYA (from σφηνω, sphaira, a sphere, and καρπos, carpos, a nut; nuts round). Wall. fl. ind. 2. p. 371.

Lin. syst. Pentandria, Monogynia. Calyx 5-parted. Pe- tals 5, alternating with the stamens, inserted in the calyx, and with 5 fringed scales between the stamens and oppose the calyceine segments. Stamens 5, inserted in the calyx. Disk none. Drupe pear-shaped, containing a smooth round nut. — A large tree, with alternate, ovate, entire, smooth, exstipulate leaves, and axillary and terminal villous racemes of small greenish, inodorous flowers.

1 S. Edulis (Wall. l. c.). \( h \). G. Native of Nipaul in the forests, about the valley. The flesh of the fruit is pale-brown, and the inhabitants of Nipaul are very fond of it, which, however, to a European palate, holds out but little temptation.

Edible-fruited Spherocarya. Tree 10 feet.

Cult. For culture and propagation see greenhouse species of Zizyphus.

Lin. syst. Pentandria, Monogynia. Calyx spreading, 5-cleft (f. 4. C. a.), adhering to the ovary; segments deciduous, but with the base permanent. Petals wanting. Anthers bilo- cular (f. 4. C. c.). Stamens alternating with the sepals (f. 4. C. c.). Style 1. Disk flat, expanded (f. 4. C. c.), pentagonal. Ovary girdled by the disk, free, 2-celled (f. 4. C. d.). Stigma small, entire. Fruit drupaceous, ovate, containing a 1-celled, 1-seeded nut (probably from abortion?). Seed ovate, destitute of a furrow.—Much branched, smooth shrubs, with spiny branch-lets, alternate, almost sessile, ovobate-oblong, entire leaves, and axillary flowers. This genus differs from Zizyphus, to which it is nearly allied, in being destitute of petals, as well as in the style and stigma being simple.

1 C. microphylla (Cav. l. c.) leaves alternate, almost sessile, ovobate-oblong, mucronate. \( h \). G. Native of Chili. Zizyphus myrtoides, Ort. dec. 9. p. 119. Branches spreading, spiny at the apex. Flowers on short pedicles, greenish-yellow.

2 C. ? Paradoxa (Spreng. syst. 1. p. 825.) leaves opposite, connate, thick, decurrent, stiff, pungent; peduncles lateral, crowded. \( h \). S. Native of Monte Video.

Paradoxic Condalia. Shrub 4 feet.

Cult. These shrubs will grow well in a mixture of loam, peat, and sand, and ripened cuttings will root freely, planted in a pot of sand, with a hand-glass placed over them.

Lin. syst. Pentandria, Monogynia. Calyx with a hemi- spherical tube, and 5 erect segments (f. 4. E. a.). Petals 5, con- volute (f. 4. E. c. d.). Stamens inclosed within the petals (f. 4. E. c.). Anthers ovate, 2-celled. Disk annular (f. 4. E. f.), rather flat. Ovary half immersed in the disk, 2-celled (f. 4. E. c.). Style simple, short, bifid at apex. Fruit dry, indisch- ced (f. 4. E. g.). Seeds adhering to the tests of the pericarp.—Erect or climbing shrubs, with alternate, many- nerved, entire leaves, and with the flowers subumbellate in the axilie of the upper leaves, or disposed in terminal panicles.

* Climbing shrubs.

2 B. floribunda (Brogn. in mem. rhamm. p. 50.) unarmed, smooth, with rambling branches; leaves ovate, acute, quite entire, retuse at the base, glaucous beneath; panicle large, termi- nal; flowers racemose; drupe somewhat cylindrical. \( h \). S. Native of Nipaul, at Thakote and Sankoo, and on Chundrugri.
Zizyphus floribundus, Wall. fl. ind. 2. p. 368. Flowers small, white.

_Bundle-flowered_ Berchemia. Fl. May, July. Shrub rambl.

4 B. calophylla; climbing; armed with solitary, short, recurved prickles; leaves ovate-oblong, smooth, glossy, 3-nerved, veinless, minutely crenulated; corymbs terminal, panicled. ıt. ıt. S. Native of Pulo-Pinang. Zizyphus calophylla, Wall. fl. ind. 2. p. 367.

**Stems erect.**

5 B. lineata (D. C. prod. 2. p. 23.) branches downy, unarmed; leaves ovate, repand, netted beneath; flowers hermaphrodite. ıt. S. Native of China. Rhamnus lineatus. Linn. amen. 4. p. 308.—Osb. it. 219. t. 7. Leaves of a beautiful yellowish-green colour beneath, with red veins. Flowers white.

_Poiretii's Berchemia._ Shrub 6 feet.

7 B. Lauretia (D. C. prod. 2. p. 23.) branches smooth, procumbent, with scattered prickles; leaves ovate, somewhat crenated, flat; flowers 10-petalled, pentandrous; drupes oblong-ovate, scabrous, 2-celled. ıt. S. Native of Cochinchina, in hedges and among bushes. Rhamnus lineatus, Lour. fl. cochin. 139. but not of Lin. Flowers white, numerous on the peduncles. Drupe small, red. A decoction of the root is deobstrucent and diuretic.

_Lauretia's Berchemia._ Shrub 8 feet, trailing.

N.B. B. Burmanni, D. C. prod. 2. p. 23., Rhamnus &c. Burn. zeyl. p. 198. t. 88. belongs to _Euphorbiaeae_ not far from _Andrachne._

_Cult._ _B. volubilis_ will grow in any common soil, and is well adapted for bowers or trellis-work. It may be increased by ripened cuttings, and slips of the root, planted under a hand-glass, or by laying down the young shoots. The other species will grow freely in a mixture of loam and peat, and ripened cuttings will strike root in a pot of sand, under a hand-glass.

**VI. VENTILAGO.** (from _ventilo_, to be exposed to wind, and _ago_, to drive away; in allusion to the flower being winged, which causes them to be scattered away by the wind). _Gaurt. fruit._ 1. p. 223. t. 49. Brogn. mem. Rhamn. p. 50. _D. C. prod._ 1. p. 38.

_Lex. syst._ _Penicandria, Monogynia._ Calyx spreading, 5-cleft (f. 4. D. c.). Petals 5, obovate, convolute (f. 4. D. a.). Stamens exerted (f. 4. D. b.). Anthers ovate, 2-celled. Disk fleshy, flat. Ovary immersed in the disk, 2-celled. Style compressed, short, bidentate (f. 4. D. j.). Fruit indeliscent, woody (f. 4. D. b.), 1-celled, 1-seeded, with the upper part drawn out into a wing (f. 4. D. k.).—Large, climbing shrubs, with stiff, smooth branches, alternate, short-stalked, coriaceous, smooth, serrated leaves, which are oblique at the base, and with the flowers disposed in long axillary racemes, which are either solitary, twin, or in threes.

1 V. madraspatana (Gaurt. l. c.) leaves bifarious, ovate-oblong, serrated; racemes disposed in terminal panicles. ıt.

**VI. VENTILAGO.** _VII. SEGERETIA._

1 S. Native of the East Indies, in forests and other uncultivated places, amongst the mountains, very common in the north of Bengal. Roxb. cor. 1. t. 76. Flowers numerous, small, greenish-white. This plant is generally dioecious. The smell of the flowers is very offensive, not unlike that of _Sterculia foetida._ While young the stem and flexuous branches are striped with white lines, which elegantly contrast with the smooth green bark, not unlike what is observed in _A'cer striatum._ This is most probably the _Ficus viniflora_ of Ramph. amb. 3. t. 2.

_V. denticulata_ (Wild. in nov. act. berl. 3. p. 417.) leaves crenulated, pubescent beneath. ıt. ıt. S. Native of the East Indies near Samulcotta.

_V. bracteata_ (Heyne, mss.) floral leaves long, villos. ıt. ıt. S. Native of Silhet in the East Indies.

2 V. cinerascens; leaves full of parallel veins, oval, acute, quite entire, smooth, cinerous beneath; racemes terminal; pedicels in fascicles. ıt. ıt. S. Native of Java. Rhamnus cinerascens? Blum. bijdr. 1141.

_Cinerous Ventilago._ Shrub cl.

3 V. oblongifolia (Blum. bijdr. 1141.) leaves oblong, acuminate, obliquely rounded at the base, serrated, teterose in the axils of the veins beneath; racemes interrupted, leafy. ıt. ıt. S. Native of Java.

_Oblong-leaved Ventilago._ Shrub cl.

_Cult._ See Berchemia for culture and propagation.

_Lin. syst._ _Penicandria, Monogynia._ Calyx pitchier-shaped, 5-cleft (f. 4. F. A.). Petals 5, convolute or cussulate (f. 4. F. E.). Stamens bearing ovate, 2-celled anthers (f. 4. F. c.). Disk fleshy, cup-shaped, riding the ovary. Ovary almost immersed in the disk, 3-celled (f. 4. F. d.). Style short, thick (f. 4. F. g.). Fruit unknown. Stigmas 3, sessile, or 3-lobed.—Shrubs with slender branches, which are usually spinescent. Leaves nearly opposite, on short petioles, lanceolate, or oblong, serrated, feather-serrated. Flowers small, solitary, or glomerated, disposed in simple or branched, interrupted, stiff, spreading, axillary, or terminal spikes.

**Spiny.**

1 S. thel'sans (Brogn. in mem. rhamn. p. 53.) branches divaricate, spiny at the apex; leaves ovate, smooth, serrulated; flowers somewhat panicked, glomerated, in terminal spikes. ıt. G. Native of China. Rhamnus thelasans, Linn. mant. 207. R. thèa, Osb. itin. 232. Flowers greenish? The poor in China make use of the leaves of this plant instead of the true tea, probably from its astrigency and perfume. They call it _Tsin._

_VAR. β, integra; leaves entire, mucronate. ıt. G. Dum._

_Cours. bot. cult._ 6. p. 258.

_Tea Segeretia._ Fl. May, June. Clt.? Shrub 4 feet.
2 S. stipulata (Brogn. in mem. rhamn. p. 53.) branches cylindrical, smooth, lateral ones spiny; leaves lanceolate, acuminate, serrated, quite smooth, with 2 stipulas at the base of each; spikes simple, stiff, divaricate, axillary, and terminal. ıt. ıt. S. Native of Peru.

_Spicate-flowered Segeretia._ Shrub 4 feet.

3 S. blumii; leaves veiny, nearly opposite, ovate-lanceolate, acuminate, rather corolate at the base, serrated, shining above, young ones furrfuraceous beneath; spikes axillary, filiform, hardly longer than the leaves, and terminal, panicked. ıt. ıt. S. Native of the East Indies and Java. Rhamnus filiformis, Roth. nov. spec. 153.? Blum. bijdr. 1140.

_Blume's branched Segeretia._ Shrub 6 feet.
4. **S. oppositifolia** (Brogn. mem. rhamn. p. 53.) branches round, climbing; leaves and branches truly opposite, and with short straight thorns, which grow out into branches; leaves ovate-lanceolate, serrated, acuminate, somewhat retuse at the base; racemes axillary and terminal, short, villous, the whole forming a pretty large bractiace panicle; flowers fascicled. h. S. Native of Java. *Rhämnum oppositifolia*, Wall. fl. ind. 2. p. 370. Flowers greenish.

5. **S. affinis**; leaves veiny, nearly opposite, ovate-oblong, long-acuminated, rounded at the base, serrulata, smooth; spikes paniculate, axillary, and terminal, shorter than the leaves. h. S. Native of Java. *Rhämnum affinis*, Blum. bijdr. 1141.

**Allied Segeretia.** Shrub 8 feet.

6. **S. halora** (Brogn. mem. rhamn. p. 53.) branches round, climbing, opposite; leaves oblong, acuminate, serrulata, villous at the origin of the nerves; flowers fascicled, disposed in short, panicled, villous, terminal racemes. h. G. Native of Nipaul, at Chundrugiri, where it climbs over trees and shrubs to a great extent. *Zizyphus hamiosa*, Wall. fl. ind. 2. p. 309. Thorns slightly curved. Flowers greenish.

**Hooked-thorned Segeretia.** Fl. Aug. Shrub cl.

7. **S. triguina**; branches round; leaves ovate, acuminate, smooth, shining, serrulata, retuse at the base; flowers glomerate, disposed in spikes, forming a terminal panicle; pediole and branches pubescent; styles 3. h. G. Native of Nipaul, in mountain woods. *Rhämnum trigynus* and *tynalis*, Hamilt. in D. Don, prod. fl. nep. p. 190. Shrub spinose.

8. **S. Guayaqueïnsis** (Brogn. mem. rhamn. p. 53.) much branched; branches quadrangular; spines scattered, awl-shaped; leaves elliptical, mucronate, hoary beneath; flowers sessile, scattered on the spikes; sigmas 3. h. S. Native on the shore of the Pacific ocean, near Guayaquil. *Rhämnum Guayaqueïnsis*, H. B. et Kunth, nov. gen. amer. 7. p. 54.

**Guayaqueï Segeretia.** Shrub 6 feet.

9. **S. senticósus** (Brogn. mem. rhamn. p. 53.) shrub very spiny, almost leafless; branches round; spines decussately opposite, very long; leaves ovate, somewhat quartuplicate, nervel; flowers rising above the base of the spines in glomerated fascicles; stigma trifid. h. S. Native of Peru, in hot places, near Contumasaay. Collettia spicata, Willd. in Schult. sist. 5. p. 513. *Rhämnum senticósus*, H. B. et Kunth, nov. gen. amer. 7. p. 54. Fruit globose, 1-3-seeded. Flowers green.

**Thorny Segeretia.** Shrub 6 feet.

10. **S. decussata**; branches angular, elongated; leaves ovate-oblong, acute, quite entire, somewhat coriaceous, quite smooth; spines axillary, decussate, spreading, stiff; flowers disposed on long spikes; spikes conjunctive at the base of the spines, and are 2-3 times longer than them. h. S. Native of Peru. *Rhämnum decussata*, herb. Pav. This is probably the same as the preceding species.

**Decussate-spined Segeretia.** Shrub 6 feet.

**Unarmed.**

11. **S. e’leons** (Brogn. mem. rhamn. p. 53.) lower leaves truly opposite, ovate-oblong, acuminate, rounded at the base, serrulata, smooth, shining; panicles axillary and terminal, simple; flowers glomerate, spiked; sigmas 3, sessile. h. S. Native of South America, but in what place is unknown. This plant is probably spiny? *Rhämnum e’leons*, Kunth.

**Elegant Segeretia.** Shrub.

12. **S. splendens**; climbing; leaves veiny, ovate, bluntly acuminate, somewhat cordate at the base, crenulate; cymes axillary, bifid, shorter than the pedioles. h. S. Native of Java. *Rhämnum splendens*, Blum. bijdr. 1140.

**Splendid Segeretia.** Shrub cl.

**Lanceolata-leaved Segeretia.** Tree 16 feet.

**Michaux’s Segeretia.** Shrub 6 feet.

15. **S. filifórmis**; leaves ovate-lanceolate, serrulata, shining, with the ribs beneath, as well as the petioles, pubescent; flowers hermaphrodite, disposed in filiform spikes, the whole forming a panicle. h. S. Native of the East Indies. *Rhämnum filifórmis*, Roth. nov. spec. 153.

**Filiform-spined Segeretia.** Shrub.

16. **S. parviflóra**; leaves somewhat coriaceous, shining, serrulata, ovate, acuminate; flowers disposed in loose spikes, the whole forming a panicle. h. S. Native of the East Indies. *Rhämnum parviflorus*, Klein et Wildl. in Schult. sist. 5. p. 294. **Small-flowered Segeretia.** Shrub.

17. **S. corymbosa**; leaves coriaceous, elliptical, a little serrated; flowers corymbose, on peduncles. h. S. Native of the East Indies. *Rhämnum corymbosus*, Vahl.

**Corymbose-flowered Segeretia.** Shrub.

18. **S. leprosa**; climbing, adult branches spiny; leaves veiny, nearly opposite, ovate, somewhat cordate, obtuse, serrated, smooth; young ones densely furfuraceous; pedicels 1-flowered, axillary, solitary. h. S. Native of Java. *Rhämnum leprosus*, Blum. bijdr. 1139.

**Leprous Segeretia.** Shrub cl.

Cult. The hardy kinds of this genus are well fitted for shrubbery; they are increased by ripened cuttings or slips of the roots, planted under a hand-glass, but they are generally propagated by laying the branches. For the culture and propagation of the stove and greenhouse species see *Bercighnia*, p. 28.

---

**FIG. 5.**

**VIII. RHAMNUS** (from the Celtic word *ram*, signifying a tuft of branches, which the Greeks have changed to *rhamvoc*, and the Latins to *rhamus*). Lam. dict. 4. p. 461. ill. t. 128. Gaert. fruct. 2. p. 106. D. C. prod. 2. p. 23. Brogn. mem. rhamn. p. 53.

**LIN. SYST. Pentandria, Monogynia.** Calyx urceolate, 4-5-cleft (f. 5. C. b. A. a.). Petals wanting or emarginate (f. 5. C. c.). Stamens bearing ovate 2-celled anthers (f. 5. A. d. B. b.). Disk thin, covering the tube of the calyx (f. 5. B. d. A. e. C. c.). Ovary free, 3-4-celled (f. 5. A. h. f.). Styles 3-4 (f. 5. A. g.), connected or free. Fruit baccate, containing 3-4 indehiscent units (f. 5. A. f. B. f.), rarely only 2 from abortion.—Small trees or shrubs, with alternate, stipulate, short, stalked, entire or toothed.
usually smooth leaves, which are permanent and coriaceous, or caducous, with feather nerves; in those with the permanent leaves the nerves are either vaguely branched, or in others approximating. Plants possessing strong purgative qualities.

1 R. A. latérnus (Lin. spec. 281.) leaves ovate-elliptical or lanceolate, coriaceous, quite smooth, serrated; flowers dioecious, disposed in short racemes. fig. II. Native of the south of Europe and the north of Africa. Dub. ed. nov. 3, p. 42. t. 14. Alatérnus Phyllae, Mill. dict. no. 1, fig. t. 16. f. 1. Flowers green, without any corolla.

Var. a. Balaeàrius (Hort. par.) leaves roundish; stipulas avulshed, and are, as well as the branches, somewhat spiny. Rh. rotundifolius, Dum. Cours. 6, p. 260.

Var. β. Hispánius (Hort. par.) leaves ovate, a little toothed.

Var. γ. vulgàris (D. C. prod. 2, p. 23.) leaves ovate, serrated.

There are several other varieties, as 1. The Smooth Alatérnus. 2. The Entire-leaved Alatérnus. 3. The Spotted-leaved Alatérnus. 4. The Gold-striped-leaved Alatérnus. 5. The Silver-striped-leaved Alatérnus.

The flowers of Alatérnus are said not to be perfectly dioecious. The fresh shoots and leaves will dye wool yellow. The honey breathing blossoms, says Evelyn, afford an early and marvellous relief to the bees, as they open in April. Clusius reports that the fishermen in Portugal dye their nets red with a decoction of the bark; and that dyers there use small pieces of the wood to strike a blackish-blue colour. The Alatérnus was much more in request formerly than at present, having been planted against walls in court-yards to cover them, as also to form evergreen hedges in gardens, for which purpose it is very improper, for the branches shoot too vigorously, and are easily broken, and is displaced by the wind. It is still, however, used in towns for covering walls, but chiefly to make a variety in ornamental plantations.

2 R. h Y R I D E S (Lher. sert. t. 5.) leaves oblong, acuminate, serrated, smooth, shining, hardly permanent, rather coriaceous; flowers androgynous. fig. Η. H. This plant has been raised in the gardens from R. alatérnus and R. alpinus. R. Burgundianus, Hort. par. R. sempervirens, Hortulan. Flowers green.

3 R. glandulósus (Alit. hort. kew. I, p. 265.) leaves ovate, bluntly-serrate, smooth beneath, in the axillae of the lower veins glandular; flowers hermaphrodite, racemose. fig. G. Native of the Canary islands, in woods on the mountains. Vent. malm. t. 34. Flowers green.

 Entire-leaved Alaternus. Clt. 1822. Shrub 2 feet
Leaves usually alternate. Flowers very small, yellow. Calyx seldom 5-cleft. Berries 2-3-seeded. Branches twiggy, the lateral branchlets terminated in a thorn.

11 R. tinctarius (Walds, et Kit. pl. rar. hang. 3. p. 255.) erect; leaves ovate, crenate-serrate; petioles villous; flowers crowded, dioecious; berries obcordate, 3-4-seeded. H. Native of Hungary, in hedges. R. cardiospermus, Willd. herb. Flowers greenish-yellow. The berries are used for dying as the inner bark.

**Dyers’ Buck-thorn.** Fl. May, June. Clt. 1820. Sh. 8 feet.

12 R. infectarius (Lin. mant. 49.) procumbent or diffuse; leaves ovate-lanceolate, serrulate, smoothish; flowers dioecious, bearing petals in both sexes. H. Native of the south of Europe, in rough places, and in the fissures of rocks.—Cmns. hist. 1. p. 111. with a figure.—Ardu. mem. 78. t. 14. Flowers greenish-yellow, with two reflexed stigmas. The unripe berries are much used for dyeing, and are imported in great quantities into England under the name of *Grain d'Avignon* or *Avignon* berries. They are what give the yellow colour to Turkey leather or yellow Morocco.

**Dyers’ or Avignon-berry.** Fl. June, July. Clt. 1683. Shrub procumbent.

15 R. viruifolius (Poir. dict. 4. p. 463.) diffuse; leaves ovate, quite entire, mucronate, smooth, coriaceous, green on both surfaces. H. Native of Nomilias. Flowers greenish-yellow. According to Desf. this is only a variety of the preceding. Perhaps this is R. buxifolius, Broth. fl. Ins. 1. p. 301.

**Box-leaved Buck-thorn.** Fl. June, July. Clt. 1820. Sh. 3 ft.

16 R. fufe’seens (Poir. dict. 4. p. 464.) diffuse; leaves ovate, quite entire, coriaceous, pubescent. H. Native of the south of France, and of the Levant. R. oleoides, Lam. fl. fr. 2. p. 545. ed. 3. no. 4075. This is probably only a variety of *R. oleoides*.

17 R. amygdalinus (Desf. atl. 1. p. 198.) diffuse; leaves permanent, lanceolate, obtuse, almost entire, coriaceous, smooth, not netted beneath. H. Native of the north of Africa, and the islands of the Archipelago, in the fissures of rocks. Flowers greenish-yellow. The Avignon berries or yellow berries are also obtained from this shrub, as well as from *R. infectarius, tinctorius, saxatilis, oleoides, buxifolius,* and *pubescent.*

18 R. peresicfolius (Moris. stirp. sard. 4to. fasc. 2.) erect; branches spiny at the apex; leaves oblong-lanceolate, crenated, obtuse, reticulately-veined, and piloae beneath. H. Native of Sardinia.

**Pearch-leaved Buck-thorn.** Shrub.

---

**VIII. Rhamnus.**

19 R. crenulatus (Ait. hort. kew. 1. p. 263.) erect; leaves oblong, somewhat serrated, permanent, smooth, netted with veins beneath. H. Native of Teneriffe, on the mountains. Flowers greenish-yellow.

**Crenulate-leaved Buck-thorn.** Fl. March. Clt. 1778. Sh. 6 ft.

20 R. crassifolius (Smith, prod. fl. grace. 1. p. 157. Rees’ cyc. no. 6.) plant depressed or procumbent; leaves obovate, obtuse, crenated, naked; flowers dioecious or polygamous. H. Native of Spain, frequent on the limestone hills of Valenta. Cav. icon. 2. t. 182. Flowers greenish-yellow. Berries black, round, 2-3-seeded.

**Var. β. Arragonensis** (Asso, syn. arr. p. 1.) leaves yellowish above.

22 R. erythroxylon (Pall. fl. ros. 2. t. 62. itin. French ed. t. 90.) erect; leaves linear-lanceolate, quite entire or serrated, smooth; flowers hermaphroditic; berries oblong. H. Native of Siberia, on rocks. Berries the size of a pea, 3-seeded. Flowers greenish. This shrub when cultivated becomes destitute of spines. The wood is orange or almost red.

**Var. β. angustissimus** (D. C. prod. 2. p. 25.) leaveslinear, narrow, very finely serrulated. H. Native of Caucasus. R. lycoides, Pall. fl. ros. t. 63. This is perhaps a distinct species.

**Branchlets not terminated by spines.**

24 R. valentinus (Willk. spec. 1. p. 1096.) procumbent; leaves roundish, elliptical, minutely-crenate, and nearly sessile; flowers 4-cleft, hermaphroditic. H. Native of Spain, on the mountains of Mecca and Palomera, in the kingdom of Valentina. R. pumilus, Cav. icon. 2. t. 181. Style deeply 3-parted. Drupe dry, 3-celled.

25 R. wulfenii (Spreng. syst. 1. p. 762.) erectish; leaves orbicular, with cartilaginous crease margins, veiny, silky beneath at the nerves; stigma simple; flowers hermaphrodite. H. Native of America. R. pumilus, Wulf. in Jauc. coll. 2. p. 141. t. 11. Flowers greenish-yellow.

**Wulfen’s Buck-thorn.** Fl. June, July. Clt. 1752. Sh. 2 ft.

26 R. fusillus (Ten. prod. 16.) procumbent; leaves obovate, acute, crenated, and mucronate at the apex; flowers hermaphrodite; stigma 3-parted. H. Native of Naples.

27 R. l-systemus (Schult. syst. 6. p. 286.) diffuse; leaves ovate-obovate-ellipsoid, almost entire, lined, villous; flowers dioecious, usually digynous. H. Native of Mount Parnassus. Allied to *R. alpinus* and *R. frangula.* R. pubescent, Schult. fl. grace. t. 239. Flowers green.

**Sibthorpi’s Buck-thorn.** Shrub diffuse.

28 R. dauli’icus (Pall. fl. ros. 2. t. 61.) erect; leaves oblong-ovate, serrated, smooth, veiny; flowers dioecious, female ones with bifid stigmas. H. Native of Dahuria, on the banks of the river Argun. Flowers greenish-yellow. Berries
about the size of a pea, sometimes twin. Very like *R. catharticus*, but without thorns. The wood is red, and is called sandal wood by the Russians.

29. *R. alnifolius* (Lher. sert. p. 5.) erect; leaves obovate or ovate, serrulate, obliquely-lined, with lateral nerves, acuminate or obtuse, smoothish beneath, except the nerves; flowers hermaphrodite or dioecious; pedicels 1-flowered, aggregate; calyces acute; fruit turbinate. H. Native of North America.

_Pursh's_ Buck-thorn. Fl. May, June. Shrub 6 feet.

32. *R. serrulatus* (H. B. et Kunth, nov. sp. amer. 7. p. 51. l. 617.) shrubby; branches villously hairy; leaves oblong, acute at both ends, sharply serrated, smooth, clamy; peduncles axillary, solitary, single-fruited. G. Native of Mexico, in the plains near St. Augustin de las Guevas. Flowers greenish-yellow.

_Serrulate-leaved_ Buck-thorn. Shrub 6 feet.

33. *R. Californicus* (Eschsholtz, mem. acad. scienc. peterb. 10. p. 281.) unarmed; flowers hermaphrodite, monogynous, in fascicled umbels; berry 2-seeded; leaves oval, serrulate. H. Native of California.

_Californian_ Buck-thorn. Shrub.

34. *R. microphyllus* (Willd. in Schult. syst. 5. p. 295.) shrubby, procumbent, much branched; branches twisted; branchlets hairy; leaves linear-lanceolate, obtuse, almost entire, smooth; peduncles solitary, axillary; flowers 5-cleft, hermaphrodite, monogynous. G. Native of Mexico. Flowers greenish-yellow. This shrub has the habit of *R. oleoides*, but with the flowers 5 or 6-cleft, and the style simple, and 2-lobed at the apex. H. B. et Kunth, nov. gen. amer. 7. p. 51. l. 616.

_Alpine_ Buck-thorn. Fl. May, June, Ct. 1752. Shrub 4 feet.

In the genus *Rhamnus*, the flowers are usually 5-cleft, or at least 5-lobed, and the calyx is often more or less expanded, and the fruit is always a drupe. The genus is perhaps best understood by a comparison of its characters with those of the genus *Althaea*.

Sect. III. _Antirrhænus_ (from anti and rhænus). D. C. prod. 2. p. 20. Leaves opposite, hispidulate. Flowers axillary. Fruit 2-celled. Unarmed species not sufficiently known. The species differ from all the others in the cells of the fruit being 2-seeded, and in the leaves being for the most part opposite.

_Humboldt's_ Buck-thorn. Tree.

**Sect. III. Antirrhænus** (from anti and rhænus). D. C. prod. 2. p. 20. Leaves opposite, hispidulate. Flowers axillary. Fruit 2-celled.—Unarmed species not sufficiently known. The species differ from all the others in the cells of the fruit being 2-seeded, and in the leaves being for the most part opposite. **Humboldt's** Buck-thorn. Tree.
43 R. benjellou (Moc. et Sesse, fl. Mex. Icon. Ind. D. C. prod. 2. p. 26.) leaves entire, oval, acute at both ends, lined with feather nerves; peduncles axillary, 2-flowered. \( \frac{3}{4} \), G. Native of Mexico. This is perhaps sufficiently distinct from the preceding species.

* Twin-flowered Buck-thorn. Shrub.

44 R. terniflora (Moc. et Sesse, fl. Mex. Icon. Ind. D. C. prod. 2. p. 26.) leaves somewhat acute, toothed, rusty beneath as well as the branchlets; pedicels 3, axillary, 1-flowered. \( \frac{3}{4} \), G. Native of the Cape of Good Hope. Probably a species of *Scutia* or *Ceanothus*.

46 R. polifolius (Vahl. symb. 1. p. 768.) leaves alternate, lanceolate, downy-white beneath, as well as the branches; flowers axillary, almost sessile, usually solitary, hermaphrodite, and usually trigynous. \( \frac{3}{4} \), G. Native of the Society Islands. Probably a species of *Sageretia*.

* * Unarmed. Leaves entire.

45 R. tetragonus (Lin. fil. suppl. 153.) leaves opposite, ovate, smooth, sessile; flowers terminal, somewhat panicled, incomplete; berries 1-celled, 1-seeded. \( \frac{3}{4} \), G. Native of the Cape of Good Hope. Probably a species of *Scutia* or *Ceanothus*.

Poly-leaved Buck-thorn. Shrub.

47 R. zizyphoides (Spreng. syst. 1. p. 768.) leaves ovate-lanceolate, acute, hoary and downy beneath; flowers terminal, loosely panicled, hermaphrodite; capsules baccate, containing 3 nuts. \( \frac{3}{4} \), G. Native of Brazil. Probably a species of *Sageretia*.

Zizyphus-like Buck-thorn. Shrub.

48 R. myrtinus (Burm. ind. p. 60.) leaves oblong-ovate, shining beneath. \( \frac{3}{4} \), S. Native of Coromandel.

Myrtle-like Buck-thorn. Shrub.

49 R. brasiliensis (Spreng. syst. 1. p. 768.) leaves oblong-lanceolate, tapering at both ends, coriaceous, shining above; peduncles axillary, 1-flowered, aggregate, rather hispid. \( \frac{3}{4} \), S. Native of Brazil.

Brazilian Buck-thorn. Shrub.

50 R. rhamnosus (Rich. act. soc. hist. nat. par. 107.) quite smooth; leaves lanceolate-oblung, shining, flowers minute in scattered bunches on the branches. \( \frac{3}{4} \), S. Native of Cayenne.

Branched-flowered Buck-thorn. Shrub.

* * Unarmed. Leaves toothed or serrated.

51 R. ? cassina (Lam. in Poir. dict. 4. p. 474.) leaves ovate, coriaceous, glaucous, obsolescently toothed; branches angular; flowers axillary, almost sessile, 5-cleft. \( \frac{3}{4} \), S. Native of St. Domingo. Probably a species of *Cassine*.

Cassine-like Buck-thorn. Shrub.

52 R. quitten (Humb. et Bonpl. in Schult. syst. 5. p. 295.) leaves obvolute-oblung, obtuse, mucronate, serrated, quite entire at the base, coriaceous; peduncles coriaceous, axillary; branches angular. \( \frac{3}{4} \), S. Native of Peru in the province of Quito.

*Quito* Buck-thorn. Shrub.

*Wihhor* Buck-thorn. Shrub.

54 R. lanceolatus (Persch. fl. amer. sept. 1. p. 166.) arborescent, unarmed; leaves lanceolate, serrulated, acute at both ends, pubescent beneath. \( \frac{3}{4} \), H. Native of Tennessee on the sides of hills. Berries black.

*Cult.* The hardy species are all proper for shrubberies, some are evergreen and some deciduous, these are usually increased by layers and seeds, which are produced in abundance. The stove and greenhouse kinds will grow in any light soil, and they are easily increased by cuttings, planted under a hand-glass.

LIN. Syst. *Pentandria, Monogynia*. Calyx pitcher-shaped, with an erect 5-cleft border (f. 6. A. a.). Petals nearly flat, emarginate (f. 6. A. b.). Stamens short; anthers ovate, 2-celled (f. 6. A. b.). Disk fleshy, covering the tube of the calyx (f. 6. A. c.), which closely girds the ovary, but not adnate to it. Ovary 2-3-celled (f. 6. A. g.). Style short, simple (f. 6. A. k.). Fruit triococcus (f. 6. A. l.), girded at the base by the circumcised calyx (f. 6. A. h.).—Smooth shrubs with alternate leaves approximating by pairs, and nearly opposite, quite entire or hardly serrulated, coriaceous, feather-nerved, bispinate; stipules minute, decussate, the tepals widening or arched, about equal in length to the petioles, rising from the axille of the lower leaves. Flowers axillary, disposed in few-flowered simple umbellets, scarcely longer than the petioles.

1 S. *indicna* (Brogn. mem. ramm. p. 56.) branchlets twiggy, armed with sub-opposite, recurved prickles; leaves nearly opposite, obovate, retuse, tootbelted towards the apex. \( \frac{3}{4} \), S. Native of the East Indies, in forests. Rhamnus circumcissus, Lin. fil. suppl. 152. Ceanòthus circumcissus, Gurt. fruct. 2. p. 111. t. 106. Shrub dividing into many long straggling scented branches. Umbellets solitary, axillary. Fruit containing 5 seeds when all come to maturity.

*Var. *pauelliforus* (D. C. prod. 2. p. 30.) pedicels 3-5. \( \frac{3}{4} \), S. Native of the Mauritius. *Ceanòthus*, nov. spec. Sieb. pl. exsic. marr. no. 75.

*Indian Scutia*. Shrub straggling.

2 S. *lúcia*; branches armed with short, opposite, and solitary, recurved prickles; leaves opposite, from round to oblong-oval, emarginate, entire, polished and firm; peduncles from 2-4-flowered; berries globular, usually 2-seeded. \( \frac{3}{4} \), S. Native of the Mauritius. Rhamnus lucidus, Roxb. fl. ind. 2. p. 333. A small much branched tree, with far spreading and straggling, somewhat climbing branches.

*Shining-leaved Scutia*. Tree 30 feet.

3 S. *commersonii* (Brogn. in mem. ramm. p. 56.) branches spreading, stiff; leaves almost opposite, approximate, distich, elliptical, quite entire. \( \frac{3}{4} \), S. Native of the Island of Bourbon, as well as on the eastern coast of Africa. Séniss, Comm. herb. Lycium Africänum, Burtn. herb. Rhamn battarticí foliis spinosum, Herm. cat. pl. Afr. p. 16. Called *Bois senti* in Bourbon.

*Commerson's Scutia*. Shrub 10 feet.

4 S. *capensis*; leaves cordate or ovate, very blunt, entire, smooth; prickles solitary, recurved. \( \frac{3}{4} \), S. Native of the Cape of Good Hope. Rhamnus Capensis, Thub. prod. 1. p. 44. fl. cap. 2. p. 73. Ceanòthus Capensis, D. C. prod. 2. p. 30. Flowers white.

5 S. *léreba* (Brogn. mem. ramm. p. 56.) leaves oblong-oval, coriaceous, smooth, shining, quite entire; peduncles axillary, shorter than the petioles, somewhat umbellate; flowers petaloid; calyx spreading. \( \frac{3}{4} \), S. Native of the Antilles. Rhamnus fíreus, Vahl. symb. 3. p. 41. t. 58. Ceanòthus fíreus, D. C. prod. 2. p. 30.

6 S. *sarcocephalus* (Brogn. mem. ramm. p. 56.) leaves ovate or oval, coriaceous, smooth, quite entire, blunt, or emar-
ginate; peduncles axillary, longer than the pedicels, racemose-corymbose. 7. S. Native of Jamaica. Sarcophalas, F. Brown, Jan. 179. Rhamnus sarcophalas, Lin. aman. 5. p. 305. Kunth, nov. gen. aman. 7. p. 67. in a note. Ceanothus sarcophalas, D. C. prod. 2. p. 30. This differs from the other species in the petals being helmet-shaped, stamens turned outwards, and in the disk being thicker, as well as in the leaves being alternate, not approximating by pairs. This tree rises generally to a considerable height; the trunk is generally about 3 feet in diameter. The wood is hard, of a dark colour, and close grain; it is looked upon as one of the best timber woods in the island of Jamaica. The name is derived from ἱππος, skarioi, the horse, and ἁλός, ala, a vessel; resemblance in the ovary, surrounded by the disk.

Sarcophalas Scutia. Tree 30 feet.

† Species not sufficiently known.

7 S. leviata; leaves oblong, obtuse, quite entire, coriaceous, veinless, smooth; flowers axillary, 2-3 pedicellate. 7. S. Native of Santa Cruz. Rhamnus leviata, Vahl. symb. 3. p. 41. Ceanothus leviatinius, D. C. prod. 2. p. 30. Var. ι, Guadalunape (D. C. prod. 2. p. 30.) leaves oval, quite entire, coriaceous, with a middle nerve and a few lateral ones; flowers axillary, 3-5 pedicelled. 7. S. Native of Guadalunape.

8 S. spilopera; leaves oblong, acuminate, serrated, smooth; peduncles axillary, subcoriaceous, length of pedicel; fruit pellucidal, spherical; seeds trigonal. 7. S. Native of Jamaica, among bushes. Rhamnus spilopera, Swartz, fl. ind. occ. 1. p. 499. Ceanothus? spiroperca, D. C. prod. 2. p. 30. Flowers yellowish-green. Berry the size of a small pepper-corn, either quite globular or obscurely 3-lobed, pellucid, pale-green, containing 1 or 3 seeds. Stigma in 2 deep, acute divisions.

Few-flowered Scutia. Shrub.

10 S. ? paniculata; leaves roundish-oval, acuminate, serrated, pubescent; panicle terminal, with subcorymbose branches. 7. S. Native of the East Indies. Celastus Rothchildii, Schult. syst. 5. p. 423. Ceanothus paniculatus, Roth. nov. spec. 154. Flowers white.

Panicled Scutia. Shrub.

Cult. Inconspicuous shrubs not worth cultivating, except in general collections; they will grow in any light soil, and are easily increased by young cuttings, planted under a hand-glass, in a moderate heat.

X. RETANILLA (the name of R. obcordata in Peru). Brogn. mem. rhamn. p. 57.—Molina in, Comm. miss. —Colletia species, Vent. and D. C.

Lin. syst. Pentandra, Monogyna. Calyx pistil-shaped, 5-cleft (f. 5. E. e.), internally fleshy. Petals 5, cucullato (f. 5. E. d.), sessile. Stamens inclosed; anthers kidney-shaped, 1-celled. Disk effuse, covering the whole inner surface of the calyx (f. 5. E. f.). Ovary free (f. 5. E. g.), 3-celled. Style simple, short. Stigma 3-toothed. Fruit adnate to the base of the calyx, indehiscent, containing a 3-celled woody nut (f. 5. E. i.). Seeds sessile (f. 5. E. i.). —Subshrubs with elongated, nearly simple naked branches, or with a few leaves at their base, these are opposite, quite entire, and small. Flowers small, villous on the outside (f. 5. E. e.), brownish, disposed in short, few-flowered, opposite spikes on the young branches (f. 5. E. a.).
6 C. CHACAYE; leaves somewhat obovate, serrated; flowers corn; branches very leafy. 6. G. Native of Peru. Rhin- nus Chacay, Domb. herb. Flowers yellowish.  

Cheenye Colletia. Shrub 2 feet.  

7 C. TETRAGONA (Brogm. mon. rhamm. p. 59.) branches almost naked, leafless, smooth; branchlets distant, simple, spiny, stiff, spreading; racemes axillary, rising beneath the spines, usually 6-flowered; fruit opposite on the branchlets, sessile on the branches, racemose. 6. G. Native of Peru. Domb. Flowers yellowish.  

Tetragonal-branched Colletia. Shrub 3 feet.  

† Allied species.  

8 C. INPESTA (Brogm. mon. rhamm. p. 59.) shrub much branched; branches almost opposite, cylindrical, ultimate ones spiny; spines simple, spreading, stiff, axillary; leaves opposite, oblong-linear, quite entire, smooth; almost nerveless; flowers axillary, solitary; peduncles slender, shorter than the leaves. 6. S. Native of Mexico, in the plains near Gazeve. Cana-thus inebus, Hook. nov. gen. amer. p. 61. t. 614.  

Troublesome Colletia. Cult. 1824. Shrub 3 feet.  

9 C. MULTIFLORA (Moc. et Sesse. fl. mex. icon. ined. D. C. prod. 2. p. 29.) leaves entire, oblong; pedicels 1-flowered, 5-6, crowded together, length of flower; petals 5, culate. 6. G. Native of Mexico. Disk extended even to the throat, and half adnate to the ovary. Branches spiny, bearing the flowers beneath the spines.  

Many-flowered Colletia. Shrub 4 feet.  

10 C. INPESTRA (D. C. prod. 2. p. 29.) leaves entire, oblong; pedicels 1-flowered, 2 or 3 in a fascicle, length of flowers; flowers 5-petalled; berries oblong, 2-celled. 6. G. Native of Mexico. Branches unarmed. Calyx very short in this and preceding species.  

Two-seeded Colletia. Shrub 3 feet.  

11 C. VELEUTINA (Spreng. syst. 1. p. 771.) leaves alternate, oblong, serrated, villous beneath; peduncles axillary, cymose, and downy, as well as the flowers. 6. S. Native of Brazil.  

Veleut Colletia. Shrub 2 feet.  

Cult. See Retanilla for culture and propagation.  

XII. TREVOA (Trevo, the name of some Spanish botanist). Meyers, miss. Hook. bot. misc. 1. p. 158.  

LIN. SYST. PENTANDRIA, MONOGYNY. Calyx turbinate, 5- cleft, permanent, with reflexed segments. Petals culate, erect, inclosing the stamens. Anthers 1-celled, bursting by a kidney- shaped chink. Disk almost wanting. Ovary superior, large, hairy, 3-celled; cells 1-seeded. Style awl-shaped, much ex- serted, and very hairy, crowned by an acute simple stigma. Capsule membranous, 2-valved, 1-seeded, (2 of the cells being abortive) crowned by the permanent style. Seed erect, elliptical, compressed, marked by a conspicuous longitudinal furrow. Ab- bument sparing, fleshy. Embryo erect, cylindrical, with an inferior radicle.—Spiny shrubs with awl-shaped short spines, cructulately disposed. Leaves in fours, marked with longitudinal nerves. Fascicles of flowers rising from tubercles in the axils of the leaves and at the base of the spines.  

1 T. QUESQUENIVIS (Gill. et Hook, bot. misc. 1. p. 158. t. 45. B.) hairy-pubescent; leaves oblont-elliptic, entire, 3-nerved, hoary beneath. 6. G. Native of Chili on the Andes.  

Five-nerved-leaved Trevoa. Shrub 4 to 5 feet.  

2 T. TRISTRIVIS (Gill. et Hook, bot. misc. 1. p. 159.) smooth; leaves elliptic, crenately-serrated, 3-nerved, green beneath. 6. G. Native of Chili.  

Cult. For culture and propagation see Retanilla, p. 34.  

XIII. DISCARDIA (from discos, diskos, a disk; disk broad). Hook, bot. misc. 1. p. 156.  

LIN. SYST. TETRA-PENTANDRIA, MONOGYNY. Calyx short, campanulate, 4-5-cleft, coloured. Petals 4-5, smaller than the stamens. Anthers 2-celled, bursting lengthwise. Disk girding the base of the germ, bowl-shaped, fleshy, with a narrow, elevated, nearly entire, free margin. Ovary half superior. Style short, crowned by a 3-lobed stigma.—Spiny shrubs.  

1 D. AMERICA'NA (Hook, bot. misc. 1. p. 156. t. 44.) calyx for the most part 5-cleft, with reflexed segments. 6. G. Native of Buenos Ayres.  

American Discaria. Shrub.  

Southern Discaria. Shrub.  

Cult. For culture and propagation see Retanilla, p. 34.  

XIV. HOVENIA (in honour of David Hoven, a senator of Amsterdam, who contributed to the success of the travels of Thunberg by his good offices). Thumb. jap. 101. D. C. prod. 2. p. 40. Brogn. mon. rhamm. p. 60.  

1 H. duc'is (Thumb. jap. 101.) leaves cordate, ovate, aca- minated, equal at the base, 3-nerved, smooth. 6. G. Native of Japan, near Nagasaki, where it is called Ken and Kewokonae. Koempf. cunpl. ex. 2. p. 809, with a figure. Flowers small, white, in axillary and terminal dichotomous panicles. Peduncles
sub-cylindrical, reflexed, smooth, an inch long, thickening after flowering, containing a sweet red pulp, which is eaten by the Japanese, and has a taste somewhat like a pear.

2 H. inequalis (D. C. prod. 2. p. 40.) leaves ovate, acuminate, rather hairy beneath, unequal at the base, 3-nerved. $\beta$. G. Native of Nipal, at Katmandu, where it is called Munko-Khoser. H. acerba, Lindl. bot. reg. t. 501. H. dulis, D. Don, prod. 189. Wall. fl. ind. 2. p. 414. Flowers small, white, disposed in axillary, rarely in terminal, dichotomous, villous cymes. Capsule round, size of a pea, seated on an enlarged peduncle, which is soft, and contains a red sweet pulp. This does not come to maturity till after the capsules are ripe.

* South American species.*

1 C. ferruginea (Brog. mem. rhamn. p. 62.) leaves ovate, a little acuminated, entire, covered with rusty villi beneath, as well as the branchlets and flowers; flowers axillary, cymose, aggregate. $\beta$. S. Native of South America, in most of the West Indies colonies. Rhamnus colubrinus, Lin. syst. 195. Jacq. hort. vind. 3. t. 50. Ceanothus colubrinus, Lam. ill. no. 2684. Ceanothus arborejfectus, Mill.—Comm. hort. 1. t. 90. Flowers greenish. Seeds ovate, shining, black. This tree is called Bois Coulouere or Snake-wood in Martinique; hence the generic name.

**Rusty Snake-wood.** Fl. May, Nov. Cl. 1762. Tree 30 feet.

2 C. fermejntum (Rich. med. in Brogn. mem. rhamn. p. 62.)

This species has not been described; it is therefore only known to Brogniart. It is a native of Guiana.

**Fermented Snake-wood.** Tree.

3 C. reлина (Brog. mem. rhamn. p. 62.) leaves elliptical, acute, quite entire, pubescent beneath, as well as the branches and flowers; branches flexible, pendulous; flowers axillary, aggregate, cymose. $\beta$. S. Native of the mountains of Jamaica, in bushy places, also in St. Domingo, where it is called Palo-amargo. Rhamnus ellipticus, Ait. hort. kew. 1. p. 265. Pallurus inermis, Hort. par. Zizyphus Dominguensis, Duham. ed. nov. 3. p. 55. ex Desf. Ceanothus reinaudii, Lhers. sert. p. 6.—Browne, Jam. t. 29. f. 2. Flowers greenish.

**Reclined-branched Snake-wood.** Fl. Aug. Cl. 1758. Sh. 6 ft.

4 C. granulosa (Brog. mem. rhamn. p. 62.) leaves ovate-oblong, acuminate, somewhat serrated from the middle, smooth, shining, with the nerves at the base pubescent, as well as the pedicels; peduncles axillary, short, dichotomous, umbellate. $\beta$. S. Native of Peru, in groves. Ceanothus granulosus, Ruiz et Pav. fl. per. 5. t. 228. f. b. Flowers white. Capsules roundish, turbinate, with prominent ribs.

**Granular Snake-wood.** Tree 24 feet.

5 C. triflorea (Brog. in mem. rhamn. p. 62.) leaves acute, crenulated, rusty beneath; peduncles axillary, 3-flowered, or pedicels 3 together, 1-flowered. $\beta$. G. Native of Mexico. Rhamnus triflorus, Moc. et Sesse in herb. Lamb. Flowers greenish-white.

**Three-flowered Snake-wood.** Shrub.

6 C. Cuneifolia (Brog. mem. rhamn. p. 62.) leaves elliptical, oblong, acutish, quite entire, greenish-velvety above, hoary and downy beneath, as well as the branchlets and flowers; peduncles axillary, corymbosely, longer than the pedicels. $\beta$. S. Native of Cuba, in bushy places, as well as at St. Domingo. Ceanothus Cuneifolius, Lam. Jacq. hort. vind. t. 49. Rhamnus Cuneifolius, Lin. Flowers cream-coloured. Sepals fringed.

**Cuba Snake-wood.** Fl. ? Cl. 1820. Shrub 8 feet.

7 C. Alamanii; leaves ovate, obtuse, serrulately, somewhat velvety and green above, hoary and downy beneath, as well as the branchlets and flowers; peduncle axillary, corymbosely, length of pedicels. $\beta$. S. Native of Mexico. Ceanothus Alamanii, D. C. prod. 2. p. 31. Leaves both opposite and alternate in the same branch.

**Alamanii’s Snake-wood.** Shrub.

8 C. ? Macrocarpus; leaves ovate, somewhat cordate at the base, roundish, serrated, downy beneath, as well as the branchlets; flowers axillary, glomerate; fruit pendulous. $\beta$. S. Native of New Spain. Ceanothus macrocarpus, Cav. icon. 3. t. 276. Flowers white.

**Long-fruited Snake-wood.** Cl. 1824. Shrub 6 feet.

**Pubescent Snake-wood.** Tree 18 feet.

10 C. ? Mocinoi; leaves oval, entire, 1-nerved, pubescent beneath, as well as the branchlets; pedicules lateral, dichotomous, few-flowered. $\beta$. G. Native of Mexico. Ceanothus Mocinoi, D. C. prod. 2. p. 32. Ceanothus macrocarpus, Moc. et Sesse, fl. mex. icon. ined. but not of Cav. Calyx spreading much after the time of flowering.

**Mocino’s Snake-wood.** Cl. 1824. Shrub.

**Asiatic species.**

11 C. Asiatica (Brog. mem. rhamn. p. 62.) leaves ovate, acuminated, serrulately, glossy, 3-nerved at the base; pedicules axillary, branched, many-flowered, shorter than the leaves. $\beta$. S. Native of the East Indies, Ceylon, Mauritius, Nipal, as well as on the western coast of equinoctial Africa. Ceanothus Asiaticus, Lin. spec. 284. Cav. icon. t. 440. f. 1. Lam. ill. t. 129. Tubantierea, Comm. mss.—Burn. zeyl. 111. t. 48. Rhamnus acuminitus, Celebr. miss. Flowers small, yellowish-green, fragrant. Capsules round, obovate, about the size of a small gooseberry, 3-furrowed, 3-valved, 3-seeded. Seeds triangular, with a gibbose back.

12 C. Nipaleensis; shrub erectish or rambling, with all the upper parts pubescent; leaves somewhat bifarious, oblong, acuminated, serrulately, smooth, and shining, with alternate nerves, the axil of which are hairy; racemes terminal, panicled, pubescent. $\beta$. G. Native of Nipal. Ceanothus Nipaleensis, Wall. fl. ind. 2. p. 375. Branches scabrous, and have a tendency to ramble over trees. Flowers small, green, fascicled, disposed in terminal racemes on the naked branches, interspersed with a number of small, lanceolate, leaflets, the whole forming a branchy panicle. Petals very small, yellowish, cuculate, concealing the stamens. Ovary 3-lobed. Style trifid. Fruit about the size of a pea at first, succulent, afterwards dry, con-
Rhamnææ. XV. Colubrina. XVI. Ceanothus.

37

Trîquestræ-capped Snake-wood. Shrub.

Downy-flowered Snake-wood. Shrub.

15 C. Leschenaulüt; leaves ovate, long-acuminated, somewhat cordate at the base, crenulate-serrate, smooth above, hoary beneath from very minute down; cymes axillary, many-flowered, almost sessile, length of petioles. ². S. Native of Ceylon. Ceanothus Leschenaultii, D. C. prod. 2. p. 30. Branches minutely-pubescent at the top, as well as the calyxes. Leschenaultia’s Snake-wood. Shrub. 10 feet.

• • • African species.

Guine Snake-wood. Shrub. 6 feet.

17 C. mystaxitus; leaves cordate, obtuse, quite entire, smooth above, but rather hairy beneath; branches ending in a tendril; flowers axillary, umbellate. ². G. Native of Abyssinia. Rhæmus mystaxicus, L. Hort. kew. ed. 1. p. 266.

Cult. These plants are not worth cultivating except in general collections. A mixture of loam and peat will suit them well, and plantings of young wood will root readily if planted in sand, and placed under a half-glass; those of the stover species require heat.

XVI. Ceanothus (cæaeængb, keanaæthus, a name employed by Theophrastus to designate a spiny plant, derived from κανα, kea, to cleave; however the modern genus has nothing to do with the plant of Theophrastus). Brogn. mem. rhum. p. 65.—Ceanothus species, Lin. Juss. Lam. Ceanothus, sect. 2. Encorenothos, D. C. prod. 2. p. 31.

Lin. syst. Pentândria, Trigynia. Calyx with a sub-hemispherical tube, and 5 connivent segments (f. 6. C. b.). Petals 5, unguiculate, cucullate (f. 6. C. c.), deflexed. Stamens with ovate 2-celled anthers (f. 6. C. b.). Disk spongy, annular (f. 6. C. d.). Ovary spherical, girded by the disk (f. 6. C. e.), 3-celled. Styles 3, diverging, terminated by small papiliform stigma. Fruit tricoccous (f. 6. C. f.), girded by the circumcised tube of the calyx (f. 6. C. g.). Seeds almost sessile (f. 6. C. c.).—Smooth or pubescent shrubs, natives of North America, with erect branches, alternate, serrated, 3-nerved leaves, and very slender, white, blue or yellow flowers, disposed in terminal panicles or in axillary racemes.

Late-flowering Red-root. Fl. Sep. Nov. Ct. 1820. Sh. 6 ft. 3 C. America’neus (Lin. spec. 284.) leaves ovate, acuminate, serrate, pubescent below, thyrsely elongated, axillary, with a pubescent racis. ². H. Native of North America, in dry woods, from Canada to Florida. Duh. hafn. 1 t. 51. Mill. fig. t. 57. Sims, bot. mag. t. 1479. Flowers small, white. Fruit bluntly trigonal. In North America this shrub is commonly known by the name of New Jersey tea, or Red-root, having been actually used in the American war as a substitute for tea. The Canadens use the infusion of the root in gonorrhea, and other authors attribute to it antisyphilitic properties. It will dye wool a fine strong mink-cinnamon colour. A beautiful shrub when in flower.

4 C. ovatæs (Desf. arb. 2. p. 381.) leaves ovate or oval, serrated, smooth on both surfaces, as well as the peduncles; thyrsely short, axillary? ². H. Native of North America. Fruit somewhat globose, 6-ribbed. Flowers white. This plant is usually confounded in gardens with the preceding.

Thyrs-flowered Ceanothus. Shrub.

7 C. interme’dius (Pursh. fl. sept. amer. 1. p. 167.) leaves oblong-oval, acute, mucronately-serrulata, triple-ribbed, pubescent beneath; pedicel axillary, long peduncles, with loose coriaceous pedicels. ². H. Native of North America, in the woods of Tennessee. Leaves not one-fourth the size of those of C. America’neus. Flowers white.

10 C. servyllifolius (Nutt. gen. amer. 1. p. 154.) leaves small, elliptical-ovate, obtuse, serrated; branches filiform, decumbent; panicles auxiliary, stalked, few-flowered; flowers compacted. H. Native of Florida, about St. Mary's. Flowers white.

11 C. ericifolius (Willd. in Schult. syst. 7. p. 62. t. 615.) leaves ovate-elliptical, obtuse, glandularly-serrate, 3-5-nerved, smooth; nerves covered with adpressed hairs on the under surface; branches round, smooth, with a few scattered spines; racemes solitary on the short branches. H. G. Native of Mexico, in woods, near Real del Monte. Flowers white.

Box-leaved Red-root. Shrub 6 to 8 feet.

Cult. Small neat shrubs, with large red roots; hence their English name. They will thrive well in any common garden soil, and are proper shrubs for the front of shrubberies. They are increased by layers or by seeds. The greenhouse species or those natives of Mexico only require to be protected from frosts during winter. Young cuttings of these will root if planted in a pot of soil, with a hand-glass placed over them.

Lin. syst. Pentadriaria, Monogynia. Calyx urceolate (f. 6. F. d.), with the tube adnate to the ovary (f. 6. F. c.) at the base, but free at the top, with a 5-cleft limb (f. 6. F. a.). Petals 5, cucullate, sessile (f. 6. F. b.). Stamens inclosed in the petals; anthers ovate, 2-celled. Disk very thin, incrusting the tube of the calyx. Ovary half-inferior, 3-celled. Style simple, trigonal. Stigma 3-lobed. Fruit unknown. A quite smooth shrub, with erect branches, alternate, oblong-lanceolate, serrated, feather-nerved leaves, and small white flowers, which are disposed in few-flowered, terminal or axillary panicules.

Cult. An elegant shrub. It will succeed well in an equal mixture of loam and peat, with a little sand, and young cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them.

XVIII. POMADERRIS (from pomus, pome, a lid, and epper, derris, a skin; in allusion to the peculiar membranous covering to the capsule). Labill. nov. holl. 1. p. 61. D. C. prod. 2. p. 33. Brogni. mem. rhamn. p. 64. — Pomadérides, Schult. syst. 5. no. 985. — Pomadérides, Kunth. nov. gen. amer. 7. p. 60.

Lin. syst. Pentadriaria, Monogynia. Calyx with the adnate tube, and a 5-cleft (f. 6. E. a.), somewhat spreading limb. Petals 5, flat, unguiculate, somewhat cordate, or wanting. Stamens exerted (f. 6. E. b.); anthers ovate, 2-celled (f. 6. E. b.). Disk wanting. Ovary half adnate, 3-celled. Style trifid, rarely diverging (f. 6. E. c.). Fruit half inferior (f. 6. E. g.). Tricocce; coccule each with a broad perforation at the base on the inside. Seeds each furnished with a short stalk (f. 6. E. g.). — Erect, branched shrubs, more or less covered with starchy down. Leaves entire or serrated, villous on both surfaces, or smooth on the upper surface, feather-nerved. Flowers disposed in axillary or terminal, corombose, or in expanded coromby-panicles, flowering from the base to the apex, for the most part yellow or cream-coloured.

* Flowers 5-petalled, disposed in corombose cymes.

1 P. phyllirœides (Sieb. pl. exs. nov. holl. no. 215.) cymes corombose, crowded; calyxes and pedicels villous; leaves elliptical-oblone, quite entire, coriaceous, smooth above, clothed with hoary-velvety villi beneath. H. G. Native of New Holland. Leaves acutish. Flowers pale-yellow.

2 P. lanigera (Sims, bot. mag. t. 1823.) cymes somewhat panicked, woolly; leaves oblong-lanceolate, quite entire, coriaceous, velvety above, rusty and woolly beneath. H. G. Native of New Holland, on the eastern and southern coast. Ceanothus laniger, Andr. bot. rep. t. 569. Pomaderris obscura, Sieb. pl. exs. nov. holl. no. 216. Flowers pale-yellow.

Far. β; leaves smooth above. P. ferruginea and P. viridiflora. Sieb. pl. exs. nov. holl. no. 214 and 209.

Wooll-bearing Pomaderris. Fl. April, June. Clt. 1806. Sh. 3 to 6 feet.

3 P. elliptica (Labill. nov. holl. 1. p. 61. t. 86.) cymes somewhat umbellate, hoary and velvety; leaves elliptical, obtuse, smooth above, clothed with short, white,omentum beneath. H. G. Native of New Holland. P. acuminata, Link. enum. 235. P. malifolia and P. discolor, Sieb. pl. exs. nov. holl. no. 208 and 213. Flowers whitish. — An intermediate species between P. elliptica and P. intermedia, but hardly distinct from the former.

4 P. dicolor (Vent. malm. t. 58.) cymes somewhat umbellately-crombose, many-flowered, hoary and velvety from very short, scarcely manifest hairs; leaves ovate-lanceolate, acuminate, smooth above, but clothed with short, white down beneath. H. G. Native of New Holland. P. acuminata, Link. enum. 235. P. malifolia and P. discolor, Sieb. pl. exs. nov. holl. no. 208 and 213. Flowers whitish. — An intermediate species between P. elliptica and P. intermedia, but hardly distinct from the former.

5 P. intermedia (Sieb. pl. exs. nov. holl. no. 210.) cymes corombose-crowned; calyxes and pedicels velvety-villous; leaves elliptical, acuminate at both ends, smooth above, but hoary and velvety beneath. H. G. Native of New Holland. Flowers pale-yellow.

6 P. andromedifolia (Cuming in Field's new south wales, p. 351.) leaves oval-lanceolate, smooth above, but clothed beneath with white down; coromby terminal, crowded; flowers with petals. H. G. Native of New Holland, on rocky parts of the Blue Mountains. Flowers pale-yellow.

Andromeda-leaved Pomaderris. Fl. April, June. Shrub 4 ft.

7 P. ledifolia (Cuming. l. c.) leaves oval or elliptical, smooth, silky-white beneath; coromby few-flowered, terminal; stems twitty. H. G. Native of New Holland, upon rocky hills at Cox's River. Flowers pale-yellow.

Leda-m-leaved Pomaderris. Fl. May, Ju. Clt. 1824. Sh. 2 ft.

** Flowers 5-petalled, corombose, or racemose-panicled. Seeds each furnished with a smaller perforation at the base than the rest of the species. Pedicels scarcely naviculata.

8 P. globulus (G. Don, in Loud. hort. brit. 84.) leaves obovate, quite entire, downy beneath, as well as the flowers and branches; peduncles axillary, corombose; capsules opening from the base to the top. H. G. Native of New Holland, on the eastern coast. Ceanothus globulus, Labill. nov. holl. 1. p. 61. t. 85. Flowers pale-yellow.

9 P. spatulata (G. Don, in Loud. hort. brit. p. 84.) leaves oblong-obovate, somewhat spatulate, obtuse, quite entire, downy beneath, as well as the branches and flowers; racemes
somewhat panicled; capsules opening from the base to the top. 

1 P. WENDLANDIANA (G. Don, in Loud. hort. brit. p. 84.) leaves obovate-lanceolate, acute, smooth above, clothed with rusty down beneath; panicles terminal and axillary. $\gamma$. G. Native of New Holland? Canæthus Wendlandianus, Schult. syst. 5. p. 299. Habit of P. elliptica. Fruit unknown. Flowers yellow.

11 P. ? CAPPARIS (G. Don, in Loud. hort. brit. p. 84.) leaves ovate, cordate, acuminate, serrated; capsules 3-valved, dehiscent. $\gamma$. G. Native of the island of Tait in the South Seas. Canæthus capsularis, Forst. prod. 112. Flowers yellow.

Flowers apetalous, panicled, or racemose.

12 P. APETALÁ (Labill. nov. holl. 1. p. 52. t. 87.) panicles racemose, many-flowered; leaves ovate-lanceolate, acuminate, irregularly serrated, smooth above, or scabrous from starchy down, clothed with hoary starchy down beneath, with rather prominent nerves. $\gamma$. G. Native of New Holland. Flowers greenish-yellow. Apetolá Pomaderris. Fl. May, Ju. Clt. 1803. Sh. 6 ft.

14 P. LIQUIDÉMNA (Sieb. pl. exs. nov. holl. no. 218.) panicles few-flowered; leaves ovate-lanceolate, smooth above, but soft, downy, and velvety beneath from simple rather silky hairs, with scarcely prominent nerves. $\gamma$. G. Native of New Holland, on the eastern coast. Calyces woolly. Flowers greenish-yellow.

Priest-like Pomaderris.* Shrub 4 ft.

15 P. PHYLLICÉLODA (Lodd. bot. cab. t. 120. Link. enum. l. p. 223.) panicles racemose, leafy; leaves linear, rather scabrous above, hoary and downy beneath, with the middle nerve rather prominent. $\gamma$. G. Native of New Holland. Flowers greenish-white. Stigma 3-4-cleft. Tube of calyx pubescent, with white oval lobes. Physicá-leaved Pomaderris. Fl. May, Ju. Clt. 1819. Sh. 2 ft.

Cult. Pomaderris is a beautiful early flowering genus of shrubs. For culture and propagation see Willemétia, p. 38.

LIN. SYST. Pentándria, Monogyna. Calyx furnished with 2 bracteas at the base, with a subhemispherical tube, and a 5-cleft limb; segments twice as long as the tube, oblong, obtuse, villous inside, imbricate in the bud. Petals 5, roundish, small, scale-formed, flat, inserted in the base of the calyx (perigynous or hypogynous). Stamens 10, 5 opposite the petals, and 5 opposite the segments of the calyx, these last are longest; filaments filiform short; anthers ovate-roundish, 2-celled; cells opening laterally by a longitudinal chink. Disk wanting. Ovary compressed, furrowed on one side, somewhat lanceolate, 1-celled, 1-seeded (or 2-seeded?) ovula fixed to the furrowed side. Style short, awl-shaped. Stigma small, simple. This genus should probably be removed to Rosaceae after Chrysobalanus.

1 B. OBOVÁTA (Brogn. l. c.). $\gamma$. G. Native of New Holland. Cryptándra obovata, Sieb. pl. exs. nov. holl. no. 129. Stem smooth; leaves alternate, stalked, obovate, thickish, smooth; heads few-flowered; bracteas entire. Calyx smooth. Flowers white.

Cult. See Willemétia for culture and propagation, p. 38.

XXI. SOLENA’NTHA (from σωλην, solen, a tube, and ανθός, anthos, a flower; in allusion to the petals converging into a tube). LIN. SYST. Pentándria, Monogyna. Calyx permanent, 5-cleft. Petals 5, conviving into a tube, deciduous. Disk? Anthers 5, 2-celled, each inserted under a scale. Ovary 2-lobed.—A stiff-branched spiny shrub with oblong-lanceolate, somewhat serrated leaves, scattered and in fascicles. Flowers axillary and lateral, white.

1 S. spinósa. $\gamma$. G. Native of New Holland, on rocky
XXVII. TETRAPA'SMA (from τετράς, tetras, four, and πασμα, shaprama, a veil or hood; in allusion to the four hooded petals veiling the stamens).

1 Juncetia. G. Native of New Holland, at Cox's River, Bathurst, and on the banks of the Macquarie. Flowers probably white.

Rushy Tetrapasma. Shrub.

Cult. See Willemita for culture and propagation, p. 38.

FIG. 7.

XXIII. TRICOCEPHALUS (from ὀπήκος, thriz trichos, hair, and κεφαλή, kephale, a head; in allusion to the hairy heads of flowers). Brogni. mem. rhamn. p. 67. - Phyllica, species of authors.

Lin. syst. Pentandria, Monogynia. Calyx with a short urceolate tube (f. 7. E. a), adnate to the ovary at the base, but free at the apex, having 5 long, bristle-like segments (f. 7. C. b.). Petals wanting or bristle-like. Stamens 5. Anthers kidney-shaped, 1-celled. Disk hardly distinct, covering the tube and segments of the calyx. Ovary inferior, 3-celled (f. 7. C. d.). Style simple, short. Stigma rather 3-lobed. Fruit half-inferior, tricoccous (f. 7. C. c.). Seed propped by a short fleshy stalk (f. 7. C. d.).—Small, heath-like shrubs, natives of the Cape of Good Hope, with fastigate, downy branches. Lower surface of leaves villous, upper surface smooth, with convolute edges, on short petioles, stipulate or exstipulate. Flowers capitate; heads elongated in T. spicata or spherical, as in T. stipulatis, very downy.

Spathular Tricocephalus. Fl. May, Sept. Cl. 1786. Sh. 3 ft.

*Acero-leaved Phyllica.* Fl. May, June. Clt. 1820. Sh. 3 ft.

5 P. *Xyrida* (Lam. ill. no. 291.) leaves linear, acutish, spreading, smooth above, and shining, but downy beneath; heads of flowers ovate, woolly. *G*. Native of the Cape of Good Hope. Flowers white.

*Yar. b. cirrophora* (Berg. cap. 52.) leaves rather hairy, lanceolate. *G*. Native of the Cape of Good Hope. This is probably identical with *P. nitida*.

6 P. secunda (Thumb. fl. cap. p. 82.) leaves linear, mucronate, erectly spreading, smooth above, but downy beneath; heads of flowers hairy. *G*. Native of the Cape of Good Hope. Flowers white.

7 P. australis (Link. enum. 1. p. 230.) leaves lanceolate-linear, smooth above, but hoary-tomentose beneath; branches hairy; heads of flowers downy, small. *G*. Native of New Holland? Segments of calyx downy on the outside, ovate, very blunt. Flowers white. According to Sprengel the this is the same as *P. parviseta*, and therefore a variety of *P. nitida*.

9 P. *necesa* (Wendl. coll. 3. p. 3. t. 4.) leaves lanceolate, villous, lower ones spreading, upper ones erect, somewhat imbricate; floral ones short, villous, erect; flowers spiky. *G*. Native of the Cape of Good Hope. Flowers white.

† Species doubtful whether they belong to this section.

*Elongated Phyllica.* Shrub 5 feet.

12 P. squamosa (Willd. in Schult. syst. 5. p. 491.) leaves oblong-obovate, obtuse, close-pressed; heads of flowers terminal. *G*. Native of the Cape of Good Hope. Flowers white.

*Scaly-leaved Phyllica.* Shrub 2 feet.

*Red Phyllica.* Shrub 3 feet.

14 P. *microsthamala* (Willd. in Schult. syst. 5. p. 491.) leaves linear, spreading, with revolute edges; heads of flowers terminal. *G*. Native of the Cape of Good Hope.

*Small-headed Phyllica.* Shrub 3 feet.

**Sect. II. Strigosà** (from strigosus, strigosus). Brogni. mem. rhann. p. 69. Calyx with a long tube, and erect, acute, awl-shaped segments, which are hairy on the outside. Petals oblong, complacently-cuculate. Anthers oblong, 2-celled; cells parallel, opening lengthwise by distinct chinks. Stigma awl-shaped or clavated, entire. Leaves pubescent, hairy, strigose or villous, linear. Flowers spiky or capitate, usually involucrated, with very long, villous, or feathery bracteas.

*Two-colored Phyllica.* Fl. April, July. Clt. 1817. Sh. 3 ft.

17 P. *rossmarinifolia* (Lam. ill. no. 291.) leaves linear, erect, somewhat revolute, and imbricate, rather pilose above, hoary beneath; floral leaves somewhat ovate, shorter than the others; spikes of flowers ovate, dense. *G*. Native of the Cape of Good Hope. Lodd. bot. cab. t. 849. Flowers white.

*Rosemary-leaved Phyllica.* Fl. April, July. Clt. 1815. Sh. 3 ft.

19 P. *horiatalis* (Vent. maln. no. 57. obs. 3.) leaves linear, villous, hoary beneath; floral leaves longer than the others, and are as well as the branches spreading horizontally; heads of flowers small; flowers spreading. *G*. Native of the Cape of Good Hope. P. plumosa, Spreng. berl. mag. 8. p. 105. f. 7. Lam. ill. t. 127. f. 4. but not of Lin.

*Horizontal Phyllica.* Fl. May, June. Clt. 1820. Sh. 3 ft.

21 P. *squarrosa* (Vent. maln. no. 57. obs. 3.) leaves linear-lanceolate, spreading, villous and hoary beneath, lower ones rather smooth; floral ones longer than the rest, spreading; heads of flowers roundish; calyxine segments erect, acute. *G*. Native of the Cape of Good Hope. Lodd. bot. cab. t. 36. Flowers white.

*Commelinia Phyllica.* Fl. May, June. Clt. 1800. Sh. 3 ft.

24 P. *lanecola* (Thunb. fl. cap. 2. p. 79.) leaves linear-lanceolate, erectly-spreading, smooth above, downy beneath; heads of flowers roundish, hairy, involucrated with bracteas.
G. G. Native of the Cape of Good Hope, on hills. Flowers white.

Cylindrical-headed Physicia. Fl. April, Aug. Ct.? Sh. 2 ft.

† Species doubtful whether they belong to this section.

27 P. inconstans (Lin. mant. 209.) leaves linear, blunt, scarious, downy beneath; heads of flowers pubescent. G. G. Native of the Cape of Good Hope.—Seb. mus. 2. t. 49. P. brunioides, Lam. ill. no. 2620. Flowers white.

Beardless Physicia. Shrub 2 feet.

28 P. papillosa (Wendel. coll. 3. p. 5. t. 71.) leaves linear, acuminated, erose, papillosa, hairy, floral ones downy; flowers disposed in terminal spikes. G. G. Native of the Cape of Good Hope. Flowers white.

Papillosa-leaved Physicia. Fl. May, Jul. Ct. 1820. Sh. 2 ft. 29 P. Divaricata (Vent. mam. no. 57. obs. 2.) leaves lanceolate, scattered, flat, somewhat villous above, but velvety and cloth-like beneath; branches slender, elongated, decumbent. G. G. Native of the Cape of Good Hope. Flowers white. Probably identical with the following.

Divaricatet-branched Physicia. Shrub decumbent.

30 P. ledifolia (Desf. cat. hort. par. 1804. p. 203.) leaves scattered, oblong, acuminate at both ends, flat, spreading, shining above, covered with hoary down beneath, as well as the branchlets. G. G. Native of the Cape of Good Hope. The spikes of flowers are terminal and involucred with bracteas, according to Lher.

Leadua-leaved Physicia. Fl. May, Jul. Ct. 1820. Sh. 2 ft. 31 P. trichotoma (Thunb. fl. cap. 2. p. 82.) leaves trigonal, obtuse, smooth; stem trichotomous, hairy; heads of flowers terminal, hairy, about the size of a pea. G. G. Native of the Cape of Good Hope, in fields, but rare.

32 P. globosea (Thunb. fl. cap. 2. p. 87.) leaves ovate, coriaceous above, smooth, imbricate; heads of flowers terminal, globose, about the size of a pea. G. G. Native of the Cape of Good Hope.

Globose-headed Physicia. Shrub 2 feet.

33 P. atrata (Licht. in Schult. syst. 5. p. 490.) leaves cordate, linear-lanceolate, with revolute edges, smoothish, but downy beneath; heads terminal, villous, woolly. G. G. Native of the Cape of Good Hope, on mountains. Flowers white. Branchlets clothed with dark villi.

Cult. Handsome shrubs, requiring the same treatment and culture as that recommended for Trichocéphalus, p. 40.

XXV. SOULANGIA (in honour of Soulange Bodin, a nurseryman near Paris). Brogn. mem. rhamn. p. 70.—Physelia, species of authors.

Lin. syst. Pentandra, Monogynia. Calyx with an obovate tube adnate to the ovary (f. 7. D. c.), 5-cleft. Petals 5, cuneolate (f. 7. D. c.). Stamens inclosed in the petals (f. 7. D. c.); anthers kidney-shaped, 1-celled. Disk epigynous (f. 7. D. d.), pentagonal, fleshy. Ovary adnate to the tube of the calyx (f. 7. D. c.), and equal in length to it, 3-celled. Style simple, short, rather conical, rarely trifid at the apex, crowned by a 3-toothed stigma or by 3 stigmas. Fruit inferior (f. 7. D. c.), marked above by a large areola (f. 7. D. h.), triecious. Seeds propped by a short, thick, fleshy stalk (f. 7. D. c. f.).—Much branched shrubs, with alternate, exstipulate, quite entire, short stalked, ovate, cordate, or lanceolate, rarely linear leaves, which are usually smooth above and villous beneath. Flowers in the axilie of the leaves or bracteas, solitary, spiked, or panicked, clothed with short down.

1 S. axillaris (Brogn. mem. rhamn. p. 71.) leaves linear-lanceolate, spreading, with revolute edges, smooth above, hoary beneath; flowers in the axilie of the upper leaves, on short pedicels, the whole constituting a leafy spike. G. G. Native of the Cape of Good Hope. Physicia axillaris, Lam. ill. no. 2615. Spreng. berl. mag. 8. p. 104. t. 8. f. 4. P. rosmarinifolia, Wildl. enum. 253. but not of Lam. Flowers white.

2 S. oleafolia (Brogn. mem. rhamn. p. 71.) leaves ovate-oblong, mucronate, acute, coriaceous, flat, spreading, covered with hoary down beneath, but smooth above or pubescent; flowers in loose racemes at the tops of the branches, intermixed with bracteas. G. G. Native of the Cape of Good Hope. P. oleafolia, Vent. mam. no. 4. obs. 2. P. spicata, Loddd. bot. cab. t. 323. P. oleoides, C. D. prod. 2. p. 36. Flowers white.

3 S. thymifolia (Brogn. mem. rhamn. p. 71.) leaves lanceolate, acuminated, spreading, smooth above, but hoary beneath, with rather revolute edges; flowers sessile, disposed in heads at the tops of the branches. G. G. Native of the islands in the Antarctic sea. Physicia thymifolia, Vent. mam. t. 77. Flowers white.

Box-leaved Soulanga. Fl. May, Sept. Ct. 1759. Sh. 6 ft.

7 S. pedicellarata; leaves linear-lanceolate, rather elet, pubescent above and hoary beneath with revolute edges, especially when dried; flowers on pedicels in the axilie of the leaves, the whole forming a terminal leafy corymb. G. G. Native of the Cape of Good Hope. Physicia pedicellarata, D. C. prod. 2. p. 36. Flowers white.

Pedicellata-flowered Soulanga. Shrub 4 feet.

8 S. reclinata; leaves lanceolate, reclinate, silky, white beneath, bearded at the apex; flowers stalked in the axilie of
the upper leaves, the whole forming a kind of umbel. G. Native of the Cape of Good Hope. Phyllica reclinata, Wendl. coll. 2. p. 49. t. 56. Flowers white.

Tree Gouania. Clt. 1817. Tree 12 feet.

LIN. Syst. Pentádoría, Monogyация. Calyx with an adhering tube and a somewhat spreading, 5-cleft limb (f. 7. A. a.). Petals convolute (f. 7. A. k.) or ciliate (f. 7. A. f.). Stamens enclosed (f. 7. A. h.). Anthers ovate, 2-celled (f. 7. A. k.). Disk epigynous (f. 7. A. e.). Pentagonal or stellate (f. 7. A. c.). Ovary adnate to the tube of the calyx (f. 7. A. e.), 3-celled. Style trilobed. Fruit inferior, trigonal, or 3-winged (f. 7. A. g.), tricoccous; coccula not joined, indehiscent, coriaceous. Seeds sessile.—Usually climbing shrubs, with the branchlets often naked from abortion and tendrilled. Leaves alternate, feather-nerved, lower nerves largest and arched, somewhat triple-nerved, toothed, rather pubescent, stipulate at the base. Flowers usually polygamous from abortion, disposed in glomerated spikes on the naked branchlets, rarely in the axilie of the bracteate leaves, as in G. smilacina.

* American species. Disk starry; flowers hermaphrodite.

1 G. Integrífolía (Lam. dict. 3. p. 5.) leaves quite entire, oval, smooth, membranous. G. S. Native of? Branchlets and petioles pubescent. Flowers greenish-white. There are two varieties of this plant, the one with acute, the other with obtuse leaves.

Striated-stemmed Gouania. Shrub cl.

4 G. Cane-secs (Rich. ex Poir. suppl. 2. p. 820.) leaves oval-

Heart-leaved Gouania. Clt. 1820. Shrub cl.

**Asiaticae** (natives of Asia). Disk starry. Flowers polygonals.

15. G. pentapetala (Smith, in Rees' cyc. 16. no. 4.) leaves ovate, entire, acuminate at the apex, with the acumens finely toothed, hairy beneath; racemes axillary; tendril terminal. "N. S. Native of the East Indies, in the island of Honimao. Flowers yellowish.

Toothed-leaved Gouania. Shrub cl.

16. G. Mauritia (Lam. dicl. 3. p. 4.) leaves ovate, acuminate, somewhat cordate at the base, subcuneate, covered with silky down on both surfaces; racemes axillary, shorter than the leaves; tendril and branchlets clothed with rusty villi. "N. S. Native of the Mauritius. G. Domingensis, var. Mauritiàna, Aubl. Wings of fruit rounded, thin, membranous. Flowers yellowish.

17. G. retinacia (D. C. prod. 2. p. 40.) leaves ovate, acutish, a little serrated, young ones rather pubescent, adult ones smooth; racemes terminal and axillary, much longer than the leaves; fruit winged, triquetrous. "N. S. Native of the Mauritius. Retinaria scandens, Gaert. fruct. 2. p. 187. t. 120. f. 4. Lam. ill. t. 845. f. 3. Flowers yellowish.

Resinous Gouania. Shrub cl.

18. G. tiliifolia (Lam. dicl. 3. p. 5.) leaves cordate, ovate, acuminate, smoothish with glandular serratures; racemes axillary and terminal, pubescent; fruit rather ovate, wingless. "N. S. Native of the Island of Bourbon. G. Steindami, Willem. her. mem. 58. Flowers greenish-yellow.

19. G. leptostachya (D. C. prod. 2. p. 40.) leaves ovate, acuminate, rather cordate, coarsely crenated, and are as well as the branches smooth; racemes axillary and terminal, very slender, elongated; flowers on very short pedicels, smoothish; fruit bluntly triquetrous, wingless. "N. S. Native of the East Indies, on mountains, in many places. G. tiliifolia, Roxb. cor. 1. p. 67. t. 98. exclusive of the synonyms. Flowers greenish-yellow.

20. G. microcarpa (D. C. prod. 2. p. 40.) leaves elliptical, acute, almost entire, and are as well as the branches smooth, upper ones oblong; racemes terminal, elongated; fruit triquetrous, winged. "N. S. Native of the East Indies. G. tiliifolia, Rottl. in herb. Puer. This species has the fruit of G. retinaria, but one half smaller. Leaves with oblique nerves.

Small-fruited Gouania. Shrub cl.

21. G. obtusifolia (Vent. miss. in herb. Brogni, mem. thamm. p. 72.) shrub erect, rusty-villos; leaves elliptical or ovate, obtuse, crenated, villous beneath, somewhat pubescent above; flowers in long simple spikes, emitting from their base one simple tendril, disposed in interrupted bundles, each propped by a bristle-like bractea; fruit with three semicircular wings. "N. S. Native of Java. Flowers greenish-yellow.

Blunt-leaved Gouania. Shrub erect.

22. G. nipaefolius (Wall in fl. ind. 2. p. 417.) leaves oval, finely acuminate, rounded, or acute at the base, seldom subcordate, villous and strongly ribbed beneath; stipules membranous, lanceolate, falcate; racemes very long, villous, terminal, or from the upper axille of the leaves. "N. S. Native of Nipao, on the high mountains of Shecopenh, Chundrugiri, &c.

Tendrils simple, terminal, or from the base of the racemes. Petioles furnished with a couple of evanescent glands at their base. Flowers greenish-yellow.

**Cult.** Gouania is a genus of insignificant shrubs, not worth cultivating, except in general collections. They will all grow freely in a mixture of loam and peat; and ripened cuttings will soon strike root if planted in a pot of sand plunged in heat, with a hand-glass placed over them.

**XXVII. CRUMENARIA** (from crumena, a purse; in allusion to the thin, papery capsule). Mart. nov. gen. bras. 2. p. 68. t. 160. Brogni, mem. thamm. p. 73.

**Lin. syst.** Pentandria, Monogynia. Calyx campanulate, 5-leafed, coloured above, with the tube conuate to the ovary below. Petals hood-formed. Stamina with inclosed, 2-lobed anthers. Style 1. Stigma 3. Capsule covered by the adnate calyx, papyraceous, tricoccous; coccia with winged margins, 1-seeded, fixed to the central, 3-parted, filiform receptacle.—A small, annual plant, with decumbent branches, alternate, stalked, corolate, quite entire leaves, furnished with twin stipulas at their base. Peduncles quite axillary, jointed, solitary, or twin. Flowers small, white.

1. G. decumbens (Mart. l. c. t. 160.). "N. S. Native of Brazil, in grassy places by the sides of woods. This genus does not differ from Gouania, unless in the calyx being campanulate, and in its tube being free at the apex, as well as in the disk being defective. However, it differs from every plant in the present order in the stems being annual.

**Decumbent Crumenaaria.** Pl. decumbent.

**Cult.** This plant is not worth cultivating, unless in the gardens of the curious. The seeds should be sown in a pot of mould about the beginning of April, and placed in a hot-bed, and when the plants are of sufficient size, some may be planted in separate pots, others may be planted in the open border, where they will probably ripen their seed.

† Genera allied to Rhámnee, but are not sufficiently known.

**XXVIII. COUPIA** (Couepi is the Guiana name of one of the species). Aubl. guian. 1. p. 296. D. C. prod. 2. p. 29.—Cúapia, Jaumn. exp.—Glossopétalum, Schreb. gen. no. 526.

**Lin. syst.** Pentándria, Tetra-Pentágyria. Calyx small, 5-toothed, permanent, adhering to the base of the ovary. Petals 5, oblong, appendiculate inside. Stamens 5, very short. Ovary roundish, crowned by 4 or 5 sessile stigmas. Berry pea-shaped, 4-5-celled, 4-5-seeded.—Trees with alternate, feather-nerved, somewhat unequal stipulate leaves, axillary peduncles, bearing numerous, umbellate pedicels and small flowers. This genus should probably be placed in *Rutaceae*.

**Smooth Coupiá.** Tree 60 feet.

2. G. tomentosa (Aubl. l. c.) leaves hairy on both surfaces. "N. S. Native of Guiana, in woods. Glossopétalum tomentósum, Willd. spec. 2. p. 1321. The bark and leaves are bitter. The latter are used by the inhabitants of Guiana against inflammation of the eyes.

**Downy Coupiá.** Tree 25 feet.

**Cult.** Loam, peat, and sand is a good mixture for this genus, and ripened cuttings will root if planted in sand under a hand-glass, in heat.
XXIX. CARPODEUTS (from καρπος, καρπος, a fruit, and ἔτος, ἔτος, tiet; there is a ring round the middle of the fruit resembling a tie). Forst. gen. t. 17. D. C. prod. 2. p. 29.
  Lin. syst. Pentáátria, Monogiónia. Calyx with a turbinate tube, adnate to the ovary, and a 5-cleft limb; lobes deciduous. Petals 5, small, inserted in the calyx. Stamens very short; anthers almost sessile. Style 1, filiform. Stigma depressed, capitulate. Berry dry, globose, 5-celled, 5-seeded, girded by the tube of the calyx.
  1 C. sárrátius (Forst. nov. gen. t. 17. Spreng. pug. 1. p. 20.) t. G. Native of New Zealand. Leaves oblong, with glandular serratures, puberulous above, pale, smooth, and netted beneath. Peduncles opposite the leaves. This plant is very little known.
  Serrate-leaved Carpodetus. Shrub 12 feet.
  Cult. See Willemia for culture and propagation, p. 38.

  1 S. fruté'scens (Jacq. amer. 259.) style slender, 2-lobed at the apex; petals blunt; leaves elliptical, acuminate at both ends, and are, as well as the branches, smooth. t. S. Native of St. Domingo, Jamaica, Carthages, and New Spain, in bushy places. S. compléta, Swartz, fl. ind. occ. 1. p. 327. t. 7. f. a. Flowers white. Berries the size of a small pea, of a yellowish-red colour.
  • Doubtful species.

  2 S. pániculá'ta (Spreng. neu. entd. 3. p. 49.) petals concave; flowers panicked; leaves apatulate, coriaceous, pubescent beneath, as well as the branches. t. S. Native of Brazil. Flowers whitish.
  Paniced Schæfferia. Shrub.

  3 S. viride'scens (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 41.) style none; stigmas 2, thick, sessile; petals acute. t. S. Native of Mexico. Leaves almost like those of S. frutescens, but more blunt. Fruit globose. Younger petals greenish on the outside, but of a dirty-white on the inside.
  Greenish-flowered Schæfferia. Shrub 6 feet.

  4 S. rácemós'a (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 41.) style wanting; stigmas 3, thick, sessile; petals obtuse. t. S. Native of Mexico. Racemes lateral, many-flowered. Scales 4 between the stamens, or alternating with the petals. Fruit globose. This will probably form a distinct genus.
  Racemose-flowered Schæfferia. Shrub.
  Cult. This is a genus of insignificant shrubs; for the culture and propagation see Cómpia, p. 44.

  Lin. syst. Penta-Hexáátria, Monogiónia. Calyx with a cam-
pulate tube, and 5 or 6 blunt teeth. Petals 5, inserted in the calyx, alternating with the teeth, linear-lanceolate, permanent, furnished with rather concave scales on the inside at the base. Stamens 5 or 6, very short, inserted in the calyx; anthers concealed under the scales. Ovary free? Style very short. Stigma thickened, pentagonal. Fruit crowned by the calyx, 5-angled, 5-seeded.—A smooth, much branched shrub. Branches tetragonal. Leaves ovate, opposite. Flowers white, in axillary panicules.
  1 O. cysmó'sa (Thunb. l. c. and fl. cap. 194.) t. G. Native of the Cape of Good Hope, on the western side of the Table Mountain. Sideroxylum cymosum, Lin. fil. suppl. 1. p. 152. Flowers white, sweet-scented.
  Cymose-flowered Olignia. Shrub 4 feet.
  Cult. This shrub will grow in a mixture of loam and sandy peat, and ripened cuttings will root if planted in a pot of sand, with a hand-glass placed over them.

XXXII. DAPHNIPHYLLUM (from ἰαφνος, ἰαφνος, the Greek name for the laurel, and φυλλον, phyllon, a leaf; in allusion to the leaves resembling the laurel). Blum. bijdr. 1152.
  Lin. syst. Die'cia, Hexá-Deccádría. Flowers dioecious. Calyx inferior, small, crenulated. Corolla none. Male flowers, with 6-10 short stamens, which are connate at the base. Anthers erect, tetragonal. Female flowers with a 2-celled ovary, with the cells containing 2 ovula, and a bifid sessile stigma. Drupe oval, baccate, crowned by the stigma containing a 1-seeded fibrous nut. Embryo minute, inverted in a fleshy albumen.—A tree, with scattered, oblong-lanceolate, entire, smooth, exstipulate leaves, which are glaucous beneath. Racemes axillary, simple.
  1 D. gláucose'scens (Blum. bijdr. 1153.) t. S. Native of Java, on the higher mountains of Salak and Gede.
  Glaucescent-leaved Daphniphyllum. Tree.
  Cult. See Cómpia for culture and propagation, p. 44.

  Calyx adhering to the ovary (f. 8. G. g. H. a.), rarely free (f. 8. C. h.), 5-cleft (f. 8. B. b. K. c.), or 5-toothed (f. 8. H. b.), imbricate in aestivation. Petals 5 (f. 8. G. b. C. d.) imbricate, inserted in the ovary, alternating with the segments of the calyx (f. 8. K. c. G. b.). Stamens 5 (f. 8. B. d.), alternating with the petals, epigynous; anthers fixed by the back, bursting inwards, 2-celled, opening lengthwise (f. 8. B. d.). Ovary half inferior (f. 8. F. l.), 1 (f. 8. A. g.)-3-celled (f. 8. E. g.).; cells 1 (f. 8. C. g.)-2 (f. 8. E. g.)—seeded; ovula suspended from the central column of the ovary. Style simple or bifid (f. 8. D. l.). Stigma 1 or 2-3, small, papilliform. Fruit dry, bicoscuces, or indehiscent, 1-seeded, inferior, or half inferior. Seeds with a small embryo, located in the apex of a fleshy albumen, with short cotyledons, and a long conical radicle.—Much branched, heath-like shrubs, with small, smooth, or hardly pilose leaves, which are usually callously-ustulate at the apex, stiff, quite entire, and are inserted in 5 rows, on the branches. Flowers small, capitulate, or rarely panicked, spiked or terminal and solitary; heads of flowers naked or involucrated with larger leaves; flowers each furnished with 3 bracteas at their base, lower bractea larger than the rest, lateral ones opposite, smaller, or wanting. In
Lincoinia, Thamnea, Audouinia, Tittmannia, the flowers are involucred by 4 or more bracteas.

FIG. 8.

Synopsis of the Genera.

3 Staavia. Calyx adhering (f. 8. G. g.). Petals free (f. 8. G. h. c.). Ovary half inferior, 2-celled (f. 8. G. k. g.); cells 1-seeded. Style simple. Fruit 2-seeded (f. 8. G. k. g.).

4 Rapsania. Calyx free (f. 8. C. h.). Petals and stamens inserted in the free ovary (f. 8. C. d. g.). Ovary 2-celled (f. 8. C. k.); cells 1-seeded. Styles 2 (f. 8. C. c.).

9 Thamnea. Calyx adhering to the ovary, with lancelolate segments. Ovary inferior, 1-celled, many-ovulate, covered by the fleshy disk. Ova hanging from the central column. Style simple.

I. Berzelia (in honour of Berzelius, the celebrated chemist). Brogni et Dum. mem. l. c. p. 14.—Brunia, species of authors.

Lin. syst. Pentandra, Monogynia. Calyx adhering to the ovary (f. 8. A. g.), with unequal gibbous segments (f. 8. A. c.). Ovary inferior, 1-celled, 1-seeded (f. 8. A. g.). Style simple, terminated by a small subconical stigma (f. 8. A. c.). Fruit indehiscent.—Small heath-like shrubs, with short, somewhat trigonal, imbricate or spreading leaves. Heads of flowers (f. 8. A. a.) naked, usually crowded at the tips of the branches, with three bracteas at the base of each flower.

1 B. aberrata (Brogni et Dum. mem. p. 15.) leaves ovate, pubescent at the apex, smooth, spreading, on short pedioles; heads of flowers the size of a halfpenny, terminal, crowded, sub-corymbose; receptacle hairy; bracteas clavate, green, smooth, pubescent at the apex; petals spreading, spatulate. P. G. Native of the Cape of Good Hope.

Var. a.; flowers 4-cleft, tetradromous; petals large, spreading; stamens very long.

Var. b.; flowers 5-cleft, pentadromous; petals smaller than those of the preceding, as well as the stamens shorter. Brunia aberrata, Burm. affl. p. 100. f. 1. Wendl. coll. t. 45. Lodd. bot. cab. t. 355. Flowers white.

2 B. intermedia (Schlecht. in Linnaea, 6. p. 188.) much branched, ultimate branches somewhat fastigate, smoothish; leaves linear-trigonal, spreading or reflexed, ciliolate at the apex, smoothish; heads of flowers size of a nut, forming a corymb on the lateral branches; bracteas lanceolate-spatulate, pilose, ciliate at the tip; calyx pilose; petals erectish, oblong, obtuse, tapering to the base. P. G. Native of the Cape of Good Hope.

Intermediate Berzelia. Shrub 2 to 4 feet.

3 B. lanuginosa (Brogni et Dum. mem. p. 16.) branches erect, fastigate, young ones villous; leaves trigonous, spreading, ciliolate at the apex, rather pilose; heads of flowers of the size of a pea at the tops of the lateral branches, disposed in a fastigate panicle; bracteas spatulate, smooth, ciliolate at the apex; petals almost erect, oblong-lanceolate, blunt. P. G. Native of the Cape of Good Hope, and in Madagascar. Brunia lanuginosa, Lin. hort. cl. p. 71. spec. 288. Wendl. coll. t. 11. Lodd. bot. cab. t. 572.—Pluk. phyt. t. 318. f. 4. Flowers white.

4 B. rebera (Schlecht. in Linnaea, 1. c. p. 188.) branched; branches erect, younger ones rather villous; leaves linear-lanceolate, rather trigonal towards the apex, with a strong middle nerve, recurvedly spreading or reflexed, ciliolate at the tip, younger ones rather villous; heads of flowers size of a pea, terminal or axillary, solitary or aggregate; bracteas somewhat rhomboid-spatulate, pilose, ciliolate at the tip; petals spreading, oblong, obtuse. P. G. Native of the Cape of Good Hope. Brunia rubra, Herb. Willk. ex Spreng. syst. 1. p. 782.

Red Berzelia. Shrub 2 to 4 feet.

5 B. cordifolia (Schlecht. in Linnaea, 6. p. 189.) branched; branches erect, younger ones pubescent; leaves subcordate-ovate, bluish, somewhat marginate, flat, spreading or reflexed, smooth, ciliolate at the tip; heads of flowers size of a nut, solitary on the tops of the lateral branches; bracteas subspatulate, pilose, ciliolate at the apex; petals spreading, oblong-elliptic, tapering to the base, and 2-crested at the apex. P. G. Native of the Cape of Good Hope. Heart-leaved Berzelia. Shrub 2 to 4 feet.

6 B. squarrosa (Schlecht. in Linnaea, 6. p. 189.) leaves lanceolate, reflexed, acute, smooth, ovulate at the apex; heads of flowers terminal, hairy, smaller than a pea. P. G. Native of the Cape of Good Hope. Brunia squarrosa, Thunb. fl. cap. 2. p. 92.

7 B. glosso's; leaves trigonal, incurved, acute, imbricate,
BRUNIA. E. II. BRUNIA.

147

villous; heads of flowers terminal, smooth, about the size of a walnut, or larger. *G.* G. Native of the Cape of Good Hope. Brinia globosa, Thumb. fl. cap. 2. p. 90. Flowers white.

II. BRUNIA (in honour of Corneille de Brunin, better known under the name of Le Brun, a Dutch traveller; he travelled through Persia to India in 1701 to 1708, and in Asia Minor, Egypt, &c. from 1763 to 1764). Lin. gen. 274. (exclusive of Stalina.) Gaert. fruct. 1. p. 152. t. 30. Thumb. fl. cap. 2. p. 92. —Brunia and Barreria, Adans. D. C. proc. 2. p. 43. Broom et Dum. mem. p. 16.

LIN. SYST. Pentándria, Monogynía. Calyx adhering to the ovary (f. 8. K. g.). Ovary half inferior, 2-celled (f. 8. K. g. B. c.); cells 1-2-seeded. Styles 2, diverging (f. 8. B. d.) at the apex. Fruit indehiscent, 1-seeded from abortion (f. 8. K. h.). —Shrubs more or less branched, with the branches in whorls, erect or spreading. Leaves small, closely imbricate, and flowers capitate (f. 8. B. a.) in B. alopecuroides, B. nodiflora, and B. virgata; but in B. racemo-sa and B. pinifolia, the leaves are larger, fir or myrtle-like, spreading, and the flowers in panicles (f. 8. K. a.). Flowers furnished with 3 bracteas each, or sometimes deficient of the two lateral ones.

SECT. I. NODIFLÓRE (from nodus, a knot, and flos, a flower; flowers disposed in close heads or knots). Calyx hairy, with spathulate segments (f. 8. B. b.). Petals somewhat spathulate (f. 8. B. d.). Stamens exerted (f. 8. B. d.), unequal. Ovary 2-celled (f. 8. B. c.); cells 1-2-seeded. Fruit crowned by the permanent calyx, stamens, and petals.

1 B. NODIFLÓRA (Lin. spec. 388. mant. 343.) leaves lanceolate, awl-shaped, trigonal, acute, smooth, closely imbricate, not usulate at the apex; heads of flowers globose, size of a cherry, on the top of the branches. *G.* G. Native of the Cape of Good Hope. Wendl. coll. t. 35.—Brem. cent. 22. t. 10. Flowers white.

2 B. PASSERINOIDES (Schlecht. in Linnaea. 6. p. 190.) dichotomously branched; branches erect, slender; leaves minute, ovate, elliptical, densely-imbricated, and pressed to the stem, callous at the points, concave outside, puberulous at first, but at length becoming smooth and shining; heads minute, few-flowered, terminal, solitary. *G.* G. Native of the Cape of Good Hope.

Passerina-like Brunia. Shrub 2 to 3 feet.

SECT. II. ALOPÉCUCÕIDEA (from alopex, a fox, and flos, a flower; flowers disposed in close heads or knots). Calyx with scarious, smooth segments (f. 8. K. c.). Petals ovate (f. 8. K. a.), inclosing the stamens. Ovary 2-celled (f. 8. K. g.); cells 1 or 2-seeded. Fruit crowned by the calyx. Petals and stamens caducous.

Pine-leaved Brunia. Fl. May, Ju. Cl. 1789. Sh. 1 to 2 ft. 5 B. IMBRICÁTA; leaves imbricate, ovate, cordate, smooth or somewhat ciliate, flat; panicle composed of numerous racemes; branches hairy. *G.* G. Native of the Cape of Good Hope. Phyllaca imbricáta, Thumb. fl. cap. 2. Flowers white.

6 B. ALOPÉCUCÕIDES (Thumb. fl. cap. 2. p. 93.) leaves awl-shaped, trigonal, acute, smooth, imbricate, incurved, usulate at the apex; heads of flowers terminal, ovate-globose, dense, naked, smaller than a pea; bracteas shorter than the flowers. *G.* G. Native of the Cape of Good Hope. Flowers white.

Tufted Brunia. Shrub 1 to 2 feet.

8 B. TéLFÁ (Thunb. fl. cap. 2. p. 88.) leaves trigonal, blunt, closely-pressed to the stem, imbricate, smooth; branches loose, twiggy; heads of flowers spike-formed, smooth. *G.* G. Native of the Cape of Good Hope, in the interior of the country. Flowers white.

Loose-branched Brunia. Fl. June, Aug. Cl. 1805. Sh. 2 ft. 9 B. LEÔVIS (Thunb. fl. cap. 2. p. 89.) leaves linear, convex, incurved, blunt, imbricate; heads of flowers terminal, downy, about the size of a filbert. *G.* G. Native of the Cape of Good Hope. Flowers white.

10 B. DEVIÁNA (Thunb. fl. cap. 2. p. 90.) leaves trigonal, blunt, smooth, black at the apex, imbricately-spreading; heads of flowers terminal, smooth, about the size of a pea. *G.* G. Native of the Cape of Good Hope. Flowers white.

11 B. COMOSÁ (Thunb. fl. cap. 2. p. 91.) leaves trigonal, smooth, spreading, obtuse, usulate at the apex; heads of flowers globose, terminal, and axillary, sessile, about the size of a pea. *G.* G. Native of the Cape of Good Hope. Flowers white.

12 B. CAPITÉLLÁ (Thunb. fl. cap. 2. p. 91.) leaves trigonal, smooth, spreading, usulate at the apex; heads of flowers terminal and axillary, about the size of a pea. *G.* G. Native of the Cape of Good Hope. Flowers white.

Small-headed Brunia. Shrub 1 to 3 feet.

13 B. ARACHNOÍDEA (Wendl. coll. 2. p. 62.) leaves linear, thin, acuminate, somewhat trigonal, cobwebbed, fuscous at the apex, spreading, crowded; heads of flowers globose, small. *G.* G. Native of the Cape of Good Hope. Flowers white.

Cobwebbed Brunia. Fl. June, Aug. Cl. 1820. Sh. 1 to 3 ft.

14 B. ERICOIDES (Wendl. coll. 2. p. 57.) leaves linear, short, acute, trigonal, pilose in the middle, brown and callous at the apex, spreading; heads of flowers globose, about the size of a cherry. *G.* G. Native of the Cape of Good Hope. Flowers white.

† Species only known by name, from catalogues, without any description. These are probably identical with some of those described above.

1 B. capitata (Desf.). 2 B. elegans (Dum. Cours). 3 B. formosa (Dum. Cours).

Cult. Elegant heath-like shrubs, but with insignificant flowers. A mixture of peat and sand suits them best, and young cuttings, planted in sand with a bell-glass placed over them, will strike root.

LIN. Syst. Pentandria, Monogynia. Calyx adhering to the bottom of the ovary (f. 8. G. g.) but free at the top, ending in 5 awl-shaped callose lobes (f. 8. G. f.). Petals free (f. 8. G. c.). Ovary half-inferior, 2-celled (f. 8. G. k. g.); cells 1-seeded. Style simple. Stigma 2-lobed. Fruit biciparious (f. 8. G. k.).—Small shrubs, with linear, spreading leaves, which are callose at the apex. Flowers collected into terminal, disk-like heads (f. 8. G. a.), involucrated by numerous shining, whitish bracteas, which are either longer or shorter than the leaves. Receptacle of flowers villous or chaffy.

1 S. radia'ta (Thund. fl. cap. 2. p. 96.) young branches and leaves pilose; leaves linear, acute, hardly keeled, spreading or deflexed, mucronate; heads of flowers corymbose; bracteas of involucral membranaceous, mucronate, arched, deflexed, white, a little longer than the flowers. G. Native of the Cape of Good Hope. Phylica radiata, Lin. spec. ed. 2. p. 285. Bruniia radiata, Lin. mant. 209.—Pluck. mant. t. 454. f. 7.—Breynt. cent. t. 82. Flowers dusky.

2 S. glutinosa (Thund. fl. cap. 2. p. 95.) branches and leaves quite smooth; leaves linear, trigonal, thickish, blunt, callose, usulate, approximate, erect; heads of flowers usually solitary, terminal; bracteas of involucral erect or stifferly spreading, not arched, white, much longer than the flowers; flowers agglutinated with resinous juice. G. Native of the Cape of Good Hope, on the Table Mountain. Wendl. coll. 1. t. 22. Bruniia glutinosa, Lin. mant. 210.—Pluck. mant. t. 431. f. 1. Flowers dusky.

3 S. xuda (Brom. et Dum. mem. p. 23.) branches fastigate, and here as well as the leaves smooth; leaves oblong-linear, short, trigonal, erect, imbricate; heads of flowers solitary, terminal; involucre shorter, or equal in length to the leaves, and of the same colour. G. Native of the Cape of Good Hope. Flowers dusky?

Naked Staavia. Shrub 1 to 2 feet.

4 S. ciliata (Brom. et Dum. mem. p. 24.) branches fastigate, villous; leaves sessile, erect, imbricate, oblong-lanceolate, acute, smooth, keeled on the back, and ciliated with long hairs on the margins, and with callose points; heads of flowers discoid, woolly (bracteas and segments of the calyx; very villous) involucre shorter than the flowers, imbricate, pilose, of the same colour as the leaves. G. Native of the Cape of Good Hope. Bruniia ciliata? Lin. spec. 288.

Small-leaved Raspalia. Shrub 1 to 2 feet. Cult. For culture and propagation see Bruniia.

V. BER'AR'DIA (in honour of M. Berard, a professor of chemistry at Montpellier). Brom. et Dum. mem. brun. p. 24.—Brunia and Lincemia, species of authors.

LIN. Syst. Pentandria, Digynia. Calyx adhering to the ovary at the base, but free at the apex, 5-cleft (f. 8. D. b.). Petals 5, cohering into a tube at the base. Stamens adhering to the petals more or less at the base. Ovary half inferior. Styles 2 (f. 8. D. k.).—Small shrubs, with erect, fastigate, slender branches, awl-shaped, acute, close-pressed leaves, covering the stem on every side. Flowers capitate (f. 8. D. a.), involucrated, with awl-shaped bracteas, which are longer than the leaves, each flower is furnished or propped by 3 bracteas, the lower one is twice the length of the flower (f. 8. D. c.), the two lateral ones are about equal in length to the flower.

1 B. paleacea (Brom. et Dum. mem. p. 25.) leaves awl-shaped, acute, short, closely pressed to the stem, quite smooth, ustulate; heads of flowers corymbose; lower bracteae twice as long as the flower, awl-shaped, ustulate, hairy at the base; segments of calyx shorter than the petals, villous; anthers ovate. G. Native of the Cape of Good Hope, Bruniia paleacea, Thumb. prod. p. 41. Lin. mant. 559. Wendl. coll. t. 21. Flowers white.

Chaffy Berardia. Fl. June, Aug. Clt. 1791. Sh. 1 to 2 ft. 2 B. affinis (Brom. et Dum. mem. p. 23.) leaves awl-shaped, acute, closely pressed to the branches, smooth, or a little fringed; lower bracteae awl-shaped, smooth, longer than the flowers; segments of calyx longer than the petals, smooth; anthers linear-oblong. G. Native of the Cape of Good Hope, Lincemia capitata, Banks. herb. Flowers white.

Allied Berardia. Shrub 1 to 2 feet.

3 B. fragarioides (Schlecht. in Linnea. 6. p. 188.) leaves linear-linearifrom, triqueterous, smooth, closely pressed to the stem with the margins and ribs densely ciliated. G. Native of the Cape of Good Hope. Bruniia fragarioides, Willd. spec. 1. p. 1143.

Strawberry-like Bruniia. Clt. 1794. Shrub 1 to 3 feet.

† An allied species or a new genus.

4 B. phylleoides (Brom. et Dum. mem. p. 25.) leaves ovate, obtuse, imbricate, convolute, in 5 rows, downy externally; heads

Lin. syst. Pentantheria, Dionysia. Calyx adhering to the ovary (f. 8. F. g.), with a 5-cleft limb; segments short, membranous (f. 8. F. a.), smooth. Petals oblong, convolute (f. 8. F. a.,) inclosing the stamens; cells of anthers diverging at the base (f. 8. F. b. c.). Ovary half inferior, 2-celled (f. 8. F. l.), cells 2-seeded. Styles 2 (f. 8. F. m.). Fruit bicoccous (f. 8. F. m.).—Heart-like shrubs, with numerous, erect, fastigate branches. Leaves spirally inserted on all sides of the branches, spreading, or loosely imbricate, on very short stalks, coriaceous, quite smooth, or a little fringed on the margins, marked with a prominent nerve, ustulate at the apex. Flowers solitary, in the axillie of the upper leaves, the whole forming a crowded leafy spike, each flower invovulated by 4 or 5 bracteas, which are about the length of the calyx.

1. ALOPECURIOIDEA (Lin. mant. 216.) leaves spreading a little, linear, acute, almost sessile, with one prominent stiff nerve; flowers a little longer than the leaves; bracteas membranous with pilose edges, longer than the calyx. H. G. Native of the Cape of Good Hope. Swartz, in her. mag. 1810. p. 86. t. 4. Brogn. mem. L. t. 37. f. 3. Flowers flesh-coloured or white.

2. THYMIPFOLIA (Swartz. in her. mag. 1811. p. 284. t. 7. f. 1.) leaves elliptical, keeled, tipped with black; bracteas naked. H. G. Native of the Cape of Good Hope, in the interior of the country. Diosma deusta, Thunn. phyt. blatt. p. 25. but omitted in the country. f. cap. as well as the following species. Brunia laxa, Thunn. fl. cap. 2. p. 93.? Flowers white.

3. CUSPIDATA (Swartz. in her. mag. 1811. p. 284. t. 7. f. 1.) leaves spreading a little, oblong, obtuse, ustulate at the apex, keeled; flowers equal in length to the leaves; bracteas equal in length to the calyx, with fringed, pilose edges. H. G. Native of the Cape of Good Hope. Diosma cuspidata, Thunn. phyt. blatt. p. 24. Flowers white.

Cuspidata-leaved Linconia. Cht. 1825. Shrub 1 to 2 feet.

4. L. PERUVIANA (Lam. dict. 3. p. 527.) leaves in whorles, linear, sessile, hairy, connate at the base. H. G. Native of Peru. Fruit unknown. This is probably a species of Marg. Ricarpus. It is certainly a very doubtful species of Linconia, being a native of Peru, and the leaves are said to be connate at the base; it is more likely they are many-parted.

Peruvian Linconia. Shrub.

Cult. See Brunia for culture and propagation. p. 48.

Cult. See Brunia for culture and propagation. p. 48.

VIII. TITTMANNIA (in honour of J. A. Tittmann, who has wrote on the structure and evolution of the embryo of plants). Brogn. et Dum. mem. p. 29. t. 38. f. 2.

Lin. syst. Pentantheria, Monogynia. Calyx with a spherical tube (f. 8. H. a.), wrinkled and glandular on the outside, adnate to the ovary, 5-cleft, with scarious, erect segments (f. 8. H. b.). Petals with the claws 2-keeled on the inside, and with ovate-roundish spreading lamina (f. 8. H. c.). Ovary inferior, spherical, 2-celled (f. 8. H. c.), with a membranous disseminium, free at the edges; cells 2-seeded. Ovala pendulous, fixed to the disseminium. Style simple, conical, crowned by a bidentate stigma.—A small shrub with subumbellate, fastigate branches. Leaves linear, subby-lindrical, wrinkled, incurred, erect, imbricate, cleft at the apex. Flowers axillary, approximate towards the tops of the branches, bent to one side, and calculated at the base by short scarious scales.

Cult. See Brunia for culture and propagation. p. 48.

Lin. syst. Pentantheria, Monogynia. Calyx adhering to the ovary at the base, but free at the apex, divided into 5 lanceolate, smooth, scarious, imbricate segments. Petals with 2-keeled claws, and an ovate, spreading limb. Ovary inferior, covered by a fleshly disk, 1-celled, many-seeded. Ovala hanging from the apex of the column. Style simple. Stigma entire.—A small shrub with filiform, erect, fastigate branches. Leaves very small, somewhat rhomboidal, short, blunt, keeled, closely pressed, spirally inserted; upper ones a little longer than the rest, forming an involucre to the flower. Flowers solitary, terminal, white.

Cult. The whole of the plants belonging to this natural order are worth cultivating for their neatness. All the genera require the same treatment. A mixture of peat and sand suits them best, but they will require but a moderate supply of water. Young cuttings planted in a pot of sand, will strike root freely, with a hand-glass placed over them.

Calyx permanent, of 3-7, but usually of 5 sepals (f. 9. a.), connected together more or less at the base into a tube (f. 9. a.). Lobes imbricate in aestivation, rarely valvate, usually petal-like and coloured on the inside. Petals wanting, unless that the coloured inside of the calyx should be considered the lamina of the petals adhering to it. Stamens adnate to the tube of the
calyx (f. 9. a.), double, triple, or quadruple the number of the sepal; filaments monadelphous at the base and flat, but awl-shaped at the apex, sometimes they are all antheriferous, sometimes the alternate ones are sterile and shorter than the fertile ones, villous or fringed, the alternate ones bearing ovate, 2-celled, erect anthers inserted by their base. Style filiform. Stigma capitate or lobed. Capsule coriaceous, 1-celled, 3-5-valved, many-seeded (f. 9. d.); valves inordinately dehiscent, usually somewhat pulpy, and coloured inside. Seeds ovate, bacate, umbilicate, fixed to the papilocele or pulpy part of the valves. Albumen fleshy. Embryo inverted, minute, with ovate, leafy, plaited cotyledons, and a blunt radicle, contrary to the external umbilicus.—Shrubs or little trees, natives of the warmer regions of the world. Leaves alternate, stipulate, usually somewhat distich, simple, quite entire or toothed, feather-nerved, permanent, usually full of pellucid dots, which are either round or oblong. Peduncles axillary, sometimes solitary, 1 or many-flowered. Sometimes aggregate, 1-flowered. This order agrees with Bixiaceae and Placocourticae in the structure of the fruit, but the situation of the stamens brings it between Rhámneae and Roséeae, Chrysobalaneae or Chailletiaceae.

Synopsis of the Genera.

1 Sámya. Stamens 10-12, all antheriferous (f. 9. a.). Stigma globose.

2 Cašára. Stamens 12-30, monadelphous at the base, alternate ones antheriferous, sterile ones awl-shaped or spatulate.

3 Chéтекář. Calyx 5-parted. Stamens 20, monadelphous at the base, forming a cup-shaped tube, the 10 antheriferous ones shorter than the rest, the 10 sterile ones are bristle-like and hairy. Stigma 3.

Sect. I. Eusámya (from ευ, ευ, good, and σαμύς; genuine species). D. C. prod. 2. p. 47. Calyx tubular at the base, cleft to the middle. Stamens 10 or 12. Flowers large.

* Flowers decandrous.

1 S. glábra (Swartz. fl. ind. occ. 2. p. 760.) peduncles axillary, solitary, 1-flowered; leaves ovate-lanceolate, obtuse, quite entire, shining. F. S. Native of Jamaica, on the mountains. Flowers white.

2 S. višlos (Swartz. fl. ind. occ. 2. p. 758.) peduncles solitary, axillary, 1-flowered; leaves oblong, acute, a little serrated, oblique at the base, silky, villous beneath. F. S. Native of Jamaica on the mountains. Flowers white, downy. Pulp of seeds scarlet.

3 S. spinlúša (Vent. choix. t. 43.) pedicles 2-3 together, axillary; leaves oval-oblong, acuminate, serrated, coriaceous, quite smooth, but pubescent on the nerves beneath. F. S. Native of the islands of St. Thomas and Porto-Rico. Flowers one half smaller than those of the preceding species, white.

Spiny Sámya. Shrub 6 feet.

Long-fruited Sámya. Shrub 6 feet.

5 S. večurína (D. C. prod. 2. p. 48.) flowers 5-cleft; pedicels numerous, axillary, very short; leaves obovate-oblong, microcute, acutely serrated, clothed on both surfaces with velvety villi. F. S. Native of St. Domingo. Flowers probably white.

Velvet Sámya. Shrub 6 feet.

6 S. affinis (Spreng. syst. 2. p. 354.) pedicels 1-flowered, numerous, axillary; leaves oblong, tapering at both ends, almost entire, opaque, smooth. F. S. Native of St. Domingo. Flowers white?

Allied Sámya. Shrub.

7 S. grandiflóra (Spreng. syst. 2. p. 354.) pedicels 1-flowered, aggregate, axillary; leaves oblong, tapering to both ends, almost sessile, opaque above, but shining beneath. F. S. Native of Brazil. Flowers probably white.

Great-flowered Sámya. Shrub 8 feet.

8 S. decúrsens (Spreng. syst. 2. p. 354.) cyymes axillary, stalked, few-flowered; leaves oblong, tapering to both ends, running down the petioles at the base, crenulate, quite smooth, opaque. F. S. Native of Brazil.

* * * Flowers polygamous, male ones decandrous.

10 S. rósea (Sims. bot. mag. t. 550.) flowers 5-cleft; pedicels 1-flowered, numerous, axillary, very short; leaves oblong, blunt, finely serrated, clothed with soft pubescence on both surfaces. F. S. Native of St. Domingo. S. serrúlata, Andr. bot. rep. t. 202. S. pubéscens, Lin. spec. 557. exclusive of the synonyms. Flowers large, rose-coloured. (f. 9.)

11 S. rušra (Moc. et Ses, fl. mex. icon. ined. D. C. prod. 2. p. 48.) pedicels numerous, axillary, very short; leaves obovate, bluets, serrate-toothed, pubescent beneath. F. S. Native of Mexico. Flowers red, 6-cleft. This species is probably sufficiently distinct from the preceding.

Red-flowered Sámya. Shrub 6 feet.

12 S. tiníflória (Vent. ex Spreng. syst. 2. p. 354.) pedicels axillary, 1-flowered, longer than the pediotes; leaves obovate, smooth, quite entire. F. S. Native of the East Indies.

Titus-leaved Sámya. Shrub.

* * * Flowers polygamous, male ones decandrous.

13 S. ? selió (Spreng. syst. 2. p. 354.) flowers polygamous, decandrous; pedicles aggregate, axillary; leaves obovate-oblong, serrulated, unequal at the base, shining above and smooth.
beneath. Σ. S. Native of Brazil. Bigelovia Brasilienis, Spreng. new. end. Flowers white.
Sello's Samyda. Shrub 6 feet?

* Flowers obovate.

14 S. multiflora (Cuv. icon. p. 48. t. 57.) flowers 4-parted; pedicels axillary, aggregate; leaves oblong, tapering to both ends, toothed, downy beneath. Σ. S. Native of St. Domingo. Flowers whitish.

Many-flowered Samyda. Shrub 4 feet.

15 S. macrophylla (Wildl. spec. 2. p. 625.) flowers 5-cleft or 3-cleft; revolute; corollas terminal; leaves ovate, acute, smooth, obscurely crenated, villous in the axil of the veins beneath. Σ. S. Native of the East Indies. Flowers greenish. Anthers brown.

** * Flowers decandrous and obovate.*

16 S. nitida (Lin. spec. 537.) flowers obovate and decandrous, 5-parted; pedicels axillary, crowded, 1-flowered; leaves cordate, smooth, somewhat serrated. Σ. S. Native of Jamaica, in the low lands. Lam. ill. t. 355. f. 2.—P. Browne, Jam. 217. f. 52. f. 3. Flowers white and red. There are small teeth between the stamens, therefore it comes near to Caseria. P. Browne calls this shrub the Larger Clove-berry-bush.

17 S. spineceps (Swartz. fl. ind. occ. 2. p. 762.) flowers decandrous and obovate, 5-parted, almost sessile, nearly terminal; leaves lanceolate-ovate, bluntly crenated, smooth; branches spreading, spinescent. Σ. S. Native of St. Domingo, where it flowers in December and January. Flowers pale, in short, dense, downy clusters or spikes.

Spinescent Samyda. Shrub 12 feet.

18 S. pubescens (Hamilt. prod. fl. ind. occ. p. 37.) leaves ovate-oblong, tapering to both ends, remotely-serrate below, quite entire at the base, tomentose-pubescent; flowers sub-alternate, axillary. Σ. S. Native of St. Domingo. Pubescent Samyda. Shrub.

Cult. See end of order for culture and propagation.

Lin. syst. Heza-Dodcândia, Monografa. Stamens 12-30, monadephous at the base, alternate ones bearing anthers, sterile ones awl-shaped or spatulate, usually villous or fringed. This genus ought probably to be divided into several genera, but the number of parts is not sufficient.

1 C. ilicifolia (Vent. choix. t. 44.) flowers 5-cleft; leaves ovate, with spiny angles, coriaceous, downy beneath. Σ. S. Native of St. Domingo. Holly-leaved Casearia. Shrub.

2 C. moccolafida (Vent. l. c. in a note) flowers 5-cleft; leaves roundish, with spiny angles, quite smooth. Σ. S. Native of St. Domingo. Conocladia-leaved Casearia. Shrub.

3 C. coriacea (Vent. choix. t. 45.) flowers 5-8-anthered; leaves very numerous, in fascicles, 1-flowered, very short; leaves oval-oblong, acuminate, smooth, a little serrated. Σ. S. Native of Bengal. Flowers small.

Coriaceous-leaved Casearia. Shrub.

6 C. ramiflora (Vahl. symb. 2. p. 50.) flowers 6-anthered; 5-cleft; pedicels 1-flowered, rising in fascicles along the branches beneath the leaves; leaves elliptical, acute, serrated, smooth on both surfaces. Σ. S. Native of the West Indies and the shores of Guiana. Ironcana Guianensis, Aulbf. guian. t. 329. t. 137. Athenea, Schreb. gen. no. 661. Flowers white. Capsules green with a tinge of violet. Seed covered with a scarlet, pulpy, viscid membrane. The bark, leaves, and fruit have a sharp aromatic taste. The last is called Caffe Diable or Devil's coffee, by the creoles.

Branch-flowered Casearia. Clt. 1824. Shrub 4 feet.

7 C. nitida (Jacq. am. 132. act. helv. 8. p. 58. with a figure) flowers 8-anthered, 5-parted; corollas terminal, ovate, leaves ovate, crenated, smooth, shining above. Σ. S. Native of Carthagebrevia, among bushes. Samyda crenata, Poir. dict. 6. p. 490. Flowers whitish. Pulp of fruit scarlet or purple.

Shining-leaved Casearia. Shrub 12 feet.

8 C. coriacea (H. B. et Kunth, nov. gen. am. 5. p. 366.) flowers 8-anthered, bluntly 5-cleft; corollas axillary, solitary, stalked, many-flowered, one-half shorter than the leaves; leaves ovate, acuminate, acute or pointed at the base, sharply toothed, smooth, full of pellucid dots. Σ. S. Native of South America, on the banks of the river Madagena, near Mompox and Honda. Calyx white inside. Corynbose-flowered Casearia. Shrub 10 feet.

9 C. nitida (Swartz. fl. ind. occ. 2. p. 756.) flowers 8-anthered, 4-parted; pedicels crowded, 1-flowered; leaves ovate, serrated, hairy beneath. Σ. S. Native of Jamaica, in the low lands. Samyda tomentosa, Swartz. prod. 68. Flowers white inside but green outside. Filaments yellow.

Hair-leaved Casearia. Shrub 7 feet.

10 C. spinosa (Wildl. spec. 2. p. 626.) flowers 8-anthered, 5-parted; pedicels 1-flowered, crowded, axillary; leaves ovate, serrated, smooth; branches spiny. Σ. S. Native of St. Domingo and the island of Cuba, where it is called Jia. Samyda spinosa, Lin. spec. 557. C. aculeata, Jacq. am. 132. The spines are strong and straight, they are only abortive indurated branches, as in Cerasus spinosa. Flowers white. Fruit greenish-purple.

Spiny Casearia. Shrub 7 feet.

2

SAMYDEÆ. 1. SAMYDA. II. CASEARIA.
11 C. Marquitepis (H. B. et Kunth, nov. gen. amer. 5. p. 364.) leaves elliptic-oblong, acuminate, acute at the base, dentilicated, smooth, full of pellucid dots; fruit solitary or twin, covered with fine tomentum. *S. S. Native of New Granada, near Mariquita. Flowers unknown.

Marigolde Caseraria. Shrub 10 feet.

12 C. argu’ta (H. B. et Kunth, nov. gen. amer. 5. p. 363.) branches finely tormentose; leaves elliptic-oblong, acuminate, rounded at the base, sharply serrated, smooth above, and pubescent on the nerves beneath, full of pellucid dots; fruit crowded, pubescent at the apex. *S. S. Native of Mexico, near La Venta del Exido. Flowers unknown.

Sharp-notched Caseraria. Tree 20 feet.

13 C. Multifíóra (Spreng. syst. 2. p. 533.) flowers 5-anthered, 5-petalled; panicles axillary, divaricate; leaves ovate-lanceolate, acute, quite entire, smooth; branches spinose. *S. S. Native of the East Indies. Flowers greenish-white. Sterile stamens cucullate. Fruit bacca, sub-4-celled.

Many-flowered Caseraria. Shrub 5 feet.

§ 3. Deçantlhiera (from ceca, deca, ten, and asthoga, althera, an anther.) *D. C. prod. 2. p. 49. Fertile stamens 10, with a sterile one between each. Leaves quite entire or serrated.

14 C. Farífióla (Willd. spec. 2. p. 627.) flowers 10-anthered, 5-petalled, small; pedicels 1-flowered, crowded, axillary; leaves oblong, acuminate, crenulate, smooth on both surfaces, shining, evidently full of pellucid dots. *S. S. Native of the West Indies, in bushy places. Samyda parviflora, Lin. spec. 557.—Slan. hist. 2. t. 211. f. 2. Flowers whitish. Pulp of fruit yellow.

15 C. silvestrés (Swartz. fl. ind. occ. 2. p. 725.) flowers 10-anthered, 5-petalled, small; pedicels 1-flowered, axillary, crowded; leaves ovate-oblong, long, and bluntly acuminate, quite entire, and smooth on both surfaces, shining, and evidently full of pellucid dots. *S. S. Native of the West Indies, among bushes on the mountains. Flowers whitish. Fruit small, red.

Wild Caseraria. Clt. 1823. Shrub 7 feet.

16 C. inequálter (St. Hil. fl. bras. 2. p. 237.) branches smooth; leaves oblong or elliptic-oblong, very unequal-sided, narrowed at both ends, acuminate, serrate-toothed, full of pellucid dots, smoothish, shining; flowers smooth, umbellate; umbels nearly sessile; fertile stamens 10, exceeding the calyx; style trifid. *S. S. Native of Brazil, in the province of Rio Janeiro.

Unequal-sided-leaved Caseraria. Shrub 4 to 5 feet.

17 C. mera’ntia; branches puberulous at the apex; leaves oblong-lanceolate, narrowed at both ends, acuminate, serrulate, full of pellucid dots, smoothish, umbellate; umbels sessile; fertile stamens 10, equal with the calyx; style trifid. *S. S. Native of Brazil, in the province of Minas Geraes, where it is called Piouya. C. parviflora, St. Hil. fl. bras. 2. p. 237. Calyx white inside.

Small-flowered Caseraria. Shrub 10 feet.

18 C. grandífóra (St. Hil. fl. bras. 2. p. 232. t. 136.) branches covered with yellowish tomentum; leaves oblong-lanceolate, acute, sharply serrated, dotless, smoothish above, but clothed with yellowish tomentum beneath; flowers clothed with yellowish tomentum, glomerate, sessile; fertile stamens 10, one-half shorter than the corolla; style undivided. *S. S. Native of Brazil, in the province of Minas Geraes.

Great-flowered Caseraria. Shrub 4 to 5 feet.

19 C. sensíllifóra (St. Hil. fl. bras. 2. p. 231.) branches smooth below and puberulous above; leaves elliptic, short-acuminated, oblong-acuminated, serrulate, full of pellucid dots, smooth; flowers pubescent, glomerate, sessile; fertile stamens 10, 3-times shorter than the calyx; style undivided. *S. S. Native of Brazil, in the province of Rio Janeiro. Calyx greenish-white.

Sessile-flowered Caseraria. Shrub 5 to 6 feet.

20 C. ulmífolía (Vahl in Vent. choix. no. 47. in a note. St. Hil. fl. bras. 2. p. 233.) flowers 10-anthered, 5-petalled, umbellate; umbels on short stalks; style undivided; leaves oval-oblong, taper-pointed, acutely serrulate, puberulous, full of pellucid dots; branches smooth. *S. S. Native of Porto-Rico and Brazil. Stamens smooth. Sterile filaments fringed, spatulate. Flowers whitish, a little larger than those of the two preceding species. In the province of Minas Geraes, in Brazil, the inhabitants employ this plant in domestic medicine. They boil the leaves, and apply them to wounds and to the bites of the most poisonous serpents.

Elm-leaved Caseraria. Clt. 1827. Shrub 6 feet.

21 C. serrulátá (Swartz. fl. ind. occ. 2. p. 751.) flowers 10-anthered, 5-parted, small, a little fringed; pedicels axillary, crowded, 1-flowered; leaves ovate-lanceolate, blunt, serrulate; branches flexuous. *S. S. Native of the West Indies, in the island of Nevis. Samyda Neviána, Poir. dict. 6. p. 493. Flowers whitish.

Acuminate-leaved Caseraria. Shrub 6 feet.

Long-leaved Caseraria. Shrub 8 feet.

25 C. cúcullátá (St. Hil. fl. bras. 2. p. 235.) branches smooth at the bottom, but pubescently tomentose at the apex; leaves oblong-lanceolate, long-acuminated, nearly entire, dotless, puberulous; flowers pubescently-tomentose, umbellate; umbels sessile; fertile stamens 10, 3-times shorter than the calyx; style undivided. *S. S. Native of Brazil, in the province of Minas Geraes. Flowers white inside.

Few-flowered Caseraria. Shrub 4 to 5 feet.

26 C. oblongifólla (St. Hil. fl. bras. 2. p. 234.) branches smooth; leaves oblong, acute, nearly entire, full of pellucid dots, smooth; flowers puberulous, umbellate; umbels sessile; fertile stamens 10, 3-times shorter than the calyx; style undivided. *S. S. Native of Brazil, in the province of Rio Janeiro. Oblong-leaved Caseraria. Shrub 4 to 5 feet.

27 C. llíngua (St. Hil. fl. bras. 2. p. 236.) branches puberulous; leaves oblong-lanceolate, roundish at the base, acuminate.
ateil, serrulatus, full of pubescence dots, smoothish; flowers pubescent, umbellate; umbel sessile; fertile stamens 10, 3-times shorter than the calyx; style trifid.  5. S. Native of Brazil, in the province of Minas Geraes, where it is called *Lingua de Frede*, and of the province of Goiay, where it is called Cha de Frede. A decoction of the leaves of this plant is used in the interior of Brazil in inflammatory diseases and malignant fevers.

*Lingua Casarea.* Shrub 4 to 6 feet.

28 *C. commersoniana* (St. Hil. fl. bras. 2. p. 232.) branches smooth; leaves oblong-elliptic, narrowed at the base and apex, bluntly acuminate, obliquely crenate-serrate, smoothish, dotted; flowers pubescently-tomentose, umbellate; umbel sessile; fertile stamens 10, nearly equal in length to the calyx; style trifid.  5. S. Native of Brazil near Rio Janeiro. Caryx white inside.

*Commerson’s Casarea.* Shrub 4 to 6 feet.

29 *C. stipularis* (Vent. choix. t. 46.) flowers 10-anthered, 5-parted, somewhat crenate; style undivided; pedicels disposed in a stalked, axillary umbel; leaves oblong-lanceolate, taper-pointed, smooth, and shining above, but clothed with hairy tomentum beneath, sharply serrated, full of pedicellus; branches clothed with white tomentum.  5. S. Native of Guiana, Porto-Rico, St. Domingo, and Brazil. *Samyda arborea*, Rich. act. soc. hist. nat. par. 1792. *C. incana*, Bert. indc. Stipulas linear, very long, deciduous. Flowers whitish.

*Stipular Casarea.* Shrub 4 to 5 feet.

30 *C. zizyphoides* (H. B. et Kunth, nov. gen. amer. 5. p. 362.) flowers 10-anthered, 5-cleft; leaves ovate-oblong, taper-pointed, rounded at the base, crenate-serrated, smooth; pedicels axillary, crowded in an umbel.  5. S. Native of South America, between Guiana and Caracas, near the city of New Barcelona. Caryx white inside.

*Zizyphus-like Casarea.* Shrub 6 to 8 feet.

31 *C. celtidifolia* (H. B. et Kunth, nov. gen. et spec. amer. 5. p. 362.) flowers 10-anthered, 5-cleft; leaves oblong, taper-pointed, acute at the base, smooth, dentately-crenulate, teeth mucronate, middle nerve puberulous beneath; umbels axillary, many-flowered, on short stalks.  5. S. Native of South America, on the banks of the river Orinoco, near Angustura and Charichana. Caryx white inside.

*Cellis-leaved Casarea.* Tree 20 feet.

32 *C. prunifolia* (H. B. et Kunth, nov. gen. amer. l. c.) flowers 10-anthered, 5-parted; pedicels in glomerate, axillary fascicules; leaves oblong, taper-pointed, acute at the base, obtusely toothed, smooth, membranous, without dots.  5. S. Native of South America, in the province of Caramoara. Caryx white inside.

*Prunus-leaved Casarea.* Tree 20 feet.

33 *C. mollis* (H. B. et Kunth, nov. gen. amer. 5. p. 362. t. 430.) flowers 10-anthered, 5-parted; pedicels crowded in axillary umbels; leaves elliptical-oblong, taper-pointed, rounded at the base, toothed, smoothish above, but covered beneath with rusty down.  5. S. Native of Caracas, in shady valleys, near Aragua. Flowers whitish.

*Soft Casarea.* Shrub.

34 *C. rufescens* (St. Hil. fl. bras. 2. p. 231.) leaves clothed with rufescent tomentum; leaves elliptical, short, acuminate, serrulatus, smooth above, but clothed with rufescent tomentum beneath, full of pedicellus; flowers puberulous, umbellate; umbel sessile; fertile stamens 10, one-half shorter than the calyx; style undivided.  5. S. Native of Brazil, in the province of Minas Geraes, in that part called Minas Novas.

*Rufescens Casarea.* Shrub 4 to 6 feet.

35 *C. irusuta* (Swartz. fl. ind. oce. 2. p. 755.) flowers 10-anthered, 5-parted, pubescently-villosus; pedicels crowded, lateral, 1-flowered; leaves ovate, taper-pointed, serrate-toothed, hairy above and villous beneath.  5. S. Native of Jamaica and St. Domingo, on the mountains. Flowers whitish. Fruit trigonal. *Var. b. globulata* (D. C. prod. 2. p. 50.) leaves smooth on the upper surface, but smooth on both surfaces in the adult leaves.  5. S. Native of Porto-Rico.

*Hairy-leaved Casarea.* Cilt. 1825. Shrub 6 feet.

36 *C. fragilis* (Vent. choix. no. 47. in a note,) flowers 10-anthered, 5-parted, smooth; pedicels axillary, few, 1-flowered; leaves ovate-lanceolate, thickish, smooth, quite entire.  5. S. Native of the East Indies, and the Mauritius. *Claria fragilis*, Comm. ind. Flowers whitish inside.

*Brittle Casarea.* Shrub 6 feet.

37 *C. guineensis;* flowers 5-cleft, 10-anthered; leaves ovate-lanceolate, acuminate, serrated, 3-nerved at the base, very villous, as well as the branches; peduncles many-flowered, crowded, axillary.  5. S. Native of Guinea. Flowers small, green.

*Guinea Casarea.* Shrub 4 to 6 feet.

38 *C. grevillefolia* (Vent. choix. no. 48. in a note,) flowers 10-anthered; pedicels axillary, 1-flowered; leaves cordate-oblong, serrulated, downy beneath.  5. S. Native of Java.

*Grevillea-leaved Casarea.* Shrub.

39 *C. elliptica* (Willd. spec. 2. p. 628.) flowers 10-anthered, 5-parted; pedicels axillary, crowded, 1-flowered; leaves elliptic-lanceolate, a little serrated, bluntish, young ones pubescent beneath.  5. S. Native of the East Indies. *Anavanga lanceolata*, Lam. dict. 1. p. 146. ill. t. 355. f. 1. Flowers whitish.

*Elliptical-leaved Casarea.* Shrub.

40 *C. obtusa* (Spreng. syst. 2. p. 535.) flowers 10-anthered, 5-cleft, subsessile, axillary, solitary, very small; leaves oblong-lanceolate, triple-nerved, acuminate, unequal-sided, serrulatus, smooth on both surfaces, shining above, and full of pellucid dots.  5. S. Native of Brazil. Flowers whitish.

*Oblique-leaved Casarea.* Shrub.

41 *C. melistaureum* (D. C. prod. 2. p. 51.) flowers 10-anthered, polygonous, 5-parted; lobes concave, obtuse, spreading; sterile stamens awl-shaped, pilose at the apex; style very short.  5. S. Native of New Caledonia. *Melistatum distichum*, Forst. gen. t. 72. *Cyma pylyandra*, Willd. spec. 2. p. 626. The name is derived from melis, honey, and *aureo*, a stake; the nectar bearing some resemblance to a fence of that kind.

*Melistatum Casarea.* Shrub.

42 *C. samyda* (D. C. prod. 2. p. 51.) flowers 10-anthered; sterile filaments fringed; style very short; calyces 5-parted; capsule 5-furrowed.  5. S. Native of Porto Rico. *Anavanga samyda*, Gart. fil. 3. p. 240. t. 224. This is probably identical with one of the Decantherous species described above.  *Samyda-like Casarea.* Shrub.

44 *C. amadamantum* (St. Hil. fl. bras. 2. p. 230. t. 125.) branches smooth above, but covered with rusty tomentum below; leaves ovate, short-acuminated, serrulatus, full of pellucid dots; flowers umbellate; umbel sessile; fertile stamens 12; a little shorter than the calyx; style undivided.  5. S. Native of Brazil, in the province of Minas Geraes, in that part called Distrito dos Diamantes.
Adamoant Casearia. Shrub 5 feet.
Javita Casearia. Tree 20 feet.

† Species not sufficiently known.
47 C. dentata (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 51.) flowers deciduous, 5-parted; pedicels axillary, very short, 1-flowered, 3 or 4 together; leaves oval, bluntish, toothed, with the petioles and nerves pubescent. 3. S. Native of Mexico. This is probably identical with C. hisitata.
Toothed-leaved Casearia. Shrub 6 feet.
48 C. duera (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 51.) flowers deciduous, 5-parted; pedicels axillary, in corymbose racemes, the length of the leaves; leaves ovate-lanceolate, serrated, acute, smooth. 3. S. Native of Mexico.
Dubious Casearia. Shrub.

†† Species only known by name, without any description being given.
Vareca Casearia. Shrub.
50 C. glabra (Roxb. l. c.) 3. S. Native of the Moluccas.
Smooth Casearia. Shrub.
51 C. tomentosa (Roxb. l. c.) 3. S. Native of the East Indies, among the Circars, where it is called Garugoodoo.
Downy Casearia. Shrub 6 feet.
52 C. esculetta (Roxb. l. c.) 3. S. Native of the East Indies, among the Circars, where it is called Kundajungira.
Esculent Casearia. Shrub 6 feet.
Cult. See end of order for culture and propagation.

III. CHETOCRATER (from χειτος, chaite, a head of hair, and σπαράχος, crater, a cup; in allusion to the stamens being joined at the base into a cup-shaped tube), Ruiz et Pav. prod. fl. per. 61. t. 36. syst. p. 106. D. C. prod. 2. p. 52.—Cratèria, Pers. ench. 1. p. 485.
Lin. syst. Monadelphia, Décandra. Calyx 5-parted. Stamens 20, joined at the base into a cup-shaped tube, 10 of which bear anthers, and are shorter than the rest, the 10 sterile ones are bristle-formed and hairy. Stigmas 3.
1 C. Fasciculatum (Ruiz et Pav. fl. per. syst. 107.) leaves oblong, serrated, acuminate; flowers in fascicles. 3. S. Native of Peru, in the groves of Chinchao. Cratèria fasciculata, Pers. ench. 1. p. 485. Bark rather bitter, furnishing a cream colour.
Fascicled-flowered Chetocrater. Tree 24 feet.

Headed-flowered Chetocrater. Tree 18 feet.
Cult. All the genera of this order will thrive in a mixture of loam and peat, with a little sand; and cuttings will strike root readily if planted in a pot of sand, plunged in a moderate heat, with a hand-glass placed over them. The plants of the first section of Samyda are the most worthy of cultivation.

Flowers hermaphrodite. Tube of calyx short, obconical, usually, or perhaps always, adhering to the ovary; limb parted into pairs of lobes, from the number of 10 (f. 12. a.) to 30, outer lobes calyciform, larger than the inner ones (f. 12. a.), somewhat valvate in aestivation between themselves, alternate or inner ones smaller (f. 12. a.), petaloid, disposed in a similar mode to the outer ones in aestivation, all spreading when in flower. Petals wanting, but with sessile glands at the base (rarely in the middle) of the inner lobes of the calyx, and perhaps on the outer ones also. Stamens rising from the apex of the tube of the calyx between the glands, opposite the outer lobes of the calyx, sometimes equal in number with the lobes of the calyx, but usually 3 or 7 times that number disposed in fascicles, therefore multiple the number of the calycine lobes. Anthers 2-celled, didymous, opening by a double chink. Ovary conical, 1-celled, containing numerous ovules, usually adhering to the calyx at the base, but in part free. Styles 3-5, simple, filiform or awl-shaped. Pericarp capsular, or somewhat baccate, 1-celled. Placentas parietal, the same number as the styles, many-seeded. Seeds small, ovate, or angular. Embryo inclosed in a fleshy albumen.—Shrubs or trees, natives of the warmer regions of the world. Leaves alternate, stalked, simple, feather-nerved, toothed or quite entire. Stipulas deciduous, or probably for the most part wanting. Flowers spicate, racemose or paniced. This order agrees with Rosaceæ in the insertion of the stamens, but in the structure of the fruit it comes near to Bixiaceæ and Flacourtiaceæ. From the absence of the petals, and the insertion of the stamens, as well as in the structure of the fruit, it comes nearest to Samyda. Probably Maunèia should be referred to this order.

Synopsis of the Genera.
1 Homalium. Tube of calyx obconical, with a 12 (f. 12. a.)-14-parted limb disposed in a double series, inner lobes narrowest. Stamens in fascicles, placed in front of the outer lobes of the calyx, each fascicle containing 3-6 stamens. Styles 3, filiform.
2 Napimoga. The character the same as in Homalium, but destitute of glands at the base of the inner lobes of the calyx.
3 Azara. Calyx 4-5-parted. Stamens numerous, inserted in the bottom of the calyx. Styles 3, joined.
HOMALINEÆ. I. Homalium. II. Napisoga. III. Azara.

7 Rhinanteëra. Calyx 10-parted; segments disposed in a double series. Stamens 5, inserted in the base of the calyx, alternating with 5 glands. Style crowned by a peltate emarginate stigma.

8 Astranthus. Tube of calyx short, limb 14-cleft, the 7 alternate lobes shortest. Stamens 7; anthers 3-celled. Ovary free. Styles 4. Fruit 1-seeded.

9 Nea. Calyx turbinate, 10-12-cleft, in a double series. Stamens 5-6, opposite the inner lobes of the calyx. Ovary half adhering to the calyx. Styles 2-3. Fruit unknown.

10 Myriantheëra. Calyx campanulate, 10-cleft, the 5 inner lobes unguiculate and petaloid. Stamens inserted in the calyx, in 5 4-5 anthered fascicles. Ovary conical at the apex, inclosing 4 ovula. Styles 4. Fruit 1-seeded from abortion.

† Genera allied to Homalineæ.

12 Neëlia. Calyx campanulate, 5-cleft (f. 10. b.). Petals 5 (f. 10. d.), roundish, sessile, inserted in the throat of the calyx. Stamens numerous, inserted with the petals in a double series (f. 10. c.). Style one, obtuse. Capsule 1-celled, many-seeded. Seeds numerous, fixed to a single parietal placenta.

Lan. syst. Polygalæphila, Polygândria. Calyx somewhat conical, adhering to the ovary; limb disposed in a double series, 10 (f. 12. a.)-14-parted, inner lobes narrowest (f. 12. a.). Glands 6-7, placed at the base of the inner lobes of the calyx. Stamens placed in front of the outer lobes between the glands, in fascicles (f. 12. a.), containing 3 (f. 12. a.) or 6 stamens each. Ovary conical above. Styles 3, filiform.—Small trees, with oval-oblong, acuminate, serrated leaves, and with the flowers disposed in spicate racemes.

1 H. racemusum (Jacq. Amer. 170. t. 183. f. 72.) leaves mammaries, serrated; racemes axillary and terminal; flowers pedicelled; fascicles triandrous. h. S. Native of Jamaica, Martinique, Guadeloupe, and other parts of South America. Lam. Ill. t. 483. f. 2. There is a variety of this tree with 4 styles. Leaves ovate, bluntly-acuminate, with coarse deep serratures. Racemes length of leaves, perhaps always axillary. Flowers yellow? Jacq. Amer. Act. t. 261. f. 43. A lofty tree, with habit and leaves of elm.

Racoubea Homalium. Shrub 8 feet.

3 H. angustifoliun (Smith in Rees's cyc. no. 3.) leaves elliptical-lanceolate, almost entire; racemes axillary; flowers almost sessile; inner lobes of calyx ovate. h. S. Native of Sierra Leone. Flowers yellowish.

Narrow-leaved Homalium. Tree.

4 H. senarium (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 2. p. 54.) leaves ovate, coarsely-toothed; racemes axillary and terminal; flowers on pedicels; fascicles of stamens hexandrous. h. S. Native of Mexico.

Six-stamened Homalium. Shrub.

Cult. See end of order for culture and propagation.

Lan. syst. Polygalæphila, Polygândria. Character the same as Homalium, but destitute of the glands at the inner lobes of the calyx.—A tree, with elliptical-oblong, serrated leaves, and axillary and terminal spikes of small greenish flowers. Stamens 15.

Guiana Napisoga. Tree 20 feet.

Cult. See end of order for culture and propagation.

Lan. syst. Polygândria, Monogândria. Perianthium 4-5-parted. Petals wanting. Stamens indefinite, inserted in the base of the calyx. Anthers round, 2-celled, bursting outwards. Styles 3, joined, crowned by 3 minute stigmata. Berry globose, 1-celled, few-seeded from abortion, opening by a fissure at the base of the styles. Placentas 3, parietal, alternating with the stigmas, with lateral branches. Seeds covered with spongy aril when mature, albuminous, having 2 covers; umbilicus basilar, perforated. Embryo straight, with reniform leafy cotyledons, and a terete radicle.—Leafy trees, with alternate, simple, stalked, stipulate leaves, which are bitter to the taste. Flowers disposed in corymb or spikes, fragrant.

N. B. This genus has been inserted in Bixineæ, p. 297. vol. 1. of this work, but since that part of the work has been printed the genus has been discovered to belong to Homalineæ. We have therefore given a fresh character both of the genus and species.

Sect. I. Azará (see genus for derivation). Perianthium 5-7-parted, spreading, with the segments somewhat imbricate in axivation. Stamens indefinite, many sterile.

1 A. dentata (Ruiz et Pav. fl. per. et chil. syst. 1. p. 138. fl. per. 5. t. 465. f. a.) leaves ovate, serrated, scabrous, tomen-
HOMALINE. III. AZARA.

Tossed beneath; corymb sessile, few-flowered; stipulas leafy, unequal, one of which is large, and the other small. | G. Native of Chili, in groves about Concepcion, where it is called Corocelen.

2. A. serrata (Ruiz et Pav. fl. per. et chil. syst. 1. p. 187. gen. t. 36. fl. per. 5. t. 465. f. b.) leaves oblong, serrated, smooth; corymb stalked, many-flowered. | G. Native with the first. Stipulas leafy, one much longer than the other.

Serrate-leaved Azara. Shrub 12 feet.

Sect. II. Alme'ja (a word of no meaning). D. Don, in edinb. new phil. journ. Jan. 1831. Perianth with a connivent 4-cleft limb, furnished with scales on the inside, valvate in aestivation. Stamens definite, all fertile, disposed in fascicles opposite the lobes of the perianth.

3. A. integrifolia (Ruiz et Pav. syst. fl. per. et chil. 1. p. 138 gen. t. 35. f. b.) leaves obovate or oblong, entire, smooth; stipulas equal, permanent; flowers spiked. | G. Native with the others, where it is also called Corocelen.

† A doubtful species.

† A. celastrina (D. Don, in edinb. new phil. journ. for Jan. 1831.) leaves roundish-oval, subsessil, smooth; stipulas small, equal; flowers axillary, in fascicled panicles. | G. Native of Chili.

Celastrus-like Azara. Shrub 10 feet.

Cult. See end of order for culture and propagation.

IV. PINEDA (in honour of Anthony Pinedo, a Spanish naturalist, who went round the world with Malespina; he died on the voyage in 1782.) leaves ovate, blunt, smooth, for the most part quite entire; panicles terminal. | S. Native of the Mauritius. Flowers dodecandrous.

1. B. integrifolia (Lam. dict. 1. p. 428. ill. t. 412. f. 2.) leaves ovate, blunt, smooth, for the most part quite entire; panicles terminal; flowers dodecandrous. | S. Native of the island of Bourbon, where it is called Bois d'orce blanche from its white bark.

2. B. paniculata (Lam. dict. 1. p. 428.) leaves ovate-roundish, toothed, smooth; panicles terminal; flowers decandrous. | S. Native of Mauritius. Flowers white.

3. B. glauca (Vent. choix. t. 53.) leaves ovate-oblong, obtuse, a little toothed, smooth, glaucous; racemes axillary, panicled; flowers with 7-8 anthers, and 5 styles. | S. Native of Mauritius. Flowers white.

IV. PINEDA. V. BLACKWELLA.

Lin. syst. Dodecandria, Pentagynia. Calyx with a short tube, adhering to the ovary more or less; limb 10-30 parted, with the lobes in pairs, the inner ones smallest, outer ones larger, bearing glands at their base, but rarely in the middle. Stamens rising from the tube of the calyx, alternating with the glands, and therefore opposite the petals. Ovary conical above. Styles 3-5. Capsule 1-celled, many-seeded. Seeds fixed to the pericarps. Small trees, with ovate-toothed leaves, and simple or panicked racemes of flowers, which are probably all whitish.

† Racemes panicked.

1. B. integrifolia (Lam. dict. 1. p. 428. ill. t. 412. f. 2.) leaves ovate, blunt, smooth, for the most part quite entire; panicles terminal. | S. Native of the Mauritius. Flowers dodecandrous.

2. B. paniculata (Lam. dict. 1. p. 428.) leaves ovate-roundish, toothed, smooth; panicles terminal; flowers decandrous. | S. Native of the island of Bourbon, where it is called Bois d'orce blanche from its white bark. Vermontan de caduca, Comm. ined. ex Steud. nom. p. 111. Flowers white.

3. B. glauca (Vent. choix. t. 53.) leaves ovate-oblong, obtuse, a little toothed, smooth, glaucous; racemes axillary, panicled; flowers with 7-8 anthers, and 5 styles. | S. Native of Mauritius. Flowers white.

4. B. nigra (S. C. prod. 2. p. 54.) leaves ovate, acuminate, serrate-toothed, smooth; racemes axillary, panicled; flowers 6-7 anthered. | G. Native of Nipaul. Branches terete, grey marked with kenticulate, linear-oblong, white glands. Stipulas deciduous. Leaves 3 inches long, and an inch and a half broad. Racemes branched, many-flowered, a little shorter than the leaves. Flowers small, whitish.

Nipaul Blackwellia. Shrub.

5. B. cathi (Vent. choix. t. 56.) leaves elliptical, acuminate, toothed, smooth, shining; racemes axillary, panicled; flowers pentandrous; glands in the middle of the lobes of the calyx; ovary free. | S. Native of Madagascar. Leaves like those of the common laurel. Flowers white.

Cherry-leaved Blackwellia. Tree.

** Racemes simple, spike-formed.

6. B. axilla (Lam. dict. 1. p. 428. ill. t. 412. f. 1.) leaves ovate, a little crenated, smooth; spikes axillary, long, simple, nodding. | S. Native of Madagascar. Flowers white.

7. B. tomentosa (Vent. choix. t. 57.) leaves cuneiformly-obovate, toothed, downy beneath; spikes axillary and terminal, erect, very long, and simple; flowers 5-6 anthered. | S. Native of Java. Flowers white.

Downy-leaved Blackwellia. Tree.

8. B. spiralis (Wall. in asiat. reser. vol. 13.) leaves obovate, with glandular teeth, rather pubescent beneath; spikes axillary, very long, nodding; flowers usually pentandrous. | S. Native of Pegu, in the East Indies. Leaves almost sessile, cuneated at the base, 6-8 inches long, 2-3 broad, with distant blunt serratures. Spikes longer than the leaves, slender, simple, perhaps nodding when fresh, but they are erect in the specimen. Flowers white.

Var. ch. glaberrima (D. C. prod. 2. p. 55.) leaves smaller, and more coarsely crenate-serrrated, smooth, coriaceous; spikes almost 3 times longer than the leaves. | S. Perhaps another species.

HOMALINEE. VI. Illigeria. VII. Rhinanthera.

9 B. padiflora (Lindl. bot. reg. 1308.) leaves oval, denticulated, smooth; flowers hexandrous and tetragynous; racemes erect, shorter than the leaves. ½. G. Native of China. Calyx 6-cleft. Petals 6, white. Perianth 12-parted, the inner segments ciliolate, resembling very much an elaborately finished shuttlecock. The shrub will grow very well in the open border in summer.

VI. ILLIGERIA (in honour of C. W. Illiger, a naturalist). Blum. bijdr. 1165.

Lin. syst. Pentändria, Monogyúnia. Calyx superior, 10-parted; segments disposed in 2 series, inner series petaloid. Stamens 5, inserted in the base of the calyx, and alternating with 5 glands. Filaments naked at the base or biauriculate. Anthers erect, bursting valvately at the sides by 2 cells, as in Laurineae. Ovary inferior, 1-ovulate. Style crowned by a petalate emarginate stigma. Fruit unknown.—Sarracinoideae shrubs, with alternate, ternate, entire leaves, and axillary panicles of flowers.

1 I. appendiculata (Blum. bijdr. 1153.) leaflets oval-oblong, bluntish, veiny, smooth; panicle tomentose; stamens biauriculate at the base. ½. S. Native of Java, on the high mountains called Burangrany.

Appendiculate-stamened Illigeria. Shrub straggling.

2 I. fulvichra (Blum. bijdr. 1164.) leaflets oval-oblong, acuminated, veined transversely, and are, as well as the panicles, smooth; stamens without appendages. ½. S. Native of Java.

Fair Illigeria. Shrub straggling.

Cult. See end of order for culture and propagation.

VII. RHINANTHERA (from πρᾶς, rhína, a snout, and αὐθής, anatha, an anther; in allusion to the anthers being beaked). Blum. bijdr. 1121.

Lin. syst. Icosándria, Monogyúnia. Calyx 8-parted, permanent, with the segments disposed in 2 series, inner series largest and biglandular at the base. Corolla wanting. Stamens numerous, unequal; anthers beaked, 2-celled. Style 1, short, crowned by an obtuse 3-4-gonal stigma. Berry globose, beaked by the permanent style, 3-4-celled; cells 2-4-seeded. Embryo perhaps exalbuminous.—A branched spiny shrub, with alternate, ovate-oblong, serrulato, coriaceous, smooth leaves, which are biglandular at the base. Racemes axillary and terminal, short, tomentose. Flowers small, sweet-scented.

1 R. odoratl’sima (Blum. bijdr. 1. c.) ½. S. Native of Batavia, in boggy places.

Sweet-scented Rhinanthera. Shrub 6 feet.

Cult. A mixture of peat and sand will probably suit this plant; and ripened cuttings will perhaps root in sand under a hand-glass, in heat.

VIII. ASTRA’NTHUS (from αστρα, astron, a star; and αὐθῆς, anathos, a flower; lobes radiating in a stellate manner). Lour. fl. cochin. D. C. prod. 2. p. 55. Sims, bot. mag. 2659.

Lin. syst. Héptándria, Tetragynía. Calyx with a short tube, with the limb cleft into 14 parts, the 7 alternate ones shortest. Stamens 7-10; anthers 3-celled. Ovary free. Styles 4-5. Fruit 1-seeded (Lour.). This genus is considered to be the same as Blackwellia.

VOL. II.

VIII. ASTRANThUS. IX. NISA. X. MYRANTHEIA, &c. 57

Lin. syst. Penta-Hexándria, Di-Trigynía. Calyx turbinate, 10-12-cleft, in a double series; the inner ones are called petals by Pet. Th.; these are erect. Glands alternating with the inner lobes of the calyx. Stamens 5-6, opposite the inner lobes, alternating with the glands. Ovary half adhering to the calyx tube. Styles 2-3. Fruit unknown.—Shrubs, with sinuate-toothed leaves.

1 N. nudiflora (D. C. prod. 2. p. 55.) flowers in naked spikes. ½. S. Native of Madagascar.

Naked-flowered Nisa. Shrub.

2 N. involucrata (D. C. prod. 2. p. 55.) flowers enveloped in large, compressed, coloured involucre. ½. S. Native of Madagascar.

Involucrated-flowered Nisa. Shrub.

Cult. See end of order for culture and propagation.

X. MYRANTHEIA (from μύρα, myrás, a myriad, and an-σκο, anthos, a flower; flowers numerous). Pet. Th. gen. mad. no. 71. D. C. prod. 2. p. 55.

Lin. syst. Polyadélphía, Polyándria. Calyx campanulate, 10-cleft, outer lobes oblong, convolute, calyciform, inner lobes shorter, unguiculate, petal-like. Stamens inserted in the calyx, polyadephous, fascicles 5, containing from 5 to 5 slender filaments. Scales 5, alternating with the fascicles of the stamens. Ovary half adhering to the calyx, conical at the apex, including 4 ovula. Styles 4. Fruit 1-seeded from abortion.—Small elegant trees or shrubs, natives of Madagascar, with alternate, short, stalked, thick leaves. Flowers numerous, white, in axillary racemes. The character of this genus is taken from Pet. Th. 1. c., but the species still remain unpublished.

Cult. See end of order for culture and propagation.

† Genera allied to Homalineae.

XI. ASTEROPEIA (from αστρα, astron, a star; in allusion to the lobes of the calyx being disposed in a stellate manner). Pet. Th. gen. afr. aust. p. 51. t. 15. gen. mad. no. 75. D. C. prod. 2. p. 55.

Lin. syst. Decándria, Monogyúnia. Calyx large, permanent, 5-cleft; lobes oblong, expanded. Petals 5, deciduous, inserted in the calyx, and alternating with its lobes. Stamens 10, the 5 alternate ones shortest, adnate to the urceolus of the calyx. Ovary trigonal, 5-celled. Style short, trifid. Sígmas capitulate. Seeds fixed by their centre.—A middle-sized tree, with alternate, short-stalked, quite entire leaves, and numerous purplish flowers, which are disposed in decussating panicles.—This genus is said to be allied to Blackwellia by the author Pat. Thouars. 1 A. multífór (Pet. Th. 1. c.) ½. S. Native of Madagascar, near Foul Point.

Many-flowered Asteropeia. Tree 20 feet.

Cult. See end of order for culture and propagation.

Lin. syst. Icosándria, Monogyúnia. Calyx campanulate (f. 10. b.), free, 5-cleft. Petals 5, roundish (f. 10. d.), sessile, inserted in the throat of the calyx. Stamens numerous, disposed in a double series (f. 10. c.), inserted with the petals; filaments smooth; anthers roundish, 2-celled (f. 10. d.), bursting lengthwise outwardly. Style terete, smooth, crowned by an obnute stigma (f. 10. g.). Capsule follicular, 1-celled, opening on the inner I
side, many-seeded, crowned by the permanent style, free within the calyx. Seeds spherical, shining, fixed to a single parietal placenta in a double series, having a double covering. Albumen fleshy. Embryo straight, with oval flat cotyledons, and a thick obtuse radicle. Plumule inconspicuous.—Shrubs, with the habit of Aristotelia, simple, alternate, doubly-serrated, stalked leaves. Stipulas deciduous, membranous or leafy, acute. Flowers disposed in racemes, white, terminal or lateral.

1 N. thyrsoflora (D. Don, prod. fl. nep. 223.) leaves corolate, ovate, and 3-lobed, doubly-serrated; stipulas leafy, serrate; racemes spicate, disposed in a terminal thyrse; bracteoles toothed; calyx silky. H. Native of Nipal. A much branched shrub, with the branches canescent, and with the leaves villous on the nerves beneath. 

FIG. 10.

Thyrse-flowered Neillia. Shrub 6 feet.

2 N. rubiflora (D. Don, prod. fl. nep. 223.) leaves corolate, 3-lobed, acuminate, doubly-serrated; stipulas, entire, membranous; racemes terminal, solitary, many-flowered; bracteoles blunter, entire; calyx tomentose; petals roundish. H. Native of Nipal. Flowers twice the size of those of N. thyrsoflora, and the calyx is furnished with pedicellate glands inside (f. 10.).

Bramble-flowered Neillia. Shrub 6 feet.

Cult. See end of order for culture and propagation.

XIII. ARISTOTELIA (named after Aristotle, the celebrated philosopher). Lher. stirp. p. 31. t. 16. D. C. prod. 2. p. 56. but not of Adams. nor Lour.

Lin. syst. Polydélphium, Polyantria. Calyx campanulate, profoundly 5-cleft. Petals 5, inserted in the base of the calyx, and alternating with its lobes. Stamens 15-18, especially 3 or 4 in each bundle, placed in front of the lobes of the calyx. Anthers opening by 2 pores at the apex. Ovary free. Styles 3, somewhat connected at the base. Berry globose, 3-celled, each cell containing 1-2-ovula. Seeds angular, with fleshy albumen, and a flat embryo.—A shrub, with diffuse branches. Leaves nearly opposite, stalked, oblong, acute, smooth, shining, dentate, permanent. Stipulas deciduous. Racemes axillary. Flowers small, greenish. Some of the stamens are sterile. From the disposition of the stamens this genus agrees with Homalium, but from the dehiscence of the anthers it comes nearer to Elevocharypea.

1 A. Macqui (Lher. l.c.) H. Native of Chili, where it is called Macqui. Lam. ill. t. 399. Watts. dend. brit. t. 44. A. glandulosa, Ruiz et Pav. fl. per. syst. p. 126. Poir. suppl. 587. The berries are about the size of a pea, very dark purplish, at length becoming black; they are acid and edible. The inhabitants of Chili make a wine from them, which they give in malignant fevers. Dombeys used this remedy with success in Chili against the plague in 1782.

Macqui Aristotelia. Fl. April, May. Cit. 1733. Sh. 6 ft. Cult. The plants of this order are scarcely worth cultivating for ornament, as the flowers of all are extremely insignificant. The stove and greenhouse species will grow freely in a mixture of loam, sand, and peat; and cuttings nearly ripe will strike root if planted in a pot of sand, with a hand-glass placed over them; those of the former should be placed in a moderate heat. The Aristotelia Macqui and the species of Neillia being hardy, and furnished with beautiful leaves, are worth cultivating in shrubberies, but they will require to be sheltered during winter by a mat, as the shoots are apt to be killed by the ground by frost. Any common garden soil will suit them, and ripened cuttings will root freely, planted under a hand-glass, and they may also be increased by layers.

Calyx (perigone) permanent, 5-cleft (f. 11. a. d.) coloured inside, with the lobes imbricate in restivation. Petals (or petal-like scales, or abortive stamens) rising from the bottom of the calyx and alternating with its lobes, situated almost in the same circle with the stamens (f. 11. b.), small, usually bifid (f. 11. b.), sometimes connected at the base with the stamens (f. 11. d.). Glands opposite, numerous. Stamens exerted from the calyx, and placed opposite its lobes (f. 11. d.), and therefore alternating with the petals; anthers roundish, 2-celled. Ovary free, hairy (f. 11. b.), 2-3-celled, each cell containing 2 ovula. Styles 2 (f. 11. g.), 3, short, free, or connected together. Stigmas somewhat capitate (f. 11. g.).—Drupes (f. 11. k.), with a dry, coriaceous rind, containing a 2-3-celled nut, but usually 1-2-celled from abortion. Seeds solitary in each cell, hanging from the apex (f. 11. i.), destitute of albumen. Embryo thick, with a short superior radicle and fleshy cotyledons.—Shrubs with alternate, bispinate, short, stalked, oval, acute, feather-nerved, entire leaves. Flowers axillary, white, usually with the peduncles adhering to the petioles. This order is furnished as if it were with a calyx and corolla.

Synopsis of the Genera.

1 Chailletia. Calyx 5-lobed (f. 11. a.). Petals 5, bifid (f. 11. b.). Stamens 5. Ovary 2-3-celled (f. 11. f.). Styles 2 (f. 11. g.) -3, free, or joined. Drupe dry, containing a 2-3-celled nut (f. 11. i. k.).

3 Tapura. Calyx 5-parted; segments fringed. Petals 3, connate and connected with the filaments; they are divided. Stamens 3. Style 1, trifid.

Lin. syst. Pentandria, Mono-Trigyna. Calyx 5-lobed (f. 11. a.). Petals 5, bifid, or emarginate (f. 11. b.). Stamens 5. Ovary 2-3-celled, 2-3-styled (f. 11. f.). Styles free (f. 11. g.), or connected together. Shrubs with axillary cymes or racemes of flowers.

1 C. Pedunculata (D. C. 1. c.) leaves ovate, obtuse, and un-
equal at the base; peduncles dichoto-
mous, corymbose, adnate at the base
to the petiole; petals bifid; styles

Stalked-flowered Chailletia. 5h.

Sect. II. Dichapetalum (from di-
cha, dica, double, and petalon,
petalon, a petal; in allusion to the
petals being emarginate). D.C. prod.
2. p. 57. Styles connected together.
2 C. Timoriensis (D. C. prod.
2. p. 57.) leaves oval, acuminate at
both ends; peduncles dichoto-
mously corymbose, not adhering
to the petiole; petals obtuse, emarginate; styles connected to
on both surfaces. Calyx and peduncles white from vili. Flowers white.

Timor Chailletia. Shrub 6 feet.

3 C. dichapetalum (R. Brown, cong. p. 24.) branches climbing,
almost leafless; flowers in umbels in the axille of
the leaves; petals bifid; styles joined. [5] S. Native of
Madagascar. Dichapetalum Madagascarense, Pet. Th. gen-
mad. no. 78. D. Thouarsianum, Rdm. et Schult. syst. 5.
the base of the ovaries. Flowers white.

Double-petalled Chailletia. Shrub.

4 C. toxica (G. Don, in edibl. phil. journ. 1824. oct.
p. 534.) leaves oblong-lanceolate, acuminate, smooth, cori-
aceus, with wavy entire margins, on short stalks; racemes
pediciled, axillary, and terminal, pubescent; drupe ovate, pubescent.
[6] S. Native of the mountains of Sierra Leone, where it is
called raw-bane by the colonists, the kernel of the fruit being
used for poisoning rats. Flowers small, white. Fruit dry, the
size of a plum.

Var. β, compresa (G. Don, l. c.) fruit roundish-compressed.

Poisonous Chailletia. Fl. year. Cl. 1823. Shrub 5 feet.

5 C. eretta (G. Don, l. c.) branches elongated, erect;
leaves oblong-lanceolate, obtuse, emarginate, entire, smooth,
coriaceus, stiff; flowers axillary; drupe ovate, rounded, pub-
escent, dry. [7] S. Native of Sierra Leone, on the moun-
tains. Fruit rather larger than those of the preceding species.

Cult. See end of order for culture and propagation.

II. LEUCOSIA (from λευκός, leucos, white). Pet. Th. gen-
mad. no. 79. D. C. prod. 2. p. 58.—Chailletia, spec. R. Br.

Lin. syst. Pentándria, Monogynia. Calyx 5-cleft. Petals
5. Stamens 5. Ovary adhering to the calyx, 3-seeded. Style 1.
Fruit trigonial, containing a wrinkled bony nut.

1 L. Thouarsiana (Rdm. et Schult. syst. 5. p. 324.). [8] S.
Native of Madagascar. A small weak shrub with few-nerved
scarious leaves, which are white from down beneath. Chailletia
Leucosia, Spreng. syst. 1. p. 931.

Petit Thouars’s Leucosia. Shrub 6 feet.

Cult. See end of order for culture and propagation.

III. TAPURA (Tapura is the name of the tree in Guiana).
p. 58.—Rohria, Schreb. no. 63.

Lin. syst. Triandria, Monogynia. Calyx 5-parted, with
unequal, fringed lobes. Petals 3, connected with the filaments at
the base, emulating a monopetalous corolla; the two longest are
2-parted, the third is short and 3-parted. Stamens 3. Style 1,
trifid at apex. Fruit unknown.

1 T. Guianaensis (Aubl. guian. l. c.). [9] S. Native of
Guiana, in woods on the Serpent Mountain. Rohria petaliflora,
17. p. 153. t. 1. f. 2. Flowers yellow. The creoles call it
Bois de Gollet.

Guiana Tapura. Shrub 8 feet.

Cult. The plants of this order are not worth cultivating but
in the gardens of the curious, as neither their leaves nor flowers
possess any beauty. They will grow in a mixture of loam and
peat, and young cuttings will probably strike root in a pot of
sand, under a hand-glass, in heat.

Order LXXII. AQUILARINÆ. (plants agreeing with
Aquilaria in important characters). R. Brown, cong. p. 25.
D. C. prod. 2. p. 59.

Calyx or perigone, turbinate, coriaceous, 5-lobed (f. 12. e.);
segments ovate, acut, spreading, permanent (f. 12. h.).
Urecloseus adhering to the bottom of the perigone, 5-parted, with
bifid lobes (f. 12. b. d). Stamens 10 (f. 12. b.), with short
filaments protruding between the lobes of the urecloses, bearing long
versatile anthers (f. 12. c). Ovary free (f. 12. c.), stipitate ovate,
crowned by a short simple stigma. Capsule pear-shaped (f. 12.
g.), 2-valved, 2-celled (f. 12. f.), with a dissepiment in the
middle of each valve (f. 12. f.). Seeds solitary in the cells from
abortion, arillate or tailed.—Trees, with alternate, feather-
nerved, quite entire leaves. This order is not sufficiently known.
It differs from Sarnylæca in the seeds being fixed to a dissep-
iment, not to the parietes; from Chailletiaceae in the seeds
being erect, not inverted, as well as in the stamens being twice
the number of the lobes of the perigone; from Thymélæce in
the fruit being 2-valved, 2-celled, 2-seeded. The genera are badly
defined, and the species are scarcely known.

Synopsis of the Genera.

1 Aquilaria. Perigone 5-cleft (f. 12. e. h.). Urecloseus
lobed (f. 12. d.). Stamens 10 (f. 12. b.). Anthers versatile

Stamens 10. Anthers adnate. Seed furnished on the side by a
long saccate wing.

3 Gyring Aprils. Perigone tubular, toothless. Seed furnished
with a spongy, awl-shaped, trigeroous tail each.

I. AQUILARIA (from aquila, an eagle; the wood of A.
Malaccensis is called Bois d’Agle, or eagle-wood, in Malacca).

Lin. syst. Decandria, Monogynia. Perigone 5-
cleft (f. 12. e. h.). Urecloses 5-lobed; lobes bifid (f. 12. d.), Stamens 10. An-
thers versatile (f. 12. e.), fixed by the middle. Style
none. Seeds covered by a spongy body.

1 A. Malaccensis (Lam. l. c.) leaves ovate, abruptly-acuminate. [10]

2 A. Agallocha (Roxb. hort. beng. p. 33.) ग. Native of the East Indies, where it is called Ugoor or Ugooroo by the natives, and by Europeans Lignum-aloe or Aloe-wood, but the Abéchyson Longuevii is a very distinct plant from this and the following. The wood has a fine scent, and is called Agallochum. This shrub is supposed to be the Calambe or Agallachum of the ancients. Agallochum or Aloe-wood. Tree.

3 A. secundaria (D. C. prod. 2. p. 59.) ग. Native of the Moluccas. Agallochum secundaria, Rumph. amb. 2. t. 10. This species, according to Lamark, differs from the preceding in the leaves being gradually acuminate, not abruptly so. The wood of this tree has been long used as a perfume, and was formerly an article of the Materia Medica, under the names of Agallochum, Lignum Aloe or Aloe-wood. This wood in its natural state is white and inodorous. That which possesses the peculiar aroma, for which it is valued, is supposed to be the consequence of a diseased process in the tree, causing the oleaginous particles to stagnate and concrete into resin in the inner part of the trunk and branches, by which the natural appearance of the wood is altered, so as to be of a darker colour, and of a fragrant smell. At length the tree dies, and when split the resinous part is taken out. The perfumes which this wood affords are highly esteemed by the oriental nations. This perfume is said to be useful in vertigo and palsy, given in the form of powder; it is recommended to restrain vomitings and alvine fluxes. But it seems to contain little else than that camphoraceous matter common to many other vegetable substances. From its bitter taste it has the name of aloes. The above description may apply to all the species, or perhaps to Abéchyson Agallochum. See Leguminoseae.

Secondary Aloe-wood. Tree.

Cult. See end of order for culture and propagation.

II. OPHISPER’MUM (from φόες, ophis, a snake, and σπέρμα, sperma, a seed; in allusion to the twisted form of the seed). Lour. fl. coch. 281. D. C. prod. 2. p. 59.

China Snake-seed. Tree 60 feet.

Cult. Sée end of order for culture and propagation.

III. GYRINO’S (from γρήγος, gyrōs, a circle, in allusion to the tail of the seed). Garr. fruct. 2. p. 276. t. 140. D. C. prod. 2. p. 60.

1 G. Wά’lla (Garr. l. c.) ग. S. Native of Ceylon, where it is called Walla. No part but the fruit of this tree is known.

Wά’lła Gyrinops. Tree.

Cult. The plants of this order are not worth cultivating unless in botanical gardens; the species will all grow in a mixture of loam and peat, and cuttings will strike root in sand under a hand-glass placed in heat.

Flowers usually unsexual, rarely hermaphrodite. Calyx small and permanent, with 5, or occasionally 3-4 or 7 divisions. Petals equal in number to the divisions of the calyx, perigynous, sometimes wanting, imbricate in vestation. Stamens equal in number to the segments of the calyx, perigynous, or twice that number, or even more, equal or alternately shorter, some of them sterile; filaments distinct, or in genera having no calycine disk, adhering at the base. Disk fleshy, annular, or cup-shaped, hypogynous, occasionally wanting. Ovary simple, very rarely 5-6, of which 4 or 5 are abortive, superior, rarely inferior, 1-celled. Styles 1-3, sometimes 4, and sometimes wanting, with an equal number of stigmas. Ovum solitary, attached by a cord to the bottom of the cell. Fruit indehiscent. Seeds exalbuminous. Embryo either with a superior or inferior radicle, but always directed towards the hilum, sometimes suddenly curved back, with leafy or fleshy cotyledons.—Trees or shrubs, full of resinous, gummy, caustic, highly poisonous, or even milky juice. Leaves alternate, simple, ternate, or pinnate, destitute of pellucid dots. Flowers terminal or axillary. All the orders broken off from Terebinthaceae, are very nearly related to each other, and whatever affinity is borne by one of them will be participated in by all the others, in a greater or less degree. They are distinguished from Rhamnaceae in their resinous juice, imbricate calyx, and stamens not opposite the petals; from Celastraceae by several of the same characters and the want of albumen; from Rosaceae and Leguminoseae by their dotted leaves, very minute stipulas, if any, resinous juice, solitary ovum, or by some one or other of these characters. Some of the trees contained in this order are celebrated for yielding a cammmy juice, which is at first white and afterwards becomes black, and is used for varnishing in India.

The varnish from Silhet is chiefly procured from Senecéarpus, one kind from Anacardiun. All these varnishes are dangerous, they inflame the skin and produce painful swellings. A valuable black lac or varnish is obtained from Stagmária vernícīfla (edin. phil. journ. 6. p. 400.). A black varnish, well known in India, is manufactured from the nupes of Senecéarpus and the berries of Holigária longifōlia, and from the trunk of Melanorrhéa. The leaves of some species of Schinús are so filled with resinous fluid, that the least degree of unusual repletion of the tissue, causes it to be discharged; thus some of them fill the air with their fragrance after rain, and S. mōlile and some others expel their resin with much violence when immersed in water, so as to have the appearance of spontaneous motion, in consequence of recoil. Schinús arroēstra is said by St. Hilaire to cause swellings on those who sleep under its shade. The fresh juicy bark of the Arrueira shrub, S. mōlle, is used in Brazil.
for rubbing newly made ropes, which it covers with a very
durable bright brown colour. The juice of the same plant
is applied by the Indians in diseases of the eye (Prince
Maximil. trav. 270.). The bark of Semecarpus Anacardiun and Ana-
cardium occidentale is said to exercise a singular effect on
the brain (Verrey. bull. pharm. 1814. p. 271.). The bark of Rhiz
glabrum is considered febrifugal, and is also employed as a
mordant for red colours. Several species of Comocladia stain
the skin black. The Cashew and the Pistacia are valuable for
their nuts, which are well-known articles in the markets of
Europe. The Mango is equally famous for its fruit within the
tropics. Mastich is the produce of Pistacia lentiscus and Ve-
etian turpentine that of Pistacia terebinthus. The bark of
Rhus coriaria is a powerful means of tanning the skins of animals,
and several of the species of the same genus produce excellent
varnishes.

Synopsis of the Genera.

Tribe I.

Anacardieæ or Cassuviæ. Petals and stamens inserted in
the calyxine disk or in the calyx. Ovary 1, 1-celled, 1-ovulate.
Seed sustained by a funiculus, which rises from the apex and
rising from the bottom of the cell, exalbuminous. Cotyledons
thick, replicae above the radicle.

1 Anacardium. Flowers polygamio-dioecious. Calyx 5-
parted. Petals 5, linear. Stamens 10, unequal, some sterile.
Style and stigma one. Nut kidney-shaped, seated on a pear-
shaped fruit. Leaves simple.

2 Rhinocarpus. Flowers polygamio-dioecious. Calyx 5-
cleft. Petals 5, oblong. Stamens 10, 4 or 5 of which are only
fertile. Style lateral. Nut oblique, compressed, seated on a
thick pedicle. Leaves simple.

3 Semecarpus. Flowers polygamio-dioecious. Calyx 5-
cleft. Petals 5, oblong. Ovary 1, sessile, 1-celled. Stamens 5,
all fertile. Styles 3. Nut compressed, heart-shaped, seated on a
thick depressed torus. Leaves simple.

4 Holigæna. Male and hermaphrodite flowers on divi-
sions of the same tree. Calyx 5-toothed. Petals 5, villous.
Stamens 5. Ovary 1-celled, 1-seeded. Nut olive-formed,
somewhat compressed. Leaves simple.

5 Mangifera. Flowers polygamous. Calyx 5-parted. Pet-
als 5. Stamens 5, 4 of which are usually without anthers.
Style 1. Drupe baccate, rather compressed (f. 13. b.), contain-
ing a fibrous woody nut (f. 13. c.). Leaves simple.

6 Buchanania. Flowers hermaphrodite. Calyx 5-cleft,
more or 3-4-cleft. Petals 5, inserted under the disk. Stamens
10. Disk 10-crenate. Ovaries 5 or concrete, 4 of which are
barren, the styles are therefore 5, and the ovary 1. Drupe
rather fleshy, 1-seeded. Leaves simple.

7 Contocoton. Flowers hermaphrodite. Calyx 5-parted.
Petals 5. Stamens 10, equal. Ovaries 4-5, 1-styled, girded by a
denticulated aracelus. Stigmas obtuse. Drupe solitary, con-
taining a 1-seeded lenticular nut. Leaves simple.

8 Pistacia. Flowers dioecious, apetalous, disposed in
amentaceous racemes, each scale with 1 flower. Calyx 3-4-
cleft. Ovary 1-3-celled. Stigmas 3, thickish. Drupe rather
dry, containing a bony, 1-celled, 1-seeded nut. Leaves pinnate.
9 Astroïnum. Flowers dioecious. Calyx of 5 coloured
Styles 3, reflexed. Pericarp membranous, 1-seeded. Leaves
impari-pinnate.

10 Melanorrhoea. Flowers hermaphrodite. Sepals 5, ca-
ducous, cohering valvately. Petals 5, rarely 6, imbricate in
resting. Stamens numerous, inserted in the torus. Style 1.
Fruit indehiscent, depressed kidney-shaped, stalked. Leaves
impari-pinnate.

11 Comocladia. Flowers hermaphrodite or monoecious.
Calyx 3-4-parted. Petals 3-4, long. Stamens 3-4, short.
Leaves impari-pinnate.

12 Cytocarpa. Flowers polygamous. Calyx 5-parted.
Petals 6, sessile, imbricate in aestivation. Stamens 10. Disk
large, 10-crenate. Style crowned by a 10-cleft stigma. Drupe
obovate, having 5 tubercles above the middle, containing a hard
nut. Leaves impari-pinnate.

13 Spathelea. Flowers dioecious or polygamous. Calyx
5-parted. Petals 5, hypogynous. Stamens 5, with tricuspidate
filaments. Stigmas 5. Drupe 5-celled, trigonal, 3-winged,
sometimes 2-celled and 2-winged. Cells 1-seeded. Leaves
impari-pinnate. Perhaps belonging to Sapindaceæ.

14 Picraænia. Flowers dioecious. Calyx 3-5-parted. Pet-
als 3-5. Stamens 3-5. Stigmas 2, sessile. Drupe containing
a 2-celled, 2-seeded nut. Leaves impari-pinnate.

15 Bischofia. Flowers dioecious. Calyx 5-parted. Petals
none. Stamens 5, connate. Ovary 3-celled; cells 2-ovulate.
Stigmas 3, sessile. Fruit containing 3 1-seeded nuts. Leaves
trifoliate.

16 Sabia. Flowers hermaphrodite. Calyx 5-cleft. Petals
5. Styles 2, contiguous, crowned by an obtuse stigma. Stam-
ens 5, inserted in a 5-lobed disk. Drupe 2-lobed; lobes 1-
seeded.

Tribe II.

Sumachææ. Petals and stamens inserted in the calyceine
disk or in the calyx. Ovary 1, 1-celled, 1-ovulate. Seed pend-
dulous, suspended from a funiculus, which rises from the base, ex-
albuminous. Cotyledons leafy, with the radicle infixed above them.

17 Rhus. Calyx small, 5-parted. Petals 5. Stamens 5,
all fertile, both in the male flowers and the hermaphrodite ones.
Ovary 1, 1-celled, 1-seeded. Styles 3, short, or stigmas 3,
sessile. Drupe nearly dry, 1-celled, containing a 1-celled, 1-2-3-
seeded bony nut. Leaves variously compound, rarely simple.

18 Maurocia. Flowers hermaphrodite. Calyx 4-5-lobed,
urecolate. Petals 4-5. Stamens 8-10, inserted under the an-
nular disk. Ovary 1, sessile, 1-celled, 1-seeded. Style very
short, crowned by a 3-4-angled stigma. Fruit compressed,
rather fleshy. Leaves impari-pinnate.

19 Stomaæia. Flowers hermaphrodite. Calyx tubular,
irregularly ruptured. Petals 5, inserted in the stipe of the ovary.
ANACARDIUM. 

Tribe I.

ANACARDIACEÆ (trees agreeing with Anacardium in important characters) or CASSUVIÆ. R. Br. cong. p. 12. D. C. prod. 2. p. 62. Petals and stamens inserted in the calyx-cine disk or in the calyx. Ovary 1 from abortion, 1-celled, containing 1 ovum. Seed sustained by a funicle rising from the bottom of the cell, which is inflates at the apex, without albumen. Cotyledons thick, replicate above the radicle.

I. ANACARDIUM (from an, without, and capéa, kardia, a heart; the nut is heart-shaped, and borne on the outside of the fruit). Rottb. coll. hafn. 2. p. 252. D. C. prod. 2. p. 62.—Acajuba, Grett. fruct. 1. t. 40. Acajou, Tourn. inst. 435. Cassuvium, Lam. dict. 1. p. 22. ill. 322. LIN. SYST. Polygynnium, Diwëcia. Flowers polygamo-dioecious. Calyx 5-parted. Petals 5, linear, acuminiated. Stamens 10, connate at the base, the tenth elongated and fertile. Style and stigmas 1 lateral. Nut reniform, umbilicated, seated internally on a fleshy, wide, pear-shaped peduncle, or what may be called a nut, seated on a fruit. Seed in conformity to the nut. Embryo erect, with half-moon-shaped cotyledons, and an exerted radicle.—Trees with entire, feather-nerved leaves, and terminal panicles of flowers.

1 A. occidentale (Lin. spec. 548.) leaves oval, cuneate, very blunt, somewhat margined, obovate-oblong, entire, smooth; panicule terminal, divaricate. h. S. Flowers small, of a dirty red colour, sweet-scented. Var. a, Americum (D. C. prod. 2. p. 62.) peduncle thick, about 10-times larger than the nut; longest filament bearing a globe-shaped anther, which is a little dilated at the apex. h. S. Native of the West Indies, and of most parts of South America. Jacq. amer. 1. t. 181. f. 55. pict. t. 121. Black. herb. t. 585. Cataeb. car. 3. t. 9.

Var. b, Indicum (D. C. prod. 2. p. 62.) peduncle thick, scarcely 3-times larger than the nut; longest filament bearing a thick anther, the rest abortive. h. S. Native of the East Indies Islands. Rumpl. amb. 1. p. 177. t. 169. Rheed. mal. 5. t. 54. Probably the American plant is a distinct species.

The Cashew-nut never exceeds 20 feet in height; it commonly rises to 12 or 16 feet, with spreading branches. The fruit or apple, or what is called above the thickened peduncle, has an agreeable, somewhat acid flavour, with some degree of astrigency. It is sometimes of a yellowish, sometimes of a red colour. The juice expressed from it and fermented, yields a pleasant wine, and distilled a spirit is drawn from it, far exceeding arrack or rum, making an admirable punch, and powerfully promoting urine. Some planters in the West Indies and elsewhere roast the ripe fruit, or slice one or two into a bowl of punch to give it a pleasant flavour. The astrigency of the juice has recommended it as a very signal remedy in dropscial habits. The nut springs from one end of the apple or peduncle. It is of the size and shape of a hare’s kidney, but is much larger at the end next the fruit than at the other. The outer shell is of an ash-colour and very smooth, under this is another which covers the kernel, between these is a thick inflammable oil, which is very caustic, this will raise blisters on the skin and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell. This oil has been used with great success in eating off ring-worms, cancerous ulcers, and corns, but it ought.
to be applied with caution. The kernel, when fresh, has a most
delicious taste, and abounds with a sweet milky juice. The
broken kernels are sometimes imported for mixing with old
Madeira wines, the flavour of which they improve. It is an in-
redient in puddings, &c. &c. When older it is usually roasted,
and in this state is not so proper for custive habits. Ground
with cacao it makes an excellent chocolate. When kept too
long it becomes shrivelled, and loses its flavour and best qual-
ities. The thick oil of the shell tingles linen of a rusty iron
colour, which can hardly be got out; and if any wood be
smear'd with the oil it prevents it from decaying. It would
therefore be an excellent preserver to house timbers. From
the body of the tree is procured by tapping or incision a milky juice,
which will stain linen of a deep black that cannot be washed out
again. The tree also annually exudes from 5 to 10 or 12 pounds
weight of a fine semitransparent gum, similar to gum Arabic,
and not inferior to it in virtue or quality, which perhaps renders it
in some respects more valuable.

Cashew-nut or Western Anacardium. Fl. year. Clt. 1699.
Tree 16 ft. tall. Clt. 1699.

Cashew. A light loamy soil answers the species of Cashew-nut,
and ripened cuttings, with their leaves on, root freely in sand
under a land-house, in heat.

II. RHINOCARPUS (from ρηξ rhin, a snout, and καρπος,
karplos, a fruit; fruit ending in a snout). H. B. et Kunth, nov.
gen. amer. 7. p. 5. t. 601.

Lin. syst. Polygynia, Diceceia. Flowers polygamous. Petals
oblong, reflexed. Stamens 10, very unequal, 2 or 4 bearing
anthers, the rest sterile, with the filament connate at the base
and adnate to the petals. Style sublateral, crowned by an obtuse
stigma. Fruit oblique, compressed? 1-seeded, on a thick fleshy
calyx.—A tree with the habit of Anacardium, having simple,
scattered, entire, ovobate, exstipulate leaves, and a terminal
cornybose raceme of flowers, with racemose bracteate pedicels.

1 R. exesa (Bert. indcl. H. B. et Kunth, 1.c.). h. S. Na-
tive of South America in St. Martha, Tobago, and New Granada.

Anacardium rhinocarpus, D. C. prod. 2. p. 62.

Tall Rhinocarpus. Tree 140 feet. Clt. 1699.

Cult. For culture and propagation see Anacardium.

III. SEMECARPUS (from σεμεσιον, seonion, a mark, and
καρπος, karplos, a fruit; use of juice). Lin. fil. suppl. 25.
Kunth, gen. tereb. p. 5. D. C. prod. 2. p. 62.—Anacardium,
Lin. dict. 1. p. 139; ill. t. 208. Gort. fruct. 40.

Calyx flat, 5-cleft. Petals 5, oblong. Stamens 5, all bearing
anthers. Disk arcuolar in the bottom of the flower. Ovary 1,
sessile, girded by a tumid ring, 1-celled? Styles 3. Stigmas
obtuse, emarginate. Nut compressed, heart-shaped, seated on
a depressed, thickened torus. Seed conforming to the nut.
Embryo inverted, with fleshy cotyledons and a 2-leaved plu-
mule, with a small radicle lying at the top between the cotyle-
dons.—Trees with entire feather-nerved leaves and axillary and
terminal panicles of flowers.

1 S. anacardium (Lin. fil. suppl. 182.) leaves oblong, blun-
fish, glaucous beneath, more or less covered on the nerves beneath
with sebaceous down; panicle terminal, tomontose. h. S. Na-
tive of the East Indies, on mountains. Anacardium orientale
officinale, Anacardium officinarum, Gort. fruct. 1. p. 192.

Var. a, angustifolium (D. C. prod. 2. p. 62.) leaves taper-
pointed at both ends. Rumph. amb. 1. t. 70. Anacardium
longifolium, Lam. dict. 1. p. 140. S. Cassavium, Spreng. syst.
1. p. 936.

Var. b, cuneifolium (D. C. prod. 2. p. 62.) leaves wedge-
shaped and acuminate at the base, blunt at the apex.

Var. γ, obtusifolium (D. C. prod. 2. p. 63.) leaves ovovate,
blunt at both ends. Roxb. cor. 1. t. 12. Anacardium latifol-
ium, Lam. dict. 1. p. 189.

P. S. Perhaps all these varieties are of many species.

These are lofty trees with spreading branches. Leaves about
eighteen inches long, and about 4 or 5 broad. Flowers small,
of a greenish-yellow colour. Receptacle of the fruit when ripe
yellow, about the size of the nut, which is black; the cover or
shell is composed of 2 laminæ, the inner hard, the outer less so
and leathery, between them are cells, which contain the black,
corrosive, resinous juice, for which this nut has been long known;
the juice is of a pale milky-colour till perfectly ripe, when it
becomes black. The wood of this tree is reckoned of no use,
not only on account of its softness, but also because it contains
much acid juice, which renders it dangerous to cut down and
work upon. The fleshy receptacle on which the seeds rest are
roasted in the ashes and eaten by the natives; their taste is very
like that of roasted apples; unroasted they taste astringent and
acid, leaving a painful sensation on the tongue for some time.
The kernels are rarely eaten. The green fruit, well pounded
into a pulp, makes good bird-time. The pure, black, acid juice
of the shell is employed by the natives externally to remove
rheumatic pains, aches, and sprains; in tender constitutions it
often produces inflammation and swelling; but where it has not
these effects it is an efficacious remedy. It is employed by
the Telinga physicians in the cure of almost every kind of venereal
complaint. It is in general use for marking cotton cloths;
the colour is improved and prevented from running by a little
mixture of quick-lime and water. This juice is not soluble
in water, and is only diffusible in spirits of wine, for it soon falls
to the bottom, unless the menstrum be previously alkalis-
ised. The solution is then pretty complete, and of a deep black
colour. It sinks in expressed oils, but unites perfectly with them:
alka-line lixivium acts upon it with no better success than plain water.

1820. Tree 50 feet.

Cult. For culture and propagation see Anacardium.

IV. HOLIGARNA (from the appellation of the tree in the

Lin. syst. Polygymia, Diceceia. Flowers polygamous, male
and female flowers in different divisions of the tree. Calyx 5-
toothed. Petals 5, broadest at the base, and somewhat oblong,
oblone, villous. Stamens 5, shorter than the corolla. Ovary
in the hermaphrodite flowers adnate to the calyx, 1-celled,
1-seeded. Nut olive-formed, ovate, somewhat compressed,
containing a valuable nut. Albumen wanting. Embryo in-
cotyledons thick. Radicle oblong, situated above the apex.—
A tall Indian tree, with oblong, acuminate, feather-nerved,
entire, smooth, coriaceous leaves, which are crowded towards
the tops of the branches. Petioles short, bearing a bristle on
each side. Panicles axillary. Flowers white. This genus is
allied to Semecarpus.

1 H. longifolia (Roxb. cor. 3. t. 282.) h. S. Native of the
East Indies, on the mountains of Malabar and Chittagong.
—Rheed. mal. 4. p. 29. t. 9. ex Roxb. and therefore referable
to Mangifera racemosa, Lam. ill. 2. p. 113. The natives of
Malabar by incision extract an exceedingly acid juice, which
they use as varnish. The nut is about the same size of an olive,
containing between the lamina numerous cells filled with black,
rather thick, acid fluid, as that of Semecarpus, which is also
used as varnish.

Long-leaved Holigarna. Tree 60 feet.

Cult. For culture and propagation see Anacardium.
V. MANGIFERA (from Mango, the name of the fruit, and 
fera, to bear). Lin. gen. no. 278. Gaert. fruct. 2. t. 100. Kunth. 

Lin. syst. Polyagámia, Moncédia. Flowers polygamous. Ca-
lyx 5-parted, deciduous. Petals 4-5. Stamens 5, 4 of these 
are usually barren. Style 1. Drupe baccate, somewhat com-
pressed (f. 13. b.), containing a woody fibrous nut (f. 13. c.). 
Seed ovate-oblong. Embryo erect, with fleshy cotyledons, and 
a short radicle. — Indian trees, with long, entire, feather-nerved 
leaves, and terminal panicles of flowers. Fruit cestable.

**Teret.**

![image](https://via.placeholder.com/150)

**Fig. 13.**

4. M. FORTISSIMA (Lour. fl. cochin. 160.) leaves cuneate, lan-
celate, acute, stiff, on short stalks; panicles of flowers erect, 
terminal, spreading; corolla funnel-shaped, with the segments at 
length, reflexed; drupe heart-shaped, downy. 7. S. Native of 
Cochin-china, Java, and the Moluccas. Rumph. amb. 1. t. 
28. Leaves about the size of those of the common mango, on 
long petioles, and scattered. Flowers red, disposed in terminal 
panicles, usually monandrous. The fruit is fleshy, strong-scented, 
of an acid flavour, and unwholesome, but is eaten by the Malays. 
The wood, though not very good, is used for floors, and lasts 
very well if it be soaked a considerable time in water.

**Fétid.**

4. M. glutíca (Blum. bijdr. 1158.) leaves on short petioles, 
scattered, large, elliptic-oblong, tapering to both ends, glance-
secent beneath; panicle terminal, divaricated, shorter than the 
leaves. 7. S. Native of the Moluccas, where it is called 
Mango utna.

**Glossèus.**

3. M. LAXIFLÓRA (Desr. in Lam. dict. 3. p. 97.) leaves broad-
lanccolate, sessile; panicles loose, pendulous; flowers monan-
drous; drupe roundish. 7. S. Native of the Mauritius.

This is probably referable to M. pentándra of Lour. 
Flowers white. Fruit cestable.

**Lax-flowered.**

3. M. QUATRIFÍDÍA (Jack. fl. fl. ind. 2. p. 438.) leaves alternate, 
lanceolate, glossy; panicles terminal; flowers monandrous; 
drupe smooth, obliquely-conical, with the point turned to one 
side. 7. S. Native of Silhet, in the East Indies. Luktikme 
is the vernacular name of this tree in Silhet. The fruit is like 
that of the common mango, and yellow; and is eaten by the 
natives, though by no means so palatable as the worst kind 
of the common inango. It is also dried by the natives and kept 
for medicinal purposes.

**Wood Mango.**

6. M. quadri'fídá (Jack. mss. Wall. fl. fl. ind. 2. p. 440.) leaves alternate, 
lanceolate, tapering to the base; panicles loose, axil-
ary; flowers quadrifid, monandrous; petals 4, glandular in 
the middle. 7. S. Native of Sumaträ, &c. Flowers small, white.
Nectary of 4 round fleshy lobes. Fruit roundish, becoming 
very dark.

**Opposite-leaved.**

4. M. SYLVA'TICA (Jack. mss. Wall. fl. fl. ind. 2. p. 441.) leaves alternate, 
lanceolate, broad-lanceolate, tapering to the base; panicle termi-
nal, erect, tomentose, glaucous; flowers monandrous; petals 
erect; fruit oblong. 7. S. Native of Sumaträ. Corolla pur-
ple within, but paler without. Fruit oblong-ovate, of a pale-red 
colour.

**Grey Mango.**

3. M. cutína (Jack. mss. Wall. fl. fl. ind. 2. p. 442.) leaves alternate, 
small, lanceolate, tapering to the base; panicles terminal; 
shorter than the leaves; stamens 4-5, fertile; drupe 
smooth, compressed. 7. S. Native of Pegu and Java, 
where it is called Gandaria, and Meriam at Rangoon. Flowers 
pale-yellow. Drupe pale-yellow, the size of a small pullet's egg, 
and is universally eaten in Burma.

**Opposite-leaved.**

7. M. SYNTÈTRA (Desr. in Lam. dict. 3. p. 97.) leaves broad-
lanccolate, sessile; panicles loose, pendulous; flowers monan-
drous; drupe roundish. 7. S. Native of Silhet, in the East Indies. 
Luktikme is the vernacular name of this tree in Silhet. The fruit is like 
that of the common mango, and yellow; and is eaten by the 
natives, though by no means so palatable as the worst kind 
of the common inango. It is also dried by the natives and kept 
for medicinal purposes.

**Wood Mango.**

9. M. CE '.NIA (Jack. mss. Wall. fl. fl. ind. 2. p. 441.) leaves alternate, 
small, lanceolate, tapering to the base; panicle terminal; 
shorter than the leaves; stamens 4-5, fertile; drupe 
smooth, compressed. 7. S. Native of Sumaträ, &c. Flowers small, white.
Nectary of 4 round fleshy lobes. Fruit roundish, becoming 
vary dark.

**Monandrous.**

9. M. CA 'NIA (Jack. mss. Wall. fl. fl. ind. 2. p. 442.) leaves alternate, 
small, lanceolate, tapering to the base; panicle terminal; 
shorter than the leaves; stamens 4-5, fertile; drupe 
smooth, compressed. 7. S. Native of Sumaträ, &c. Flowers small, white.
Nectary of 4 round fleshy lobes. Fruit roundish, becoming 
vary dark.

**Grey Mango.**

3. M. cutína (Jack. mss. Wall. fl. fl. ind. 2. p. 442.) leaves alternate, 
small, lanceolate, tapering to the base; panicle terminal; 
shorter than the leaves; stamens 4-5, fertile; drupe 
smooth, compressed. 7. S. Native of Sumaträ, &c. Flowers small, white.
Nectary of 4 round fleshy lobes. Fruit roundish, becoming 
vary dark.

**Grey Mango.**

VI. BUCHANA'NIA (in honour of Francis Hamilton, M.D. 
formerly Buchanan, of Leny in Scotland, an excellent botanist, 
and great traveller in the East; formerly superintendent of 
the botanical garden at Calcutta). Roxb. hort. beng. v. 92. D. C. 
prod. 2. p. 63. — Láunznn, Buch. in asiat. res. 5. p. 128.— 
4 and 6.

Calyx 5-cleft, rarely 3-4-cleft, obtuse. Petals 5, inserted 
under the disk, oblong, revolute, imbricate in succession. Stamens 
9, shorter than the petals. Disk furnished with 10 crescents.
involving the ovary. Ovaries 5, concrete, or approximate, 4
of which are abortive, reduced to the styles. Styles therefore 5,
and ovary single, almost covered by the disk. Drupe obovate,
rather fleshy, 1-seeded. Seed recurved, resting on a funicle,
which rises from the bottom of the cell.—Indian trees, with
simple, quite entire, coriaceous, smooth, feather-nerved leaves,
and axillary panicles of flowers, crowded at the tops of
the branches. Flowers small, white. Fruit red. Nut oily. In
the leaves this genus appears to be allied to Mangifera, but
in the fruit it is more nearly allied to Spôdias.

1 B. LATIFÔLIA (Roxb. hort. beng. 32.) branches of panicle
haired, crowned with flowers, assuming the appearance of a corymb
at the tops of the branches. h. s. Native of the East Indies.
Leaves 6 inches long, and 3 broad, blunt at both ends. Fruit
eatable?

2 B. ANGUSTRÔFÓLIA (Roxb. hort. beng. 32.) branches of panicle
smooth, rather loose, axillary. h. s. Native of the East
Indies, particularly in Mysore. Mangifera axillaris, Lam. dict.
cur. ber. 4. p. 87. Lûndia mangifórides, Puer. herb. Cames-
sèdea, Kunth, gen. tereb. p. 4. Leaves oval-oblong, 3-4 inches
long, 1 1/2 broad, blunt or emarginate at the apex. Fruit the size
of a large cherry, and perhaps eatable.

Narrow-leaved Buchanania. Clt. 1820. Tree 50 feet.

3 B. LANCEÔFÓLIA (Roxb. 1. c.) h. s. Native of Chitta-
gong, in the East Indies. This species is only known by name.

Lance-leaved Buchanania. Tree.

Cult. A light loamy soil is the best for these trees, and
ripened cuttings will root freely in sand under a hand-glass, in
heat.

VII. CONIOGETON (meaning unknown). Blum. bijdr. 1156.

LIN. SYST. Decedôntia. Tetra-Pentagyria. Calyx inferior, 5-
parted. Petals 5. Stamens 10, equal. Ovaries 4-5, 1-styled,
1-ovulate, girdled by a denticulate urceolus. Stigmas obtuse.
Drupe solitary, baccate, containing a 1-seeded lenticular nut.
A tree, with alternate, simple, cuneate-oblong, obtuse, quite
entire, smooth leaves; flowers in terminal panicles.

1 C. Arborêsçens (Blum. bijdr. 1156.) h. s. Native of Java.

Arborescent Coniogeton. Tree 30 feet.

Cult. For culture and propagation see Buchanania.

VIII. PISTACIA (pistacia is altered from the Arabic word
foostag, the name of P. têra). Lin, gen. no. 1108. Lam. ill. t.
811. Kunth, gen. tereb. p. 7. D. C. prod. 2. p. 64.—Terebin-
thus, Juss. gen. 371.

LIN. SYST. Dioçcia, Pentândria. Flowers dioecious, apetalous.
Male ones disposed in amomentaceous scaly racemes, with a flower
to each scale. Calyx 5-cleft. Stamens 3; anthers almost ses-
sile, tetragonal. Female flowers disposed in more loose racemes,
with a 3-4-cleft calyx. Ovary 1-3-celled. Stigmas 3, thickish.
Drupe dry, ovate, containing a somewhat bony nut, usually 1-
celled, and 1-seeded, sometimes bearing laterally 2, abortive
cells. Seeds solitary in the cells, fixed to the bottom of the
cells, without albumen. Cotyledons thick, fleshy, oily, with a
superior lateral radicle. Trees with pinnate leaves.

§ 1. Leaves impari-pinnate, deciduous.—Terebinthus, Tourn.
inst. 1. t. 345.

1 P. vêra (Lin. spec. 1454.) leaves pinnate; leaflets ovate,
tapering a little to the base, rather mucronate at the apex; fruit
ovate, pointed. h. H. Native of Syria, from whence it has been
introduced to Italy by the emperor Vitellius, when he was legate
in that province. It is now to be found throughout the whole region
of the Mediterranean.—Pistacia officinarum, Hort. kew.—Black.
icon. t. 461. Duh. ed. nov. 4. t. 17. Flowers small, brownish, green.
Fruit panicked, about an inch long, ovate, with an oblique point,
reddish, well known for the sake of its nut at our tables. The
green internal hue of the kernel is remarkable. The Pistachia
or Pistach nut is brought from several parts of Asia, chiefly from
Aleppo and Persia. When wrapped in all its coats, it is the
size of a green almond, but when strip of all but its shell it
resembles a small nut. The kernel is red without, and green
within, and its taste very agreeable. Pistacias have been
reckoned aperitive, and proper to give vigour, and used in emulsions,
&c. in phthisical and nephritic cases. They also enter into
several ragouts, and are emolient, made into conserves, &c.
The fruit is rarely eaten raw, because of the ill effects it pro-
duces. There is a kind of false Pistachia nut brought from
the West Indies, which is sometimes confounded with the real one.

2 P. reticulâta (Willd. spec. 4. p. 751.) leaves ternate and
pinnate, with roundish, abrupt, somewhat pointed leaflets, which
taper to the base, and are strongly reticulated with prominent
veins; fruit roundish-oval, obtuse. h. H. Native of Sicily
and Syria. Pistacia reticulata, Lin. spec. 1454. P. Narbonensis,
Lin. spec. 1454.—Boce, mus. 2. t. 93. Leaflets usually 5, rarely 3,
when young downy at the margin. The fruit of this species is as
good as the true Pistachia-nut.

Tree 20 feet.

3 P. terebinthus (Lin. spec. 1456.) leaflets usually numer-
os, ovate-lanceolate, rounded at the base, acute, and mucron-
atate at the apex. h. H. Native of the south of Europe, and
northeast of Africa. Woodv. med. bot. 415. t. 155.—Blackw. t.
579. There is a fine female tree of this species in Chelsea gar-
den, near the gate, which for want of male blossoms can never
perfect its fruit. Leaves with 3 to 6 pair of leaflets, with an odd
one. Their red hue when young is beautiful. Flowers in large
Fruit hardly bigger than a large pea. Galls of the same shape
are found on the leaves, and very large oblong ones like legumes
are often produced from the young branches. The resin of this
tree is the Chian or Cyprus-turpenite, generally preferred for
medical use to what is obtained from the fir tribe, but it is
scarcely to be had without adulteration. This resin is obtained
by wounding the bark of the trunk in several places, during
the month of July, leaving a space of about 3 inches between the
wounds; from these the turpenite is received on stones, upon
which it becomes so much condensed by the coldness of the
night, as to admit of being scraped off with a knife, which is
always done before sunrise; in order to free it from all extra-
aneous admixture it is again liquified by the sun's heat, and
passed through a strainer; it is then fit for use. The quantity
produced is very inconsiderable, 4 large trees, 60 years old,
only yielding 2 pounds 9 ounces and 6 drachms, but in the
eastern part of Cyprus and Chio the trees afford somewhat more,
though still so little as to render it very costly, and on this
account it is commonly adulterated, especially with other tur-
pentines. The best Chio turpenite is usually about the con-
sistency of thick honey, very tenacious, clear, and almost trans-
parent, white, inclining to yellow, and of a fragrant smell, mod-
erateiy warm to the taste, but free from acrimony and bitterness.
For the medicinal qualities of the turpenite, see Flavus Lûrix,
vii, iv.

Var. b. spheroœcâpa (D. C. prod. 2. p. 64.) fruit larger,
and rounder than in the species.—J. Bauh. hist. 1. p. 278. with a K
figure. Native of the Levant, and is said to be cultivated in the
garden of Neumaus.

Turpentine Pistacia or Venetian or Chian Turpentine-tree.

4 P. ATLANTICA (Desf. atl. 2. p. 304.) leaves usually 9, lanceolate, tapering to the base; petiole between the terminal pair a little winged. 1. H. Native of Barbary, very common in sandy uncultivated fields near Coffa, where many being in
rows it is plain that this tree was cultivated at the foot of the
mountains near Mayane and Tlemsen, &c. This is a large tree,
with a thick roundish head. Leaves 7 to 9. Male flowers
disposed in terminal thyrs-like racemes. Stamina 5, but some-
times 7. Anthers deep red. Pollen yellow. Female flowers
disposed in loose panicked racemes. Style purple. Drupe rather
fleshy, about the size of a pea when ripe, blueish, containing a
roundish nut. From the bark of the trunk and branches
flows at different seasons of the year, but especially in summer,
a resinous juice, hardening in the air, of a pale-yellow colour,
of an aromatic smell, and taste that is not unpleasant, scarcely to
be distinguished from oriental mastick, and known by the same
name of Helcul among the Moors. It is inspissated into lamellae
round the branchlets, or into irregular globsules, differing in
thickness and shape, frequently as big as the end of the finger
or thumb, some of which drop from the tree, and are found scat-
tered on the ground. The Arabs collect this substance in
autumn and winter, and make the same use of it as of the mastic
from Chio, chewing it to give a pleasant smell to the mouth
and brightness to the teeth. At the foot of Mount Atlas this
tree is larger than any other which grows there, but the resinous
juice is softer, and of a much less pleasant smell and taste than
that which flows from the trees of the desert, which is probably
occasioned by the climate being cooler, and the soil more moist
and fertile. The leaves have often red galls on them resembling
berries. The Moors eat the drupes, and bruise them to
mix with their dates.

Var. β, latinifolia (D. C. prod. 2. p. 64.) leaves rounded and
broader at the base than in those of the species. 1. F. Native
of the island of Chio, and is said to be the same as that which
grows about Constantinople.

5 P. MEXICA'NA (H. B. et Kunth. nov. gen. amer. 7. p. 22.
t. 608.) leaves 16-20, alternate and opposite, oblanceolate,
mucronated, acute at both ends, mucronate, membranous, smoothish,
pubescent on the middle nerve beneath, as well as on the inside
of the rachis; fruit turgid, lenticular. 1. G. Native of Mexico,
chlorinated, Turpentine-tree.

Mexican Turpentine-tree. Tree 30 feet.

6 P. FAGAROIDES (Willd. enum. suppl. 66.) leaves ovate,
blunt; petioles winged. 1. G. Native of? Fruit unknown.

Fagara-like Pistacia-tree. Shrub 10 feet.

7 P. OLEOSA (Lour. fl. cochin. 615.) leaves impari or abruptly
pinnate; leaves 4-7, ovate-lanceolate; young fruit echinated.
1. G. Native of Cochin-china, as well as the Moluccas.

Cassambium, Rumph. amb. 1. t. 57. The nuts of fruit contain
a yellow, bitterish, sweet-scented, thin oil, which thickens on
exposure to the air. It is used to anoint the heads of the
natives, and also to scent ointments.

Oily Turpentine-tree. Tree 30 feet.

§ 2. Lentiscus (from lentisco, to be clammy; it is from the
P. Lentiscus that mastick is obtained, which comes from the
word mastico, to chew; because it is thus used in Chio, and by
the Turkish women to sweeten their breath). Tourn. inst. p. 380.
Leaves permanent, abruptly pinnate.

8 P. LEN'TISCUS (Lin. spec. 1455.) leaves 8, lanceolate;
petiole winged. 1. H. Native of the south of Europe and
north of Africa, both wild and cultivated in gardens. Woody.
med. bot. t. 159. Blackw. t. 195. Duh. arb. ed. nov. 4. t. 18.
Leaves with 3 or 4 pairs of small leaflets. Both male and
female flowers come out in loose racemes from the sides of the
branches; they are of a green colour. The fruit when ripe is
brownish. Fabricius remarks, that the male plant in time pro-
duces hermaphrodite flowers, with 3 stamens and 5 styles. It has
been observed by Gerard that the buds are different from
those of the other sorts, the branch-bearing buds being termi-
nating, the flowering buds in both sexes axillary and in pairs;
the latter are also in pairs. The leaves have sometimes
5 leaflets on each side. The petioles are so much winged that
the leaves may be called articulately-pinnate; they are usually
terminated by a thread instead of a leaflet. Desfontaines informs
us that the Lentiscus or Mastick-tree in Barbary is little if at
all resinous, though the branches and bark of the trunk were
wounded at different seasons; that the wood, however, yields an
aromatic smell on burning; and that the berries yield an oil fit
both for the lamp and the table. In the island of Chio the officinal
mastick is obtained most abundantly by making transverse inci-
sions in the bark of the tree, whence the mastick exudes in drops,
which is suffered to run down to the ground, and after they are
concreted, they are collected for use. These incisions are made
at the beginning of August, when the weather is very dry, and
are continued to the end of September. Mastick is a resinous
substance, brought to us in small, yellowish, transparent, brittle
grains or tears; it has a light agreeable smell, especially when
rubbed or heated; on being chewed it first crumbles, soon after
sticks together, and becomes soft and white like wax, without
impressing any considerable taste. It totally dissolves, except
the earthy impurities, which are commonly in no great quantity,
in rectified spirit of wine, and then discovers a greater degree
of warmth and bitterness, and has a stronger smell than the resin
in substance. Boiled in water, it impregnates the liquor with
its smell, but gives out little or nothing of its substance; distilled
with water, it yields a small quantity of limpid essential oil, in
smell very fragrant, in taste moderately pungent. Rectified
spirit brings over also in distillation the more volatile odorous
matter of the mastick. It is a common practice with the Turkish
women to chew this resin, especially in the morning, not only to
render their breath more agreeable, but to whiten the teeth, and
strengthen the gums; they also mix it with their fragrant waters,
and wrap it, with other odoriferous substances in the way of
fumigation. It is used in Europe by japanners in some of their
varnishes. As a medicine, mastick is considered to be a mild
corborbant and astringent; and as possessing a balsamic power
it has been recommended in haemoptysis proceeding from ulcera-
tion, flux albus, debility of the stomach, and in diarrhoeas and
internal ulcers. Chewing this drug has likewise been said to be
of use in pains of the teeth and gums, and in some catarrhal com-
plaints; it is now, however, seldom used either externally or
internally. The wood is received into the Materia Medica in
some foreign Pharmacopoeias, and is highly extolled in dyspeptic,
gouty, haemorrhagic, and dysenteric affections; but its chief
fame at present is in Portugal, where it serves for toothpicks.
These are rather nearer than if made of common deal.

Var. β, angustifolia (D. C. prod. 2. p. 65.) leaves almost
linear. 1. H. P. Massiliensis, Mill. dict. P. angustifolia
Massiliensis, Tourn. 580. This shrub scarcely ever exceeds
10 feet in height.

Var. γ, Chia (Duhum. ed. nov. 4. p. 72.) leaves ovate. 1. F.
Native of the island of Chio. 1. Chia, Desf. cat. hort. par.
This is the tree from which they procure the resin called mas-
tick. It is probably a distinct species from the true Lentiscus,
which yields little or no resin. See the preceding account.

Cult. All the hardy species require to be planted in a sheltered situation, or against a wall; they may either be increased by seeds, layers, or ripe cuttings planted under a hand-glass. The greenhouse kinds grow well in a mixture of loam and sand, and ripened cuttings will root in sand under a hand-glass.

1 A. graveolens (Jacq. l. c.) ½. S. Native of Carthagen, in woods, and of St. Martha. Leaflets 3 pairs, with an odd one, stalked, ovate, acuminate, a little serrated.

Strong-scented Astronium. Tree 20 feet.

Cult. A mixture of loam and peat will answer this tree, and ripened cuttings will root in sand under a hand-glass in heat.

X. MELANORRHEA (from μέλας, μελανος, melas, melanos, black, and φρές, rhéa, to flow; the tree when wounded yields a black juice). Wall. pl. rar. asiat. 1. p. 9. t. 11, 12.

LIN. SYST. Polypodiaceae. Monogynium. Flowers hermaphrodite. Sepals 5, cohering valvately to a 3-nerved caducous calyptra. Petals 5, rarely 6, imbricate in asstivation, permanent, borne beneath the fruit. Style 1, rather lateral in the vertex of the ovary, crowned by a small convex stigma. Fruit indehiscent, coriaceous, depressed reniform, oblique, pedicellate, furnished with a stellately spreading corolla-like involucre. Seeds exaluminous. Cotyledons fleshy, thick. Radicle lateral, lying in the fissure of the cotyledons. Large trees, with the habit of Semecarpus, full of viscid sargassous juice, becoming black on exposure to the atmosphere, with large, simple, deciduous leaves, and panicles of flowers.

1 M. usitata (Wall. l. c. p. 9.) leaves ovate, very blunt, villous. ½. S. Native of Hindostan, in a large valley called Kaddub, in the kingdom of Munipur, Silhet, and Tipperah, as well as in the Burmese empire, on the banks of the Irrawady, where it is called Theet-tsee or Zit-si. This is identical with the majestic Khen or varnish-tree of Munipur, on the north-east frontier districts of Silhet and Tipperah. Mr. M. R. Smith, who has resided a long time in Silhet, considers this the same as the varnish-tree of the Chinese, in the eastern and north eastern provinces. It is marketable in great quantities from Munipur, where it is used for painting river craft, and for varnishing vessels destined to contain liquid. The drug is conveyed to Silhet for sale by the merchants. On being handled it occasions extensive erysipelasulswellings, attended with pain and fever, but never of long duration. In the neighbourhood of Prome a considerable quantity of varnish is extracted from the tree, but very little at Martaban, owing, it is supposed, to the poorness of the soil, and partly also to there being none of the people in that part whose business is to perform the process, although it is very simple. Short joints of a thin sort of bamboo, sharpened at one end, and shut up at the other, are inserted in a slanting direction into holes made in the trunk and principal branches, and left there for 24 or 48 hours; after which they are removed, and their contents emptied into a basket previously varnished over. Sometimes a hundred bamboo may be seen sticking into the tree at once during the collecting season, which lasts as long as the tree is destitute of leaves, namely, from January until April, and they are renewed as long as the juice will flow. In its pure state it is sold at Prome at the rate of one tical or 2s. ed. the viss, and at Martaban 2 Madras rupees the viss, although of an inferior quality to that sold at Prome, being usually mixed with oil of Sesamum. A tree is reckoned to produce 2 to 3 viss annually, a viss being equal to £2½. Every article of household furniture destined to contain solid or liquid food is lacquered over with it. The article to be varnished with it must be prepared with calcined bones, after which the varnish is laid on thinly, either in its pure state or variously coloured. The process of drying is the most difficult part, being effected in a very slow and gradual manner by the articles thus varnished being placed in subterraneous vaults for several months. The drug is also used as a size glue in the process of gilding; nothing more being required than to besmear the surface of the article to be gilt with it, and immediately to apply the gold leaf. If it is considered how very extensively that art is practised by the Burmese nation, it being among their most frequent acts of devotion and piety to contribute to the gilding of their numerous religious edifices and idols, it will be evident that a great quantity of the drug must be consumed for that purpose alone. Finally, the beautiful Pali writing of the religious order of the Burmese on ivory, palm-leaves, or metal, is entirely done with this varnish in its native and pure state.

Useful Black varnish-tree. Clt. 1828. Tree 70 feet.

Cult. For culture and propagation see Astronium.

1 C. ilicifolia (Swartz. 2. fl. ind. occ. l. p. 75.) leaves ovate or roundish, sessile, smooth, with spiny angles; spines 1-3 on each side. ½. S. Native of the West Indies, on calcareous rocks. Flowers small, of a deep red colour, without scent. Leaves long. Dodonaea, Plum. ed. Bum. t. 118. f. 1. Flex Dodonaea, Lin. spec. 178. C. strupisulata, Lam. act. par. 1781. p. 847. and C. ilicifolia, Lam. Ill. t. 27. f. 2. C. anguifolia, Willd. spec. l. p. 188. Petioles puberulous. There is a variety with angular leaves, not spiny.

Var. β. globra (Schult. mant. 1. p. 300.) leaves smooth on both surfaces as well as the petioles. ½. S. Native of Porto Rico. C. glabra, Spreng. syst. l. p. 176.

2 C. acuminata (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 65.) leaves sessile, lanceolate, acuminate, smooth, somewhat cordate at the base, with 6-7 spiny teeth on each side.

½. S. Native of Mexico. An intermediate species between C. ilicifolia and C. dentata. Flowers dark red. Stamens opposite the petals in the figure quoted above.

Acuminated-leaved Maiden Plum. Tree 20 feet.
TEREBINTHACEÆ. XI. COMOCLODA. XII. CYRTOCARPÆ. XIII. SPATHELIA. XIV. PIRCANDRA.

5 C. dentata (Jacq. amer. 13. t. 173. f. 4.) leaflets on short, footstalks, oblong, erosely-toothed, smooth above and downy beneath.  \( \text{F.S.} \) Native of Cuba in woods, as well as of St. Domingo, where it is called Guao. H. B. et Kunth, nov. amer. 7. p. 16. This species is very like C. ilefólia. Leaflets from 6 to 10. The whole tree abounds in a milky glutinous juice, turning very black, not to be washed from cloth. If the tree be ever so slightly wounded it has a very unpleasant smell. The natives have a notion that it is dangerous to sleep under it.

Toothed-leaved Maiden Plum. Fl. Jul. Clt. 1790. Tree 29 ft. 4 C. propinqua (H. B. et Kunth, nov. gen. amer. 7. p. 16.) leaflets lanceolate-oblong, acute, almost entire, smooth above, hairy-pubescent beneath and furrugineous. \( \text{F.S.} \) Native of the island of Cuba near La Trinidad, where it is also called Guao.

Allied Maiden Plum. Tree 12 feet.

5 C. mollissima (H. B. et Kunth, nov. gen. amer. 7. p. 16. t. 937.) leaflets small, oblong, acute, rounded at the base, downy-pubescent above, but clothed with soft silky tomentum beneath. \( \text{F.S.} \) Native of Mexico, between Acapulco and Venta del Exido. C. tonomenta, Willd. herb. ex Schult. mant. 1. p. 350.

Very soft Maiden Plum. Tree 20 feet.

6 C. integrifolia (Jacq. amer. 12.) leaflets stalked, lanceolate, quite entire, smooth. \( \text{F.S.} \) Native of Jamaica. Sloan. jan. 2. t. 222. f. 1. Lam. ill. t. 27. f. 1. Flowers small, deep red, without scent. Drupes black and succulent when ripe; they are eatable but not inviting. The wood is hard, of a fine grain, and reddish colour. Leaves about 2 feet long, with about 8 leaflets on each side. The whole tree abounds in a watery juice, slightly glutinous, which grows black in the air, and dies the hand of a deep black colour, that can hardly be washed out.

† Species not sufficiently known.

7 C. ? Tapa'cúlo (H. B. et Kunth, l. c. p. 66.) leaflets oblong, acuminated, acutish at the base, quite entire, smooth. \( \text{F.S.} \) Native on the banks of the river Orinoco, near Maypures and Carichana, where it is called Tapacuila. The Indians near St. Fernandez de Atabapo use a preparation of the leaves against chigars.

Tapacuila Maiden-plum. Tree 50 feet.

8 C. ? Loxánxis (H. B. et Kunth, l. c.) leaflets oblong, somewhat acuminated, acute at the base, quite entire, shining, and smooth above, pubescent and downy beneath, with the middle nerve, rachis, and branches clothed with russeted down. \( \text{F.S.} \) Native of New Granada, near Loxa, in woods.

Loxa Maiden-plum. Tree 30 feet.

Cult. See Astrónum for culture and propagation, p. 67.

XII. CYRTOCARPA (from κυρκῶς, kyrtos, gibbous, and καρπός, karpos, a fruit; in allusion to the 5 gibbosities above the middle of the fruit.) H. B. et Kunth, nov. gen. amer. 7. p. 19. D. C. prod. 2. p. 91.

Lin. syst. Polygánum, Dic'cia. Flowers polygamous. Calyx 5-parted, permanent, spreading. Petals 5, sessile, longer than the calyx, imbricate in aestivation. Stamens 10, length of calyx. Disk large, 10-crenate. Ovary I. Style I. Stigma 4-cleft. Drupe obovate-elliptical, with 5 tubercles above the middle, containing a hard nut.—An American tree, with imparipinnate leaves and quite entire sessile leaflets. Flowers almost sessile, disposed in glomerated spikes, white. This tree has the appearance of a species of Comocladia.

1 C. procera (H. B. et Kunth, l. c. t. 600.). \( \text{F.S.} \) Native of New Spain.

Tall Cyrtocarpa. Tree 60 feet.

Cult. See Astrónum for culture and propagation, p. 67.

XIII. SPATHELIA (from σπάθη, spathè, a palm-tree; the upright habit and want of branches of S. simplex has caused it to be likened to a palm-tree). Lin. gen. no. 375. Gaert. fruct. 1. p. 275. t. 58. Kunth, gen. teph. 25. D. C. prod. 2. p. 84.

Lin. syst. Dic'cia, Pentándria. Female flowers. Calyx 5-parted, membranous, coloured. Petals 5, hypogynous, imbricate in aestivation. Stamens 5, with short, 3-pointed filaments, which are dilated and villous at their base. Ovary somewhat conical, 3-angled, 3-celled, each cell containing 2 ova. Style wanting. Stigmas 5. Drupe oblong, 3-celled, trigonal, sometimes 2-angled, 2-celled; angles winged. Seeds oblong, solitary in the cells. Albinum fleshy. Embryo straight, inverted, with oblong-lineate, thin cotyledons, and a short radicle.—Trees with impari-pinnate leaves, and subterminal racemose panicles of flowers. This genus perhaps does not belong to this order.

1 S. simplex (Lin. spec. 386.) leaves with about 20 pairs of short, toothed leaflets. \( \text{F.S.} \) Native of Jamaica. Ker. bot. reg. t. 670. Sloan. hist. 2. t. 171. Trunk hardly branchless. Leaves like those of Sörbus. The habit of the plant of that of Comocladia. The fruit is full of a resinous juice. The flowers are red.

Red-leaved Spathelia. Tree 20 feet.

Cult. See Astrónum for culture and propagation, p. 67.

XIV. PIRCÁMNIA (from πικρῶς, pícrros, derived from πίκρος, pícrros, bitter; the plants are bitter in every part). Schwartz, fl. ind. 1. p. 218. t. 4. Schreb. gen. no. 1517. D. C. prod. 2. p. 66.

Lin. syst. Dic'cia, Tri-Pentándria. Flowers dioecious. Calyx 3 or 5-parted. Petals 3 or 5, oblong. Male flowers with exserted stamens, equal in number with the petals. Female flowers with an ovate ovary, and 2 sessile stigmas. Drupe ovate, containing a 2-celled, 2-seeded nut. Seeds oblong.—Small trees with impari-pinnate leaves, alternate, stalked, quite entire, ovate-lanceolate leaflets. Racemes of flowers elongated, pendulous, opposite the leaves. The character of the seed being unknown, the place which this genus should occupy in this order is truly doubtful.

1 P. antidesma (Schwartz, fl. ind. occ. 1. p. 218.) flowers triandrous; racemes longer than the leaves; leaflets elliptic, acuminated. \( \text{F.S.} \) Native of Jamaica and St. Domingo, on mountains in woods. Sloan. hist. t. 208. f. 2. Flowers small, greenish-white. Fruit at first scarlet; but black when ripe, about the size of a gooseberry. Schwartz informs us that the negroes in Jamaica look upon this shrub as antivenereal, and that they commonly use an infusion of it in colic. The whole plant is exceedingly bitter, and is called Majo-Bitters. Antidesma-like Majo-Bitters. Fl. Aug. Clt. 1793. Sh. 8 ft.

2 P. fessónia (D. C. prod. 2. p. 66.) flowers triandrous; racemes shorter than the leaves; leaflets ovate, acuminated. \( \text{F.S.} \) Native of Mexico. Fessónia dependens, Moc. et Sesse, fl. mex. icon. inde. Flowers greenish-white? Fruit red, with 3 scales in the female flowers in place of the stamens.

Fessons’s Majo-bitters. Shrub 8 feet.

3 P. pentândra (Schwartz, fl. ind. occ. 1. p. 220.) flowers pentandrous; racemes shorter than the leaves; leaflets ovate-elliptical, acuminated. \( \text{F.S.} \) Native of the islands of Montserrat and St. Domingo. P. pseudobrazilianum, Hort. part. in Juss. gen. 370. and hence Comocladia Brasilístrum, Poir. suppl. 2. p. 325. Flowers greenish-white.

Tariri Majo-bitters. Shrub 10 feet.

Cult. See Astronium for culture and propagation, p. 67.

XV. BISCHO 'FIA (in honour of — Bischoff, of the Botanical Academy of Munich). Blum. biogr. 1168.

Lin. syst. Dioc'cia, Pentändria. Flowers dioecious. Calyx inferior, 5-sepalled. Corolla wanting. Male flowers with 5 short stamens, which are joined into an unilocular, hardly free at the apex. Anthers 2-celled. Female flowers with the rhiitzums scale-formed, sometimes 2. Ovary ovate, globose, 3-celled; cells 2-ovulate; ovula pendulous. Stigmas 3, sessile, linear, reflexed, approximate at the base. Fruit containing 3 or 1-seeded nuts.—A strong tree, with very hard wood, alternate, trifoliolate leaves, serrulate leaflets, axillary and lateral panicles of flowers, with each pedicel furnished with 13 bracteae at the base. This genus agrees better with Rutaceae than Terebinthaceae.

1 B. Java'nica (Blum. biogr. 1168.). сил. Native of Java, in mountain woods in the western provinces, where it is called Godok.

Java Bischofia. Fl. Sept. Tree 60 feet.

Cult. See Astronium for culture and propagation, p. 67.

XVI. SABA'IA (Soojha is the Bengalese name of one of the species). Cebolr. in Lin. trans. 12. p. 331 and 335. Wall. in fl. ind. 2. p. 308.

Lin. syst. Pentändria, Monogynia. Calyx inferior, 5-cleft. Petals 5, lanceolate, inibricate in anthesis. Stamens 5; opposite the petals, inserted round the base of a perigynous 5-lobed disk. Anthers bursting by a dorsal longitudinal fissure. Style suffrutose, or 2 contiguous, crowned by a blunt stigmas. Drupes deeply 2-lobed; lobes kidney-shaped, 1-seeded, one of them usually abortive. Embryo erect, folded. Climbing shrubs, with simple stipulate leaves, and axillary, 1 or many-flowered peduncles. Notwithstanding many anomalies in this genus, Dr. Wallich seems to think it belongs to the present tribe of Terebinthaceae.

1 S. lanceol'ata (Cebolr. l. c. t. 14.) smooth; leaves oblong, lanceolate, slightly blistered; corymbs axillary and terminal. сил. Native of Silhet. An extensively rambling shrub. Flowers very fragrant, marked with linear purple dots.

Lanceolate-leaved Sabia. Shrub cl.

2 S. farvil'ora (Wall. fl. ind. 2. p. 310.) young shoots slightly pubescent; leaves ovate, with membranous, waved margins; peduncles axillary, finely flowered; petals lanceolate. сил. Native of Nipaul. An extensive climber. Flowers smaller than those of the last species, purple.

Small-flowered Sabia. Shrub cl.

3 S. campanu'la (Wall. fl. ind. 2. p. 311.) leaves oblong, with membranous margins; flowers solitary, axillary, corymbed, with large, round, concave petals. сил. Native of Shepore, in Nipaul. Flowers green, large. Anthers 2-celled.

Bell-flowered Sabia. Shrub cl.

Cult. Loam and sand, with a little peat, is a good soil for this genus, and ripened cuttings will root in sand under a handglass. The species are not worth cultivating, except in botanical gardens.

Tribe II.

SUMACHINEAE (plants agreeing with Sumach in important characters). D. C. prod. 2. p. 96. Petals and stamens inserted in the calycine disk or in the calyx. Ovary solitary (from abortion), I-celled, containing only 1 ovulum. Seed pendulous, exalbuminous, sustained by a funicle rising from the base of the cell. Cotyledons leafy, with the radicle bent in above the fissure of the cotyledons.

XVII. RHUS' (derived from ροιος or ροις, in Greek, which is derived from rhudd, a synonyme of rub in Celtic, red; in allusion to the colour of the fruit and leaves of some species in autumn). Lin. gen. no. 369. Lam. ill. t. 207. Kundii, gen tereb. p. 5. D. C. prod. 2. p. 66.

Lin. syst. Pentändria, Trigynia, or Dioc'cia, Pentändria. Calyx permanent, small, 5-parted. Petals 5, ovate, spreading. Stamens 5, all antheriferous, both in the male and female flowers. Ovary I, somewhat globose, 1-celled. Styles 3, short, or stigmas 3, sessile. Drupes almost dry, 1-celled, containing a bony, 1-seeded nut from abortion, and sometimes 2 or 3 seeds. Seeds without albumen, sustained by a funicle rising from the bottom of the cell. Cotyledons leafy, with the radicle lying on the upper suture of the cotyledons. Gerst. fruct. 1. p. 205. t. 44.—Shrubs with alternate, various, but usually compound leaves. Flowers usually polygamous, or dioecious from abortion.

SECT. I. Cotinus (coricos, cotinos, a name under which Pliny speaks of a tree with red wood, which is supposed to grow in the Apennines). Tourn. inst. p. 380. D. C. prod. 2. p. 77. Flowers hermaphrodite. Drupe half cordate, veiny, smooth, containing a triangular nut. Leaves simple. Flowers loosely panicled, many of which are abortive, and of these the pedicles are elongated and hairy after flowering.

1 R. Cotinus (Lin. spec. 383.) leaves obovate. сил. Native of the south of Europe from Spain to Caucasus, in places exposed to the sun. J. acq. aust. t. 310. Mill. fig. t. 370. Cotinus Coggyria, Scop. corr. ed. 2. no. 368. Mauz. med. 73. —Lob. icon. 92. Cotinus coriacea, Dub. arb. 1. t. 78. Flowers greenish-yellow. This is rather an ornamental shrub, and the wood is much used by the modern Athenians for dyeing wool of a most beautiful and rich yellow. The whole plant is used for tanning in Italy, where it is called Scotoine.

Fenus Sumach or Wild-olive. Fl. June, July. Cl. 1656. Shrub 4 to 6 feet.

2 R. Velutina (Wall. mss. in Lin. soc. herb.) leaves simple, oblong, on long petioles, repand-toothed, clothed beneath with velvety white pubescence, as well as the branches; peduncle racemose, terminal. сил. Native of Kamoon, in the East Indies. Flowers small, white.

Veloety Sumach. Shrub.

3 R. Le'ye (Wall. mss. in herb. Lin. soc.) leaves simple, ovate, or ovate-oblong, mucronate at the apex on long petioles, entire, quite smooth, and rather glaucous beneath; peduncle terminal. сил. Native of the East Indies. Flowers small, white.

Smooth Sumach. Shrub.

SECT. II. Metopium (Metopion is a name under which Pliny speaks of a resinous tree unknown to us; it is derived from ὀρός, juice). D. C. prod. 2. p. 67. Flowers hermaphrodite. Drupe ovate, rather oblong, dry, smooth, containing a large, ample membranous nut. Seed, according to Linnaeus, arillate and 3-lobed. Leaves impart-pinnate, with 2 pairs of ovate, quite entire, long-stalked leaflets.

4 R. Metopium (Lin. amoen. 5. p. 395.) leaves quite smooth. сил. Native of Jamaica, in woods on the mountains. Sloam. hist. 2. t. 199. f. 5.—Brown, elm. 177. t. 13. f. 3. Drupes reddish. This tree yields a great quantity of gummy resin called Doctors’ gum, which, when pure, is of a yellow colour, and after a short time, acquires a hard brittle consistence. It
is daily used in strengthening plasters, for which it is deservedly much recommended. It is of a warm disconsolate nature, and may be used in all swellings arising from colds, both externally and internally. The gum, dissolved in water, is an easy purgative, and thought to be extraordinarily diuretic. In Jamaica the tree is frequent enough, and the hogs are said to have recourse to it when wounded in the woods.

Metepium or Hog gum-tree. Cl. 1823. Tree 20 feet.

Sect. III. Su'Mach (el-simac or es-simac is the Arabian name of some species). D. C. prod. 2. p. 67.—Rhûs and Toxicodendron. Tourn. inst. 381. Mæcæth. meth. 72. Flowers polygamous, dioecious, or hermaphrodite. Drupes ovate-roundish, usually villous, containing a smooth or stripted nut.—Shrubs with impari-pinnate leaves or palmately trifoliate ones. Petioles naked or a little winged. Flowers panicked.

§ 1. Leaves impari-pinnate.

* Petioles naked.

5 R. filicina (Moc. et Sesse, fl. mex. icon. ined.) leaves 7-9 pairs; petiole naked; leaflets sessile, pinnatifid, pilose, oblong; lobes blunt, awned, with a hair. H. H. Native of Mexico, on the mountains, where it is called Tettaziana, but it is not the Tetracynum h. mex. p. 153. Fruit covered with violet hairs.

Fern-like Sumach. Shrub.

6 R. trypaina (Lin. spec. 380.) leaves with 8 or 10 pairs of leaflets; petioles naked, and are as well as the branches hairy; leaflets lanceolate, acuminate, serrate, rather pilose beneath. H. H. Native of North America, from Canada to Carolina, in rocky dry situations. Dub. arb. ed. nov. 2. t. 47. Wats. dendr. brit. t. 17. and 18. R. Virginiana, Bauh. pin. p. 517. The purple velvety berries appear in large close clusters. The leaves change in autumn first to a purplish, but just before they fall to a feUulement colour. This species, as well as R. coriaria is used for tanning leather; and the roots are prescribed as a febrifugal medicine in the country of its natural growth. Var. a, arborascens (D. C. prod. 2. p. 67.) leaves somewhat pubescent beneath. H. H. Willd. emm. 323. Tree 20 feet. Var. b, frutescens (Willd. l. c.) leaves white, with pubescence beneath. H. H. Shrubs 8 feet.

Fever or Virginian Sumach. Fl. July, Aug. Cl. 1629. Shrubs 8 to 20 feet.

7 R. viridiflora (Poir. dict. 7. p. 504.) leaves with 8-10 pairs of leaflets; petioles naked, and are as well as the branches pilose; leaflets lanceolate-oblong, serrate, pubescent beneath. H. H. Native of North America, in Pennsylvania and Virginia, on the edges of woods in dry sunny situations. R. Canadiensis, Mill. dict. no. 5. Flowers yellowish-green, probably not much more than a variety of the following species. Racemes of flowers erect.

8 R. glabra (Lin. spec. 380.) leaves with 8 or 10 pairs of leaflets, and are as well as the branches smooth; petioles naked; leaflets lanceolate-oblong, serrate, whitened beneath. H. H. Native of North America from New England to Carolina, common in old fields. Flowers greenish-red. Fruit silky, red. They are used for dyeing the same colour, and they are eaten by children with impunity, but they are very sour. On cutting the stem a yellow juice comes out between the bark and the wood. The bark boiled with the fruit affords a black ink-like tincture.

Var. b, dioica (D. C. prod. 2. p. 67.) flowers dioecious, greenish. Lam. ill. t. 307. f. 1.

9 R. rufa (Mich. fl. bore. amer. 1. p. 182.) a humile shrub wholly covered with pubescence; leaves with many pairs of deeply-toothed oval leaflets, which are downy on the under surface; petals? H. H. Native of upper Carolina. Fruit silky. This is the most poisonous of the genus, according to information from Mr. John Lyon, who by collecting the seed of this species was poisoned all over his body and was lamed for a considerable time.

10 R. acuminata (D. C. prod. 2. p. 68.) leaves with 3 or 4 pairs of leaflets, and are as well as the branches smooth; petioles naked; leaflets oval, quite entire, with long taper-points, paler beneath, and full of parallel feather nerves. H. H. Native of Nipaul. Lateral veins of leaves 20-30, parallel. Panicle of flowers axillary, shorter than the leaves. Flowers dioecious.

Acuminated-leaved Sumach. Shrub.

11 R. succedanea (Linn. mant. 221.) leaves with 5-7 pairs of leaflets, smooth, permanent; petioles wingless; leaflets ovate-lanceolate, taper-pointed, shining, netted with veins and glaucous beneath, self-coloured. H. G. Native of Japan, Futao-No-Ki, Kewmp. amon. 793. t. 795.—Thumb. jap. 121. Drupe ovate, white, about the size of a cherry, containing a smooth nut. The oil of the seeds, expressed whilst warm, acquires the consistence of suet, and serves for making candles. The trunk yields a varnish, but in so small a quantity as not to be worth collecting. Osbeck informs us that this is called Toy-sha in China.

Succedaneous or Red Lae Sumach. Fl. June, July. Cl. 1768. Shrub 10 to 15 feet.

12 R. nuda (Blum. bijdr. 1164.) leaflets 3-4 pairs, ovate-oblong, entire, bluntly acuminate, a little obliquely attenuated at the base, smooth; petioles wingless, terete, geniculately knotted; petiole terminal, fastigate. H. S. Native of Java, on the mountains of Salak, where it is called Kadomuang-aroy. Knotted-petioled Sumach. Tree.

13 R. pubescens (Blum. bijdr. 1165.) leaflets 3-7 pairs, ovate-lanceolate, entire, acuminate, a little obliquely attenuated at the base, opaque on both surfaces, and are as well as the petioles somewhat pubescent; panicles axillary. H. S. Native of Java.

Pubigrous Sumach. Tree.

14 R. vernicifera (D. C. prod. 2. p. 68.) leaves with 5-6 pairs of leaflets; petioles naked, and are as well as the branchlets clothed with soft down; leaflets elliptic, acute, quite entire, smoothish above, but velvety beneath from pubescence. H. G. Native of Japan, where it is called Sitz or Ursus (ex Komp. amon. 791. t. 792.), and of Nipaul. R. vernix, Lin. mat. med. 151. Thumb. jap. 121. but not of others. R. juglandifolia, Wall. in Litt. D. Don. prod. fl. nep. 248. but not of Willd. Leaves long, resembling those of a walnut. Thombs affirms that the very best Japan varnish is prepared from this tree, which grows in greatest abundance in many parts of that country, and is likewise cultivated in many places on account of the great advantages derived from it. This varnish, which oozes out of the tree on being wounded, is procured from stems that are three years old, and is received in some proper vessel. At first it is of a lightish colour and of the consistence of cream, but grows thicker and black on being exposed to the air. It is so transparent when laid pure and unmixed upon boxes or fur-
nature, every vein of the wood may be clearly seen. For the most part a dark ground is spread underneath it, which causes it to reflect like a mirror, and for this purpose recourse is frequently had to the fine sludge, which is got in the trough under a grind-stone, or to ground charcoal; occasionally a red substance is mixed with the varnish, and sometimes leaf-gold, ground very fine. This varnish hardens very much, but will not endure any blows, cracking and flying almost like glass, though it can stand boiling water without any damage. With this the Japanese varnish over the posts of their doors, and most articles of household furniture, which are made of wood. It far exceeds the Chinese and Siamese varnish, and the best is collected about the town of Jasino. It is cleared from impurities by wringing it through very fine paper; then about a hundredth part of an oil called toi, which is expressed from the fruit of Bignonia tonentosâ is added to it, and being put into wooden vessels, either alone or mixed with native cinnabar, or some black substance, it is sold all over Japan. The expressed oil of the seeds serves for candles. The tree is said to be equally poisonous with the Rhus venenâ, or American poison-tree.

Varnish-bearing Sumach or Japan Varnish-tree. Clt. 1818. Tree 50 feet.

15 R. venenâta (D. C. prod. 2. p. 68.) leaves with 6-7 pairs of smooth deciduous leaflets; petioles naked; leaflets ovate-lanceolate, acuminate, quite entire, netted with veins beneath. H. Native of North America, from Canada to Carolina, in low copses, where it is called Poison-sumach or Poison-wood.—Dill. edh. t. 292. R. vernix, Lin. spec. 380. Big. med. bot. 1. p. 96. t. 10. Wats. dend. brit. t. 19. Toxicodendron pinnâmum, Mill. dict. no. 5. Flowers dioecious, green. Fruit white, smooth, containing a furrowed nut. The milky juice of this tree stains linen a dark brown. The whole shrub is in a high degree poisonous, and the poison is communicated by touching or smelling any part of it. In forty-eight hours, inflammation appears on the skin in large blotches, principally on the extremities and on the glandular parts of the body; soon after small pustules rise in the inflamed parts, and fill with watery matter, attended with burning and itching. In two or three days the eruptions suppurbate, after which the inflammation subsides and the ulcers heal in a short time. It operates, however, somewhat differently on different constitutions; and some are incapable of being poisoned with it at all. Persons of irritable habits are most liable to receive it. Kalm gives much the same account of the American poison-tree or Swamp Sumach. An incision being made, a whitish-yellow juice, which has a nauseous smell, comes out between the bark and the wood; it is noxious to some persons, but does not in the least affect others. On himself it had no effect, except on a hot day, when being in some perspiration, he cut a branch and carried it in his hand for half an hour, smelling it now and then. It produced a violent itching in his eyelids and the parts thereabout; during a week his eyes were very red, and the eyelids very stiff, but the disorder went off by washing the eyelids with very cold water. The Abbé Sauvages stamed linen black with the juice of this tree, which it retained after a great number of washings in ley. The Abbé Mazaes made trial of that of R. toxicodendron. The instant, he says, the cloth was exposed to the sun, it became the finest black he had ever seen.

16 R. rufescens (Hamilt. prod. fl. ind. occ. p. 32.) rufescence; leaflets 5 pairs, nearly sessile, obliquely cordate, oblong, acuminate, adpressly serrated, shining above, covered with rufescence tomentum beneath, with the veins parallel; flowers axillary, subcamomel, tomentose. H. Native of Jamaica.

Rufescens Sumach. Tree 20 feet.

17 R. Commersânh (Poir. suppl. 5. p. 264.) leaves with 3-4 pairs of smooth leaflets; petioles; leaflets tapering to the base, but blunt at the apex, somewhat mucronated and quite entire. S. Native of Brazil. Like R. venenâta or vernifera, ex Poir. R. meridionalis, Sprmg. syst. 1. p. 395.

Commerson's Sumach. Clt. 1818. Tree 30 feet.

18 R. perrugiosa (H. B. et Kunt. nov. gen. amer. 7. p. 10.) leaves with 7-8 pairs of leaflets, and are smooth, as well as the branches; petioles naked; leaflets on long stalks, elliptical or rhomboid-ovate, quite entire, membranous. S. Native of New Spain, near St. Theresa and Tepicauacuaca. Flowers, as well as fruit, unknown. This species resembles in its poisonous effects the R. venenâta, no. 15.

Pernicious Sumach. Shrub 3 to 4 feet.

19 R. Juglandifolîa (Wild. in Schult. syst. 6. p. 619. but not of Wall.) leaves with 11-15 pairs of oblong, acuminated, quite entire, smooth (but rather pilose beneath) leaflets, which are rounded on the upper edge at the base, but narrowed at the lower edge; panicles axillary, much branched; calyxes smooth. S. Native of New Granada, where it is commonly called Caspi of Pita. H. B. et Kunt. nov. gen. amer. 7. p. 6. t. 603 and 604. Allied to R. coriaria, but the petioles are wingless. The juice is very acrid and poisonous.

Walmart-leaved Sumach. Shrub 5 to 6 feet.

20 R. fraxinifolîa (D. Don, prod. fl. nep. p. 248.) flowers hermaphrodite; leaflets 7, lanceolate, acuminated, serrated, glabrous, shining, oblique at the base; rhachis rather tereque, simple; panicle much branched, villous. G. Native of Nipaul. A large tree, with leaves nearly 2 feet long.

Ash-leaved Sumach. Clt. 1820. Tree 40 feet.

21 R. striâta (Ruiz et Pav. fl. per. 3. p. 29. t. 252.) leaves pinnate, with quite entire ovate-lanceolate leaflets, downy beneath; racemes large; fruit striated. G. Native of Peru, in the groves of Chinchao. Flowers white.

Striped-fruiting Sumach. Tree 20 feet.

* * Leaves with the petioles more or less winged.

22 R. coriaria (Lin. spec. 379.) leaves with 5-7 pairs of villous leaflets; petioles naked or somewhat margined at the apex; leaflets elliptical, bluntly and coarsely toothed. H. Native of the south of Europe, on rocks in exposed situations, from Portugal to Tauria. Duh. ed. nov. 2. t. 46. Wats. dend. brit. t. 136. Blackw. t. 486.—Plenck. Icon. t. 323. Leaves of a yellowish-green colour. Flowers white-green, disposed in terminal panicles. The branches of this tree are used instead of oak bark for tanning leather, and it is said that Turkey leather is all tanned with it. The leaves and seeds are used in medicine, and are esteemed very restringent, stiptic, tonic, and cooling. The Tripoli merchants sell the seeds at Aleppo, and they are in common use there to provoke an appetite. The taste of the fruit is very acrid and astringent, and does not possess the dangerous qualities for which some species of this genus are so remarkable.

23 R. semifâlâta (Mur. comm. goett. 6. 1784. p. 27. t. 3.) leaves with 5-7 pairs of leaflets; petioles naked or somewhat margined from the middle to the apex; leaflets ovate, acuminated, serrated, downy beneath. G. Native of the East Indies and Cochinchina. R. Javânicum, Lour. cochin. 183. Flowers white, bell-shaped. Leaflets clothed with rusty down on the under surface. The Chinese extract an oil from the berries by bruising them, and boiling them in water; they use it as a varnish, which is beautiful, but does not keep its polish so well as the true sort.

24. **R. javanica** (Linn. spec. 380.) leaflets 5-7 pairs, ovate-oblong, acuminate, blunt-toothed, tomentose beneath; petioles submarginate; panicle terminal, tomentose.  h. G, native of Japan and China, but introduced to Java. R. semialata, var. β, Osbeckii, D. C. prod. 2. p. 67.

**Java Sumach.** Clt. 1793. Tree 30 feet.

25. **R. Chinensis** (Mill. dict. no. 7.) leaves with 3 or 4 pairs of leaflets; petioles membranous, and are, as well as the branches, clothed with downy villi; leaflets ovate, bluntly-serrate.  h. G, native of China.

**Chinese Sumach.** Clt. 1800. Shrub 5 to 6 feet.

**Bucke-Amela Sumach.** Clt. 1823. Tree 40 feet.

27. **R. Fauchéföra** (Linn. fil. suppl. 183.) leaves pinnate; petioles winged, covered with very fine villi; leaflets alternate, wedge-shaped, serrated at the apex; panicles sessile, few-flowered.  h. G, native of the Cape of Good Hope. Thumb. fl. cap. 2. p. 225.

**Few-flowered Sumach.** Shrub 6 feet.

**Oblique-leafletted Sumach.** Clt. 1825. Shrub 6 feet.

29. **R. altaïta** (Thum. fl. cap. 2. p. 225.) leaves pinnate; petioles winged, tomentose; leaflets alternate, ovate, serrated at the apex; peduncles axillary.  h. G, native of the Cape of Good Hope.

**Winged-petioled Sumach.** Clt. 1824. Shrub 10 feet.

30. **R. copallina** (Linn. spec. 380.) leaves of 5-7 pairs of leaflets, which are smooth above, and rather pilose beneath; petioles winged, jointed; leaflets elliptic, quite entire.  h. H, native of North America, in dry fields and woods, particularly in a sandy soil, from New Jersey to Carolina. Jacq. Hort. Scaenb. 341.- Plak. Alm. t. 56. f. 1. Root stoloniferous. Flowers dioecious, yellowish-green. Berries red. The leaves of this species change to purple in the autumn, and are used as tobacco by the Indians of the Missouri and Mississippi.

**Var. β, leucantha** (Jacq. scænbb. t. 342.) root not stoloniferous; flowers white; panicles more contracted.  h. H, native of North America. Leaflets many pairs, narrow.

31. **R. triloba** (Poir. dict. 7. p. 508.) leaves with 3 pairs of coriaceous opposite leaflets, which are pubescent beneath; petioles flat, striated.  h. S, native of Brazil, at Rio Janeiro. Fruit globose, shining.

**Three-paired-leafed Sumach.** Tree.

§ 9. **Toxicodendron** (from *rožkov*, toxikon, poison, and *έπωρ*, déndon, a tree; tree very poisonous). Town. inst. t. 381. *Moench. meth. 73.* but not of Garin. nor Thumin. *—Pilocophorum, Neck. clin. no. 964.* Leaves pinnately trifoliate, with the middle leaflet stalked.

32. **R. radicans** (Linn. spec. 381.) leaflets ovate, smooth, entire.  h. H, native of North America, from Canada to Georgia, common in all woods, fields, and along fences. Berries white. Flowers dioecious, greenish.

**Var. a, vulgaris** (D. C. prod. 2. p. 69.) plant climbing and rooting; leaflets large, entire or rarely toothed, ovate. **Toxicodendron**, var. a, vulgaris, Pursh. fl. amer. spec. 1. p. 205.

**Sims, bot. mag. t. 1806.** Dub. ed. nov. 2. t. 48. **Toxicodendron vulgaris**, Mill. diet. This plant having in common with *ivy* the quality of not rising without the support of a wall, tree, or hedge; it is called in some parts of America creeping *ivy*. It will climb to the top of high trees in woods, the branches everywhere throwing out fibres, which penetrate the trunk of the tree which it grows on. When the stem is cut it emits a pale-brown sap, of a disagreeable scent, and so sharp that letters or marks made upon linen cannot be got out again, but grows blacker the more it is washed. Like *R. venenata* it is poisonous to some persons, but in a less degree. Kalm relates of two sisters, one could manage the tree without being affected by its venom, while the other felt its exhalation as soon as she came within 3 feet of it, or even when she stood to windward of it, at a greater distance; that it had not the least effect upon him, though he had made many experiments upon himself, and once the juice squirted into his eyes; but that on another person’s hand, which he had covered very thick with it, the skin a few hours afterwards became as hard as a piece of tanned leather, and peeled off afterwards in scales.

**Var. β, volubilis** (D. C. prod. 2. p. 69.) stem climbing, scarcely rooting; leaflets ample, ovate. **Toxicodendron volubile**, Mill. diet.

These two last varieties possess the same poisonous qualities as the first, but in a less degree.

**Rooting Poison-oak or Sumach.** Fl. June, July. Clt. 1640. Shrub creeping or climbing.

33. **R. Toxicodicendron** (Linn. spec. 381.) leaflets deeply-angled or sinuated, pubescent.  h. H, native of North America, along with *R. radicans*. **Toxicodendron quercifolium**, Michx. fl. bor. americ. 1. p. 182. Pursh. fl. sept. americ. 1. p. 205. **Toxicodendron pubescens**, Mill. dict. no. 2. According to Nuttall, this is a truly distinct species from the preceding. Perhaps the *T. serratum*, Mill. diet. is a variety of this plant. Flowers greenish. The juice of this tree is milky when it first exudes, but becomes jet black by exposure to the air. It is poisonous to the touch. It was first tried as a medicine by Dr. Alderson of Hull, in imitation of experiments of M. Fresnay, with the *Rhæsudicans*. He gave it in four cases of paralysis in doses of half a grain or a grain three times a day, and all his patients recovered to a certain degree the use of their limbs. The first symptom of amendment was always an unpleasant feeling of prickling or twiching in the paralytic limbs. Dr. Duncan has given it in larger doses without experiencing the same success; it was not however inactive. In one case the patient discontinued its use on account of the disagreeable prickling it occasioned, and in general it operated as a gentle laxative, notwithstanding the torpid state of the bowels of such patients.

**Common Poison-tree or Poison-oak.** Fl. June, July. Clt. 1640. Shrub creeping upon walls or trees.

34. **R. Bahamaeis**; leaflets ovate, acuminate, entire, lateral ones oblique at the base, pubescent beneath, especially on the nerves; petioles and branches hairy; racemes axillary, rather compound.  h. H, native of the Bahama Islands. The plant is poisonous like the two preceding.

**Bahama Poison-tree.** Fl. June, July. Shrub cr. or el.

35. **R. Lineatifolia** (Ort. dec. p. 89.) leaflets ovate, acuminate, toothed, quite entire at the base, lined, with the edges rather villous, lateral ones on short stalks, middle one on a long stalk; racemes axillary; berries striated.  h. S, native of the Island

**Leaflets entire, more or less downy, as well as the petioles and branches.**

**Pilose Sumach.** Fl. July. Cl. 1714. Shrub 6 feet.

38 R. pyroides (Burch. cat. 1796. voy. 1. p. 340.) leaflets oblong, obovate-oblong, quite entire, mucronate, and are, as well as the branchlets, covered with close-pressed pubescence; races axillary, shorter than the leaves, disposed in a terminal, elongated, leafless panicle. G. Native of the Cape of Good Hope. Leaves pale.

**Pinnate-like Sumach.** Cl. 1816. Shrub 6 feet.

39 R. atomaria (Jacq. hort. sansob. t. 343.) leaflets obovate, mucronate, quite entire, smoothish above, but clothed with velvety villi beneath, as well as the branches and petioles; panicle terminal, much branched. G. Native of the Cape of Good Hope. Flowers greenish-yellow. The leaves when bruised have the smell of turpentine.

**Atomated-leaved Sumach.** Fl. July. Cl. 1800. Sh. 6 to 8 ft. 40 R. elliptica (Thunb. fl. cap. 2. p. 214.) leaflets elliptical, entire, acut, downy beneath; petioles filiform; branches smooth; panicle axillary. G. Native of the Cape of Good Hope. Flowers greenish-yellow.

**Elliptical-leaved Sumach.** Fl. July. Cl. 1818. Shrub 6 feet.

**Fringed-leaved Sumach.** Cl. 1816. Shrub 6 feet.

42 R. bicolor (Licht. in Schult. syst. 6. p. 661.) leaflets oblong, acute, downy beneath; races axillary. G. Native of the Cape of Good Hope.

**Two-coloured-leaved Sumach.** Shrub 6 feet.

**Narrow-leaved Sumach.** Cl. 1714. Shrub 7 feet.

44 R. rosmarinifolia (Vahl. symb. 3. p. 50.) leaflets linear, acute, with revolute, quite entire edges, clothed with rusty down beneath; panicles axillary and terminal. G. Native of the Cape of Good Hope.—Burm. afr. t. 91. f. 1. R. rosmarinifolia, Thunb. fl. cap. 2. p. 212. is probably a distinct plant.

**Rosemary-leaved Sumach.** Cl. 1800. Shrub 6 feet.

**Leaflets entire, smooth, but the petioles and branchlets are more or less downy.**

**Tendril-flowered Sumach.** Shrub cl.

46 R. pubescens (Thunb. fl. cap. 215.) leaflets obovate, quite entire, mucronate, smooth; petioles very short; branchlets pubescent. G. Native of the Cape of Good Hope. Flowers greenish-yellow.

**Pubescent Sumach.** Cl. 1800. Shrub 6 feet.

47 R. pendulina (Jacq. ex Willd. enum. 324.) leaflets lanceolate, quite entire, smooth on both surfaces, but fringed; petioles pubescent; branches pendulous; panicle racemose, terminal. G. Native of the Cape of Good Hope. Flowers greenish-yellow.

**Pendulous-branched Sumach.** Shrub 6 feet.

**Leaflets entire, and are, as well as petioles and branchlets, smooth.**

Thunberg's Sumach. Shrub 6 feet.

49 R. luctida (Lin. spec. 382.) leaflets obovate, quite entire, very blunt, somewhat emarginate, smooth on both surfaces; racemes shorter than the leaves, in terminal panicles. G. Native of the Cape of Good Hope. R. licida, Ait. hort. kew. ed. 2. vol. 2. p. 166.—Comm. hort. 1. t. 93.—Pluck. phyt. t. 219. f. 9.—Burm. afr. 232. t. 91. f. 2. Flowers whitish. Fruit reddish.

**Var. b, subdentata (D. C. prod. 2. p. 69.) some of the leaves are a little toothed. Jacq. hort. sansob. t. 347.**

**Shining-leaved Sumach.** Fl. July, Aug. Cl. 1694. Sh. 8 ft. 50 R. Cavannahi (D. C. prod. 2. p. 69.) leaflets obovate, very blunt, somewhat emarginate, quite entire, smooth on both surfaces; racemes longer than the leaves. G. Native of Mexico. R. lucidum, Cav. icon. 2. p. 27. t. 132. exclusive of the synonyms. Flowers greenish-yellow. Fruit reddish.

**Cavanilles's Sumach.** Fl. July, Aug. Cl. 1697. Shrub 6 ft. 51 R. Buda'nnit (D. C. prod. 2. p. 69.) leaflets obovate, blunt, mucronate, quite entire, pale beneath, smooth on both surfaces, as well as the branches; racemes interrupted, a little shorter than the leaves. G. Native of the Cape of Good Hope. Burm. afr. p. 232. t. 91. f. 2. R. lucidum a, Ait. hort. kew. ed. 2. vol. 2. p. 166. Flowers greenish-yellow or whitish.

**Burman's Sumach.** Fl. July, Aug. Cl. 1797. Shrub 6 feet.

52 R. paniculata (Wall. miss. in herb. Lin. soc.) leaves palmately-trilobate; leaflets smooth, coriaceous, obovate-oblong, emarginate at the apex; panicles axillary and terminal. G. Native of Asia.

**Panicked-flowered Sumach.** Shrub.

53 R. nervosa (Poir. suppl. 5. p. 264.) lateral leaflets small, cuneately-ovate, very blunt, mucronate, shining on both surfaces, and are, as well as the branches, quite smooth; racemes rather shorter than the leaves, disposed in a terminal panicle. G. Native of the Cape of Good Hope. Burch. cat. no. 2871. Flowers greenish-yellow.

**Var. b, mucronata (Thunb. fil. cap. 2. p. 216.) petioles very short; panicles axillary.**

**Nerved-leaved Sumach.** Cl. 1800. Shrub 6 feet.

54 R. levigata (Lin. spec. 1672.) leaflets oblong, quite entire, acute at both ends, and are, as well as the petioles and branches, smooth; panicle terminal, elongated, loose. G. I.
Native of the Cape of Good Hope. R. elongata, Jacq. hort. schenb. t. 344. Flowers yellowish-white.

55 R. lancea (Lin. fil. suppl. 184.) leaves linear, acuminate at both ends, and smooth, as well as the branches, lateral ones diverging in a straight angle; pinnule loose, terminal.

\[ G \] Native of the Cape of Good Hope. Thunb. fl. cap. 2. p. 212.

Lance-leafed Sumach. Cl. 1810. Shrub 10 feet.

56 R. VIMALIS (Vahl. symb. 3. p. 50.) leaves linear-lanceolate, very long, quite entire, somewhat tapering to the base, and are, as well as the branches, quite smooth; pinnules axillary, shorter than the leaves. \[ G \] Native of the Cape of Good Hope. Jacq. hort. schenb. t. 344. Flowers greenish-yellow.

57 R. Eragranis (Licht. in Schult. syst. 6. p. 661.) leaves linear-lanceolate, mucronate, smooth. \[ G \] Native of the Cape of Good Hope. Probably quite distinct from R. rigidata.

58 R. BENUDATA (Licht. in Schult. syst. 6. p. 661.) leaves lanceolate-linear, and are smooth, as well as the branches; pinnules capillary, axillary, shorter than the leaves. \[ G \] Native of the Cape of Good Hope. Flowers greenish-yellow.

Naked Sumach. Shrub 6 feet.

59 R. triaetya (Burch. cat. no. 1667. voy. 1. p. 340.) leaves smooth, quite entire, linear, very blunt, broadest towards the base; branches stiff, spreading, unarmed. \[ G \] Native of the Cape of Good Hope. Flowers greenish-yellow.

Three-fingered-leaved Sumach. Cl. 1816. Shrub 6 feet.

**** Leaves tooted, crenate or serrated, more or less downy.

60 R. Parviflora (Roseb. hort. beng. p. 22.) leaves obovate, crenate-toothed, somewhat velvety, and are as well as the petioles and branches velvety-villous beneath; middle one much larger than the rest; pinnule terminal, villous. \[ G \] Native of Nipaup. This species is allied to R. atomaria, but the leaves are not entire. Flowers greenish-yellow.

Small-flowered Sumach. Shrub 6 feet.

61 R. xerida (Schoumb. muroc. 128.) leaves wedge-shaped, entire, or somewhat crenated, obtuse, whitish-glanscous, and lepidot, smooth; petioles a little winged; pinnules axillary and terminal. \[ G \] Native of Mogodog. R. albicans, Willd. ennum. 325.

Whitened-leaved Sumach. Cl. 1816. Shrub 2 feet.

62 R. oxyacantha (Schoumb. in act. soc. hain. p. 71.) leaves cuneate-obovate, usually entire, middle one longest, hoary on both surfaces, as well as the branches and petioles; branches unarmed; racemes axillary and terminal; flowers probably dioecious. \[ G \] Native of Mogodog. R. crataegiflora, Pers. ench. 1. p. 326. This species is perhaps sufficiently distinct from R. dioica and R. albida. Flowers greenish-yellow.

Sharp-spired Sumach. Cl. 1823. Shrub 6 feet.

63 R. sinuata (Thunb. fl. cap. 2. p. 292.) leaves ovate, obtuse, sinuate, villous beneath, as well as the branches; pinnules axillary. \[ G \] Native of the Cape of Good Hope. Myersc trifoliata. Lin. ex Thunb. 

**Sinuate-leafletted Sumach.** Cl. 1820. Shrub 6 feet.

64 R. MSOREXIS; leaves obovate, middle one long, all retuse, sinutately-lobed, brown and pubescent beneath. \[ G \] Native of Mysoor. Racemes panicled, axillary, and terminal.

Mysoor Sumach. Shrub.

65 R. dimidiatea (Thunb. fl. cap. 2. p. 292.) leaves sessile, smooth above but villous beneath, obovate, middle one 3-toothed, lateral one dimidiate, sinutately toothed. \[ G \] Native of the Cape of Good Hope. This species is allied to R. tridentata. Flowers greenish-yellow.

Dimidiate-leaved Sumach. Shrub 6 feet.

66 R. TRIDENTATA (Lin. fil. suppl. 184.) climbing; leaves on short petioles, ovate, hoary, serrated; serrures 3-5; tendril axillary. \[ G \] Native of the Cape of Good Hope. Thunb. fl. cap. 2. p. 220. Flowers yellowish-green.

Three-toothed-leafletted Sumach. Cl. 1816. Shrub cl.

67 R. disseata (Thunb. fl. cap. 2. p. 223.) leaves sharply cut, pinnatifid, smooth above, but clothed with white down beneath; branches smooth. \[ G \] Native of the Cape of Good Hope. Flowers greenish-yellow.

Dissected-leaved Sumach. Cl. 1820. Shrub 6 feet.

68 R. tomentosus (Lin. spec. 382.) leaves elliptical, acuminate at both ends, coarsely serrated from the middle to the apex, clothed with white down beneath, but smoothish above, as well as the branches; pinnules terminal, downy. \[ G \] Native of the Cape of Good Hope. Comm. hort. amst. 1. t. 92. - Pluk. phyt. t. 219. f. 7. Flowers greenish-yellow.

Downy-leaved Sumach. Cl. 1691. Shrub 8 feet.

69 R. incurva (Lin. fil. suppl. 183.) leaves obovate, wedge-shaped, obtuse, deeply pinnatifid, clothed with white down beneath, but pubescent above, as well as the branches; calyces downy. \[ G \] Native of the Cape of Good Hope. Flowers greenish-yellow.

Incised-leaved Sumach. Cl. 1789. Shrub 6 feet.

**** Leaves toothed, serrated, smooth, but the petioles and branchlets are sometimes downy.

70 R. excisa (Thunb. fl. cap. 2. p. 216.) leaves obovate or somewhat oblong, entire or a little cut, smooth; branches divaricate, smooth. \[ G \] Native of the Cape of Good Hope. Flowers and fruit unknown.

Cul-leaved Sumach. Cl. 1816. Shrub 6 feet.

71 R. rigidata (Mill. dict. no. 14.) leaves linear, acuminate, smooth, stiff, entire, or with a few acute teeth; pinnules terminal; branches smooth. \[ G \] Native of the Cape of Good Hope. Burch. cat. no. 2929. Flowers greenish-yellow.

Stiff-leaved Sumach. Cl. 1700. Shrub 6 feet.

72 R. serratifolia (Burch. cat. no. 1697.) leaves linear, acuminate, elongated, serrated, and are, as well as the branches, smooth; pinnules terminal. \[ G \] Native of the Cape of Good Hope. Flowers greenish-yellow.

Saw-leaved Sumach. Cl. 1816. Shrub 6 feet.

73 R. undulata (Jacq. hort. schenb. t. 346.) leaves obovate, tapering to the base, somewhat serrated, wavy; pinnules axillary, length of leaves. \[ G \] Native of the Cape of Good Hope. Pers. ench. 1. p. 326. Flowers whitish-yellow.

Wavy-leaved Sumach. Cl. 1816. Shrub 6 feet.

74 R. dioica (Brass. in Willd. ennum. p. 325.) leaves obovate, middle one largest, 5-5-toothed, cuneate at the base, smooth; branches spiny, smooth; racemes short, axillary; flowers dioecious. \[ G \] Native of Mogodog. R. oxyacantha, Cav. ann. 3. p. 36. R. oxyacanthoides, Dum. Cours. bot. cult. 6. p. 662. Flowers greenish-yellow.

Diocious Sumach. Cl. 1825. Shrub 6 feet.

75 R. lobata (Poir. suppl. 5. p. 264.) leaves wedge-shaped at the base, and entire, but furnished with lobe-like teeth at the apex, and are, as well as the branches, smooth; racemes axillary. \[ G \] Native of Teneriffe, in bushy places. This species is sometimes furnished with simple leaves, rising from the axil of the others. Flowers greenish-yellow.

Label-leaved Sumach. Cl. 1800. Shrub 6 feet.

76 R. erosa (Thunb. fl. cap. 2. p. 212.) leaves lanceolate, crozily-toothed, shining, and are, as well as the branches, quite smooth; pinnules axillary. \[ G \] Native of the Cape of Good Hope. Flowers greenish-white.

Erose-leaved Sumach. Shrub 6 feet.
77 R. cuneifolia (Desf. cat. par. ed. 2. p. 227.) leaflets wedge-shaped, smooth, with 5 or 6 blunt teeth at the apex; branches pubescent. *G.* Native of the Cape of Good Hope. Perhaps the same as R. cuneifolia, Thunb. fl. cap. 2. p. 222. Flowers greenish-white.

**Wedge-leaved Sumach.** Ch. 1816. Shrub 6 feet.

78 R. saxatilis (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 71.) leaflets ovate-lanceolate, acuminate, coarsely-serrate, and as, well as the branches, smooth; racemes axillary, length of petals. *G.* Native of Mexico, on rocks, where it is called *Metzgrandis.* Flowers white-green.

**Rock Sumach.** Shrub 6 feet.

79 R. grandidentata (D. C. prod. 2. p. 72.) leaflets obovate, euneated at the base, with 3 or 4 teeth at the apex; panicles terminal; fruit round, smooth. *G.* Native of the Cape of Good Hope. Burch. cat. no. 3079. Flowers white-green.

**Large-toothed-leaved Sumach.** Shrub 6 feet.

80 R. micha'ntia (Thunb. fl. cap. 2. p. 221.) leaflets ovate, acute, toothed at the apex; panicles axillary, supra-decompound. *G.* Native of the Cape of Good Hope. Flowers greenish-white.

**Small-flowered Sumach.** Ch. 1818. Shrub 6 feet.

81 R. de'ntata (Thunb. fl. cap. 2. p. 219.) leaflets ovate, mucronately-toothed; stem covered with scabrous tubercles. *G.* Native of the Cape of Good Hope. Flowers yellowish-green.

**Toothed-leaved Sumach.** Ch. 1793. Shrub 6 feet.

82 R. crenata (Thunb. fl. cap. 2. p. 219.) leaflets wedge-shaped, crenately trifid at the apex, smooth, but rufous beneath; branches villous; racemes terminal. *G.* Native of the Cape of Good Hope. Flowers greenish-yellow.

**Crenate-leaved Sumach.** Ch. 7. Shrub 3-6 feet.

83 R. supe'ra (Thunb. fl. cap. 2. p. 217.) leaflets ovate, toothed at the apex, and are, as well as the branches, smooth; flowers spatiate. *G.* Native of the Cape of Good Hope. Perhaps this species is referable to section *Lobium.*

**Spike-flowered Sumach.** Shrub 6 feet.

84 R. africana (Mill. dict. no. 11.) leaflets ovate, nerved, usually toothed, green on both surfaces. *G.* Native of the Cape of Good Hope. Flowers greenish-yellow.

**African Sumach.** Shrub 6 feet.

**Meerburgh's Sumach.** Shrub 8 feet.

**Sect. IV. Theze'ra (from *thy'c, thesas, a point; in reference to the prickles).** D. C. prod. 2. p. 72. Flowers dioecious. Styles 3, distinct, short. Drupe roundish, marked with 3 tubercles at the apex, containing a compressed nut. Leaves palmate, 5-7-foliate; leaflets sessile. Flowers disposed in short racemes.

86 R. pentaphylla (Desf. fl. atl. 1. p. 267. t. 77.) branches spiny; petals a little winged; leaflets 3-5, linear-lanceolate, broadest at the apex, blunt, entire or 3-toothed. *G.* Native of Sicily and Barbary. Rhûmus pentaphyllus, Jacq. obs. 2. p. 27.—Bocc. sic. t. 21. R. Theze'ra, Pers. ech. 1. p. 325. Tin. pug. 1. p. 7. Flowers pale-yellow. Fruit red when ripe, with a subacid, rather pleasant taste. The bark dyes red, and is used for tanning leather.

**Five-leaved Sumach.** Ch. 1816. Shrub 10 feet.

**Sect. V. Lobâ'drum (from *loba, a stalk of wheat; similarity in the dense amens of flowers).* Rafin. in journ. phys. 89. t. 98. D. C. prod. 2. p. 73.—Turpinânia, Rafin. in Desv. journ. 1809. 2. p. 170.—Schmûlzânia, Desv. journ. Flowers polygamous. Glands 2-lobed, alternating with the stamens under the ova. Styles 3, short, distinct. Drupes somewhat compressed, villous, containing a smooth nut.—Aromatic shrubs, with palmately-trifoliate leaves, rising from the top of the common petiole, sessile, coarsely and deeply serrated. Flowers disposed in dense amens.

**Sweet-scented Sumach.** Fl. May. Ch. 1759. Shrub 6 feet.

89 R. aro'matica (Ait. hurl. kew. 1. p. 367.) leaflets sessile, ovate-rhomboid, deeply serrated, covered with longish pubescence. *H.* Native of North America, in Pennsylvania, Carolina, and Kentucky, in rocky situations, about springs. Flowers yellow in cattows, as well as those of the preceding species, which give them quite a distinct appearance from the rest of the genus.

Aromatic Sumach. Fl. May, June. Ch. 1772. Shrub 6 ft.

† *Species not sufficiently known.*

* Leaves simple.

90 R. A'tha (Forst. prod. 142.) leaves simple, ovate-oblong; flowers polygamous. *G.* Native of New Caledonia.

**Atha Sumach.** Shrub.

91 R. sz'ser (Forsk. suppl. 207.) leaves long, lanceolate, serrated, clothed with white down beneath; fruit glbose, hispid, crowded. *F.* Native of Arabia, on the mountains about Hadjo, where it is called *Sa'eneb.*

**Sa'eneb Sumach.** Shrub.

92 R. mol'sis (H. B. et Kunth, nov. gen. amer. 7. p. 10. t. 602.) leaves simple, oblong-elliptical, cordate, almost entire, coriaceous, and are, as well as the branches, clothed with soft hairs; racemes axillary, few-flowered; calyxes closed, covered with long pubescence. *G.* Native of Mexico, near Quaratearo. The branches of this shrub, when immersed in water, turns it blue. Fruit unknown. This is probably a genuine species of the genus.

**Soft Sumach.** Shrub.

93 R. ca'stica (Hook. bot. Beech. p. 15. t. 7.) leaves simple, coriaceous, elliptical, quite entire, with cartilaginous margins; racemes subpanicled, axillary, and terminal; flowers dioecious, decandrous; fruit drupaceous, dry. *G.* Native of Chili, at Concepcion. Lautñas caustiea, Moliniti, Willd. and others.—Litri or Litlihi, Feull. per. vol. 3. t. 23. A much branched shrub, of which there are two varieties; the one with rather pubescent branches and smooth leaves, the other with the branches pubescent, as well as the leaves beneath. This is so extremely poisonous that individuals resting or sleeping under it at certain times of the year are afterwards attacked with eruptions all over the body.

**Cauastic Sumach or Lithi-tree.** Shrub 10 feet.

** Leaves pinnate.

Terebinthaceae. XVII. Rhus. XVIII. Mauria. XIX. Stigmaria. XX. Duvaua. XXI. Schinus.

Balb. cat. taur. 1813. p. 64. and Poir. suppl. 5. p. 262. is the same, or a distinct species. It is also probably the R. varifolium, Moc. et Sesse, fl. mex. con. ined.

Variable-leaved Sumach. Shrubs.

95 R. Digitata (Lin. fil. suppl. 184.) climbing; leaves pinnate; leaflets 5, oblong, quite entire, smooth, obtuse; tendrils axillary. h. G. Native of the Cape of Good Hope. Flowers and fruit unknown.

*** Leaves trifoliate.

96 R. arborea (D. C. prod. 2. p. 73.) leaflets lanceolate, unequally serrated, downy beneath; petioles and branches pilose-tomentose; stem arborescent. h. S. Native of Jamaica, on hills, as well as of Campenacho. Toxidocordum arboreum, Mill. dict. no. 5. Orange berry, smooth. Sloan. cat. 170.

Tree Sumach. Tree 20 feet.

97 R. arborescens (D. C. prod. 2. p. 73.) leaflets ovate-lanceolate, acuminate, smooth, oblique at the base; stem shrubby, branched; flowers dioecious. h. S. Native about Carthagena. Toxidocordum arborescens, Mill. dict. no. 9.

Arborescent Sumach. Shrub 6 feet.

Cult. The hardy species of this genus are very proper for shrubbery; some of them are propagated freely from cuttings of the roots, and others from cuttings and layers. The greenhouse and hothouse species will grow in any kind of soil, and ripened cuttings of them root freely under a hand-glass in sand; those of the stowe species require heat.

1 M. simplexflora (H. B. et Kunth, 1. c. t. 605.) leaves simple, somewhat elliptical. h. S. Native of South America. Flowers pale-red.

Simple-leaved Mauria. Tree 20 feet.

2 M. heterophylla (H. B. et Kunth, 1. c. t. 606.) leaves with 1 or 2 pairs of leaflets, with an odd one, which is oblangu. h. S. Native of Peru, between Locza and Ayavaca. Fruit unknown. Flowers pale-red.

Variable-leaved Mauria. Tree 20 feet.

Cult. For culture and propagation see the stowe species of Rhus.

XIX. STIGMATORIA (from eratología, stazó, to run out; the bark exudes a resin). Jack, mal. misc. no. 1. p. 12.

Lin. syst. Pentándria. Mono-Trigynia. Calyx inferior, tubular, deciduous, with the mouth irregularly ruptured. Petals 5, inserted in the stipe of the ovary. Stamens 5, alternating with the petals; filaments about the length of the corolla; anthers oblong. Ovary 3-lobed; lobes 1-seeded, 1-2 of which are usually abortive. Styles 1-3, rising from the tops of the lobes of the ovary. Stigmas obtuse. Berry kidney-shaped, furrowed, 1-seeded, warty. Seed exalbuminous. Embryo falsely mono-cotyledonous.—A small amount of resinous juice, with simple exstipulate leaves, and panicles of flowers.

1 S. verniciflua (Jack, l. c.) h. S. Native of Sumatra and Borneo, and other East India Islands.—Rumph. amb. 2. p. 250. t. 86. A large tree, with alternate elliptic-lanceolate leaves. It is dangerous to handle, or even to sit or sleep under its shade. The resinous exudate, which soon becomes hard and black on exposure, is collected and employed as varnish. According to Rumphius, this is the celebrated varnish-tree of Japan, and probably the Aúgia of Loureiro.

Varnish-flowing Stigmatoria. Tree 50 feet.

Cult. For culture and propagation see stowe species of Rhus.

Lin. syst. Monoeica or Dietesia, Ocatédria. Flowers monococious or dioecious. Calyx 4-cleft, permanent. Petals 4, concave. Stamens 8-10, inserted under the disk, alternate ones longer than the petals, they are barren in the female flowers. Disk urceolar, 8-toothed. Ovary sessile, conical, containing only one ovulum, sterile in the male flowers. Styles 5-4, very short. Stigmas capitulate. Drupe globose, containing a coriaceous nut. Seed 1, pendulous, destitute of albumen, with flat cotyledons and a long superior radicle.—Smooth, somewhat spinaceous trees, natives of Chili, with simple, almost entire leaves, and axillary, many-flowered racemes. Flowers sometimes 5-cleft.

1 D. dependens (D. C. prod. 2. p. 74.) leaves ovate-lanceolate, entire, and sometimes trifid; racemes simple, length of the leaves; flowers usually octandrous. h. F. Native of Chili, where it is called Huisinghan. Amyris polygama, Cav. icon. 3. p. 20. t. 229. Schinus dependens, Orb. dec. 8. p. 102. Flowers yellowish-white. Berries black. The flowers are occasionally polygamous, monococious, and dioecious.

2 D. ? dentata (D. C. prod. 2. p. 74.) leaves lanceolate, toothed; racemes compound, a little longer than the leaves; flowers deciduous. h. F. Native of the island of Owhyhee. Schinus dentatus, Andr. bot. rep. t. 620. Flowers white, numerous, in compound axillary racemes. Berries black, the size of a small currant, with a sweet fleshy pulp, each having many seeds, though generally perfect but one seed.

Cult. For culture and propagation see greenhouse species of Rhus.

XXI. SCHI'NUS (eucor, schinos, is the Greek name for the mastick; a resinous juice exudes from this tree similar to mastick). Lin. gen. no. 1130. Lam. ill. t. 822. Kunth, gen. tereb. p. 7. D. C. prod. 2. p. 74.

Lin. syst. Dicévia, Decindria. Flowers dioecious. Calyx 5-parted. Petals 5. Male flowers with 10 stamens and the rudiment of an ovary. Female flowers with sterile stamens and one single ovary. Style wanting. Stigmas 3-4, collected into a dot. Drupe globose, with a thin epicarp, and very little pulp, containing a 1-seeded bony nut, having 6 hollows or cavities in the circumference. Seed without albumen, compressed, suspended by a funicle, which rises from the side of the pericarps. Embryo with flat cotyledons and an inferior radicle.—Shrubs or little trees, natives of America, abounding in peppery, balsamiferous gum. Racemes or panicles axillary. Leaves impari-pinnate. This genus agrees with Spándias in the radicle being inferior.

1 S. mu'li (Lin. spec. 1467.) leaves with numerous pairs of lanceolate, serrated leaflets, terminal one longest; flowers panicled. h. G. Native of Brazil and Peru. Mill. fig. t. 246. Lam. ill. t. 822. Flowers small, yellowish-green. Berries about as large as a pea, of a singularly beautiful rose-colour, and highly polished. The Peruvians are reported to make a vinous drink by boiling the dry berries, as well as a kind of honey, and a sort of vinegar, according to the mode of management. A resinous gum exudes from the stem, which par-
takes of the nature of mastick. The fresh leaves have a
singular motion when immersed in water, and emit a turpentine
odour when bruised. *Mulli* is the Peruvian name of the tree.

Var. β, *Acria* (Lin. spec. 1467.) leaflets almost quite entire.
γ, *G. Mulli*, with a figure. Both varieties are beautiful shrubs in England, but they are said to
grow to considerable trees in the places of their natural growth.
The first variety stands in the open air in Sicily.

Tree 20 feet.

2 S. *Terebinthifolius* (Raddi, pl. bras. p. 20.) leaves im-
pari-pinnate, with 7 somewhat serrated, almost equal leaflets;
flowers racemose. ½. Native of Brazil. C. Arochiri, Marac-
bas. p. 90. Flowers greenish-white.

*Terebinthifolius*—Schinus. Clt. 1890. Tree 20 feet.

3 S. *Huycgan* (Mol. chil. ed. gall. 337.) leaves impari-
pinnate; leaflets serrated; stalked; the odd one very short. ½. G.
Native of Chili, where it is called *Huycgan*. Flowers greenish-
white.

*Huycgan* Schinus. Tree.

Cult. For culture and propagation see greenhouse and stow
species of *Rhizas*, p. 76.

† *Genera allied to Terebinthaceae*, Tribe Sumachinae, but
are not sufficiently known.

*Petals 4-5. Stamens usually 3-5.*

XXI. TRICEROS (from πεπες, τρίς, three, and πεπες, κέρας, a
horn; in allusion to the fruit being crowned by three horns).

Lour. fl. coch. 184. D. C. prod. 2. p. 89.

Lin. syst. *Pentandria, Trigynia*. Calyx 5-parted, per-
Styles 5, distinct. Corolla 94. Berry coriaceous, 3-
horned, 5-celled. Seeds 2 roundish.—A tree with impari-
pinnate leaves, having 2 pairs of pinax. Racemes loose, sub-
terminal.

1 T. *Cochinchinea* (Lour. l. c.) ½. G. Native of Coch-
china, on the mountains. Flowers white.

*Cochinchina* Tricos. Tree 25 feet.

Cult. See *Cochinorum* for culture and propagation, p. 78.

XXII. TRATTINICKIA (in honour of Trattinick, a German
botanist). Willd. spec. 4. p. 975. but not of Pers. nor
Esp. D. C. prod. 2. p. 89.

Lin. syst. *Menorea, Pentandria*. Male and female flowers
mixed. Calyx campanulate, 3-toothed. Corolla campanulate,
3-toothed. Stamens 5, rising from the torus. Ovary 1, ovate.
Style awl-shaped, simple. Fruit unknown.—A large tree, with
the appearance of *Rhizas*. Leaves impari-pinnate. Panciles of
flowers terminal. From the petals being connected, it would
appear that this tree is closely allied to *Homilggia*.

1 T. *Khohßia* (Will. l. c.) ½. S. Native of Brazil, in the
province of Para.

*Red-leaved* Tratinickia. Tree 66 feet.

Cult. See stowe species of *Rhizas*, for culture and propagation,
p. 76.

XXIV. HUERTIA (in honour of Jerome Huerta, a Spaniard,
who translated Pliny into his own language). Ruiz et Pav. fl.
per. prod. 34. t. 6. syst. 1. p. 63. D. C. prod. 2. p. 90.

Lin. syst. *Pentandria, Monogynia*. Calyx 5-toothed. Petals
bifid, acute. Drupes obovate, containing a 1-celled, 1-seeded
nut.—A tree with impari-pinnate leaves, and stalked, oval-
lanceolate, serrated leaflets, which are villous at the origin of
the veins beneath, bearing 2 glands at the base of each. Racemes
axillary and terminal. Flowers yellow.

1 H. *glandulosa* (Ruiz et Pav. fl. per. 3. p. 5. t. 227. f. a.)
½. S. Native of Peru in groves.

*Cult.* See stowe species of *Rhizas*, for culture and propaga-
tion, p. 76.

XXV. RUMPHIA (in honour of George Everard Rump-
hius, Consul of Ambotna, author of Herbarium Amboinense,
1750 in fol.; died 1766). Lin. gen. no. 47. Lam. ill. t. 25.
D. C. prod. 2. p. 90.

Petals 3, oblong. Stamens 3, exerted equal with the petals.
Ovary 1, somewhat trigonal. Style 1. Drupe coriaceous, tur-
binate, 3-furrowed, containing a 3-celled, 3-seeded nut.—A
tree, with simple leaves and axillary racemes of white flowers.
This genus is excluded from *Terebinthaceae* by S. Kunth.

1 R. *Tellefôlia* (Lam. dict. 6. p. 352.) ½. S. Native of
Malabar, not of Amboyna. R. Amboinensis, Lin. spec. 49.—
Rheed. mal. 4. t. 11. Leaves cordate, ovate, crenate, hairy, rough.

*Time-tree*—Rumphia. Tree 60 feet.

*Cult.* See stowe species of *Rhizas* for culture and propaga-
tion, p. 76.

XXVI. BARBYLUS (a name by which Theocritus and others
have called the common damask prune). P. Browne, jam. 116.
D. C. prod. 2. p. 91.—Barola, Adans. fam. 344.

Lin. syst. *Octo-Deóandra, Monogynia*. Calyx 4-5-cleft,
campanulate. Petals 4-5, rising from the margin of the calyx.
Stamens 8-10, rising from the bottom of the calyx. Ovary free.
Style and stigma 1. Capsule 5-celled, each cell containing 2
seeds.—A tree with alternate, pinnate leaves, and racemes of
white flowers. This genus is hardly known, but according to
Adamson it is allied to *Terebinthaceae*.

1 B. *Jamaicensis* (D. C. prod. 2. p. 91.) ½. S. Native of
Jamaica.

Barbylus. Tree 20 feet.

*Cult.* See stowe species of *Rhizas* for culture and propaga-
tion, p. 76.

** Petals wanting. Stamens 10-12.**

XXVII. LUNANE'A (in honour of John Lunan, author of
Spec. 1. p. 158. but not of Salis.—Bichy, Lunan, hort. Jam.
1. p. 86.

Lin. syst. *Polygània, Dioscia*. Flowers polygalaceous. Calyx
coloured, 5-parted; lobes erectly-spreading, thick, and
piloous on the outside. Petals wanting. Disk concave, 10-
toothed. Stamens 10, exserted from the disk; anthers with
coloenscent teeth on the outside. Ovary roundish, crowned by
5 stigmas. Capsule somewhat ovate, gibbous, 1-celled, valve-
less (ex Rafin), semilocular, 2-valved (ex Lunan). This genus
is allied to *Poupartia*, according to Rafin. Seeds fixed by the
back.

1 L. *Bichy* (D. C. prod. 2. p. 92.) ½. S. Native of Guiana,
from whence it has been introduced to the West Indies by the
negroes, under the name of *Bichy*. Edwrdas lúrida, Rafin. 1 c.
Amyris Lunani, Spreng. syst. 2. p. 217. Leaves alternate,
stalked, oblong, acuminate, smooth, wavy, veiny, and com-
 pound racemes of yellow flowers, which are striped with purple
and have an ungrateful smell.

*Bichy* Lunana. Tree.

*Cult.* For culture and propagation see stowe species of *Rhizas*,
p. 76.

XXVIII. HETERODE'NDRON (from ἔτερος, heteros, variable,
and ἔδρων, dendron, a tree; tree variable in form). Desl.

Calyx small, permanent, simately 4-5-toothed. Petals wanting. Stamens 10-12, hypogynous; anthers 2-celled, inserted by the base. Ovary bluntly 2-4-sided, 2-4-celled, hairy. Style scarcely any. Fruit unknown.—A shrub, with the appearance of *Cnecorum*. Leaves simple, oblong-lanceolate, quite entire. Flowers in axillary racemes.

1. **H. olearifolium** (Desf. l. c.). G. Native of New Holland. Flowers yellowish-green. 
*Olive-leaved Heterodendron*. Shrub.
*Cult.* See *Cnecorum* for culture and propagation.

**XXX. STYLOBAS'IUM** (from στυλος, stylos, a style, and βας, basis, a base; style at the base of the ovary). Desf. mem. mus. 5. p. 37. t. 2. D. C. prod. 2. p. 92.

**Lin. syst.** Decandria, Monogynia. Calyx nectarous, bluntly 2-lobed (f. 14. a.), coloured. Petals wanting. Stamens 10 (f. 14. b.), hypogynous; anthers 2-celled (f. 14. g.). Ovary obovate (f. 14. f.), containing 2 ovula, bearing from the side at the base a filiform style (f. 14. f.), which is capitulate at the apex (f. 14. c.). Drupe (f. 14. c.), 1-celled, 1-seeded, roundish, girded by the calyx.—A shrub, with alternate, somewhat spatulate, quite entire, smooth leaves. Flowers usually polygamous from abortion, on short pedicles from the axil of the upper branches. This genus probably belongs to *Terebinthaceae* near Heterodendron or perhaps to Rosaceae, Tribe Chrysobalaneeae.

1. **S. spatulatum** (Desf. l. c.). G. Native of New Holland, on the eastern coast. *Spatulate-leaved Stylobasium*. Shrub 6 feet.
*Cult.* See *Cnecorum* for culture and propagation.

**XXX. CNEORUM** (κενός, κενόρος, a name given to some shrub resembling an olive by Hippocrates and Theophrastus). Lin. gen. no. 48. Lam. ill. t. 27. Kunth, gen. tereb. p. 25. D. C. prod. 2. p. 85.—Chamaelea, Tourn. inst. t. 421.

**Lin. syst.** Tri-Tetrándria, Monogynia. Flowers hermaphrodite. Calyx 3-5-toothed, small, permanent. Petals 3-4, equal, imbricate in estivation. Torsus somewhat globose. Stamens 5-4. Stigmas 3-4. Drupes baccate, 3-4, joined together by the axis; putamen 2-celled; cells 1-seeded. Seed pellulous. Albumen fleshy. Radicle recurved downwards and beyond the cotyledons. Cotyledons semicylindrical (Gaert. fruct. 1. t. 70).—Subshrubs, with entire linear-oblong, dotted leaves, and axillary, yellow flowers. This genus is perhaps more nearly allied to *Dodonaea*.

1. **C. tri'S'cos'um** (Lin. spec. 49.) smooth; flowers axillary; pedicels free from the floral leaves. G. Native of Spain and the south of France, in gravelly and rocky places. Sims, bot. mag. icon. Lam. ill. 27.—Cam. epig. t. 973. Jaume, pl. fr. t. 5. Flowers usually 3-cleft. This is a dwarf spreading shrub with narrow leaves, having fruit resembling some of the *Euphorbia*.
*Three-berried Widow-wail*. Fl. April, Sept. Cl. 1793. Shrub 1 to 2 feet.
2. **C. pu'er'cul'le'stum** (Vent. hort. cels. t. 77.) plant covered with greyish powdery, flowers axillary; pedicels adhering to the base of the floral leaves. G. Native of Teneriffe, among rocks in hot situations. Flowers usually 4-cleft.
*Powdery Widow-wail*. Fl. April, Sept. Cl. 1822. Sh. 1 to 3 ft.
*Cult.* The species thrive well in a mixture of loam and peat, or any light loamy soil. They will survive the winter in the open air in mild winters. Ripened cuttings root freely in sand, under a hand-glass. Seeds ripen in abundance.

**Lin. syst.** Penta-Decandria, Pentagynia. Calyx 5-parted. Petals 5, hypogynous, or inserted in the bottom of the calyx. Stamens 5-6. Carpels 5, bearing each a filiform style on the inside laterally, ending in a valveless, indischisent, coriaceous nut. Seed 1 from the base, obturate, kidney-shaped, destitute of albumen. Embryo replicates, with a terete radicle directed downwards, and flat incumbent cotyledons.—A shrub with simple, oblong, spathulate, thickish, rather velvety, exstipulate leaves, which are crowded at the tops of the branches, and yellow, bracteate, terminal flowers. From this the genus is allied to *Cnecorum*, not to Rosaceae, and perhaps with it and Heterodendron will constitute a distinct order. According to Kunth it is more nearly allied to Geraniaceae.

1. **S. ma'ritima** (Lin. spec. 364.). G. Native of South America, by the sea-side as well as of India and New Caledonia, &c. Plum. ed Burm. t. 249. f. 1. Flowers yellowish.
*Sea-side Suriana*. Cl. 1733. Shrub 3 to 4 feet.
*Cult.* Loan and sand is a good mixture for this tree, and ripened cuttings will root in sand under a hand-glass, in heat.

Flowers sometimes unisexual. Calyx 5-cleft (f. 15. a.), regular, permanent or deciduous. Petals 5 (f. 15. b.), inserted below the disk which surrounds the ovary, somewhat valvate or imbricate in estivation. Stamens 10, perigonous, inserted with the petals. Disk annular in the male flowers, orbicular, 10-toothed. Ovary superior, sessile, from 2-5-celled, with one pendulous ovum in each cell. Styles 5, very short, crowned by obtuse stigmas. Fruit drupaceous (f. 15. d.), containing a 2-5-celled nut (f. 15. c.). Seeds exalbimous. Cotyledons plano-convex. Radicle superior, pointing towards the hilum, but inferior in *Spodium*, according to Gartnert.—Trees, with unequally-pinnate, alternate, dotted leaves, a few simple ones occasionally intermixed, all exstipulate. Flowers axillary and terminal, disposed in panicles or racemes.—This order comes very near to *Terebinthaceae* in the structure of its fruit, which is almost that of *Mangifera*, except that it is compound and not simple, destitute however of the resinous juice of that order.

**Synopsis of the Genera.**

1. **Spodium**. Flowers sometimes unisexual. Calyx 5-cleft (f. 15. a.). Petals 5 (f. 15. b.), rather valvate in estivation. Stamens 10, glandular, exserted from the disk. Ovary 1. Styles 5. Drupa (f. 15. d.) containing a 5-celled fibrous nut (f. 15. c.), each cell containing 2 ova, one of which only comes to maturity.
I. Spondias (στόνδιας, spondias, one of the Greek names for the plum; the fruit exactly resembles a plum). Lin. gen. no. 577. Gurt. fruct. 2. t. 104. Kunth. gen. tereb. p. 31. D. C. prod. 2. p. 74.

Lin. syst. Decandria, Pentagynia. Flowers sometimes of separate sexes. Calyx 5-angled (f. 15. a.), coloured. Petals 5 (f. 15. b.), oblong, spreading, somewhat valvate in estimation. Stamens 10, glandular, exserted, arising from the crenate disk. Ovary 1, ovate. Styles 5, erect, distant, simple. Drupes ovate (f. 15. d.) or roundish, crowned by the punctiform vestiges of the styles, containing a fibrous 5-celled nut (f. 15. c.), each cell containing 2 ovula. Seed solitary from abortion, without albumen. Embryo straight, with somewhat fleshy cotyledons, and an inferior radicle. —Trees, with impari-pinnate leaves, very rarely simple. Racemes axillary or terminal, simple or panicked. This genus agrees with Schinus in the radicle being inferior.  S. Purpurea (Lin. spec. 613.) leaves impari-pinnate; petioles compressed. \( \delta \), S. Native of the West Indies and South America. S. Molbin, Lin. syst. veg. 357, but not of Jacq. S. myrobalanus, Jacq. amer. t. 88. Gurt. fruct. 2. p. 102. t. 104.

—Sloan. jam. 2. p. 136. t. 219. f. 3, 4, and 5. Flowers small, red, in simple racemes. Fruit ovate or oblong, purple or variegated with yellow, an inch long; pulp yellow, with a singular, but agreeable acid aromatic flavour, but is not held in much esteem by Europeans. The tree is very variable in size; the boughs are set in the ground when in flower as hedges, and in the course of 2 or 3 months they are laden with fruit. It is called Spanish plum-tree.

Purple-fruited Hog-plum or Spanish plum. Clt. 1800. Tree 30 to 40 feet. 2 S. Zanzece; leaves impari-pinnate, with entire leaflets; fruit small, black, edible; panicle terminal. \( \delta \), S. Native of Quenia, where it is called Zanzece.

Zanzece Hog-plum. Tree 60 feet. 3 S. Leuca (Lin. spec. 613.) leaves impari-pinnate, with 7-9 ovate, oblong, shining leaflets, which are gradually acuminate; petioles round. \( \delta \), S. Native of South America and the West Indies, where it is called Molbin, Hobe, &c. S. myrobalanus, Lin. syst. 357. S. Molbin, Jacq. amer. 158. Gurt. fruct. 2. p. 102. —Sloan. hist. t. 219. f. 1 and 2. Racemes in branched panicles. The fruit of this tree is yellow, and as large as a plum; the flesh is of an agreeable acid aromatic flavour, eaten by children and some of the inhabitants, but furnishing excellent food for hogs. There is a variety of this species in Jamaica, esteemed by some persons. As the branches grow very readily, the tree is used by some for hedges, and one or two is planted in pastures to afford shade for hogs.

Yellow-fruited Hog-plum. Clt. 1799. Tree 50 feet. 4 S. Ochee; leaves impari-pinnate; leaflets ovate, acute, entire; panicle spreading, terminal; flowers pentandrous. \( \delta \), S. Native of Guineia, where it is called Ochigee. Fruit about the size of a pigeon's egg, yellow, of a fine sweetish acid taste. Flowers small, white.

Ochigee Hog-plum. Tree 60 feet. Cult. Loam and sand is a good mixture for the species of Spondias, and large cuttings will root if planted in sand or mould, in heat.

II. Poupartia. Bursaroraceae.

Lin. syst. Dioecia, Decandria. Flowers of separate sexes. Calyx 5-parted, deciduous. Petals 5, spreading very much, imbricate in estimation. Stamens inserted on the margin of a hydropogynous disk. Ovary 5-celled? cells 1-seeded, with some of the cells usually abortive. Styles 5, approximate or subcon- nate, crowned by obtuse truncate stigmas. Drupe baccate, containing a 5-2-celled nut; cells remote from the axis. Seeds flatish, without albumen, somewhat falcate. Embryo exalbuminous, inerminated with plano-convex cotyledons, and a lateral or centrifugal radicle. —Trees, with impari-pinnate leaves, and quite entire acuminate leaflets, and subterminal panicles of flowers. This genus is said to belong to Bursaroraceae by R. Brown.

1 P. Bordonica (Lam. dict. 5. p. 606.) leaves pinnate; racemes compound. \( \delta \), S. Native of the island of Bourbon, where it is called Bois de Poupart. Leaves some of them simple, others with numerous leaflets, 11-19. Flowers dark-purple.

2 P. Mangifera (Blum. bijdr. 1160.) leaves ovate or elliptic-oblong, acuminate, oblique at the base, quite entire, veiny, and smooth; panicle divaricate. \( \delta \), S. Native of Java, and other parts of the East Indies, where it is called Dako. Mangifera pinnata, Lin. fil. suppl. 156. Spodias mangifera, Pers. encl. p. 509. Spodias amara, Lam. dict. 4. p. 92. The leaves of this tree are said by Rheed to be agreeably acid. The fruit oval, of a yellowish-green colour, an inch and a half long, edible, and agreeably fragrant. The cat-ambalan of Rheede. mal. p. 93. appears to be a wild state of the same plant.

3 P. Duicis (Blum. bijdr. 1161.) leaves elliptic-oblong, acuminate, repandly-crenulated, smooth, with parallel veins; panicle divaricate. \( \delta \), S. Native of Java, Moluccas, and the Society Islands. Spodias dulcis, Forst. prod. 198. Spodias Cytherea, Sonn. itin. 2. t. 123. Lam. dict. 4. p. 180. ill. t. 384. Gurt. fruct. 2. p. 101. t. 109. The fruit is large, and very smooth, of a golden-yellow colour, and a somewhat nauseous fetid smell, containing a sweet, aromatic, succulent pulp. The tree is cultivated to a great extent in the Society and Friendly Islands, especially in Otahiti, for the sake of its fruit, which is esteemed one of the most wholesome; it has almost the flavour of a pine-apple, and not only assuages thirst, but is given to the sick without distinction.

Flowers hermaphroditic (f. 16.), but occasionally unisexual (f. 18.). Calyx permanent, nearly regular, with from 2-5 divisions (f. 16. a.). Petals 3-5 (f. 16. c.), inserted below the disk, rising from the calyx, usually valvate in estimation. Stamens 2 (f. 16. d.), or 4-times as many as there are petals, perigynous, all fertile. Disk orbicular (f. 18. d.), or annular (f. 16. b.). Ovary 2-4-celled, superior, sessile (f. 16. c. f. 18. e.). Style short or wanting, with the stigmas equal in number to the cells of the ovary. Ovula in pairs, attached to the axis, collateral. Fruit drupaceous (f. 18. e.), 2-5-celled, with the outer part often splitting into valves. Seeds exalbuminous. Cotyledons either
winkled or plaited or fleshy. Radicle superior, straight, turned
towards the hilum.—Trees or shrubs, abounding in balsamic
resin or gum. Leaves alternate, unequally pinate, occasionally
stipulate, usually without pellucid dots. Flowers axillary or
terminal, disposed in racemes or panicles. This order differs
from Terebinthaceae, to which it is closely allied, in the com-
pounded ovary and pinate leaves, and also in the very generally
valvate aestivation of the calyx. The plants abound in a fra-
grant resinous juice, which, however, is destitute of the
acridity and staining properties of that of Terebinthaceae. The
resin of Boswellia is used in India as incense, and also as pitch.
It is hard and brittle, and according to Dr. Roxburgh, is boiled
with some low-priced oil to render it soft and fit for use.
The native doctors prescribe it mixed with ghee (clarified butter) in
cases of gonorrhœa, and also in what they call ritta. A sub-
stance like gum elemi is produced by Icica Icicariba and I. Co-
avia, and a yellow essential oil by Bursera acumínata, which has
the same properties as those of balsam of capava; the 3-horned
n eyes of Canarium commune are eaten in Java both raw and dressed,
and an oil is expressed from them which is used at table when
fresh, and for lamps when boiled. The raw nuts, however, are
apt to bring on diarrhoea.

Synopsis of the Genera.

1 Boswel'lia. Flowers hermaphrodite (f. 16.). Calyx 5-
toothed (f. 16. a.). Petals 5 (f. 16. c.), with the edges incum-
bent in aestivation. Disk cup-shaped (f. 16. b.), crenated,
staminiferous. Stamens 10 (f. 16. d.). Style crowned by a
 capititate stigma. Capsule trigonal (f. 16. c.), 3-valved, 3-celled.
Seeds solitary in the cells, girded by a membrane.

2 Balsamode'ndron. Flowers unisexual. Calyx 4-toothed.
Petals 4, induplicate-valvate in aestivation. Stamens 8,
inserted under the annular disk, with elevated warts between them.
Ovary 1. Style 1, short, obtuse. Berry or drupe ovate, acute,
marked by 4 sutures, 1-2-celled; cells 1-seeded.

3 Icica. Flowers usually hermaphrodite. Calyx 4-5-toothed.
Petals 4-5, inserted under the disk, valvate in aestivation. Sta-
mens 8-10. Ovary 4-5-celled; cells 2-ovulate. Disk orbicular.
Style short, crowned by 3-4 stigmas. Fruit coriaceous, 2-3-valved,
containing 4-5 little, 1-seeded nuts involved in pulp.

4 Pa'trium. Flowers unisexual. Calyx 5-cleft. Petals 5,
inserted under the disk, valvate in aestivation. Stamens 10. Style
1. Disk truncate, 10-ribbed. Drupe indelscent, containing
3 nuts, 2 of which are usually abortive.

5 Burse'ba. Flowers polygamous (f. 18.). Calyx small,
3-5-parted. Petals 3-5 (f. 18. b.), valvate in aestivation.
Stamens 6-10 (f. 18. c). Disk annular, 8-crenate (f. 18. d.).
Ovary 3-celled. Style short, tridf. Drupe (f. 18. e), 3-valved,
containing 3 1-2-seeded nuts, 2 of which are abortive.

6 Marig'nya. Flowers hermaphrodite. Calyx 5-cleft. Pe-
5-celled. Stigma nearly sessile, somewhat 5-lobed. Drupe
containing 1-5 1-seeded nuts, covered with pulp.
with vegetable oil for the more useful purpose of marine pitch. Leaves crowded at the ends of the branches, a span long, deciduous. Flowers small, white, with a red nectary and yellow anthers.

2 B. murzata (Smith, in Rees' cyc. no. 21). leaflets oblong-lanceolate, hairy, densely serrated; racemes axillary, simple, many-flowered. f. S. Native of Ambayna. Rumph. amb. 2, t. 51, ex Smith, and therefore Canarium hisutum, Willd. spec. 4, p. 760.

Hairly Boswellia. Tree 50 feet.

Boswellia. (Stack, extr. bruc. p. 19, t. 3.) leaflets ovate-oblong, taper-pointed, serrated, pubescent, racemes axillary, simple. f. S. Native of the moun-
taious parts of India. From this tree is collected the gum olibanum ex Colbr. in asiatic. res. 9, p. 277. called a coloured figure. B. thurifera, Roxb. hort. beng. p. 32. Flowers whitish-yellow. It is generally agreed that the gum resin, called olibanum, is the frankincense which was used in the religious ceremonies of the ancients, but there is not the same agreement as to the plant supposed to produce it. Linneus has referred it to the Lycian juniper, and the chemical writers agree with him; but the French botanists deny it, and say that Linneus made the assertion without proof. This remark is evidently well founded. A great degree of obscurity has always hung over this subject; and we learn from Theophrastus and from Pliny that the Greek writers differed in their description of the tree. Olibanum is named Liban and Cundur by the Arabs. But benzoin having been introduced into general use as incense, in place of Olibanum, the name of Liban is given to that fragrant balsam, but the Mahomedan writers of India on materia medica apply only the term Cundur to Libanum. From the Hebrew Lebanon or Arabic Luban, the Greeks obtained their names for the tree and gum Libanum and Libanotis. They seem likewise to have been acquainted with the term Cundur, from which spongiosus is probably derived. The Hindoo writers on materia medica notices a fragrant resinous gum under the name of Cundurum, which their grammarians consider as a Sanscrit word, and accordingly date an etymology of it from a Sanscrit root. They concur in declaring it to be the produce of the Sallata, a tree which they affirm to be vulgarly called Salai. The tree which is known by that name is the Boswellia serrata. Mr. Turnbull, who was surgeon to the residency of Nagpore in the East Indies, and on his return to the station of Mirzapore he procured considerable quantities of the gum of the Salai, which he sent to Europe at different times, first without assigning the name of Olibanum, and afterwards under that denomination. It was in England recognised for Olibanum, though offered for sale as a different gum; and annual consignments of it have been since regularly sold at the East India Company's sales. The experience of several years at a market such as that of London, where a mistake, if any had been committed, would have been soon discovered, seems to be conclusive. Olibanum is said to be principally collected in Arabia and brought from Mecca to Cairo, from whence it is imported into Europe. It consists of various brittle grains of different sizes, not larger than a chestnut, of a red or yellow colour, having little taste and a peculiar aromatic smell. Neumann got from 480 grains, 340 alcoholic and 125 watery extract, and inversely 200 watery and 273 alcoholic. The distilled spirit and water both smelt of Olibanum, but no oil separated. Olibanum forms a transparent solution with alcohol, and a milky fluid when triturated with water; it is not fusible but inflammable, and burns with an agreeable smell. It is said to be the frankincense of the ancients; and the diffusion of its vapour around the altar still forms part of the religious ceremonies of the Greek and Roman Catholic churches.

Cult. A mixture of loam, peat and sand will suit these trees, and ripened cuttings will root in sand, under a hand-glass, in heat.
tague says that the **Balm of Mecca** of the best quality is not easy to be got, even at Constantinople; that on applying some of it to her face it became swelled and red during three days, but that her complexion was much mended by the operation; and that the ladies all use it in Constantinople, and have the loveliest bloom in the world. An inferior sort of balsam is prepared from boiling the twigs in a quantity of water, and the balsamic matter rises to the surface and is skimmed off. After they have thus procured all they can, it is said that they push the fire, and a large quantity of thicker balsam, like turpentine, rises, which is preserved by itself, and is that principally which we have in Europe. The other can only be obtained by presents; and that which naturally distils from the trees hardly supplying the scragio and great officiers, there is none of it sent out of the country. Hasselquist describes the **Balsam of Mecca** as being yellow and pellucid, with a most fragrant resinous balsamic smell, as being very tenacious, and drawing out into long threads; that it is taken to the quantity of 3 grains to strengthen a weak stomach, and that it is a most excellent remedy for wounds. To know whether it is adulterated, drop some in a glass, and if it remains still on the surface it is of little or no use, but if it extends itself over the surface it is then of the best kind. The drugs used to adulterate this balsam are oil of sesamum, Cyprus turpentine, and ostrich fat. According to Bruce the tree is 5 or 6 feet high, branching much, with the aspect of a standard cherry-tree, having red branches and white flowers. The young shoots were formerly cut off and tied up in Egypt, and sent to Venice to make the Therice or Venice treacle, when bruised or drawn by fire. From very early ages great value has been set upon this drug in the East. We know from Scripture, that the Ishmaelites, or Arabic carriers and merchants, trafficking with Indian commodities to Egypt, brought with them balm as part of their cargo. Strabo alone, of all the ancients, has given us an account of the place of its origin. “Near to this,” he says, “is the most happy land of Sabeans, and they are a very great people. Among them frankincense, myrrh, and cinnamon grow, and in the coast that is about Saba the balsam also. Among the myrrh trees behind Azab, all along the coasts to the straits of Babylomandeb is its native country.” We need not doubt but that it was early transplanted into Arabia, that is into the south part of Arabia Felix, immediately fronting Azab. The first plantation that succeeded seems to have been at Petra, the ancient metropolis of Arabia, now called Beder or Beder Hunein. Afterwards being transplanted into Palestine, it obtained the name of **Balsamum Judaicum** and **Balm of Gilead**, and became an article of commerce there. There were three productions obtained from the tree much esteemed among the ancients, the first was called **Opobalsamum**, or juice of balsam, which was the finest kind, composed of the greenish liquor found in the kernel of the fruit; the next was **Carpos balsamum**, made by the expression of the fruit when at maturity; the third was **Xylobal sammum**, worst of all; it was an expression or decoction of the young twigs, of a reddish colour. But the principal quantity of balsam at all times was produced by incision, as at the present day. The wound is made by an axe when the juice is in its strongest circulation, in July and August. It is then received into small earthen bottles, and every day’s produce is poured into a larger, which is kept closely corked. The **balsam of Judea** appears to be the same balsam adulterated.

**Opobalsamum** or Balsam of Mecca tree. Tree 14 feet.

3 B. **Káfal** (Kunth, l. c.) leaves palmately-trifoliate; leaflets smooth, serrated at the apex; pedicles bifid; berry globose, umbilicate at the apex. H. G. Native of Arabia Felix. Amyris Káfal, Forsk. desc. p. 80. Vahl. symb. 1. p. 28. Mart. akad. muench. 6. p. 178. This tree probably also produces **Balsam of Mecca**. There is a red sweet-scented powder obtained from it, which the women in Arabia use to wash and cleanse their heads.

**Káfal**-tree. Tree 14 feet.

4 B. **Káfal** (Kunth, l. c.) leaves palmately-trifoliate; leaflets serrated at the apex, younger ones villous; berry compressed, with a prominent dot at the apex. H. G. Native of Arabia, where it is called **Káfal**. Amyris Káfal, Forsk. eg. p. 80. The balsam obtained from this tree is purgative.

**Káfal**-tree. Tree 20 feet.

† A species perhaps allied to the present genus.

5 B. **Zeylanicium** (Kunth, l. c.) leaves impari-pinnate, with 5-7 stalked, ovate, acute leaflets; racemes of flowers interrupted, downy; flowers 5-petalled, hexandrous. H. S. Native of Ceylon. Amyris Zeylanica, Retz. obs. 4. p. 25. From this tree flows the Gum emolli of the East, but it is truly distinct from the American elem. Calyx 5-toothed. Drupe dry, containing a 3-celled bony nut. Flowers glomerated, involucrated. This is probably a proper genus, or a species of **Colophonia**, judging from the number of parts.

**Ceylon Balsam**-tree. **Cult.** See **Boswellia** for culture and propagation, p. 81.

III. **ICI CA** (Iecia is the name of one of the species in Guiana). **Aubl. guian.** 1. p. 345. t. 134.) leaves 3-5, stalked, ovate, entire, acuminate, tapering to the base, netted with veins; pinnacles racemose, longer than the pedicels. H. S. Native of French Guiana in woods, where it is called **Arououca**. Petals 5-6. Stamens 9. Amyris encequina, Willd. spec. 2. p. 355. A very fragrant resinous juice flows from the bark of the tree.

**Nine-stemmed Iecia.** Clt. 1822. Tree 30 feet.

2 I. **heterophylla** (D. C. prod. 2. p. 77.) leaves ternate or pinnate; leaflets stalked, ovate, acuminate, entire, simply veined; racemes simple, rather shorter than the leaves. H. S. Native of Guiana, in woods at the river Courou, where it is called **Aracouchini**. Iecia Aracouchini, Aubl. guian. 1. p. 344. t. 133. Amyris heterophylla, Willd. spec. 2. p. 355. On the slightest incision being made in the bark of this tree, a yellow, balsamic, aromatic fluid resembling turpentine flows out in great quantities, which retains its fluidity a long time, even when exposed to the air. The inhabitants of Guiana use this fluid to cure wounds, and they carry with them always the little nuts of the fruit, which retain their scent, and which they name **Aracouchini**. They send presents of them to their friends as something very precious. The Caribbees perfume with the balsam the oil

FIG. 17.
The wood of the Cedre rouge is considered more durable than the Cedre blanc for household furniture and for carpentry, and canoes and boats made with it last longer than those made with the other kind.

**Tall Icica.** Tree 100 feet.

*Species not sufficiently known.*

10 I. serrata (D. C. prod. 2. p. 77.) leaves almost sessile, oblong, acuminate, serrated; racemes simple, numerous, terminal. ʃ. S. Native of Mexico, on the warmer mountains. A. ambrosia, Moc. et Sesse, fl. mex. icon. et descript. ined. but not of Lin. Drupe oblong, acute, 2-celled.

**Serrate-leaved Icica.** Tree.

11 I. ? Cara'na (H. B. et Kunth, nov. gen. amer. 7. p. 34.) leaves trifoliolate (and pinnate?); leaflets oblong, acuminate, smooth, shining above, white and glistering beneath. ʃ. S. Native of South America, near Javita, in the Mission of Orinoco, where it is called Carana. Amýris Carana, Humb. relat. 2. p. 421. and 455. Flowers and fruit unknown. A grateful white resin is found closely adhering to the bark of this tree, which at length becomes yellowish, and is used against bruises.

**Carana Icica.** Tree 50 feet.

12 I. ? cuspidata (H. B. et Kunth, l. c.) leaves imparipinnate with 3 pairs of elliptical leaflets, having cuspidate points, which are smooth, and full of pellucid dots, shining above, but white and pruinose beneath. ʃ. S. Native with the preceding species. Flowers and fruit unknown. Glue is made of the resin of this tree mixed with tortoise oil.

**Cuspidate-leaved Icica.** Tree 100 feet.

13 I. acuminata (D. C. prod. 2. p. 78.) leaflets 9, very large, lanceolate, acuminate; racemes short, lateral, crowded. ʃ. S. Native of Cayenne. Amýris acuminata, Poir. suppl. 2. p. 156, but not of Roxb.

**Acuminate-leaved Icica.** Tree.

**Tooth-leaved Icica.** Tree 60 feet.

15 I. ? timorensis (D. C. prod. 2. p. 78.) leaflets 11, stalked, ovate, acuminate, unequal at the base, almost quite entire; panicles racemose, shorter than the petioles. ʃ. S. Native of the island of Timor.

**Timor Icica.** Tree.

**Cult.** For culture and propagation see Bosnélia, p. 81.
Calyx small, 5-5-toothed, with blunt teeth. Petals 3-5 (f. 18. b.), spreading, valvate in activation. Stamens 6-10 (f. 18. e.). Disk annular, with usually 6-10 teeth (f. 18. d.). Ovary ovate, 3-, or 5-seeded. Style short, trifid at the apex. Drupe oblong, covered by a 3-valved succulent rind (f. 18. c.), containing 3-5 nuts, 2 or 4 of which are abortive, the fertile one is fleshy, and containing 1 seed or 1 nut. Seed baccate according to Swartz, pendulous, without albumen. Cotyledons leafy, corrugated, and plaited or 3-lobed, with a straight superior radius.—American balsam-bearing trees, with impari-pinnate or simple leaves, and axillary and terminal racemes of flowers.

1. **B. cunninghamii** (Jacq. amen. 94, t. 65. Lin. spec. 741.) leaves deciduous, usually impari-pinnate; leaflets ovate, acute, membranous; racemes axillary; flowers hexadrous. H. S. Native of the West Indies.—Sloan. hist. t. 193. There are varieties of this plant with simple, trifoliolate, and impari-pinnate leaves, with 5-9 leaflets. Not not exactly trinodal, but rather roundish, very like *Pistacia*. The tree is common in all the sugar islands of the West Indies. The bark is very thick, and exudes a clear transparent resin, which soon hardens in the air, and looks like the mastick of the shops; but by incision it yields a considerable quantity of a more fluid substance, which has much the smell and appearance of turpentine, and may be used for the same purposes. In the French islands it is called *Gomnier blanc*, and an infusion of the buds and young leaves is recommended in disorders of the breast.

**Gun-bearing Bussara.** Cht. 1690. Tree 80 feet.

2. **B. serrata** (Wall. ex Coleb. in Lin. trans. vol. 15. t. 4. f. 1.) leaves impari-pinnate, with 3-5 pairs of broad-lanceolate, bluntly-acuminate, serrated leaflets; petioles pubescent, as well as the pedicles and young roots; panicles axillary, shorter than the leaves; flowers deciduous. H. S. Native of the forests bordering on Bengal. The timber is close-grained and hard, and is much esteemed, and used for furniture by the inhabitants. It is as tough as oak, and heavier. Its vernacular name is *Najar or Neyer.*

**Serrate-leaved Bussara.** Cht. 1518. Tree 70 feet.

3. **B. acuminate** (Willd. spec. 4. p. 1120.) leaves impari-pinnate; leaflets oblong, acute at the base, acuminate at the apex; racemes axillary. H. S. Native of Caraccas, as well as of Porto-Rico and St. Domingo. Flowers and fruit unknown. This tree contains a very concrete yellow essential oil.

**Acuminate-leaved Bussara.** Tree 60 feet.

4. **B. leptophyloides** (Mart. bot. zeit. July 1838.) trunk branched at the base; bark shining, smooth, papyraceous, soluble; leaves impari-pinnate, and are, as well as the branches, pubescent; leaflets 5-7, oblong, acute; lobed in front; racemes few-flowered, lateral and axillary. H. S. Native of Brazil. A tree full of thin resinous juice.

**Thin-juiced Bussara.** Tree 50 feet.

5. **B. simplicifolia** (D. C. prod. 2. p. 79.) leaves simple, oblong-obovate, obtuse, somewhat emarginate, coriaceous; racemes terminal, somewhat corymbose; nut exactly trigonal, with the angles a little winged. H. S. Cultivated in Jamaica.

**Simple-leaved Bussara.** Tree.

Cult. For culture and propagation see *Boswellia*, p. 81.

VI. **MARIGNIA** (meaning unknown.) Comm. ined. Kunth. nov. gen. tereb. p. 15. D. C. prod. 2. p. 79.—Dâmarna, Guert. fruct. 2. p. 100. t. 103. but not of Lam. nor Link.

**Lam. syl. Desccandria, Monogyna.** Flowers hemipollinoid. Calyx 5-7-celled, permanent, with acute lobes. Petals 5, twice as long as the calyx, valvate in activation. Disk entire. Stamens 10, length of calyx. Ovary roundish, 5-celled. Stigma almost sessile, somewhat 5-lobed. Drupe crowned by the stigma, containing 1-5-1-seeded nuts, with the bark coriaceous, and perhaps soluble; nuts covered with pulp. Seed pendulous, without albumen. Cotyledons leafy, finely contortuplicate (Guert.), but flat in the immature seeds (Kunth.). Radicle superior.—Balsamiferous trees, with impari-pinnate leaves, and numerous coriaceous, variable leaflets. Racemes of flowers axillary and terminal.

1. **M. obtusifolia** (D. C. prod. 2. p. 79.) leaflets obovate, obtuse. H. S. Native of the Mauritius, where it is called *Colophane Butard*. Bussara obtusifolia, Lam. dict. 2. p. 768. Dâmarna grayvolens, Guert. fruct. i. c. Leaflets blunt, glaucous, and shining above.

**Blunt-leaved Marignia.** Tree 50 feet.

**Acute-leaved Marignia.** Tree.

Cult. For culture and propagation see *Boswellia*, p. 81.

**Lam. syl. Hexandra, Monogyna.** Calyx urceolar, bluntly 3-lobed. Petals 3, inserted under the disk, roundish-ovate, imbricate in the bud. Stamens 6, one-half shorter than the petals, equal in length to the calyx. Disk 6-lobed. Ovary 1—Resinous trees, with impari-pinnate, coriaceous, dotted leaves, and panicles of unisexual flowers.

**Mauritian Colophonia.** Tree.

Cult. For culture and propagation see *Boswellia*, p. 81.

**Lam. syl. Polyganiurn, Dioicium.** Flowers dioecious or polygamous. Calyx urceolar, 3-toothed. Petals 3, concave, connivent, imbricate in activation. Stamens 6, rarely 7-8, connate at the base into a tube girding the ovary. Ovary ovate-globose, 3-celled, 2 of which are usually abortive. Style short, thick, crowned by a trigonal stigma. Drupe bacate, containing a trinodal 3-celled nut, each cell containing 1 pendulous seed, but sometimes solitary from abortion, destitute of albumen. Cotyledons 2, each divided into 3 oblong, somewhat leafy lobes, which are twisted in various ways.—Indian trees, with impari-pinnate leaves and stalked leaflets; stipulas deciduous. Flowers racemose or panicled.

**Sect. 1. Canariæ** (see genus for derivation). D. C. prod. 2. p. 79. Drupe containing a 1-celled nut when mature.

1. **C. commune** (Lin. mant. 127.) Leaflets 7-9, on long stalks, ovate-oblong, bluntly acuminate, quite entire, smooth; stipulas toothed or undivided; panicle terminal; flowers glomerate, nearly sessile, bracteate; stamens connate into a membranous...
tube at the base. Ⅱ. S. Native of the East Indies, and the Moluccas, where it is also cultivated for the sake of its fruit. C. vulgāre, Rumph. amb. 2. t. 47. C. Mehenbēthēne, Gaert. fruct. 2. p. 102.—Korn. ann. bot. 1. p. 260. t. 7. f. 2. Flowers white. Fruit ovate, with a thin olive skin. When the nuts are mature, they contain a sweet kernel, which does not become rancid, and which resembles a sweet chestnut; they are eaten both raw and dressed by the inhabitants of the Moluccas, Banda, and New Guinea; and an oil is expressed from them, which is used at the table when fresh, and for lamps when stale; bread is also made from them, eakes, biscuits, &c. for the table. Eaten fresh, they are apt to bring on diarrhoeas and dysenteries, and to occasion an oppression of the bowels.

Var. β. Zephyrinum (D. C. prod. 2. p. 79.) leaves 13.—Rumph. amb. 2. t. 48.

Common Canarium. Tree 50 feet.

2. C. sylvāstrē (Gaert. fruct. 2. p. 99. t. 102.) leaves 3-5, oblong, tapering to both ends, quite entire; flowers racemose, terminal. Ⅱ. S. Native of Ambonya, on the mountains.—Rumph. amb. 2. t. 54. Amyris oleāceus, Lam. dict. 1. p. 362. Pimela oleāceus, Lour. coeh. 408. Flowers white. Drupe small, oval, of a blueish-black colour. Not eatable by incisions made in the trunk of the tree, a viscid, odorous, yellowish oil flows out, very like Cappiva, which is mixed with the Chinese varnish; used medicinally it is vulnerary and resolvent. It is frequently used in the naval yards, and is commonly called Damar; it is mixed with a little chalk, and used with oakum made of the bark of reeds to fill up the scas in ships and boats, and becomes as hard as a piece of stone.

Small-fruited Canarium. Tree 50 feet.

Sect. II. Pimelā (from πιμέλη, pimelé, fat; the trees yield a very fat oil and resin). D. C. prod. 2. p. 80. Drupe when mature containing a 3-celled nut.

4. C. decumānēm (Gaert. fruct. 2. p. 99. t. 102.) leaves 9-11, elliptical, quite entire, acute; racemes few-flowered, axillary; drupe containing a 3-celled nut. Ⅱ. S. Native of the Molucca Islands.—Rumph. amb. 2. t. 55. Flowers white. Fruit larger than the others; shell of nut 3-corned.

Huge Canarium. Tree 80 feet.

5. C. pimelā (Kun. amb. bot. 1. p. 361. t. 7. f. 1.) leaves 9-11, oblong, acuminate, quite entire, somewhat unequal, smooth; stipules wanting; racemes lateral, aggregate; flowers sessile, naked; stamens connate into a membranous tube; drupe containing a sub 3-celled nut. Ⅱ. G. Native of Cochincina, China, and Java; in woods. Pimela nigra, Lour. fl. cochin. 407. Flowers white. Fruit black, somewhat pickled, and has somewhat the taste of an olive, but is heavy on the stomach.

Fat Canarium. Tree 50 feet.

6. C. l'abum (Raensch. nom. D. C. prod. 2. p. 80.) leaves 11-13, scabrous, ovate-lanceolate; racemes crowded, almost terminal; drupe containing a 3-celled nut. Ⅱ. S. Native of China and Cochincina, in woods. C. Sinānæ, Rumph. amb. 2. p. 154. Pimela alba, Lour. cochin. 408. Flowers white. Fruit greenish-yellow; it is pickled and used like olives, and is similar both in taste and form, and is reckoned very wholesome, and considered good for digestion and provoking the appetite. Leaflets half a foot long.

White-fruitd Canarium. Tree 40 feet.

C. denticulātum (Blum, bijdr. 1162.) leaves elliptic-oblong, acuminate, completely dentilicate above, smoothish; stipules stem-clasping, sagged; panicule subterminal; flowers glomerate, sessile, bilocular; stamens connate into a membranous tub at the base. Ⅱ. S. Native of Java, in woods, on the mountains of Salak, Parang, &c. where it is called Kipella.

Denticulate-leafletted Canarium. Tree.

8 C. hi'spidum (Blum, bijdr. 1163.) leaves oblong, acuminate, subcordate at the base, unequal-sided, quite entire, hispid beneath, as well as the fruit; stipulas petiolar, small; racemes subterminal, aggregate; flowers fascicled, naked; stamens seated on the margin of a villous disk. Ⅱ. S. Native of Java, on mountains about Bantam, where it is called Surian.

Var. β. seabrūm (Blum. bijdr. 1163.) leaves larger, scabrous beneath; racemes compound. Ⅱ. S. Native of Java, on the mountains of Salak.

Hispid Canarium. Tree.

C. arī'sium (Blum. bijdr. 1163.) leaves oblong, cuspitate, subcordate at the base, quite entire, smaller parallel on both surfaces, ciliated; stipulas petiolar, small, subulate; racemes axillary, simple; fruit hispid; stamens seated on the margin of a villous disk. Ⅱ. S. Native of the Islands of Nusa and Kambanga on the sea shore.

Curt. For culture and propagation see Bosnællia, p. 81.

Linn. sect. Octandria. Monogynia. Flowers polygamous or hermaphrodite. Calyx 4-5-toothed, permanent. Petals 4-5, valvate in restitution, connected together to the middle into a 4-5-cleft corolla. Stamens 8-10, adnate to the base of the corolla. Disk cup-shaped, 8-lobed. Ovary 4-celled, 8-16-furrowed. Style wanting. Stigma 4-furrowed, blunt. Berry 4-furrowed, 4-lobed at the bottom, containing 4 1-celled nuts (or from abortion only 2-3), with a thin coriaceous flesh. Seed pendulous, destitute of albumen. Cotyledons thick, fleshy, plano-convex. Radicle retracted, superior.—Balsaminiferous West Indian trees, with impari-pinnate leaves, and stalked, coriaceous, quite entire leaflets. Flowers in panicled racemes.

1 H. balsamīfēra (Swartz. l. c.) flowers 4-cleft, octandrous, with no glands between the stamens. Ⅱ. S. Native of St. Domingo, in woods, on the mountains. Tetragastris O'ssea, Gaert. fruct. 1. c. Ursēa balsamīfera, Pers. enc. 1. p. 413. Bois cochon, Nich. hist. 169. Flowers small, whitish. This tree is called in its native country Bois de Cochon or Wild-bour's-tree, because those animals are, when wounded, reported to strip off its bark and heal their wounds with the gum which exudes from it. This exudation is, according to Sloane, of a balsamic nature, very like balsam of Capiva, both in scent and virtues. It is given in complaints of the chest or lungs, and is copiously procured by wounding the trunk of the tree.

Balsam-bearing Hedwigia. Tree 60 feet.

1 S. MADAGASCARIE'Nsis (D. C. prod. 2. p. 80.) h. S. Native of Madagascar, where it is called Mangvier à grappes, from the fruit being similar to that of the Mango. A weak shrub, with alternate leaves, standing on woody petioles. Flowers small, in axillary racemes.

Madagascar Sorindeia. Cl. 1828. Shrub 12 feet.

2 S. AFRI'Can (D. C. prod. 2. p. 80.) Native of the western coast of Africa, along the banks of the river Congo. See R. Br. con. p. 12.

African Sorindeia. Tree.

Cult. For culture and propagation see Borrêlia, p. 81.

XI. GARI'GA (called Garuga or Garogoo by the Telin- gases). Roxb. lort. beng. p. 33. cor. 3. t. 208. D. C. prod. 2. p. 80.

1 G. PINNATA (Roxb. cor. 3. t. 208.) leaves somewhat villous; leaflets oblong lanceolate, bluntly crenate. h. S. Native of the East Indies, in mountains of districts.—Rheed. mal. 4. p. 69. t. 33. Rheed’s and Roxburgh’s plants may be distinct species. A deciduous tree, the wood of which being soft and spongy is very little used. The fruit is eaten raw by the natives, but is chiefly used for pickling; it has a rough astringent taste, which renders it unpalatable as taken from the tree, though very fit for pickling.

Pinnate-leaved Garuga. Clt. 1808. Tree 60 feet.

2 G. JAVANICA (Blum. bijdr. 1165.) leaflets many pairs, oblong-lanceolate, acuminate, oblique at the base, serrated, tomentose beneath; flowers panicled; fruit densely villous. h. S. Native of Java, in mountain woods.

Java Garuga. Fl. May. Tree 60 feet.

3 G. MADAGASCARIE'Nsis (D. C. prod. 2. p. 81.) leaves smooth; leaflets acutely serrate. h. S. Native of Madagascar. This may be Roxburgh’s G. pinnata?

Madagascar Garuga. Tree 50 feet.

Cult. For culture and propagation see Borrêlia, p. 81.

XI. GARUGA. XII. ELAPHRIUM.

Orary superior, sessile, 2-celled, with 2 collateral ova in each cell attached to the central axis. Disk orbicular in the bottom of the calyx. Style short, crowned by a bifid stigma. Drupes pea-formed, 2-3-valved, soluble. Seeds suborbicular, with a double integument, without albumen. Cotyledons suborbicular, corrugated or plaited, with a superior radicle. —Umbelliform trees or shrubs, having white smooth wood. Leaves crowded at the tops of the branches, impari-pinnate, and exstipulate, with dotless opposite leaflets, having the rachis usually winged. Racemes axillary, simple. Flowers insignificant, of a whitish-green colour or yellowish. Pedicels bracteate. Bark of the fruit containing balsam.

1 E. TOMENTOSUM (Jacq. amer. 105. t. 71. f. 1-2.) leaves tomentose; leaflets 9, ovate, toothed; racemes few-flowered, shorter than the leaves. h. S. Native of Curacoa and the islands adjacent, in rocky gravelly places. Lam. iii. l. 304. f. 1. Tagara octandria, Lin. mant. 40. Amyris tomentosa, Spreng. syst. 2. p. 219. A balsamic, glutinous, odorous resin flows from this tree, which much resembles that which flows from Borrêria.

Tomentose Elaphrium. Tree 20 feet.

2 E. GLABRUM (Jacq. amer. 106. t. 71. f. 4.) leaves quite glabrous; leaflets oblong-lanceolate, bluntly toothed; racemes few-flowered, twice the length of the leaves. h. S. Native of Carthagena, in bushy places by the sea side. Lam. iii. l. 304. f. 2. Fagara Elaphrum, Wildl. spec. 1. p. 668. Amyris Elaphrum, Spreng. syst. 2. p. 219.

3 E. PENICILLATUM (Moc. et Sesse, f. mex. ined. D. C. prod. 1. p. 724.) leaves subglabrous; leaflets oval-oblong, acuminate, coarsely toothed; petioles pilose at the base, and with fascicles of hairs at the origin of the pairs of leaflets; racemes few-flowered, much shorter than the leaves. h. S. Native of Mexico. Amyris pennisetà, Spreng. syst. 2. p. 219.

Pencilled-haired Elaphrium. Tree 20 feet.

4 E. FAGARÓIDES (H. B. et Kunth, nov. gen. amer. 7. p. 27. t. 611.) branches angularly furrowed, flexuous, and are as well as the leaves smooth; leaflets 7, obtuse, serrate-crenate, terminal one elliptical-rhomboid, lateral ones unequal-sided; rachis wingless. h. S. Native of Mexico. Fruit 4-valved. Amyris fagaroides, Spreng. syst. append. 148.

Fagara-like Elaphrium. Tree 12 feet.

5 E. GLÄRRÍFÖLÜM (H. B. et Kunth, nov. gen. amer. 7. p. 28. t. 618.) branches twisted and flexuous, terete, tomentose; leaflets 7-9, obtuse, coarsely crenated, smooth, shining above, terminal one elliptical-oblong, lateral ones unequal-sided; rachis winged; wing subdeltate. h. S. Native of Mexico, between Pachuca and the burning mount Jorullo, near Ario. E. glabrum, Jacq. amer. 106.?

Smooth-leaved Elaphrium. Tree 12 to 20 feet.

6 E. JORULLÉNIS (H. B. et Kunth, nov. gen. amer. 7. p. 28. t. 619.) branches round, smooth; leaflets 15-17, oblong, obtuse, doubly crenated, wrinkled, and tomentose on both surfaces, hairy above, and rufescent beneath; rachis winged; wings double crenated. h. S. Native of Mexico, at the bottom of Mount Jorullo.

Jorullo Elaphrium. Tree 20 feet.

7 E. JACQUINIA'NUM (H. B. et Kunth, nov. gen. amer.) branches terete, covered with rusty tomentum above; leaflets 7-9, coarsely crenated, wrinkled above, hairy and shining, but covered with rufescent tomentum beneath, younger ones rusty, terminal one rhomboid-ovate, lateral ones unequal-sided; rachis winged; wings doubly crenated. h. S. Native of South America, in the province of Venezuela, near La Victoria. E. tomentosum, Jacq. amer. 105. t. 71. f. 7. Fagara octandria, Lin. A glutinous juice flows from this tree when cut or broken, which thickens to a resinous gum.
on exposure to the air, which is generally used to erase caticacies occasioned by ulcers or wounds. The wood and bark have a strong grateful scent.

_Jacquin's Elaphrum._ Tree 40 feet.

8 _E. excelsum_ (H. B. et Kunth, nov. gen. amer. 7. p. 30. t. 611) branches terete, tomentose above; leaflets 5-9, obtuse, coarsely crenate, rugose, soft, pubescent above and rusby beneath, terminal one ovate-elliptic, lateral ones subelliptic, nearly equal at the base; rachis winged; wings crenate. _F._ S. Native of Mexico, between Acapulco and La Venta del Exido. E. copalliferum, _Moc. et Sesse, fl. mex. ined._ D. C. prodr. 1. p. 724. Amyris copallifera, _Spreng. syst. 2._ p. 219. A fragrant resin flows spontaneously from this tree, which is called gun-copal in Mexico.

_Tall Elaphrum or Mexican Copal._ Tree 50 feet.

9 _E. Arisnse_ (H. B. et Kunth, nov. gen. amer. 7. p. 31.) branches angulary furrowed, villous; leaflets 5-7 pairs, oblong, somewhat acuminate, crenate-serrate, hairy above, and covered with canescent hairs beneath; rachis somewhat winged. _F._ S. Native of Mexico, between Paucauro and Mount Jorullo, near Ario.

_Ario Elaphrum._ Tree 30 feet.

10 _E. craveolens_ (H. B. et Kunth, nov. gen. amer. 7. p. 31.) leaflets 7, oblong, acuminate, coarsely serrate-crenate, smooth; rachis winged at the top; wings entire. _F._ S. Native of South America, on the banks of the river Magdalena, where it is called _Cupa o Cañari._ Amyris graveolens, _Spreng. syst. append._ 148.

Strong-scented Elaphrum._ Tree 40 feet.

11 _E. lanigonsum_ (H. B. et Kunth, nov. gen. amer. 7. p. 31.) branches terete, rather flexuous, finely tomentose; branchlets woolly; leaflets 9-13, oblong, crenated, younger ones villously-tomentose above, and white and woolly beneath. _F._ S. Native of New Spain.

_Woolly Elaphrum._ Tree 40 feet.

_Cult._ For culture and propagation see _Boswellia,_ p. 81.

**XIII. FAGARASTRUM** (from FAGARA and astra, an affixed signification, like; resembling FAGARA).

_Lin. syst._ _Heo proportio_. _Monogynia._ Flowers hermaphroditic. Calyx 3-4-parted, short. Petals 3-4. Stamens 6-8, alternate ones shortest; filaments thickened above the base. Anthers large. Ovary simple, tapering to the base into a stipe, which bears the petals and stamens at its base, tube-celled, 3-4-lobe at the apex, 3-4-celled; cells 2-ovulate. Ovula suspended from the inner angle. Style prismatic, 3-4-angled, thick, smooth, 3-4-lobed at the apex. Fruit? Shrubs, with alternate, pinnate leaves, and alternate, oblique leaflets, full of pellucull dots. Flowers disposed in axillary panicles and racemes, with the peduncles and pedicels bracteate at the base.

1 _F._ inequalle; petioles puberulous; leaflets stalked, olate, irregularly crenate, glabrous; racemes few-flowered, much shorter than the leaves; flowers octandrous. _F._ G. Native of the Cape of Good Hope. _Elaphrum inequalle_, D. C. _prod._ 1. p. 724.—Burch. _cata._ 3082 and 3051. _Amyris_ inequalis, _Spreng. syst. 2._ p. 218. Unequal-leafletted _Fagaristrum._ Shrub.

3 _F._ thunbri; prickly; leaflets sessile, olate, finely crenated; petioles prickly, with a narrow margin; flowers octandrous? _F._ G. Native of the Cape of Good Hope. _Fagastra annuita_, _Thunb. fl. cap._ 1. p. 141. _Zanthoxylum Thunbergii_, _D. C. prod._ 1. p. 726. _Thunberg's Fagaristrum._ Shrub.

_Cult._ For culture and propagation see _Boswellia,_ p. 81.

_Calyx_ small, regular, permanent, in 4-5 divisions. _Petals_ 4- (f. 19. a.) 6, hypogynous, imbricate in aestivation. Stamens double the number of the petals, also hypogynous. _Ovary_ superior, 1-celled, seated on a thickened disk, containing 2 pendulous ovula. _Stigma_ sessile, capitate. _Fruit_ indehiscent, somewhat drupaceous (f. 19. b.), 1-seeded, glandular. Seeds without albumen (f. 19. c.). _Cotyledons_ fleshy. _Radicle_ superior, very short.

—Trees or shrubs, abounding in resinous juice, with opposite compound leaves, full of pellucid dots, and axillary and terminal panicles of flowers. _Pericarp_ covered with granular glands, filled with aromatic oil. The general structure of this order is that of _Terebinthaceae_, but the qualities more nearly resemble those of _Burseraceae_. In consequence of the leaves being full of dots filled with resinous oil, as well as in the hypogynous insertion of the petals and stamens, it comes nearer to _Aurantiaceae_. The order contains fragrant shrubs. _Gum_ of the Island of Nevis is related to _Amyris_, which Dr. Hamilton calls _Amyris hexandra_, _fl._ _ined._ 35. The gum resin called Bidellium is probably produced by a species of _Amyris_, the Nioutout of Adamson, according to Verey, _hist._ nat. _des._ _med._ 291. is probably also a species of _Amyris_. The layer of the liber or inner bark of a species of _Amyris_ was found by _M._ Gailland to be used by the _Nubian_ Mahommedans as paper, on which they write their legends. _Delile._ cart. _13._ _Amyris ambrosiana_ is said to be poisonous. The resin of _Couina_ is the produce of _Amyris ambrosiana_.

_Synopsis of the Genera._

1 _Amyris._ Calyx 4-toothed. Petals 4 (f. 19. a.). Stamens 8.

2 _Pachylobus._ Fruit egg-shaped, superior, 1-celled, containing a large embryo, with 3-parted, fleshy, angular, twisted cotyledons.

1. _AMYRIS_ (from *a* intensive, and *myrs* myrrh., balm; the whole of the tree in this genus smell strong of balm or myrrh). _Lin._ _gen._ _no._ 473, exclusive of some species, _Kunth._ _gen._ _trec._ p. 22. _D._ _C._ _prod._ 2. p. 81.

_Lin. syst._ _Octandria_, _Monogynia._ Flowers hermaphroditic. Calyx 4-5-toothed, permanent. _Petals_ 4 (f. 19. a.) 6, hypogynous, cuneate, unguiculate, imbricate in the bud. _Stamens_ 8-12, shorter than the petals. _Ovary_ 3-4-celled; cells 2-seeded, girded by a ring, seated on the thick disk-like torus. _Style_ short,
crowned by an obtuse stigma. Drupe (f. 19. b.) containing a 1-seeded chartaceous nut (f. 19. c.), some of the cells full of diaphanous mucilage. —Trees or shrubs, abounding in a resinous fluid. Leaves compound; leaflets full of peltate dots. Flowers white, disposed in panicles. Drupe turpigin, with an aromatic oil.

§ 1. Americae. Leaves with 1-5 pairs of opposite leaflets, odd one stalked or sessile.

1. A. Martima (Jaq. amer. 107.) leaflets 3, sessile, odd one stalked, ovate, crenate, obtuse. f. S. Native of Jamaica and of Cuba, about the Havana, on rocks by the sea-side. The shrub abounds in a juice which smells like rue.

2. A. Florida'na (Nutt. in Sill. journ. 5. 1822. p. 294.) leaflets 3, ovate, quite entire, obtuse, smooth; flowers somewhat panicled; berries almost globose, tapering to the base. f. G. Native of Eastern Florida. Leaves reticulately-veined, glandular, resinous, and fragrant. Berries black, the size of black pepper.

Florida Amyris. Shrub 10 feet.

3. A. Sylla'tica (Jaq. amer. 107.) leaflets 3, ovate, acuminated, somewhat crenate, all stalked, odd one longest. f. S. Native of Carthagena, St. Domingo, and St. Thomas, in shady woods by the sea-side. A. cymosa, Reich. in Sieb. pl. exsiccat. fl. trinid. no. 29. is probably distinct from this. The whole shrub abounds in a turpentine juice, of a strong disagreeable smell. Gum elemi has erroneously been supposed to be yielded by this plant. Berry red, about the size of a pea.

4. A. Brasilie'ssis (Spreng. syst. 2. p. 217.) leaflets lanceolate, tapering to the base, rounded at the apex, mucronate, quite entire, veiny, shining above, discoloured beneath; petals triqueterous; panicles axillary, shorter than the leaves. f. S. Native of Brazil.

Brazilian Amyris. Chit. 1818. Tree.

5. A. Dy'atria (Spreng. neue, entd. 3. p. 48.) leaflets 3, ovate, quite entire, obtuse, somewhat emarginate, all stalked, odd one longest. f. S. Native of St. Domingo. The specific name appears to be derived from dyas, two, and tri pes, having three feet; perhaps in allusion to the stalked leaflets.

Dyatria Amyris. Shrub 10 feet.

6. A. Plume'ri (D. C. prod. 2. p. 81.) leaflets 3-5, all stalked, somewhat serrated, ovate, acuminated, villous beneath. f. S. Native of the Antilles.—Plum, ed. Burm. t. 106. A. elemifera, Lin. spec. p. 495. f. But Catesby's figure is cited by the author, and therefore the country; this is referred to Ptelea. The fruit is the shape and size of an olive, but red, having an odoriferous pulp within it. Gum elemi is said to be extracted from this tree; it is brought to this country in roundish cakes, wrapped up in leaves. This resin is only used as an ingredient in a digestive ointment, called Unguentum elemi.

Plumier's Amyris or Gum-elemi-tree. Chit. 1820. Tree 20 ft.

7. A. Hex'andra (Hamilt. prod. fl. ind. occ. p. 54.) branched; leaves impari-pinnate, with 3 pairs of quite entire, ovate, bluntly and obscurely acuminate leaflets, which are somewhat decurrent down the petiole, smooth above, and reticulately veined beneath; flowers panicled, small, greenish, always hexandra.

Panicles axillary and terminal; calyx cup-shaped, entire; pedicel 3, greenish, entire; ovary oblong, smooth, inferior; style short, with an obtuse stigma; drupe membranous, elliptic, acuminate at both ends, 1-valved. f. S. Native of the island of Nevis, in cold subhumid groves.—A tall tree, full of resinous fragrant juice, differing from A. eleusifera in the leaves being smooth on both surfaces, not tomentose beneath. The tree is called Gum Elemen-tree, Gum Elem-tree in its native country.

8. A. Ton'si'era (Willd. spec. 2. p. 336.) leaflets 5-7, stalked, ovate, somewhat crenate, acuminate; racemes simple, about the length of the pedicels. f. G. Native of Carolina (Cat. car. 1. t. 40.), as well as the West India islands. Laciniun, Pluk. t. 201. f. 3. A. balsamifera, Lin. spec. 496. exclusive of the synonym of Shawe. Eleferi'ma folis pinnatis, Lin. hort. cliff. 486. The fruit hangs in bunches, of the shape of a pear, of a purple colour. A juice distils from the trunk of the tree, a black as ink, which the inhabitants of Carolina say is poi-<events>onous. The Janca-tree is said to be a very valuable timber tree, the wood bears a fine polish, and has a pleasant smell. The berries have much the taste of balsam of Capaiva. An infusion of the leaves has a very pleasant flavour, it is moister than honey, and is particularly restorative to weak eyes.

Poison-wood or White Candle-wood Amyris. Chit. 1820. Tr. 50 ft.

Pinnate-leaved Amyris. Tree 20 feet.

§ 2. Asidicae. Leaflets alternate, all stalked.

10. A. Heptaph'ylla (Roxb. hort. beng. p. 28.) leaflets 3-4 pairs, simple, obliquely-lanceolate, acuminate, entire; pedicels branched, axillary, and terminal. f. S. Native of the East Indies, on the mountains bordering Silhet, where it is called Karum-phul. Flowers whitish-yellow. Berry oblong, 1-celled. Seed filling the berry. Disk fleshy, contracted in the middle, the lower swelling receiving the petals and stamens.

Seven-leaved Amyris. Chit. 1823. Tree.

11. A. Na'axa (Roxb. l. c.) leaflets 7, ovate-lanceolate, serrated; racemes simple, axillary, nearly the length of the leaves. f. S. Native of Amboyna.

12. A. Punct'a (Roxb. hort. beng. ex Celebri in Lin. trans. 15. t. 5. f. 3.) branches spreading; bark smooth, rusty; leaflets about 20 pairs, obliquely-oblong, crenate, full of glandular dots, terminal one largest; pedicels rather hairy; panicles terminal. f. S. Native of Chittagong. Flowers small, white. Disk fleshy, bearing the petals and stamens. Ovary 4-celled, tetragonal. Berry 1-celled, 1-seeded.

Dotted-leaved Amyris. Shrub.

† Species not sufficiently known.

13. A. Tecomaca (D. C. prod. 2. p. 82.) leaves on long petioles, hanging down, trifoliolate; leaflets oblong, acute, serrated; peduncles numerous, terminal, loosely pinnate, dependent. f. S. Native of Mexico, where it is called Tecomaca and Tacamatoca, but it is distinct from the Tacomaca of Hern. A. maritima, Moc. et Sesse, fl. mex. icon. ined.

Tecomaca Amyris. Chit. 1827. Tree 30 feet.

Philippine Amyris. Tree.

15. A. Dent'a (Willd. spec.? Blum. bijdr. 1160.) leaflets
stalked, 5-9, oblong-lanceolate, bluntly acuminated, repandly-crenulated at the top; racemes axillary, simple. ę. S. Native of Java, where it is called Katos.

Robinson's Amyris. Shrub 8 feet.

17 A. bifinna (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 82.) leaves bipinnate at the base; leaflets numerous, small, ovate, quite entire; peduncles terminal, rather hairy, longer than the leaves. ę. S. Native of Mexico. Bifinna-leaved Amyris. Shrub.

18 A. papyrifer (Guillaum, voy. a Meroc. cent. ex Bull. scien. Aug. 1827. p. 285.) trunk arboreous, covered, with vertical, somewhat diaphanous lamina; flowers racemose-panicled, decandrous. ę. G. Native of Africa, at the White River. The Nubian Mahomedans use the bark of this tree for writing their legends upon.

Paper-bearing Amyris. Tree.

Cult. The species of Amyris grow freely in a mixture of loam and peat, and cuttings root freely in sand, under a handle glass, of the sorts of the species in heat.

II. PACHYLODUS (from παχύς, pachys, thick, and λοβός, lobos, a lobe; the lobes of the cotyledons are thick).

Lin. syst. unknown. Fruit oval, black, superior, about the size of a hen's egg, 1-celled, containing a large embryo, having 2 3-parted cotyledons, the lobes large, thick, angular, and twisted.—A large tree with impari-pinnate, smooth leaves, with the leaflets nearly opposite, ovate, acuminate, entire, the young branches rather tomentose.

1 P. edulis. ę. S. Native of the island of St. Thomas, in the Gulf of Guinea, where the fruit is much esteemed by the inhabitants, and sold in great quantities in the market of St. Ann de Chaves, under the name of Safiu: in taste it is bitter and astringent. It is usually roasted. There is another species, which goes under the name of Paseo, which appears only to differ in having hairy leaves, and in the shape of the fruit. The whole description of this tree is given from memory, as we have had no specimen to examine.

Edible Safiu. Fl. Nov. Tree 40 feet.

Cult. For culture and propagation see stow species of Amyris.

Flowers hemaphrodite, rarely unisexual. Calyx 5-parted, regular, permanent, either imbricate or valvular in aestivation. Petals 5 (f. 20. b.), inserted in the calyx, imbricate, rarely valvate in aestivation. Stamens twice the number of the petals (f. 20. c.), hypogynous, those opposite the petals shorter than the others, usually monadelphous at the base (f. 20. d.). Ovary solitary or simple, or several together, each with a separate style, with an unusually dilated stigma. Ovula 2, collateral, ascending. Capsules usually several, rarely single (f. 20. k.), dehiscent, splitting lengthwise internally. Seeds erect, in pairs, or solitary, with or without albumen, but usually furnished with aril. Radicle superior at the extremity most remote from the hilum. Cotyledons thick in the species without albumen, and leafy in those with albumen.—Trees or shrubs, with compound, dotted, alternate, exstipulate leaves, and terminal racemes or panicles of bracteate flowers. Connàrus can only be distinguished from Leguminosae by the relation the parts of the embryo have to the umbilicus of the seed (R. Brown, congo. 452.) that is to say by the radicle being at the extremity most remote from the hilum. The want of stipules is, however, usually sufficient to distinguish them. It differs from Terebinthaceæ in the want of resinous juice.

Synopsis of the Genera.

1 Connàrus. Calyx 5-parted. Petals imbricate in aestivation. Stamens somewhat monadelphous at the base. Carpels 5, each bearing a style, biovulate, some of them are usually abortive. Capsules sessile, 2-valved, 1-seeded; seeds exalbuminous. Leaves trifoliolate or impari-pinnate.

† A genus allied to Connaràceæ, but not sufficiently known.

Lin. syst. Decandria, Pentagynia. Calyx 5-parted, permanent, girding the fruit closely at the base; lobes ovate, imbricate in aestivation. Petals 5, also imbricate in aestivation. Stamens 10, somewhat monadelphous at the base, inserted in the base of the calyx. Ovaries 5, each bearing a style and containing 2 4 of which are almost always abortive, or reduced to the styles. Capsule baccate, sessile, 2-valved, bursting at the side, ovate, 1-seeded. Seed erect, inserted in the bottom of the cell, arillate at the base, destitute of albumen. Cotyledons thick.—Shrubs, with impari-pinnate leaves with 1 or many pairs of leaflets. Flowers disposed in racemose panicles, white.

1 C. monoca'rus (Lin. spec. 1. p. 678.) leaves trifoliolate; leaflets ovate, acuminate, quite smooth; panicles terminal. ę. S. Native of Ceylon. Lin. fl. zey. no. 248. exclusive of the synonym of Burma. Flowers yellowish.

One-fruited Connàrus. Ch. 1768. Shrub 10 feet.

2 C. purè'scens (D. C. prod. 2. p. 85.) climbing; leaflets 5, oval, acute, smooth above, covered beneath with rather white pubescence. ę. S. Native of French Guiana. Roùrea
fruticosus, Aubl. guian. 1 p. 467 t. 187. Robérgia frutescens, Willd. spec. 2 p. 752. Flowers white, sweet-scented, disposed in axillary and terminal panicles. Fruit very like that of C. monocarpus.

3 C. Java'nicus (Blum. bijdr. 1166.) leaves terminate and pinnate, ovate, or elliptical-oblong, obscurely acuminate, veiny, smooth; racemes crowded, axillary; flowers pentagynous; stem sarmentose. $S$. Native of Java.

Jacca Connarus. Fl. May. Shrub 8 feet.

† Species not sufficiently known.

Smooth Connarus. Shrub 6 feet.

5 C. ? Sàntalóides (Vahl. symb. 3 p. 87.) leaves with 2-4 pairs of ovaries, acuminate, smooth leaves, with an odd one; peduncles axillary, aggregate; flowers disposed in racemes, monogynous. $S$. Native of the East Indies. Santalóides, Lind. fl. zeyl. no. 408. Segments of calyx rounded (ex Lind.) acute (ex Vahl.). Flowers white. Fruit not sufficiently known. It is probably a species of *Omphalobium*.

Santalum-like Connarus. Shrub 6 feet.

6 C. Mimosóides (Vahl. symb. 3 p. 87.) leaves about 10 pairs, with an odd one, oval-oblong, emarginate; petals and branchlets pubescent; racemes axillary; flowers monogynous. $S$. Native of the islands of Nicobar. This is also probably a species of *Omphalobium*.

Mimosà-like Connarus. Shrub 6 feet.

Cult. A mixture of loam and peat will answer the species of this genus, and ripened cuttings will root in sand, under a hand-glass, in heat.

II. OMPHALOBium (from ὀμφαλός, omphalos, a navel; and λόβος, lobos, a pod). Gært. fruct. 1 p. 217 t. 40. D. C. diss. prod. 2 p. 85.—Connarà, species of authors.

Linn. syst. Monodelphia, Decàndria. Calyx 5-parted, permanent, girding the fruit loosely at the base; lobes oblong, acute, imbricate in aestivation. Petals 5 (f. 20 b.). Stamens 10 (f. 20 c.), monadelphous at the base (f. 20 d.), or somewhat polyadelphous. Carpels 5, each bearing a style, and containing 2 ova, some of them usually abortive. Capsules 1 (f. 20 k.)-5, legume-formed, 2-valved, dehiscent (f. 20 h.), narrowed or stipitate at the base. Seeds twin, but usually solitary, not inserted at the base, but in the lower part along the suture, arillate, without albumen. Cotyledons thick.—Trees and shrubs with pinnate leaves, having 1 or many pairs of leaves. Racemes axillary, usually disposed in a terminal panicle.

§ 1. Connaroidàea (from their similarity to Connàrus, in having a solitary carpel). D. C. prod. 2 p. 85. Carpels solitary (f. 20 k.).

1 O. Índicum (Gært. fruct. 1 p. 217 t. 46.) leaves 3, ovate, somewhat acute, quite smooth on both surfaces, coriaceous; flowers panicked; carpels solitary, stipitate. $S$. Native of Ceylon. Rhùs, &c. Burm. zeyl. 199 t. 89. and therefore Connàrus Asiaticus, Willd. spec. 3 p. 691. Rhùs Radhaeljával, Mill. dict. no. 13. Leaves panicked, and the stamens are, according to Gærtner, somewhat polyadelphous. Capsules nearly an inch and a half long, and evidently stalked. Radicle at the vertex of the seed.

Indian Omphalobium. Clt. ? Shrub 6 feet.

2 O. Afrique'num (D. C. prod. 2 p. 85.) leaves 3, ovate, acuminate, smooth on both surfaces, somewhat membranous and feather-nerved; flowers panicked; carpels solitary, stipitate. $S$. Native of Sierra Leone. Connàrus Africànum, Lam. dict. 2 p. 95. Cav. diss. 7 p. 375 t. 221. Connàrus venosum, Sméatham. imp. Flowers white. Capsule about an inch and a half long, and evidently stipitate. Radicle under the top of the seed, usually germinating in a simple or branched root in the fruit (f. 20 i.).

3 O. Nervósum; leaves 3, obovate, acuminate, 3-nerved at the base, pubescent beneath, smooth above, on long pubescent petals; flowers terminal, panicked. $S$. Native of Sierra Leone.

Nerved-leaved Omphalobium. Shrub 10 feet.

4 O. Gaudichaudi (D. C. prod. 2 p. 85.) leaves 3, ovate, acuminate, quite smooth on both surfaces; fruit racemose; carpels solitary, stipitate, somewhat obovate, obtuse, smooth. $S$. Native of the Moluccas, in marshes by the sea-side at Rawak. Capsule 12-14 lines long, 7-8 broad. Radicle at the top of the seed.

Gaudichaud's Omphalobium. Shrub 6 feet.

5 O. Lambe'rti (D. C. prod. 2 p. 85.) leaves 3, elliptical-oblong, acuminate, smooth on both surfaces, somewhat membranous; flowers panicked; carpels solitary, stipitate, incurred, a little striated, smooth. $S$. Native of Guiana, in the interior or sandy savannahs. Connàrus Guiana'sis, Lamb. herb. Flowers white. Capsule 8-10 lines long, 5-8 broad. Radicle at the vertex of the seed.

Lambe's Omphalobium. Shrub 6 feet.

6 O. Fascícula'tum (D. C. prod. 2 p. 86.) leaves? fruit rising in fascicles from the branches; carpels solitary, stipitate, compressed. $S$. Native of French Guiana. Capsule an inch long, 5 lines broad. In the disposition of the flowers this species is very distinct.

Fascicled-flowered Omphalobium. Shrub 6 feet.

7 O. Patræs (D. C. diss. with a figure,) leaves 5-9, oval-oblong, acuminate, quite smooth on both surfaces, coriaceous; flowers panicked; carpels solitary, stipitate, obovate, blunt, smooth. $S$. Native of Cayenné. Leaves smooth, with 3-4 pairs of leaflets and an odd one. Carpels dehiscent. Seeds arillate.

Patræ's Omphalobium. Shrub 6 feet.

Thonnings Omphalobium. Shrub 6 feet.

9 O. Pinnà'tem (D. C. prod. 2 p. 86.) leaves 3-5, oval-oblong, acute, quite smooth on both surfaces, feather-nerved, with the lateral veins confluent at the apex; panicle terminal, elongated; ovary solitary, downy; petals with two bristles at the base of each. $S$. Native of the East Indies. Connàrus pinnà'tus, Lam. dict. 2 p. 95. ill. t. 572. Cav. diss. 7 p. 376 t. 222. Flowers white.
Pinnate-leaved Omphalobium. Shrub 6 feet.

10 O. SMEATHMANI (D. C. prod. 2. p. 86.) leaflets 3-5, elliptical-oblong, acuminate, smooth above, somewhat ferruginous and somewhat pubescent, feather-nerved, and finely reticulated; panicles terminal; ovary solitary, somewhat pubescent. $\gamma$. S. Native of Sierra Leone. Leaflets 3 inches long, and about 1 inch broad.

Smeathman's Omphalobium. Shrub 12 feet.

11 O. PEROTTEI (D. C. prod. 2. p. 86.) leaflets elliptical-oblong, acuminate, smooth above and shining, but covered with short woolly ferrugineous down beneath; panicles terminal; carpels solitary, obovate, obtuse, somewhat stipitate, young ones clothed with deciduous rusty down, but they are smooth at length. $\gamma$. S. Native of French Guiana. Leaflets 3-6 inches long and 1-2 inches broad.

Perot's Omphalobium. Shrub 6 feet.

Cuestoides (plants agreeing with Cnestis in having numerous carpels). D. C. prod. 2. p. 86. Carpels numerous.

12 O. villosa (D. C. prod. 2. p. 86.) leaflets 3, oval, acute, tapering to the base, somewhat membranous, feather-nerved, smooth above, but clothed beneath with rusty velvety villi, as well as the panicles and carpels. $\gamma$. S. Native of Sierra Leone. Cnestis trifoliolata, Lam. dict. 3. p. 34. Spondioideae villosa, Smeathm. herb. Lobes of calyx imbricate in restoration. Carpels 1-5, tapering very much to the base. Cotyledons thick. Radicle superior. Albumen wanting.

Villosa Omphalobium. Shrub 6 feet.

Five-styled Omphalobium. Shrub 6 feet.

Cult. See Cnestis for culture and propagation, p. 90.

III. EURYCOMA (from euphorbiaceae, wide, and eury, kome, hair; in allusion to the tufts of leaves at the tops of the branches). Jack. in Roxb. fl. ind. 2. p. 307. D. C. prod. 2. p. 86.

Cult. See Cnestis for culture and propagation, p. 90.

Linn. syst. Decandra, Pentagynia. Calyx 5-cleft, downy on the outside, valvate in the bud. Petals 5, inserted in the bottom of the calyx as well as the 10 stamens, free. Carpels 5, (1-4) distinct, 1-styled, somewhat stipitate at the base, coriaceous, 2-valved, pod-formed, opening on the back, usually clothed with stinging hairs both inside and outside, with 2 ova in each carpel. Seeds solitary, rising from the base of the carpel, erect, destitute of aril. Albumen fleshy. Embryo straight. Cotyledons leafy. Radicle superior.—Usually scandent shrubs, with impari-pinnate leaves, and racemose panicles of flowers.

1 C. glabra (Lam. dict. 3. p. 29. ill. t. 387. f. 1.) leaflets 5-7 pairs, ovate-oblong, smooth; small racemes in fascicles; carpels obovate, obtuse, pruriens. $\gamma$. S. Native of the islands of the Mauritius and Bourbon.

Smooth Cnestis. Shrub 6 feet.

2 C. Polyphylla (Lam. dict. 2. p. 33. ill. t. 387. f. 2.) leaves with 5-9 pairs of ovate-oblong leaves, which are villous beneath; racemes terminal; carpels very blunt, villous. $\gamma$. S. Native of Madagascar.

Many-leaved Cnestis. Cult. 1823. Shrub 8 feet.

3 C. ferruginea (D. C. prod. 2. p. 87.) leaves with 8-10 pairs of oval-oblong leaflets, which are somewhat coriaceous at the base and acuminate at the apex, smooth above, but downy below from ferrugineous hairs as well as the pedioles and branchlets. $\gamma$. S. Native of Sierra Leone. Spondioides ferruginea, Smeathm. herb.

Rusty Cnestis. Shrub 8 feet.

4 C. corniculata (Lam. dict. 3. p. 23.) leaves with 4-5 pairs of oval-oblong, smooth, acuminate leaflets, but with the midrib beset with rusty hairs; carpels oblong, covered with stinging hairs, and drawn out at the apex into a long acumene. $\gamma$. S. Native of Sierra Leone. Spondioideae pruriens, Smeathm. Petals pale-red.

Horned-capped Cnestis. Shrub 5 feet.

5 C. racemosa; leaves pinnate; leaflets ovate-elliptic, entire, acuminate, smooth on both surfaces; racemes simple, lateral; capsules obovate, arched, very villous. $\gamma$. S. Native of Sierra Leone.

Racemose-flowered Cnestis. Shrub 10 feet.

6 C. monadenphtia (Roxb. hort. beng. p. 34.) leaves with 2-3 pairs of quite smooth, shining, ovate-lanceolate, acuminate leaflets. $\gamma$. S. Native of the East Indies, in the province of Silhet.

Monadelphous Cnestis. Shrub 10 feet.

7 C. ? Pennata (Beauv. fl. d'ow. 1. p. 98. t. 60.) leaves impari-pinnate; leaflets ovate, acute; flowers corymbose, axillary, bibracteate. $\gamma$. S. Native of Guiana, in the kingdom of Warre. This is probably a species of Omphalobium.

Pinnate-leaved Cnestis. Shrub 8 feet.

8 C. oblonga (Beauv. fl. d'ow. 1. p. 98. t. 59.) leaflets 3, ovate, acuminate, lateral ones oblique at the base, the odd one a great distance from the lateral ones; flowers in panicles. $\gamma$. S. Native of Guiana, in the kingdom of Warre.

Oblique-leaffed Cnestis. Shrub 6 feet.

Cult. See Cnestis for culture and propagation, p. 90.

Linn. syst. Decandra, Pentagynia. Calyx 5-parted, deciduous, equal; sepals roundish. Petals 5, exserted from the hypogynous prominent disk, as well as the 10 stamens. Styles none. Stigma 5. Capsule 5-furrowed, 5-valved, 5-seeded. Seeds arillate (perhaps the capsule is composed of 5 1-seeded carpels?).—A tree, with impari-pinnate leaves, having 2-3 pairs of almost opposite leaflets, and axillary and terminal panicles of flowers. This genus is excluded from Conneraceae by S. Kunth, but a more apt place for its insertion in the natural system is not known to De Candolle.

Guiana Tapiiria. Tree 50 feet.

Cult. See Cnestis for culture and propagation, p. 90.

Order LXXVIII. LEGUMINOSE (this order is composed

$\gamma$

Calyx constantly of 5 sepals (f. 31. a.), which are more or less connected at the base, forming a 5-cleft (f. 31. a.) or 5-toothed (f. 27. a.) calyx, never 5-sepa¬led, in the strict sense of the word, it is, however, sometimes composed of 1 (f. 52. g.) or 2 sepals from coalition or abortion (f. 43. a.), the teeth or seg¬ments of the calyx usually unequal, sometimes connected into 2 lips (f. 48. a.); the upper lip bidentate (f. 48. a.); the lower one trifid (f. 48. a.). Petals usually 5 (f. 27. c. f. 47. c.), generally unequal, inserted in the bottom of the calyx, rarely in the torus, usually variously imbricated in estimation, rarely valvate, generally free, rarely joined into a gamopetalous corolla (sometimes, however, the petals are wanting, and sometimes the corolla is formed of 1, 2, 3, or 4 petals only). Stamens inserted with the petals, usually double the number of the petals, rarely triple or quadruple that number or fewer, sometimes all free (f. 54. b. f. 56. c. f. 24. c.), sometimes variously connected or monadelphous, with the staminiferous tube entire (f. 29. c.), or cleft in front (f. 27. d.), or diadelphous, usually with 9 joined and 1 free (f. 44. d.), rarely joined in 2 equal bundles, containing 5 stamens each, and more rarely connected into 3 bodies. Anthers 2-celled (f. 29. f.), sometimes some of them are changed into abortive threads. Ovary oblong (f. 25. d.) or ovate, sessile (f. 25. d.) or stipitate (f. 58. d.), usually free, rarely with the stipe adnate to the calyx. Style filiform (f. 25. c. f. 31. d.), rising from the top of the upper suture of the ovary, crowned by a terminal (f. 44. e.) or lateral stigma. Legume usually 2-valved (f. 29. d.), membran¬ous, coriaceous, rarely fleshy or drupaceous, dehiscent (f. 29. d.) or indehiscent (f. 44. g.), 1-celled (f. 52. h.), some¬times longitudinally 2-celled from the upper suture being bent in so much, or often transversely many-celled in con¬sequence of the seeds being separated by spongy or mem¬branous substance (f. 49. c.), often separating into 1-celled joints (f. 41. e.). Seeds usually numerous (f. 29. d.), rarely solitary (f. 36. a.) or twin (f. 56. c.) from abortion, fixed to the upper suture of the legume (f. 56. e. f. 52. h. f. 29. d.), alter¬nately inserted in both valves, usually oval (f. 29. d.) or kidney¬shaped (f. 51. e.), hanging by various shaped funicles, rarely expanded into aril. Testa or spermaderm smooth, usually very smooth and hard. Endopleura usually tannish, appearing like albumen. Embryo sometimes straight (f. 21. i. l. m.), sometimes with the radicle curved back upon the edge of the cotyledons, and ly¬ing in the commissure formed by them (f. 21. c.f. b.), but in either case the radicle is directed towards the hilum (f. 21. i. m.). Cotyle¬dons leafy, flat (f. 21. a. f.), changing through germination, or fleshy (f. 21. c. g.), (the flesh fari¬
ciple exhibits much less uniformity in its results than any other. It is without doubt to the presence of the extractive principle in considerable quantities that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potass, which they are almost universally found to contain. Thus the leaves and pods of Cássia sámana, and several other species, the Colubëa arborëscens of Genista púrgans, and of Coronilla E'meraus act as brisk purgatives, and often cause pain in the bowels. The juice of Coronilla vária excites vomiting. It is perhaps from a different cause that the pulp, which is contained in the husks of leguminous plants, operates upon the human body, being gently laxative without causing the least pain; such is the character of Cathartocarpus fistula, Tamarindus índica, Ceratănia sílvia, and probably some species of l'nga and Púrkia. There is a juice which surrounds the seeds in the humid pods of Gleditéschia and Sephóra, which differs altogether in its very astringent nauseous flavour. It is undoubtedly a secretion from the external part of the seed, or of the pericarp, or some one of these modifications, that the singular property of the Púcida and many Galégas is derived, which are employed in America to stumpy fish, which are taken by this means as readily as by Nox vomíca. The decoction of the root of Galéga Virgíniána is considered in America as a powerful vermifuge. It is perhaps to the extractive principle that the rubefacient properties of the fresh leaves of some leguminous plants are to be attributed, which act readily upon the skin if applied in plasters; as for example, the leaves of Ornithopus scorpióides and Moringa pterosperáma. It appears that it is to the greater or less considerable mixture of the extractive principle with the feacula contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, scarlet runners, beans and peas, &c. If found in a more considerable quantity, it will render them purgative or emetic, as in Cýtisus Labórnum and Anagyris foetída, &c., and most of those belonging to the subdivision Phyllólóbe. The seeds of leguminous plants also present many other anomalies more difficult to reduce to any fixed laws; thus some are found which contain a rather large portion of fixed oil, such as the seed of the Árachis hypogýæa and Moringa pterosperáma, which produces oil of ben; there are some of which the smell and flavour are rather powerful, as the seed of Díptérez odóra or Tonquín bean; there are others, which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the Andíra, which are so bitter as to be used in Java and Brazil as tonic, alesteriter, and vermifuge. In short, are not the aperient and diuretic qualities which are observable in the roots and herbage of many leguminous plants, such as broom, beans, Onoñís, &c. to be attributed to a modification of this extractive principle? There are, in another view, roots which are tuberos, and furnish mankind with wholesome food, as Láthyrys tuberóso, Déllichos tuberóso, and D. bulbóso, which last the Indians use for food. The roots of liquorice have a sweet and mucilaginous taste, which, united to an acid and rather exciting principle, causes it to be employed as a pectoral. It may be here added, that the sweet flavour of liquorice and its properties are not confined to the genus, but is found equally in the roots of many other plants of the order, as A'bus procédarius, various species of Trifólium, &c. The bark of some trees of leguminous plants is remarkable for its bitterness, and is used as febrifuges; the different kinds of Geopolýgoa and Andíra possess this bitter and febrifugal quality in a remarkable degree. In India the barks of the Ægáti grandifóra and of the Guindánuma Bonducélla are employed for the same purpose. The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the Acónia Cátécho and A. Aráálica, which are used for tanning leather. It is well known that almost all colouring matter proceeds from the extractive principle, and this principle abounds in Leguminóse. To this family belong the principal blue colours known by the name of Indigo, extracted from every kind of Indigófera, and from some Tephrórias; and the red colours are yielded by all the species of Cesalpínia, and of Haematencxylon or Logwood. We may add the red juice which is drawn from the Pterocárpus Dráco and Santalínuma, under the name of Sandal and Dragon's blood; from Butea, under the name of Gum lac, and also from Dalbégía Monétaria. The red juice of Erythróphlum or Greéce-tree, is used as an ordeal in Africa. These juices appear to differ in many particulars, but their history and analysis being unknown, it is impossible to form an estimate of the nature of their differences.

Among the exotic drugs employed in the arts, are the balsam of Cepiva, produced by the Copaífera; the balsam of Peru, which Mutis says is produced by Myroserpum perúferum, and the balsam of Tolú from Myroserpum tolúferum; the cachout, which has been found to be almost pure tannin, and which is supposed to be produced by Acónia Cátécho. Of the same character is that remarkable resin that is yielded by Hymenáe Coárbaril; gum Arabic, produced by the bark and roots of Acónia vérá, Sénegal, Aráálica, and others; gum tragacanth, obtained from Astrágalus Créticus, gúnner, and vérus; and, finally, manna is secreted by Alhági Maurórum.

It is remarkable that the botanical characters of Leguminóse should so strictly agree with the properties of their seeds; the latter may be divided into two sections, namely, the first Sarcólóbe, or those of which the cotyledons are thick (f. 21. c. g.), and filled with secal, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; second, the Phyllólóbe, or those of which the cotyledons are thin (f. 21. a. f), with a very little secal, and furnished with cortical pores, and which change at once into leaves at the time of germination, for the purpose of elaborating food for the young plant. All the seeds of Sarcólóbe are used as food, in different countries, and none of those of Phyllólóbe are ever so employed.

M. de Candolle's arrangement of Leguminóse being here adopted, it will be useful to explain the principles on which it is founded. He divides Leguminóse into two grand divisions,
the first of which consists of plants, the radicle of whose embryo is curved back upon the edge of the cotyledons (f. 21. b. c.f.); the second, of those whose radicle and cotyledons are straight (f. 21. b. l. m.n); the former is called *Curtumbrica*, the latter *Rectumbrica*. In the *Curtumbrica* certain diversities in the structure of the calyx and corolla again divide into two principal forms, one of which, comprehending all the genera with papilionaceous flowers (f. 27.), is called *Papilionaceae*, and the other consisting of a very small number of species with 1 or 2 petals or more, and an obscurely lobed calyx, is called *Sesamia* (f. 52.). The last is not subdivided, but the *Papilionaceae* resolve themselves into two great tribes, namely, those with fleshy cotyledons (f. 21. c. e.) and one-petaled, or papilionaceous calyx (f. 21. af.), and those with foliaceous cotyledons (f. 21. a.f.), and seeds which are not eatable, called *Phylllobae*, each of these is divisible by three upon slight differences in the fruitification. In the *Rectumbricae* two suborders, *Minacea* (f. 53. f. 54.) and *Caesalpinae* (f. 55. f. 57.), are formed upon variations in the vestiment of the calyx and corolla; in the former it is valvate, in the latter imbricate; the first constitutes a single tribe, the latter divides into three. Having thus explained the principles upon which *Leguminosae* is arranged, the following synopsis of the genera will be intelligible.

**Synopsis of the Genera.**

**Division I.**

*Curvumbrica*. Radicle bent back upon the edge of the lobes of the cotyledons in embryo (f. 21. b. c.f.).

**Suborder I.**

*Papilionaceae*. Embryo with the radicle lying in the fissure of the cotyledons (f. 21. b. c.f.). Sepals imbricate in vestiment or somewhat valvate. Petals disposed in a papilionaceous manner (f. 21. b. c. f.), always irregular, the upper one is called a vexillum (f. 21. n.), the two side ones wings (f. 21. a. e.), and the lower one, which is usually composed of 2 petals, the keel (f. 21. p.). Stamens inserted in the bottom of the calyx, or perigynous.

§ 1. *Phylllobae*. Cotyledons thin, leafy (f. 21. a.f.).

**Tribe I.**

*Sophoreae*. Flowers papilionaceous (f. 24. b. f. 22. c. &c.). Stamens 10, unconnected (f. 23. f. 24. c.). Legume continuous, not articulated (f. 22. d.). Cotyledons flat, leafy (f. 21. a.f.).

1 *Myosoperum*. Calyx campanulate, 5-toothed, superior petal larger than the rest. Legume stipitate, naked at the base, and winged at the apex, indehiscent, 1-celled, 1-seeded. Seeds enveloped in balsamic juice. Trees, with pinnate leaves.

2 *Sophora*. Calyx 5-toothed (f. 22. a.), campanulate, petals of keel usually at the apex. Legume wingless, moniliform, many-seeded (f. 24. d.). Trees, with impari-pinnate leaves, and variable flowers.

4 *Orthosia*. Calyx 5-parted, bilabiate. Vexillum roundish, hardly longer than the keel and wings. Legume woody, compressed, 2-valved, 1-3-seeded. Trees, with impari-pinnate leaves, and blue or purple flowers.

6 *Macrocris*. Calyx cup-shaped, inflated, 5-toothed. Keel longer than the vexillum. Legume straight, compressed or suberect, many-seeded. Shrubs, with impari-pinnate leaves and white flowers.

7 *Anacyris*. Calyx 5-toothed, somewhat bilabiate. Wings longer than the vexillum and keel. Legume on a short stipe, compressed, many-seeded, 2-valved. Shrubs, with trifoliate leaves and yellow flowers.

9 *Thermopsis*. Calyx campanulate, 4-5-cleft, somewhat bilabiate, convex behind. Petals nearly equal. Vexillum with reflexed sides. Legume compressed, falcate or linear, many-seeded. Perennial herbs, with trifoliate leaves and yellow flowers.

12 *Podalyria*. Calyx 5-cleft, thrust in at the base. Vexillum large. Keel covered by the wings. Stamens rather con-nate at the base. Legume sessile, ventricose, many-seeded. Shrubs, with simple leaves and red or white flowers.

13 *Chorizema*. Calyx half 5-cleft, bilabiate. Keel ventricose, shorter than the wings. Legume ventricose, 1-celled, many-seeded, sessile or sub sessile. Shrubs, with simple, toothed or entire leaves, and yellow and red flowers.

14 *Podolobium*. Calyx 5-cleft, bilabiate. Vexillum spreading. Legume stalked, linear-oblong, smooth inside, 4-seeded. Shrubs, with simple, lobed or entire leaves, and yellow and red flowers.

15 *Oxylobium*. Calyx deeply 5-cleft (f. 23. a.), somewhat bilabiate. Vexillum spreading (f. 23. b.). Legume sessile (f. 23. d.) or sub sessile, many-seeded, ventricose, ovate, acute. Little shrubs, with whorled leaves and yellow flowers.

16 *Callistachys*. Calyx 5-cleft, bilabiate. Vexillum crenate. Legume stipitate, woody, opening at the top, many-seeded. Shrubs, with entire, scattered, or whorled leaves, and yellow flowers.

17 *Bracheysma*. Calyx 5-cleft, ventricose. Vexillum shorter than the wings or keel. Legume ventricose, many-seeded. Procumbent or climbing shrubs, with simple entire leaves, and scarlet or greenish-yellow flowers.

18 *Cuminolobium*. Calyx 5-parted. Vexillum spreading.
Legume many-seeded, rather spherical, and very obtuse. Shrubs, with impari-pinnate or palmately 3-5-foliolate leaves, and yellow flowers.

20 Jacksōnia. Calyx 5-parted. Petals and stamens deciduous. Legume rather ventricose, ovate or oblong, with the valves pubescent inside. Shrubs, almost leafless in the adult state, with filiform branches, and yellow flowers.

22 Spirerolimum. Calyx 5-cleft, bilabiate. Legume spherical, 1-2-seeded, pedicellate. Shrubs, in the adult state nearly leafless, when present simple, with red or yellow flowers.

26 Sclerothermania. Calyx 5-cleft, bilabiate, bibracteate at the base. Keel length of wings. Legume ventricose, pedicellate, 2-seeded. A shrub, with simple leaves and yellow flowers.

28 Echimus. Calyx deeply 5-cleft, bibracteolate at the base. Legume compressed, pedicellate, 2-seeded. Seed strophiolate. Shrubs, with opposite simple leaves and yellow flowers.

29 Pulzenea. Calyx 5-cleft, somewhat bilabiate (f. 24 a.), bibracteolate at the base. Legume sessile (f. 24 d.), 2-seeded. Shrubs, with simple alternate leaves.

30 Daviesia. Calyx angular, 5-toothed. Keel shorter than the wings. Legume compressed, angular, opening elastically at the lower suture, 2-seeded, pedicellate. Seeds strophiolate. Spiny or unarmed shrubs, with simple leaves, sometimes leafless, and yellow flowers.

31 Mirbelia. Calyx 5-cleft, bilabiate. Legume 2-seeded, longitudinally 2-celled, from the suture being bent inwards above. Shrubs, with ternately-verticillate leaves and purple flowers.

Tribe II.

Lo'tee. Corolla papilionaceous (f. 25 b.). Stamens 10, monadelphous (f. 25 c. f. 29 c.) or diadelphous, that is to say, 9 joined, and 1 free. Legume continuous, 1-celled (f. 29 d.), rarely 2-celled, from the upper suture being bent inwards. Cotyledons flat, foliaceous (f. 21 a. f.).

32 Hovea. Calyx 5-cleft, bilabiate (f. 25 a.). Keel obtuse (f. 25 f.). Stamens monadelphous (f. 25 c.), upper one more or less free. Legume sessile (f. 25 d.), roundish, ventricose, 2-seeded. Seeds strophiolate. Shrubs, with alternate simple leaves and purplish flowers.

34 Flavolium. Calyx 5-cleft, bibracteate, bilabiate. Stamens all connected. Legume pedicellate, compressed, flat, many-seeded, winged on the back. Shrubs, with opposite simple leaves and yellow flowers, with the base of the vexillum red.

35 Bossleia. Calyx 5-cleft (f. 27 a.), bilabiate. Stamens monadelphous (f. 27 d. f. 28 b.). Legume compressed (f. 28 c.), pedicellate (f. 27 c.), many-seeded, with the margins thickened on both sides. Seeds strophiolate. Shrubs, with flat or terete branches, and alternate simple leaves, when present, and yellow flowers, with the keel usually red or brown.

43 Li'aria. Calyx thrust in at the base, 5-lobed, lower lobe very long, elliptic, petaloid. Corolla smooth. Keel acute.
Stamens diadelphous. Legume ovate, few-seeded. Shrubs, with lanceolate leaves, which are pungent at the apex, and fulvous flowers.

44 PRIESTLEYA. Calyx 5-lobed, subbilabiata. Corolla smooth. Wings falcate. Stamens diadelphous. Legume sessile, compressed, 4-6-seeded. Shrubs, with simple leaves and yellow flowers.

47 CHOTA'RIA. Calyx 5-lobed, subbilabiata. Vexillum cordate, large. Keel falcate, acuminate. Stamens monadelphous. Style bearded laterally. Legume turgid, with ventricose valves, usually many-seeded. Herbs or shrubs, with simple or palmately compound leaves and usually yellow flowers, rarely purplish.

49 HYPOCALY'PTUS. Calyx 5-lobed, thrust in at the base. Stamens monadelphous. Legume compressed, lanceolate. A smooth shrub, with trifoliate leaves and purple flowers.

51 LODDIE'SIA. Calyx rather inflated, acutely 5-toothed. Vexillum shorter than the wings or keel. Stamens monadelphous. Ovary oblong, 2-4-ovulate, compressed. Shrubs, with trifoliate leaves and reddish-white flowers.

52 DICHRUS. Calyx tapering at the base, 5-toothed, deeply bilabiata; teeth all acute. Vexillum shorter than the obtuse keel. Stamens monadelphous, with the sheath cleft in front. Ovary linear, 8-ovulate. A shrub, with trifoliate leaves and white or yellow flowers.

53 LEBE'CKIA. Calyx 5-cleft; lobes acute. Stamens monadelphous, with the sheath cleft in front. Legume cylindrical, many-seeded. Shrubs with the habit of GENISTA, with simple or trifoliate leaves and yellow flowers.

54 SARCOPHYLLUM. Calyx 5-parted, regular, 2 superior teeth divaricate. Keel obtuse. Stamens monadelphous. Legume compressed, elongated, falcate, many-seeded. A shrub, with fascicles of filiform fleshy leaves and yellow flowers.

55 ASPALATHUS. Calyx 5-toothed. Vexillum stipitate. Stamens monadelphous, with the sheath cleft in front. Legume oblong, few-seeded. Shrubs, with fascicled leaves, usually trifoliolate and sessile, and usually yellow flowers.

56 U'LEX. Calyx 5-toothed, bifracteate, 2-parted. Stamens monadelphous. Legume short, turgid, few-seeded. Shrubs, with spiny branches and leaves, and yellow flowers.

57 STURA'CA'NTHUS. Calyx 5-toothed, bilabiata. Stamens monadelphous. Legume long, exserted, flat, many-seeded. Shrub with the habit of ULEX, with yellow flowers.

59 GENISTA. Calyx 5-toothed, bilabiata (f. 29. d.). Vexillum obtuse (f. 29. a.). Keel oblong (f. 29. b.). Stamens monadelphous (f. 29. c.). Legume compressed, rarely somewhat turgid (f. 29. d.), few or many-seeded. Unarmed or spiny shrubs, with simple or trifoliate leaves and yellow flowers.

60 CYTRUS. Calyx bilabiata, upper lip usually entire, lower one 3-toothed. Vexillum large. Keel obtuse. Stamens monadelphous. Legume compressed, many-seeded. Shrubs or trees, with trifoliate leaves, and yellow, purple, or white flowers.

62 OX'ONIS. Calyx campanulate, 5-cleft, with the segments linear. Vexillum large. Stamens monadelphous, one of which is sometimes nearly free. Legume usually turgid, few-seeded. Herbs or shrubs, with simple, trifoliate, rarely impari-pinnate leaves and variable flowers.

63 REQUE'NIA. Calyx 5-toothed, acute. Keel obtuse. Stamens monadelphous, with the sheath cleft in front. Legume oval, compressed, 1-seeded. Shrubs, with bistipulate, obcordate, simple leaves.

64 AN'THyllUS. Calyx tubular, 5-toothed, more or less inflated after flowering. Petals about equal in length. Stamens monadelphous. Legume ovate, 1-2-seeded, rarely oblong-linear and many-seeded, covered by the calyx. Shrubs or herbs, with trifoliate or impari-pinnate leaves, and yellow, white, or red flowers.

SUBTRIBE II. TRIFOLIE'RE. Legume 1-celled (f. 30. c. f. 31. c.). Stamens diadelphous (f. 31. b.). STEMS HERBACEOUS, RARELY FRUTESCENT. Leaves usually palmately 3-5-foliolate, rarely impari-pinnate, primordial ones alternate.

65 MEDICAGO. Calyx subcylindrical, 5-cleft. Keel remote from the vexillum (f. 30. b.). Legume many-seeded, of various forms, usually spirally twisted (f. 30. c.). Herbs or shrubs, with yellow or red flowers.

66 HYMENOSC'ARPEUS. Calyx subcylindrical, 5-cleft. Keel remote from the vexillum. Legume membranous, compressed, archched. Herbs, with yellow flowers.

67 TRAGONE'LLA. Calyx campanulate, 5-cleft. Keel small, but with the wings and vexillum spreading, appearing like a 3-petalled corolla. Legume oblong, compressed, or cylindrical, many-seeded. Herbs, with yellow and white flowers.

68 PO'CkEA. Calyx campanulate, 5-toothed. Keel shorter than the wings and vexillum. Legume longer than the calyx, membranous, compressed, winged. An upright herb, with yellow flowers.
69 *Mellōtus*. Calyx tubular, 5-toothed. Keel shorter than the wings or vexillum. Legume longer than the calyx, coriaceous, 1 or many-seeded, of various forms. Herbs, with yellow or white flowers.

70 *Triplōllum*. Calyx tubular, 5-cleft (f. 31. a.). Keel shorter than the wings and vexillum. Legume small (f. 31. c.), hardly dehiscing, shorter than the calyx, usually ovate, 1-2-seeded, rarely oblong, 3-4-seeded, and a little longer than the calyx. Herbs, with variable flowers.

72 *Doryńcium*. Calyx subcampanulate, bilabiate, rather gibbous at the base. Wings shorter than the vexillum. Keel almost nucifer. Stigma capitate. Herbs or subshrubs, with white or red flowers.

75 *Hosá́ćka*. Calyx campanulate, 5-cleft (f. 32. a.). Wings equal in length to the vexillum (f. 32. b.). Keel beaked. Stigma capitate. Legume cylindrical, or rather compressed, straight. Herbs, with impari-pinnate leaves, and variegated flowers.

76 *Carnihéllia*. Calyx cup-shaped, 5-toothed. Vexillum broad. Ovary many-seeded. Legume few-seeded, with the valves separating at both margins, leaving the dissepiments upon the plant after the seeds have fallen. A shrub, with flat branches and blue flowers, and the leaves pinnate when present.

Subtribe III. *Clítőrá*. Legume 1-celled (f. 34. c.). Stamens usually diadelphous (f. 34. d.). Stems herbaceous or subfrutescent, usually climbing. Leaves various, primordial ones opposite. Flowers usually blue, red, or purple, rarely yellow.

78 *Pośraléa*. Calyx tubular, 5-cleft, usually glandular; lobes acuminate, lowest one longest. Legume valved, 1-seeded, length of calyx. Shrubs or herbs. Flowers blue.

79 *Indiófēra*. Calyx 5-cleft; lobes acute. Vexillum roundish, emarginate (f. 33. a.). Keel having an awl-shaped spur on both sides. Legume terete (f. 33. c.), flat, or tetragonal, 2-valved, rarely few-seeded, usually many-seeded. Herbs or shrubs, with simple, impari-pinnate or trifoliate leaves, and red, blue, or white flowers.

80 *Ouśtrophi*. Calyx tubular, 5-cleft. Wings equal in length to the vexillum. Keel blunt, with an anicle on each side. Legume compressed, 2-valved, 3-1-celled; cells 1-seeded. A prostrate herb, with trifoliate leaves, and heads of red flowers.

81 *Clítórá*. Calyx biclactate at the base, 5-cleft (f. 34. a.). Vexillum large (f. 34. b.). Stamens and petals inserted above the base of the calyx. Style rather dilated at the apex. Legume linear (f. 34. c.), compressed, 2-valved, 1-celled, many-seeded. Climbing herbs, with trifoliate or impari-pinnate leaves. Flowers large, white, blue, or purple.

82 *Neurocárphum*. Calyx tubular, with 5 acuminate, nearly equal teeth, and furnished with 2 bracteas at the base. Vexillum large, roundish. Keel obtuse. Legume stipitate, compressed, sub-tetragonal, from the middle nerve of the valves being rather prominent, 4-8-seeded. Usually climbing subshrubs, with trifoliate leaves, and large white or purplish flowers.

83 *Martíśía*. Calyx tubular, somewhat bilabiate, with 5 acute teeth, lowest one longest. Corolla none. Stamens 4, 2 fertile and 2 sterile, distinct. Legume stipitate, compressed, somewhat tetragonal in consequence of the valves being furnished with a prominent middle nerve. A climbing shrub, with trifoliate leaves.

84 *Colóagna*. Calyx tubular, 5-cleft, biclactate at the base, somewhat bilabiate. Vexillum roundish. Ovary stipitate, linear, very hispid, girded by the disk. Style smooth, obtuse. Procumbent or twining herbs, with simple or trifoliate leaves, and violaceous flowers.

85 *Galácťia*. Calyx biclactate at the base, 4-cleft. Petals 5, oblong, distinct, with the vexillum broader than the rest. Stigma obtuse. Legume terete or compressed, many-seeded, elongated. Climbing herbs or subshrubs, with trifoliate or impari-pinnate leaves, and usually red flowers.

86 *Odónia*. Calyx 4-parted. Vexillum erectly spreading. Wings having a tooth each at the apex. Keel 2-parted, reflexed, remote from the vexillum. Legume compressed, usually 8-seeded. A twining herb, with trifoliate leaves.

87 *Stéganótropis*. Calyx 5-toothed, biclactate, permanent. Vexillum cucullate, bicalcarcous at the base, and spurred behind, inclosing the wings and keel, which are membranous. Style membranous, dilated and bearded at the apex. Legume linear, many-seeded. A twining herb, with terno leaves, and 2-flowered peduncles.

88 *Vilmórbínia*. Calyx cylindrical, 4-toothed, somewhat bilabiate. Wings shorter than the keel. Style acute. Legume stalked, lanceolate, compressed, tapering. A shrub, with impari-pinnate leaves, and purple flowers.

90 *Barbéria*. Calyx tubular, 5-cleft, biclactate at the base. Wings shorter than the keel, and keel shorter than the vexillum. Style bearded at the apex. Stigma obtuse. Legume linear, villos, many-seeded. A shrub, with impari-pinnate leaves, and scarlet-purplish flowers.

91 *Kíséría*. Calyx campanulate, gibbous at the base, 5-toothed, lower tooth longer and keeled. Vexillum orbicular. O
Stamens diadelphous. Style villous in front. Legume linear, compressed, hooked at the end, many-seeded. A tomentose herb, with pinnate leaves, and racemes of white flowers.

93 **Colle'a.** Calyx 5-leaf; upper lobe a little broader than the rest. Petals unguiculate. Vexillum biariculatum at the base. Stigma capitate. Legume compressed, tomentose, 4-6-seeded. Shrubs, with trifoliate leaves, and purple flowers.

95 **Pue'ráia.** Calyx bilabiata, upper lip entire or hardly bidentate, lower one trifid. Keel obtuse. Vexillum obovate. Legume monadelphous. Legume compressed, stipitate, many-seeded. Climbing shrubs, with trifoliate leaves, and yellowish flowers.

96 **Duma'sia.** Calyx obliquely truncate, toothless, bibracteate at the base. Claws of petals length of calyx. Keel obtuse. Legume tapering to the base, compressed, few-seeded. Climbing herbs, with trifoliate leaves, and purplish or yellow flowers.

97 **Glycîne.** Calyx 5-leaf, somewhat bilabiata. Style acute. Legume linear, compressed, straight, many-seeded, hooked at the end. Climbing herbs, with trifoliate leaves, and usually yellowish flowers.

98 **Chle'cályx.** Calyx bilabiata, with awl-shaped segments, those of the upper lip recurved and those of the lower lip adpressed, beset with glandular bristles. Vexillum roundish, emarginate. Keel conforming to the wings. Ovary linear, many-seeded. Style filiform, villous. A climbing shrub, with imparipinnate leaves, and yellow flowers.

**Subtribe IV. Gale'gæ.** Legume 1-celled (f. 36. c. f. 37. c.). Stamens diadelphous, rarely monadelphous. Stems herbaceous, shrubby, or arboreous. Leaves alternate or opposite, usually impari-pinnate.

99 **Petaloste'num.** Calyx 5-leaf or 5-toothed. Petals unguiculate, like each other in shape. Stamens 5, monadelphous. Vexillum conduplicate, free. Legume covered by the calyx, 1-seeded, indehiscent. Herbs, with white or purple flowers.

100 **Da'lea.** Calyx 5-leaf (f. 36. a.), or 5-toothed. Wings and keel adnate to the base of the stamens (f. 36. b.). Vexillum short, free. Stamens 10, monadelphous. Legume ovate, 1-seeded (f. 36. c.), shorter than the calyx. Herbs, with white or blue flowers.

101 **Glycyr'iza.** Calyx tubular, 5-leaf, bilabiata, especially the 2 upper lobes are joined together, higher up than the others. Vexillum ovate-lanceolate. Keel 2-edged or 2-petalled, acute. Legume ovate or oblong, compressed, 1-4-seeded. Herbs, with sweet roots, and bluish or white flowers.

103 **Callótiopis.** Calyx of 5 equal filiform teeth. Vexillum erect, ovate. Wings shorter than the keel, which is incurved. Style incurved, tipped by a hairy stigma. Stamens diadelphous, the 9 joined ones incurved. Legume stipitate, compressed, tapering to both ends, many-seeded. Herbs, with blue flowers.

104 **Tepiôrhôsia.** Calyx 5-toothed (f. 37. a.). Vexillum large (f. 37. b.), roundish, silky or pubescent outside, reflexed. Wings adhering to the obtuse keel. Stamens either monadelphous or diadelphous. Legume compressed, linear, many-seeded (f. 37. c.). Shrubs or herbs, with purple or white flowers.

106 **Eysehnha'rdtia.** Calyx campanulate, 5-toothed, upper teeth more remote, lowest one longest. Vexillum oblong, distinct from the keel. Ovary biovulate. Style hooked at the apex. A tree, with white flowers.

107 **Nissôlia.** Calyx campanulate, 5-toothed. Stamens monadelphous, with a dorsal fissure, or diadelphous. Legume stipitate, ending in a leafy wing, or many-seeded. Climbing shrubs.

108 **Mullè'ra.** Calyx campanulate, 5-toothed, circumcised at the base after flowering. Petals deciduous. Stamens 8-10, monadelphous, falling off with the calyx. Legume moniliform; links 1-5, distinct, indehiscent, 1-seeded. A tree.

109 **Loxenohâ'rus.** Calyx urceolate, 5-toothed. Vexillum orbicular, about equal in length with the wings and keel. Stamens monadelphous and diadelphous. Legume on a short stipe, flat, membranous, 4-8-seeded. Trees, with purplish flowers.

110 **Robînìa.** Calyx 5-toothed; teeth lanceolate, 2 superior ones shorter and approximate. Vexillum large. Keel obtuse. Stamens deciduous. Style bearded in front. Legume nearly sessile, many-seeded, margined at the seminiferous suture. Spiny trees, with white or rose-coloured flowers.

111 **Poîta'a.** Calyx obliquely truncate, 5-toothed, 2 upper teeth very short. Petals convolute. Vexillum rete, shorter than the wings, but with the keel longer than the wings. Stamens a little exserted. Legume stipitate, mucronate, compressed, many-seeded. Shrubs, with white or red flowers.

112 **Sarînêa.** Calyx cup-shaped, with a truncate somewhat entire margin. Keel very blunt, rather shorter than the vexillum. Legume compressed, elongated, mucronate, many-seeded. Shrubs, with abruptly-pinnate leaves, and purplish flowers.

113 **Curse'tia.** Calyx 5-leaf, 2 superior lobes shorter than the rest, and joined together a little higher. Vexillum obcordate. Keel obtuse, shorter than the wings. Style bearded at the apex. Stigma capitate. Legume compressed, 5-8-seeded, mucronate. Woolly trees, with abruptly pinnate leaves, and yellow flowers.

114 **Sesbâ'nia.** Calyx 5-leaf, or 5-toothed (f. 38. a.). Vexillum roundish, complicated (f. 38. b.), larger than the keel,
which is oblong, and 2-edged at the base. Sheath of stamens puberulous at the base. Legume elongated, slender (f. 38 c.). Shrubs or herbs, with abruptly pinnate leaves, and usually with yellow flowers.

117 Psilida. Calyx campanulate, 5-cleft. Keel obtuse. Legume stalked, linear, having 4 membranous wings, with the seeds interrupted by spongy substance. Trees, with white flowers variegated with red.

120 Caragan'a. Calyx tubular, 5-toothed. Wings and vexillum about equal in length. Stigma truncate. Legume sessile and subterete, many-seeded. Shrubs, with abruptly pinnate leaves, and yellow and white flowers.

122 Diphy'sa. Calyx 5-cleft, 2 upper lobes roundish. Vexillum obovate, reflexed. Wings flat. Keel caliform. Legume linear, compressed, 5-6-seeded, furnished with a large membranous vesicle at each side on the sutures, opposite each other. Shrubs, with yellow flowers.

Subtribe V. Astragal'ae. Legume (f. 39 e. f. 40 c.) bicollor or half bicollor from one of the sutures being bent towards lengthwise. Stamens diadelphous, 9 joined and 1 free. Stems herbaceous or suffrutescent. Leaves impari-pinnate, primordial ones alternate.

130 Oxytropis. Calyx 5-toothed (f. 40 a.). Keel ending on the back in a mucron. Legume turgid (f. 40 c.). Herbs, with radicle spikes of white or blue flowers.

131 Astragalus. Calyx 5-toothed. Keel obtuse. Herbs or subshrubs, with blue, purple, red, white, or yellow flowers.

132 Gildensete'dia. Calyx campanulate, bicraterate at the base, 5-cleft, 2 superior segments broadest. Vexillum entire, about the length of the wings. Keel minute. Legume subcylindrical, 1-celled, many-seeded. Stemless herbs, with simple or impari-pinnate leaves, and red or violaceous flowers.

Tribe III.

Hedysar'ee. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21 c.). Corolla papilionaceous (f. 42 b.). Stamens rarely free, usually monadelfous (f. 43 c.) or diadelphous, 9 joined and 1 free (f. 44 d.), or 5 in each bundle. Legume dividing transversely into 1-seeded cells or joints (f. 41 e.). Cotyledons flat (f. 21 f.). This tribe is easily distinguished from the rest in the legumes dividing transversely into joints or cells.

Subtribe I. Coronilleae. Flowers umbellate (f. 41 b. f. 42 b.). Legume terete (f. 41 c.) or compressed. Stamens diadelphous, 9 joined and 1 free.

135 Coronilla. Calyx 5-toothed (f. 41 a.), 2 upper teeth approximate. Petals ungulate. Keel acute. Legume rather terete, many-jointed (f. 41 c.). Shrubs or herbs, with impari-pinnate leaves, and yellow, white, or purple flowers.

137 Ornithopus. Calyx bracteate, 5-toothed. Keel small, o 2
compressed. Legume compressed, many-jointed. Herbs, with impari-pinnate leaves, and white or rose-coloured flowers.

138 Hippocrepis. Calyx 5-cleft (f. 42. a.), lobes acute. Keel 2-edged (f. 42. d.). Style acute. Legume curved, many-jointed (f. 42. c.). Herbs, with impari-pinnate leaves, and yellow flowers.

Subtribe II. Echydysae. Flowers disposed in racemes (f. 43. gr. f. 44. c.). Legumes compressed (f. 43. i. f. 44. g.).

140 Drithaca. Calyx 5-cleft, bibracteate at the base. Stamens disposed in two 5-anthered bodies. Legume compressed, joined. A shrub, with impari-pinnate leaves.

141 Dictéia. Calyx 5-cleft, 2 upper lobes obtuse, 3 lower ones spiny. Vexillum roundish, complicated. Keel obtuse, a little shorter than the wings. Stamens diadelphous (9-1). Legume stipitate, compressed, few-seeded. Shrubs, with impari-pinnate leaves and yellow flowers.

143 Amicia. Calyx 5-cleft, very unequal. Vexillum orbicular. Wings applied to the keel. Stamens monadelphous, with the sheath cleft in front. Legume linear, compressed, many-jointed. Climbing shrubs, with abruptly-pinnate leaves, and yellow flowers.

144 Poteridia. Calyx bilabiata; upper lip bidentate, lower one 3-toothed. Vexillum semiorbicular, emarginate, with reflexed sides. Wings spreading. Stamens 8-10, monadelphous, with the tube cleft above. Stigma capitate. Legume compressed, 3-4-jointed. Climbing shrubs, with abruptly-pinnate leaves.

149 Adeimia. Calyx 5-cleft; lobes acute. Vexillum complicated above the wings when young. Keel curved and truncate at the apex. Stamens distinct, but approximate. Legume compressed, many-jointed. Herbs, with abruptly-pinnate leaves, and usually yellow flowers.

150 Αφλεχύμωνος. Calyx 5-cleft, bilabiata; upper lip bifid or bidentate, lower one 3-toothed. Stamens 10, diadelphous in 2 equal bundles. Legume compressed, joined, straight. Herbs or shrubs, with impari-pinnate leaves, and usually yellow flowers.

151 Smythia. Calyx bipartite. Stamens diadelphous, divided in 2 equal bundles. Legume plicate, joined, inclosed in the calyx. Herbs, with impari-pinnate leaves, and yellow flowers.

152 Lourea. Calyx campanulate, 5-cleft (f. 43. a.), when in fruit inflated. Vexillum obcordate (f. 43. d.). Keel obtuse (f. 43. b.). Legume 4-6-jointed (f. 43. i.), plaited, or rather spiral (f. 43. i.). Herbs, with simple or trifoliolate leaves, and white or purple flowers.

153 Ursinia. Calyx 5-cleft; segments setaceous. Legume with few joints, plaited, or rather spiral. Herbs or subshrubs, with impari-pinnate, ternate, or simple leaves, and purplish or yellow flowers.

154 Nicolsonia. Calyx 5-parted; segments subulate, bearded. Corolla shorter than the calyx. Legume straight, exserted, compressed, many-jointed. Herbs, with trifoliate leaves, and bluish-purple flowers.

155 Desmodium. Calyx bibracteolate at the base, obscurely bilabiata; upper lip bifid, lower one 3-parted (f. 44. a.). Vexillum roundish (f. 44. c.). Keel obtuse (f. 44. b.), shorter than the wings. Legume compressed, many-jointed (f. 44. g.); joints separating at maturity. Herbs or shrubs, with trifoliate, rarely simple leaves, and purple, blue, or white flowers.

156 Diceirma. Calyx bibracteolate, bilabiata; upper lip entire, lower one trifid. Vexillum obovate, about equal in length to the keel and wings. Keel obtuse. Legume 2-3-jointed. Shrubs, with trifoliolate leaves, and yellow flowers.

157 Taverniera. Calyx bibracteolate, half 5-cleft; segments lanceolate-linear. Vexillum somewhat obovate. Wings shorter than the calyx. Keel obtuse. Style long, flexuous. Legume of 2 orbicular, flat joints. Shrubs, with simple or trifoliolate leaves, and rose-coloured or yellow flowers.

158 Hedysarum. Calyx 5-cleft; segments linear-saw-shaped. Vexillum large. Keel obliquely truncate, longer than the wings. Legume many-jointed, compressed. Herbs or subshrubs, with impari-pinnate leaves, and rather large, purple, white, or cream-coloured flowers.

159 Onobrychis. Calyx 5-cleft; segments subulate. Keel obliquely truncate. Wings short. Legume sessile, compressed, 1-seeded, echinated, crested or winged. Herbs, with impari-pinnate leaves, and red or white flowers.

161 Lespedeza. Calyx 5-parted, bracteate at the base. Keel transversely obtuse. Legume 1-seeded, compressed, unarmed. Herbs and subshrubs, with trifoliolate leaves, and purplish or cream-coloured flowers.

162 Ebenus. Calyx 5-cleft, with the tube at length rather
ventricose; segments linear-awl-shaped, equal in length to the corolla. Wings small, shorter than the tube of the calyx. Stamens monadelphous. Legume roundish, 1-2-seeded. Leaves usually impari-pinnate, and flowers red.

163 *Flemingia*. Calyx acutely 5-cleft; lower segment longest. Vexillum striated. Legume sessile, ovate, turgid, 2-valved, 1-celled, 2-seeded. Herbs or subshrubs, with simple or trifoliolate leaves, and red or purple flowers.

**Subtribe III. Althaeae. Flowers disposed in racemes (f. 45. h.) or spikes. Legumes rather terete (f. 45. d.).**

165 *Alysicarpus*. Calyx campanulate, 5-cleft (f. 45. a.). Legume many-jointed, terete (f. 45. d.) or somewhat compressed. Herbs, with simple leaves, and yellow or purple petals, which are hardly longer than the calyx.

166 *Beimontiera*. Calyx campanulate, subtruncate, hardly 5-toothed. Corolla 3 times longer than the calyx. Legume many-jointed, somewhat compressed. Shrubs, with simple leaves, and small purple flowers.

§ 2. *Sarcolobus*. Embryo with thick fleshy cotyledons (f. 21. b.).

**Tribe IV.**

*Viciae*. Corolla papilionaceous (f. 46. d.). Stamens diadelphous (f. 46. g.), that is, 9 joined together, and 1 free. Cotyledons thick, mealy, not changing even in germination, when above the earth, but remaining inclosed in the spermatangia. Radicle curved inwards (f. 21. f.). The leaves of all are abruptly pinnate (except in *Cicer*), and the common petiole either terminates in a bristle or tendril, and it is not articulated above the stem.

167 *Cicer*. Calyx 5-lobed, with the tube rather gibbous at the base, 2 or 4 of the upper lobes lying over the vexillum. Legume turgid, few-seeded. Tendrilled herbs, with white flowers, and impari-pinnate or abruptly-pinnate leaves.

168 *Faba*. Character the same as that of *Vicia*, but the legume is large and coriaceous, containing large flat seeds, and the leaves are almost without tendrils, and the stem is erect. Flowers white or red.

169 *Vicia*. Calyx tubular, 5-cleft (f. 46. a.) or 5-toothed, 2 superior teeth shortest. Style villous at the apex (f. 46. f.). Legume many-seeded (f. 46. h.). Usually climbing herbs, with the leaves generally ending in a branched tendril (f. 46. i.). Flowers white, purple, or yellow.

170 *Eremurus*. Calyx 5-cleft, with linear acute segments, about equal in length to the corolla. Stigma smooth. Legume oblong, 2-4-seeded. Tendrilled herbs, with small white flowers.

172 *Lathyrus*. Calyx, campanulate, 5-cleft, 2 superior lobes shortest. Style flattened, dilated at the apex, villous or pubescent in front. Legume many-seeded. Usually climbing tendrilled herbs, with purple, white, or yellow flowers.

173 *Ochna*. Calyx campanulate, 5-cleft, 2 upper segments connivent. Vexillum furnished with a tooth on each side. Style flattened, villous above. Legume few-seeded, winged on the seminiferous suture. An herb, with bifoliolate tendrilled leaves, and solitary white flowers.

174 *Orcinus*. Calyx campanulate, 5-cleft, 2 superior lobes shortest. Style slender, linear, villous at the apex. Legume cylindrical, many-seeded. Erect herbs, with the leaves having one or many pairs of leaflets and with the common petiole ending in a bristle. Flowers of various hues.

175 *Platystylis*. Calyx campanulate, 5-cleft, 2 superior lobes shortest. Style broad-spatulate, villous at the apex. Legume oblong, many-seeded. Erect herbs, with abruptly-pinnate few-paired leaves, ending in a simple tendril at the apex. Flowers bluish-purple.

**Tribe V.**

*Phaseoleae*. Corolla papilionaceous (f. 47. c. f. 48. b.). Stamens monadelphous (f. 47. g.), but usually diadelphous (f. 48. e.), that is, 9 joined together, and 1 free. Legume many-seeded (f. 49. c.), dehiscent, with a cellular transverse membrane between each seed, usually subdivided, but not articulated. Radicle bent in above the fissure of the lobes of the cotyledons (f. 21. f.). Cotyledons not changing by germination (f. 21. c.), but grow into thick leaves, and when above the earth they are usually exserted beyond the spermatangia. Primordial leaves opposite, the rest with the leaflets usually pinnately, rarely palmately disposed.

180 *Teresaea*. Calyx bilabiate, upper lip longest and bifid, lower one 3-parted. Keel small. Stamens monadelphous, 5 alternate ones sterile. Stigma sessile, capitate. Legume linear, compressed, 2-valved, many-seeded. Twining subshrubs, with trifoliolate leaves, and axillary racemes of small reddish flowers.
181 **Amphicarpa.** Calyx campylanulate, 4-toothed; teeth equal, obtuse. Vexillum broad, incumbent. Stamens diadelphous. Style filiform, crested by 4 capitate stigma. Legume compressed, stipitate, 1-4-seeded. Twining herbs, with trifoliolate leaves, and apetalous flowers.

182 **Kennedy.** Calyx bilabiate (f. 47. a.), upper lip bidentate, lower one trifid. Vexillum recurved (f. 47. b.). Stamens diadelphous (f. 47. g.). Stigma obtuse (f. 47. f.). Legume linear, compressed, transversely many-celled. Twining shrubs, with simple or trifoliolate leaves, and white or purple flowers.

183 **Rhynchôsia.** Calyx 5-cleft, somewhat bilabiate. Corolla usually shorter than the calyx. Stamens diadelphous, free, filaments jointed at the base. Style filiform, bent. Legume sessile, compressed, rather filiform, 2-seeded. Climbing herbs or shrubs, with simple or trifoliolate leaves, and yellow flowers.

184 **Euclâsia.** Calyx 5-cleft, subbilabiate. Stamens diadelphous. Vexillum silky or villous. Legume straight, 1-celled. Subshrubs, with trifoliolate leaves, and yellow flowers.

185 **Faeôlia.** Calyx 5-cleft; segments linear, acute, 2 upper ones adhering together a greater length than the others. Vexillum reflexed. Keel obtuse, longer than the wings. Stamens diadelphous. Legume ovate, cylindrical, turgid, 6-seeded. Decumbent or twining shrubs, beset with clammy hairs, having trifoliolate leaves, and yellowish flowers.

186 **Westâria.** Calyx campylanulate, somewhat bilabiate (f. 48. a.), upper lip with 2 short teeth, lower one with 3 subulate lobes. Vexillum bicallose. Wings conforming to the keel (f. 48. b.). Keel 2-edged. Stamens diadelphous (f. 48. e. f.). Legume coriaceous (f. 48. c.). Climbing shrubs, with impari-pinmate leaves, and lilac-blue flowers.

188 **Phaseôlús.** Calyx campylanulate, bilabiate, upper lip bidentate, lower one 3-parted. Keel, as well as the diadelphous stamens and style, twisted together, rarely incurved. Legume compressed or cylindrical, many-seeded. Seeds intercepted by cellular substance. Twining herbs or subshrubs, with trifoliolate leaves, and scarlet, red, or white flowers.

190 **Sôja.** Calyx bibracteate at the base, 5-cleft, with 2 of the teeth approximate or joined at the base. Vexillum ovate, with a short unguis. Keel oblong, straight. Stamens diadelphous. Legume 2-5-seeded. Seeds intercepted by cellular substance. Hispid climbing herbs, with trifoliolate leaves, and violaceous flowers.

191 **Dôichos.** Calyx bibracteolate at the base, campylanulate, 5-toothed, 2 of which are approximate or joined. Vexillum roundish, having 2-4 callosities at the base. Wings oblong, obtuse. Keel obtuse. Stamens diadelphous. Style bearded above the middle. Legume compressed. Seeds intercepted by cellular substance. Climbing herbs or shrubs, with trifoliolate leaves, and white or purple flowers.

194 **La'bâlab.** Calyx tubular, 4-cleft, 3 lower ones acute. Vexillum with 4 callosities at the base. Stamens diadelphous. Style compressed, bearded below. Legume compressed. Seeds separated by cellular substance. Twining herbs, with trifoliolate leaves, and white or purple flowers.

195 **Pachyhrizus.** Calyx urceolate, 4-lobed, upper lobe broader and emarginate. Vexillum roundish. Stamens diadelphous. Legume compressed, 7-8-seeded. Twining subshrubs, with trifoliolate leaves, and violaceous flowers.

197 **Diôclæ.** Calyx bibracteate at the base, 4-cleft, 2 lateral segments narrowest. Vexillum obovate-oblong, reflexed. Stamens diadelphous. Stigma subclavate. Legume linear, compressed, winged on the upper suture. Twining shrubs, with trifoliolate leaves, and red flowers.

198 **Psophôca'rus.** Calyx urceolate, unequally bilabiate. Vexillum roundish, reflexed, bearing 2 callosities at the base. Wings stipitate. Keel oblong, 2-edged. Stamens diadelphous. Legume oblong, 4-winged, 7-8-seeded. A tuberous rooted herb, with trifoliolate leaves, and blush flowers.

199 **Canava'lia.** Calyx tubular, bilabiate (f. 49. b.), lower lip 3-toothed, upper lip with 2 large rounded lobes. Vexillum large (f. 49. d.), bicallose at the base. Wings stipitate, oblong, auriculated. Keel 2-petalled (f. 49. c.). Stamens monadelphous (f. 49. a.). Legume compressed (f. 49. e.), 3-keeled, with a membrane between each seed. Twining herbs or subshrubs, with trifoliolate leaves, and large purplish flowers.

200 **A'mphidus.** Calyx bilabiate, upper lip bidentate, lower one trifid. Vexillum reflexed, with a tooth on each side at the base. Wings and keel linear. Stamens diadelphous. Legume compressed, many-seeded. A climbing plant, with trifoliolate leaves, and dark-red flowers.

201 **Mucu'na.** Calyx campylanulate, bilabiate, lower lip trifid, upper one entire. Vexillum shorter than the wings and keel. Keel acute. Stamens diadelphous. Legume hispid, oblong, torose, having cellular substance between the seeds. Twining herbs or subshrubs, with trifoliolate leaves, and large, purplish, white, or yellow flowers.
LEGUMINOSÆ.

202 CALOPÓGOSUM. Calyx bracteless, inclosing the corolla, 5-leaf; segments elongated, rather unequal, pinnately bearded. Legume straight, depressed, rather hooked, pilose, 8-seeded. A herbaceous twining plant, with trifoliate leaves.

204 LUPINUS. Calyx bilabiate. Vexillum reflexed on the sides. Keel acuminate. Stamens monadelphous, the sheath entire, bearing 5 small round anthers, and 5 oblong ones, which are later of coming to perfection. Style filiform, crowned by a bearded roundish stigma. Legume coriaceous, compressed, torulose. Erect herbs, with digitate leaves, composed of 5-9 leaflets, rarely simple, and racemose-spikes of blue, white, or yellow flowers.

205 CYSTIS. Calyx 4-leaf, larger than the corolla, upper segment margined or bised, lower one largest. Corolla shorter than the calyx. Keel 2-edged. Stamens diadelphous. Legume 2-seeded. Climbing shrubs, with trifoliate leaves, and yellow flowers.

206 ERYTHRINA. Calyx tubular (f. 50. a.), with a truncate subdentate mouth (f. 50. a.) or spatheaceous. Vexillum oblong (f. 50. b.), very long. Wings and dipetalous keel shorter than the vexillum (f. 50. c.). Stamens diadelphous (f. 50. c.), straight. Legume long (f. 50. d.), torulose, many-seeded (f. 50. d.). Trees or shrubs, rarely herbs, with trifoliate leaves, and racemes of scarlet flowers.

207 RUDOLFIA. Calyx tubular, bilabiata, upper segment obtuse, lower one acute, 2 lateral ones very short. Vexillum oblong-linear, very long. Wings shorter than the calyx, very narrow. Stamens diadelphous. Legume compressed, many-seeded. Climbing shrubs, with simple leaves, and scarlet flowers.

208 BUTEA. Calyx campanulate, 5-toothed, 2 upper teeth approximate. Vexillum lanceolate, spreading, equal in length to the wings and keel. Stamens diadelphous. Legume stipitate, compressed, membranous, 1-seeded at the apex. Trees, with trifoliate leaves, and large scarlet flowers.

TRIBE VI.

DALBERGIEÆ. Corolla papilionaceous (f. 51. b.), perigynous. Stamens variously connected. Embryo with the radicle bent back upon the edge of the cotyledons (f. 21. e, f.). Cotyledons fleshy (f. 21. e, f.). Legume 1-3-seeded (f. 51. d.), indehiscent. Usually climbing shrubs, with impari-pinnate, rarely trifoliate leaves, or reduced to the terminal leaflet.

210 ENDESPÉRÉRUM. Calyx bibracteate at the base, bilabiata, upper lip 2-lobed, lower one 3-toothed. Wings and keel unguiculate. Stamens 9, monadelphous. Legume stipitate, leafy, indehiscent, 1-seeded. A climbing shrub, with abruptly or impari-pinnate leaves, and bluish flowers.

212 DALBERGIA. Calyx campanulate, 5-toothed (f. 51. c.). Stamens 8-10, monadelphous, with the tube cleft in front, sometimes disposed in 2 equal bundles. Legume stipitate (f. 51. d.), membranous, compressed, tapering to both ends, 1-3-seeded (f. 51. d.). Usually climbing shrubs, with impari-pinnate leaves, and red, white, or blue flowers.

213 PTEROCA'RPSUS. Calyx 5-toothed. Stamens 10, monadelphous or diadelphous. Legume indehiscent, suborbicular, girded by a wing, 1-seeded. Trees or shrubs, with impari-pinnate leaves, and usually yellow flowers.

214 DREPANOCA'RPSUS. Calyx bibracteate at the base, 5-toothed. Stamens 10, monadelphous, with the tube cleft in front or equally diadelphous. Legume compressed, indehiscent, wingless, falcate, 1-seeded. Shrubs, with impari-pinnate leaves.

215 ECASTAPHYLLUM. Calyx campanulate, somewhat bilabiata, upper lip marginate, lower one trifid. Stamens 8-10, equally diadelphous. Legume nearly orbicular, membranous, indehiscent, 1-seeded. Shrubs, with impari-pinnate or simple leaves.

216 AMERI'MNUM. Calyx 5-toothed, somewhat bilabiata. Stamens 10, monadelphous, with the tube cleft in front. Legume 2-valved, 1-seeded, with the upper suture straight, and a little winged. Shrubs, with simple leaves, and whitish flowers.

218 DEQÜÉLLA. Calyx bilabiata, upper lip entire, lower one trifid. Wings and keel equal in length, larger than the vexillum. Stamens 10, diadelphous, one of which is free. Legume globose, 2-valved, 1-seeded. Seeds covered with farina. A climbing shrub, with impari-pinnate leaves.

SUBORDER II. OR TRIBE VII.

SWARTZIÆ. Sepals closely joined into a globose or oblong alabastrum before expansion (f. 52. b.), but at length ruptured, valvately (f. 52. g.). Petals few, irregular (f. 52. c.) or wanting, and are, as well as the stamens, hypogynous (f. 52. d.). Radicle incurved. Cotyledons thick. Germination unknown. Leaves simple or simply pinnate. This is a very distinct tribe, agreeing with DÉTRA'NUM in the valveless calyx, with MIND'ÉER in the hypogynous stamens, and in habit with DÁLBERGIEÆ.

219 SWARTZIA. Calyx ovate, globose, ruptured valvately. Petals few or wanting. Stamens 10-13-25, 2-4 of which are larger and sterile, the rest connected at the base. Legume stipitate, 2-valved, few-seeded. Seeds arillate. Trees or shrubs, with simple or pinnate leaves, and white flowers.

221 Zollé́ria. Calyx entire, cleft laterally, reflexed (f. 52, g.). Petals 5, nearly equal (f. 52, c.). Stamens 9 (f. 52, d.)-13. Legume stipitate (f. 52, c.), 1-celled, 2-valved (f. 53, h.), few-seeded. Trees or shrubs, with simple leaves, and axillary racemes of yellow flowers.

**Division II.**

Rectémierle. Radicle and cotyledons straight (f. 21, i. h. l. m.).

**Suborder III. or Tribe VIII.**

Mimóseæ. Embryo straight (f. 21, m.), with the radicle bent a little above the lobes. Flowers regular (f. 53, a.), usually polygamous (f. 53, b.), rarely all hermaphrodite (f. 54, b.). Sepals 4-5, equal, valvate in aestivation, usually connected at the base into a 4-5-toothed calyx (f. 54, a.). Petals 4-5, equal (f. 53, a.), also valvate in aestivation, usually hypogynous. Stamens inserted with the petals, rarely in the bottom of the calyx, sometimes free (f. 53, b. f. 54, b.), sometimes more or less connected at the base, equal in number to the petals, or multiple that number (f. 53, b.). Embryo straight. Funicle usually twisted. Leaves abruptly- or bipinnate. Cotyledons all foliaceous, except in Entá́da, and some species of Inga.

223 Mimósa. Flowers polygamous. Corolla 4-5-cleft, funnel-shaped. Stamens 4-5-10-15, inserted in the bottom of the corolla, or in the stipe of the ovary. Legume compressed, one or many jointed; joints 1-seeded. Leaves conjunctly digitate, or doubly pinnate. Flowers white or red, in small round heads.

225 Inga. Flowers polygamous. Calyx 5-toothed. Corolla 5-cleft. Stamens indefinite, exserted, monadelphous. Legume compressed, 1-celled. Seeds covered, with pulp or farina. Trees or shrubs, usually unarmed, with variously pinnate leaves, and spikes or heads of red or white flowers.

227 Schiránka. Flowers polygamous. Petals connected together into a 5-cleft corolla. Stamens 8-10, free. Legume echinate, tetragonal, and as if it were 4-valved, the valves separating lengthwise. Seeds numerous. Herbs, with bipinnate leaves, and globose heads of rose-coloured flowers.

229 Desmántius. Flowers polygamous. Calyx 5-toothed. Petals 5, distinct. Stamens 10, rarely 5, in the lower flowers sterile, membranous or filiform. Legume 2-valved. Herbs or shrubs, with bipinnate leaves, and pedunculated spikes of white flowers with yellow filaments.

231 Prósopsis. Flowers polygamous. Calyx 5-toothed. Petals 5, free. Stamens 10, hardly connate at the base. Legume filled with pulp, torulose. Unarmed or prickly trees or shrubs, with bipinnate leaves, and loose spikes of yellow flowers.

233 Acácia. Flowers polygamous (f. 53, c. f. 54, b.). Calyx 4-5-toothed (f. 54, a.). Petals 4-5, connected or free (f. 53, a.) Stamens from 10 to 200. Legume dry, 2-valved. Unarmed or prickly trees of shrubs, with very variable leaves, and spikes or heads of white or yellow, rarely red, flowers.

**Suborder IV.**

Cesalé´neæ. Flowers more or less irregular, sometimes papilionaceæ, but usually regular (f. 55, c. f. 56, b.). Petals irregularly imbricate in aestivation, sometimes wanting, always free (f. 55, c. f. 56, b.). Stamens more or less unequal (f. 56, c. f. 57, d.), always perigynous, usually free, rarely with the filaments concretes, as in tribe Geoffré́zé. Embryo straight (f. 21, g. h. l. m.), with a large plumule.

**Tribe IX.**

Geoffrézé. Petals perigynous, unequal, disposed in a papilionaceous manner (f. 55, c.), imbricate in aestivation. Stamens monadelphous or diadelphous. Cotyledons fleshy or oily (f. 21, l.). This is an artificial tribe, and perhaps should have been brought in among the Papilionaceæ, but it agrees with Cassinæ in the embryo being straight.

235 Aráechis. Calyx tubular, bilabiate. Corolla resupinate. Stamens inserted in the calyx with the petals, 9 joined and 1 free, the last is sterile. Legume ovate-oblong, obtuse, indehiscent, 2-4-seeded. Seeds thick. Herbs, with abruptly pinnate leaves, and yellow flowers.

236 Voandizé́la. Flowers polygamous. Calyx campanulate. Wings horizontal. Stamens diadelphous. Legume roundish,
fleshy, 1-seeded. An herb, with trifoliolate leaves and yellow flowers.

237 Pera'tea. Calyx bicrenate, bilabiata, lower lip trifid, upper one bidentate. Stamens diadelphous. Legume compressed, 4-8-seeded. Subshrubs, with impari-pinnate leaves and large purplish flowers.

238 Bronchiatia. All as in Pera'tea, but the calyx has a longer stipe, and the seminiferous suture is without a margin.

240 Geoffrroya. Calyx campitulate, somewhat bilabiata, half 5-cleft. Wings and keel about equal in length, shorter than the vexillum. Stamens diadelphous, 9 joined, and 1 free. Legume drupaceous, egg-shaped, 1-celled, 1-seeded. Trees, with impari-pinnate leaves, and axillary racemes or panicles of yellowish flowers.

241 Brownea. Calyx with 2 connate bracteas at the base, constituting a sheath (f. 55. a.). Calyx 5-cleft (f. 55. b.). Petals 5 (f. 55. c.), unguiculate (f. 55. c.). Stamens 10-15, monadelphous, with the sheath in front. Legume 1-celled, many-seeded, aciculiform, compressed. Trees, with abruptly pinnate leaves, and rose-coloured flowers rising in fascicles from the buds.

242 Diphtheria. Calyx 3-5-cleft, 2 upper segments largest, wing-formed, 1-3 lower ones small. Corolla papilionaceous. Stamens 8-10, monadelphous, with the sheath in front. Legume somewhat compressed, thick, 2-valved, 1-seeded. Trees, with abruptly pinnate leaves and panicled flowers.

Tribe X.

Cassie. Lobes of calyx imbricate before expansion (f. 57. a.). Petals perigenous (f. 56. b. f. 57. b.), nearly equal, rarely sub-papilionaceous, imbricate in actinostyle. Stamens distinct (f. 57. c. f. 56. c.). Legume usually dry and 2-valved (f. 58. g. f. 56. c.). Cotyledons leafy, rarely fleshy. Leaves bi or tri-pinnate, sometimes abruptly or impari-pinnate, sometimes simple. Habit variable.

244 Gleditschia. Flowers unisexual or hermaphrodite. Calyx 3-4-5-cleft. Petals 3-4-5, the 2 lowest ones joined into a keel. Stamens equal in number to the petals, and opposite the sepals. Legume transversely many-celled, rarely 1-celled, 1-seeded. Spinose trees, with abruptly pinnate or bipinnate leaves, and spikes of greenish flowers.

246 Anoma. Calyx 5-cleft. Petals 5, equal. Stamens 10, the 5 alternate ones sterile. Legume oblong, thick, 2-valved, 1-celled, many-seeded. A tree, with opposite bipinnate leaves, and panicles of white flowers.

249 Cesalpinia. Calyx 5-cleft, lower segment largest and arched. Petals 5, unequal, unguiculate, upper one shortest. Stamens 10, villous at the base, ascending. Legume unarméd, compressed, 2-valved, many-seeded. Prickly or unarmed trees or shrubs, with abruptly bipinnate leaves, and yellow flowers.

250 Poisca. Calyx 5-cleft, unequal, lower segment arched. Petals 5, unguiculate, upper one diffrorm. Stamens 10, long, hairy at the base. Legume compressed, 2-valved, many-celled. Trees or shrubs, with abruptly bipinnate leaves, and usually with variegated flowers.

251 Mezoneura. Calyx 5-cleft; lower segment arched, the other suborbicular. Petals 5, unguiculate, upper one smallest. Stamens 10, decurrent, villous at the base. Legume leafy, flat, ovate-oblong, indehiscent, 1-celled, many-seeded, expanded into a wing on the upper surface. Prickly trees, with abruptly bipinnate leaves.

252 Reichardia. Calyx campanulate, 5-toothed. Petals 6-10, unequal, sub-papilionaceous. Stamens 10, decurrent, cohering by a beard below the middle. Legume samaroid, expanded into a wing. A genus hardly known.

254 Hoffmannseggia. Calyx 5-cleft. Petals 5, unguiculate, glandular at the base, upper one broadest. Stamens 10, covered with glandular hairs, one usually abortive. Legume linear, compressed, many-seeded. Herbs or subshrubs, with impari-bipinnate leaves, and racemes of yellow flowers.

256 Pomaria. Calyx 5-cleft (f. 56. a.). Petals 5 (f. 56. b.), unguiculate, upper one concave and shorter. Stamens 10 (f. 56. c.), decurrent, hairy at the base. Legume oblong (f. 56. d.), compressed, 2-seeded (f. 56. c.). Shrubs, with abruptly bipolar leaves.

P
257 **Hematoxyylon.** Calyx 5-cleft. Petals 5, nearly longer than the calyx. Stamens 10, pilose at the base. Legume compressed, acuminate at both ends, 1-celled, 2-seeded, with the valves ruptured longitudinally in the middle. A tree, with abruptly pinnate or bipinnate leaves and whitish flowers.

258 **Parkinsonia.** Calyx 5-cleft. Petals 5, upper one roundish, unguiculate. Stamens 10, declinate. Legume linear, acuminate at both ends, torose. A spiny shrub, with pinnate leaves and yellow flowers.

259 **Caesia.** Calyx campanulate, 5-cleft, beset with glands on the inside of the tube. Petals 5, equal, inserted in the calyx. Stamens 10, joined at the base. Legume linear, many-seeded, stipitate. An unarmed shrub, with impari-pinnate leaves and white flowers.

262 **Castanospermum.** Calyx coloured, somewhat bilabiate. Wings and keel about equal in length. Stamens 10, free. Legume large, 2-valved, 4-seeded, spongy inside, stipitate. Seeds large. A tree, with large impari-pinnate leaves, and racemes of coloured flowers.

264 **Jone'sia.** Calyx bibracteate at the base, coloured, funnel-shaped, 4-lobed. Petals wanting. Stamens 8, sometimes only 6-7, exserted. Legume 4-8 seeded, compressed, acainiform. Trees, with abruptly pinnate leaves, and orange-coloured flowers.

265 **Tagiozia.** Calyx 5-cleft, unequal, obtuse. Petals 5, inserted in the mouth of the calyx, unequal. Stamens 10, exserted, villos at the base, unequal. Legume compressed, membranous, indehiscent, 1-seeded. Trees, with abruptly-pinnate leaves and yellow flowers.

267 **Moldenhaeura.** Calyx 5-cleft. Petals 5, on long claws. Stamens 10, smooth, one of which is sterile, longer, and furnished with hairs. Legume linear-oblong. A tree, with pinate and bipinnate leaves and yellow flowers.

268 **Humihaitia.** Calyx 4-cleft. Petals 5, inserted in the mouth of the calyx. Stamens 5, smooth. Legume oblong, compressed. Trees, with abruptly pinnate leaves.

269 **Heterostemon.** Calyx 4-cleft, bibracteate at the base. Petals 3, inserted in the mouth of the calyx. Stamens 8, de-

283 Cynomé'tra. Calyx 4-parted; segments reflexed, pencilled at the apex. Petals 5, equal. Stamens 10; anthers bifid at the apex. Legume roundish, flasky, indehiscent, tubercled, 1-seeded. Trees, with bifoliate leaves, and red flowers, rising from the trunk.

284 In'telia. Calyx campanulate, 5-parted. Petal one, unguiculate. Stamens 9, 3 of which are fertile, longer, and declinate. Legume compressed, 3-4-seeded. Trees, with abruptly or imparsi-pinnate leaves.

285 Epe'rua. Calyx urceolate, 4-cleft. Petal one, fringed, inserted in the middle of the calyx. Stamens 10, long, villous, and rather monadelphous at the base. Legume compressed, falciform, 1-4-seeded. A tree, with abruptly-pinnate leaves and red flowers.

286 Parvióa. Calyx bibracteolate, 3-5-parted. Petal one, large, convolute, inserted in the calyx. Stamens 10, 9 joined at the base, and 1 free. Legume thick, compressed, 1-seeded. A tree, with abruptly-pinnate leaves and purple flowers.

287 Anthionóta. Calyx 4-cleft, unequal, girded by a 2-lobed bractea at the base. Petal one, on a long claw, emarginate. Stamens 10, 3 of which are very long. Legume compressed, hardly dehiscent, 1-celled, many-seeded. A tree, with abruptly-pinnate leaves.

288 Ou'tea. Calyx 5-cleft, bibracteate at the base. Petals 5, one of which is very large and undulated. Stamens 5-4, free, one sterile. Legume compressed, 1-seeded. Trees, with abruptly-pinnate leaves.

292 Bau'nia. Calyx 5-cleft. Petals 5, upper one distant from the rest. Stamens 10, sometimes 9 of which are sterile (f. 58. c), and joined, and 1 free (f. 58. c) and bearing an anther, sometimes all monadelphous at the base and fertile, or 5 or 3 fertile. Legume (f. 58. g) 2-valved, 1-celled, many-seeded (f. 58. h). Shrubs, with 2-lobed leaves.

293 C'ús. Calyx urceolate, 5-toothed. Petals 5, unguiculate, sub-papilionaceous, all distinct, the wings largest. Stamens 10, free, unequal. Legume oblong, compressed, 1-celled, many-seeded. Trees, with simple cordate leaves.

294 Pal'o'vea. Calyx girded by a 2-lobed bractea, 4-5-lobed. Petals 3-4. Stamens 9, rising from the tube of the calyx. Legume compressed, 6-7-seeded. A shrub, with simple leaves.

Tribe XI.

Detarie'æ. Calyx 4-lobed, globose before expansion, with valvate lobes. Petals wanting. Stamens 10-25, perigynous, nearly free. Legume fleshy. Cotyledons thick. Trees, with imparsi-pinnate leaves. It differs from all the other tribes of this order in the drypaceous fruit, and therefore comes near to Ros'aceæ.

† Genera belonging to Leguminosæ, but they are not sufficiently known, and are therefore not received among the tribes.

304 Chemün'ium. Calyx cup-shaped, truncate. Legume compressed, flat, many-seeded, margined on both sides.

305 Phyllo dol'arium. Calyx campanulate, 5-cleft; teeth equal, awl-shaped. Corolla papilionaceous, the vexillum a little larger than the other petals. Legume turgid, compressed at the sutures, falcate, 6-10-seeded, opening at one of the sutures. A flexuous herb, with imparsi-pinnate leaves and whitish flowers.

306 Amphinò'mia. Calyx ventricose, 5-cleft; segments lan-
ceolate, spreading. Petals 5, unguiculate. Stamens 10, monadelphous. Style lateral. Legume roundish, 1-celled, 2-valved, many-seeded, the most of which are abortive. A decumbent hairy herb, with trifoliate leaves.

314 Rive'ria. Flowers unknown. Legume stipitate, obliquely-elliptic, flatish, mucronate, 2-valved, 1-seeded. Cotyledons thick. A tree, with impari-pinnate leaves, with the rachis winged.

Division I.

Curembriæ (from curvis, curved, and embryo, (f. 21. b. e. f.)) Radicle curved back upon the edge of the cotyledons.

Suborder 1.

Embryo with the radicle curved back upon the edge of the cotyledons, lying above the commissure formed by the lobes (f. 21. b. e. f.). Sepals usually imbricate in restoration, rarely somewhat valvate. Petals disposed into a papilionaceous corolla or a pea flower (f. 24. b. f. 25. b., &c.), therefore always irregular. Stamens inserted in the bottom of the calyx (f. 22. c.), or perigynous.—Plants with simple, trifoliate or simply pinnate leaves.

I. Myrospérmum.

§ 1. Phyllólaber (from phyllon, phyllon, a leaf, and lobos, lobos, a lobe; in reference to the lobes of calyx or cotyledons being foliaceous). D. C. Cotyledons thin, foliaceous (f. 21. a. f.).

Tribe I.

Corolla papilionaceous (f. 22. e. f. 24. b.). Stamens free (f. 23. f. f. 24. e.). Legume continuous (f. 22. d.), never articulately. Cotyledons flat, leafy (f. 21. a. b.). This is a very natural tribe, known by its papilionaceous flowers, free stamens, and unarticulated pods.

I. Myrospérmum (from μυρος, myron, myrrh, and σφορα, sperma, a seed; the seeds and cells yield a balsam that has a strong smell). Jacq. amer. (1796) p. 120. Lam. ill. 341. D. C. leg. mem. V. prod. 2. p. 94. Myroxylon, Lin. fil. suppl. 233. but not of Forst. et Juelius, Lin. gen. 524.

Lin. syst. Decandria, Monogyinia. Calyx campanulate, 5-toothed. Petals 5, the upper one larger than the rest. Stamens 10, free. Ovary stipitate, oblong, membranous, 2-6-ovulate, bearing a lateral, ascending, filiform style towards the apex. Legume with a naked stipe at the base, but amply winged at the apex, samaroid, indiscisate, 1-celled, 1-2-seeded, bearing the style laterally towards the apex. Seed enwrapped in balsamic resin. Radicle incurved in the first section, in the rest unknown. Cotyledons thick and flat.—American trees, with abruptly-pinnate leaves, and with the leaflets usually full of pellucid dots, the glands or dots are oblong-linear, as in Symydræ. The terminal leaflet usually solitary. Perhaps a proper tribe.

1 M. fruct'seens (Jacq. amer. 120. t. 174. f. 34.) leaves membranous, deciduous; legume with a recticulately-veined wing; style permanent. H. S. Native of South America, in bushy places at Carthagena and St. Martha, on the declivities of mountains in Caracas, as well as on the banks of the Rio Guianas. H. B. et Kunth, nov. gen. amer. t. 570. and 571. Leaflets 7-8 pairs, alternate, somewhat crenulated, ovate, emarginate, marked with pellucid lines. Legume nearly 2 inches long, with the stipe inclosed in the calyx. According to Jacquin this is an inedible shrub. Leaves alternate, pinnate, deciduous, with commonly 3 pairs of leaflets and an odd one, which are quite entire and smooth. Flowers of a whitish rose-colour, disposed in terminal, simple, or bifid racemes. The seeds and cell of the legume yield a balsam that has a strong unpleasant smell.

Shrubby Balsam-seed. Shrubs 10 feet.

Sect. II. Myroxylón (from μυρος, myron, myrrh, and ὕλος, xylon, wood; the wood is resinous and sweet-scented). Mutis, Lin. fil. et Kunth. Stamens deciduous.

2 M. rubes'eens (D. C. prod. 2. p. 95.) branches and petioles hairy; leaflets ovate-lanceolate or oblong, rather membranous, smooth above and pubescent beneath, rather acuminate, emarginate. H. S. Native of South America, near Carthagena and Popayan. Myroxylon pubescens, H. B. et Kunth, nov. gen. amer. 6. p. 374. M. periferum, Lamb. ill. cinech. 92. t. 1. Leaves rather membranous, marked with line-like dots. An elegant tree, with white flowers disposed in terminal racemes. The bark is filled with white resin, which, according as it abounds more or less, changes the colour to citron-yellow, red, or dark chestnut; the smell and taste are grateful, balsamic, and aromatic, resembling those of Red Peruvian Balsam, and sold in druggists' shops under the name of white balsam. The legume contains 1
seed, which is crescent-shaped, projecting from the cell, and between this and the lining of the pericarp is filled with a yellow liquid balsam, which in time dries and becomes a hard resin. The tree grows in the mountains of Panachua, in the forests of Puzuzo, Muna, Cuchero, and in many other countries near the river Maranon, in low, warm, and sunny situations. The natives of these countries call the tree by the name of Quinquina, and its bark and fruit by that of Quinquina, a plant very different to the Quina. The Indians of Puzuzo and the above-mentioned countries do not collect the balsam of this tree, they only collect the barks most filled with resin, condensed into drops and lumps, and the fruits, in order to sell them in the neighbouring provinces, both of which are used for the purpose of perfuming cloth and apartments. It is called perfume of quinquina, to distinguish it from the true perfume, which is a composition of Benzoin, storax, and ambergris, these substances being formed into a paste, from which they make pastilles. The fruit as well as the bark being reduced to a coarse powder, they mix it with oil of maria, carana, jacamaca, lera, or sebo, and make with it little plasters, which they apply upon the temples and behind the ears, to mitigate the pains of the head-ache and the tooth-ache. It closes recent wounds, strengthens the brain, mitigates pains proceeding from agues, and dissipates the shivering produced by fevers. The balsam of quinquino is procured by incision at the beginning of spring, when the showers are gentle, frequent, and short; it is collected into bottles, where it keeps liquid for some years, in which state it is called white liquid balsam. But when the Indians deposit this liquid in mats or calabashes, which is commonly done in Carthagena, it hardens into a resin and is then denominated dry white balsam. The wood of the quinquino is compact, heavy, and durable, but is difficult to work on account of its uneven grain. It is never exposed to attacks of worms, wherefore the Indians make use of the trunks for beams and stanchions.

3 M. peruvifera (D. C. prod. 2. p. 95.) leaflets coriaceous, permanent, and are as well as the branches glabrous; legume with a very thick wing; style deciduous. I. S. Native of Peru, New Granada, Colombia, Mexico. Myrsxylon peruviferum. Lin. supp. 293. Bent 4. H. B. et Kuntl, nov. gen. amer. 6. p. 374. M. pedicellatum, Lam. dict. 4. p. 191. ill. t. 341. f. 1. Flowers white, disposed in axillary racemes. Legume coriaceous, with the stipe inclosed in the calyx, about 3 inches long. There are varieties of this tree, or perhaps distinct species, differing in having quite entire or crenated, oval, or ovate, obtuse or emarginate leaflets, marked with oblong or roundish pellucid dots. The lower leaflets alternate, and the upper ones more or less opposite, to the number of 2-5 pairs. It is a very beautiful tree, with a smooth bark full of resin, as are all parts of the plant. The leaves are abruptly pinnate, usually with about 2 pairs of ovate-lanceolate, entire, emarginate leaflets, which are full of transparent, linear, resinous dots. The balsam of Peru is the produce of this tree, according to Joseph Caelastine Mitis. This balsam, when brought to us, is of the consistence of thin honey, of a reddish-brown colour, inclining to black, an agreeable aromatic smell, and a very hot biting taste. It is said to be obtained by boiling the cuttins of the twigs in water, and skimming off with a spoon the balsam, which swins on the top. Peruvian balsam consists of a volatile oil, resin, and benzoic acid; it is accordingly entirely soluble in alcohol and in essential oils. Water dissolves part of the benzoic acid, and fixed oil combines with the resin. It may be suspended in water by triturating with mucilagre and yoke of eggs. Balsam of Peru is a very warm aromatic medicine, considerably hotter and more acrid than copaiva. Its effects are stimulating and tonic. Hence its use in some kinds of asthma, gonorrhoeas, dysenteries, suppressions of the uterine discharges, and other disorders proceeding from debility. It is also employed externally for cleansing and healing wounds and ulcers, and sometimes against palsy, and rheumatic pains.

Balsam of Peru-tree. Tree 40 feet.

4 M. toluriferum (Ach. Rich. ann. sc. nat. 1834. jun. p. 172.) branches and leaves glabrous; leaflets oblong, acuminate, equal-sided, rounded at the base. I. S. Native of South America, on the branches of the river Magdalena, between Carapata and Mompos. Balzsamum Toluratum, C. Bauh. pin. 101. Tolunfera Balsamum, Mill. dict. Lin. med. med. 201. Woody. med. bot. 3. p. 556. t. 193. Myrsxylon toluriferum, H. B. et Kuntl, nov. gen. amer. 6. p. 375. A large spreading tree, with very thick, rough, brown bark. Leaves oblong-ovate. Flowers yellowish, disposed in small axillary racemes. The balsam of Tolua is the produce of this tree; it flows from incisions made in the bark, during the hot season, and is brought to us in little gourd shells. It is of a yellowish-brown colour, inclining to red; in consistence thick and tenacious; by age it grows hard and brittle. The smell of this balsam is extremely fragrant, somewhat resembling that of lemon, its taste warm and sweetish. Lewis says that he has sometimes procured benzoic acid from it. It yields very little volatile oil, although it impregnates the distilled water strongly with its flavour. By dissolving a proper quantity of sugar in this water a more elegant syrup is obtained than that prepared in the common way with a decoction of the balsam; in its medical virtues it agrees with other balsams.

Balsam of Tolua-tree. CIt. 1733 Tree 40 feet. Cult. Fresh imported seeds of any of the species will grow, if sown in a pot immediately on their arrival in this country, and placed in a hot-bed. The plants are to be potted off separately when they are 3 inches high, in a mixture of peat and loam; young cuttings will also root, if planted in sand, with a hand-glass placed over them, in heat.

II. SOPHORA (altered from sophora, the Arabic name of a papilionaceous flowering tree). R. Br. hort. kew. ed. 2. vol. 3. p. 2. D. C. leg. mem. 5. prod. 2. p. 95.—Sophora, spec. Lin. gen. no. 508. exclusive of some anomalous species.

I. SOPHORA (from sopho, the Arabic name of a papilionaceous flowering tree). R. Br. hort. kew. ed. 2. vol. 3. p. 2. D. C. leg. mem. 5. prod. 2. p. 95.—Sophora, spec. Lin. gen. no. 508. exclusive of some anomalous species.

LIN. SYST. Deodandra, Monogyna. Calyx 5-toothed (f. 22. a.) campanulate at the base, or somewhat attenuated. Petals of the keel usually conelate at the apex. Legume somewhat moniliform (f. 22. d.), wingless, many-seeded.—Trees, shrubs, or herbs, with impari-pinnate leaves, which are usually exstipulate and terminal, simple racemes or panicles of yellow, white, or blue flowers.

Sect. I. Europophora (from eu, eu, well or good, and sophora; genuine species). D. C. prod. 2. p. 93. Stamens 10, free.

Var. variegata; leaves variegated.

Var. g. pendula; branches pendulous.
usually confounded in gardens with the preceding. "H. Native of China.

China Sophora. Fl. Aug.-Sept. Clt. 1763. Tr. 30 to 40 ft. 3 S. CLAVIUS (Lesh. ind. D. C. ann. sci. nat. 4. p. 98.) shrubby; leaves 19-23, elliptic, mucronate, velvety, and glaucous on the upper surface, but villous beneath; racemes terminal, crowded. S. Native of the East Indies, on the mountains of Nelligery, where it is called by the natives Houlbey. Branches, petioles, and peduncles velvety. Flowers purplish.

Glaucesc Sophora. Clt. 1818. Shrub 7 feet. 4 S. TONCENTOSA (Lin. spec. 533.) arboreous; leaves 15-19, oval-rounded, clothed with hoary tomentum on both surfaces, as well as the calyces; racemes terminal, elongated. S. Native of the Caribbean Islands and the East Indies. Lam. ill. t. 325. f. 2. - Plun. ed Bermm. t. 101. Trevchr. t. 59.-Browne, cam. 289. t. 31. f. 1.-Sloane, jam. 2. p. 40. t. 107. f. 3. Flowers yellow.

Tomentose Sophora. Fl. June, Jul. Clt. 1739. Sh. 7 to 8 feet. 5 S. CRASSIFOLIA (Jaun, in Duh. ed. nov. 3. p. 57.) arboreous; leaves 15-19, oblong, obtuse, oblique at the base, dilated on the inner side, pubescent beneath; racemes terminal, elongated. S. Native of Senegal. Very like S. toncentosa. Leaves coriaceous, pale.

Thick-leaved Sophora. Clt. 1818. Tree. 6 S. HAVANE'XSIS (Jacq. amer. 118. t. 173. f. 1. a flower) shrubby; leaves 25, oblong-ovate, obtuse, emarginate, and are as well as the branches villous; raceme terminal, elongated. S. Native of Cuba, native of the Hawaiian, in bushy places. Flowers yellow.

Side-flowed Sophora. Clt. 1820. Shrub 6 feet. 8 S. MACROCA'REA (Smith, in Rees' cyc. no. 6.) arboreous; leaves with 13-19 elliptic-oblong, obtuse, coriaceous leaves, which are silky beneath; racemes short, axillary. S. Native of Chili, where it is called Mayo. Lond. bot. cab. t. 1125. Legume silky, wingless. An elegant shrub with yellow flowers. Allied to Edwardsia.

Long-fruited Sophora. Clt. 1822. Shrub 8 to 10 feet. 9 S. LITTO'RIA (Schrad. in Neuw. rels. no. 9. gootz. ann. 1821. p. 709.) shrubby; leaves few pairs, roundish-elliptic, glabrous above, but strigilo-canescent beneath; racemes terminal. S. Native of Brazil. Pluk. alm. t. 104. f. 3. S. are'ncola, Nees, in flora, 1821. p. 227. Flowers probably yellow.

Sea-shore Sophora. Clt. 1820. Shrub 6 feet. 10 S. Heptaphylla (Lin. spec. 533.) arboreous; leaves 7, glabrous. S. Native of the East Indies. This is a very obscure species and perhaps is the same as S. flavescens. - Rumphi. amb. 4. p. 50. t. 22. Flowers yellow.

Sect. II. Disem'ea (see, dis, twice, and έν, sema, a standard; vexillum bifid). Lindl. bot. reg. 1185. Petals imbricate. Calyx 5-toothed, equal. Stamens irregularly monadelphous at the base.

13 S. VELO'TINÁ (Lin. bot. reg. 1185.) shrubby; leaves 23, alternate, elliptic, mucronate, velvety on both surfaces, as well as the peduncles and branches; racemes cylindrical, terminal; petals imbricate; vexillum bifid. S. Native of Niapas. Flowers in long racemose spikes, pale-purple. This species being very shewy, it would be worth attention to graft it on the common Sophora Japonica, by which means it would be rendered so hardy as to stand our winters in open shrubberies, for which purpose it would be a very desirable addition.

Sect. III. Pseudosop'horá (from দ্বেপ, pseudes, false, sophorá; called false sophoras because the stamens are diadelphous, and not monadelphous, as in the preceding section). D. C. prod. 2. p. 96. Stamens 10, somewhat diadelphous, that is 9 joined at the base and the tenth free.

14 S. ALOPÉCOUGÉOIDS (Lin. spec. 533.) herbaceous; leaves 15-25, oblong, young ones silky on both surfaces, adult ones only on the under surface; racemes terminal. S. Native of Siberia, Iberia, Tauria, and Persia. Pall. astr. t. 87.-Dill. hort. ethic. t. 136.-Buxb. cent. 3. t. 46. S. Albicans, Jaunue, in Duh. ed. nov. 3. p. 86. There is a variety of this plant with the leaves less villous. Racemes many-flowered. Flowers yellowish. Legume moniliform, tapering to both ends, sometimes only 1-seeded from abortion. Root creeping much. The plant should never be ever flowering in England from the shortness of the summer.

† A species not sufficiently known.

16 S. ACUMINÁTÁ (Desf. journ. bot. 1814. 1. p. 75.) leaves 39-41, lanceolate, acute, pubescent, rather cinnereous; legume tomentose, moniliform. S. Native of North America. Accuminated-leaved Sophora. Pl.? Cult. The S. Japonicas and S. Chinéntis are very hardy shrubs, well adapted to stand singly in lawns; while young they require a little protection in winter. These may be raised from layers, but they are generally increased by seeds. The stove species will thrive well in a light loamy soil, and cuttings will root if planted in a pot of sand, with a handglass placed over them, in heat. The hardy herbaceous kinds will grow well in a dry light soil, and they are easily increased.
by dividing them at the root in spring, or by seed, which sometimes ripen.

**Lin. syst. Decandria, Monogynia.** Calyx obliquely 5-toothed, with the upper side cleft. Petals 5, distinct, conviving into a papilionaceous corolla. Keel long. Stamens 10, with the filaments deciduous, according to Salisbury, and inserted into a cup-shaped, 10-angled torus. Legume moniliform, 1-celled, 2-valved, 4-winged, many-seeded. Shrubs or little trees, with impari-pinnate, exstipulate leaves, having numerous pairs of leaflets, which fall off late in the autumn. Flowers golden, axillary, disposed in short racemose spikes.

1. *E. microphylla* (Salisb. l. c.) leaves with 12-15 pairs of obovate-roundish, emarginate leaflets, smooth or pubescent beneath; petals of keel elliptic, hooked on the back. \( F \) Native of New Zealand. Sophora microphylla, Ait. hort. kew. 2. p. 43. Lam. ill. t. 325. 

**Lin. syst. Decandria, Monogynia.** Calyx triterapeta, Lin. fil. suppl. 230. Leaflets 25-41, 2-3 lines long. This is a magnificent shrub when in flower, displaying large pendulous bunches of golden flowers. 

2. *E. grandiflora* (Salisb. l. c.) leaflets 17-21, oblong-linear, somewhat lanceolate, rather villous beneath; petals of keel broadly falcate. \( F \) Native of New Zealand. Sophora grandiflora, Ait. hort. kew. 2. p. 43. Mill. icon. 1. Curt. bot. mag. 167. Lam. ill. t. 325. f. 3. Red. in Duh. ed. nov. 3. t. 20. E. macrophylla, Wanderoth, l. c. Leaflets 13-19, 5-10 lines long. This is an elegant tree when in flower, bearing large pendulous clusters of golden flowers, which rise in spring before the leaves.

3. *E. microphylla* (Wanderoth, in Schlecht. Linnaea. 5. p. 202.) arboreosa; leaves having 20 pairs of obovate, entire, emarginate leaflets, the odd one emarginate, smooth, or pubescent beneath. \( F \) Native of New Zealand. E. microphylla, Brown, in Duh. ed. nov. 3. p. 86. Flowers yellow.

4. *E. cruciatus* (Salisb. l. c. t. 26; f. 1.) leaflets 17, obovate, younger ones clothed with yellow pubescence; petals of keel elliptic, with the dorsal margin straight. \( F \) Native of the Sandwich Islands. Leaflets 8-10 lines long. Ker. bot. reg. 738. Flowers smaller than those of the preceding species, yellow.

5. *E. nitida* (D. C. prod. 2. p. 97.) leaflets 21-25, elliptic, somewhat obovate, retusely emarginate, silky on both surfaces; wings of flower oblong, with the dorsal margin straight; legume villous. \( S \) Native of the Island of Bourbon. Sophora nitida, Smith, in Rees’s cyc. vol. 7. S. sericea, Jaume, in Duh. ed. nov. 3. p. 86. Shining Edwardsia. Clt. 1829. Shrub 8 feet.

Naked Edwardsia. Shrub.

_Cult._ This is a genus of elegant shrubs. The four first species are hardly enough to survive our winters, in the open air, when they are not too severe, but it is much better to protect them under a frame in winter; they are generally propagated by seeds, which usually ripen; they may also be increased by young cuttings planted in sand, with a hand-glass placed over them. The above or those natives of the Island of Bourbon, will grow freely in a mixture of loam, peat, and sand, and young cuttings of them will root readily if planted in a pot of sand, with a hand-glass placed over them, in heat.

IV. ORMO'SIA (from *opus*, ormos, a necklace; the seeds of *O. coccinea* are strung for necklaces; they are red, and have a black spot at one end). Jacks, in Lin. trans. 10. p. 360. B. Br. in hort. kew. ed. 2. vol. 3. p. 3.

**Lin. syst. Decandria, Monogynia.** Calyx bilabiata, upper lip 2-lobed, lower one 3-parted. Vexillum roundish, hardly longer than the wings and keel. Stamens 10, with the filaments dilated at the base. Style incurved, crowned by 2 approximate stigmas. Legume woody, compressed, 2-valved, young ones 5-6-ovulate, 1-2-seeded. South American trees, with the branches clothed with rusty villi. Leaves large, impari-pinnate, usually with 5 or 6 pairs of leaflets. Stipulas distinct from the petioles. Flowers panicked, blue, or purplish.

1. *O. dasycarpa* (Jacks. l. c. t. 26.) leaflets acuminate, glabrous on both surfaces; legumes tomentose. \( S \) Native of the Caribbean Islands. Sophora monospérama, Swartz. fl. ind. occ. 2. p. 723. Podalyria, Poir. dict. 3. p. 440. Flowers large, blue. Legume containing only 1 large, round, spherical, scarlet seed, which has a large black spot at one end. Browne calls the tree the Red Beard-tree.

2. *O. coccinea* (Jacks. l. c. t. 25.) leaflets somewhat ovate, thick, with revolute margins, glabrous on both surfaces; legume glabrous, shining. \( S \) Native of Guiana and Brazil. Robinia coccinea, Aubl. guian. 2. p. 773. Flowers blue. Seeds scarlet, with a black spot at one end, as in the preceding. 

3. *O. coarctata* (Jacks. l. c. t. 27.) leaflets unequal, glabrous above, but covered with rusty hairs beneath. \( S \) Native of Guiana. Seeds colour and shape of those of the two preceding, but much smaller.

Coarctate Beard-tree. 

_Cult._ For culture and propagation see *Cultus*, p. 536. 

**Lin. syst. Decandria, Monogynia.** Calyx 5-cleft. Petals 5, about equal in length. Vexillum with the edges not reflexed. Stigma beardless. Legume compressed, oblong, 2-valved, many-seeded.—Trees or shrubs with impari-pinnate leaves, and with the flowers disposed in racemes.

darker towards the base of the vexillum, disposed in dense racemes.

Cape Virgilia. Fl. July, Aug. Cl. 1767. Sh. 3 to 10 feet. 2 V. intybs (R. Br. in Ait. Hort. kew. 3. p. 4.) stamens permanent; ovaries smooth; calyx thrust in at the base; leaflets oval, obtuse, mucronate. ♀. G. Native of the Cape of Good Hope. Flowers pale-yellow.

2 V. aemata (Lam. ill. t. 326. f. 1.) stamens permanent; ovaries tomentose; legumes glabrous; leaflets opposite, oval, obtuse, mutic, smoothish. ♀. G. Native of Abyssinia. Robinia subulicintina, Lher. stirp. nov. t. 75. Podalyria aitens, Wllld. spec. 2. p. 502. D. C. leg. t. 4. f. 2. germs. Flowers large, golden, drooping. The roots taste like liquorice. The bark affords a yellow dye.

5 V. lutea (Michx. fil. arb. ann. 3. p. 266. t. 3.) stamens deciduous, smooth; ovaries puberulous; legumes stipitate, glabrous; leaflets 9-11, alternate, ovate, acuminate, glabrous. ♀. II. Native of North America, between the mountains of Cumberland and the Mississippi. Delaun. herb. amat. t. 107. Flowers yellow, disposed in pendulous racemes. The whole tree strongly resembles the Robinia pseudacacia. The bark affords a yellow dye.

Yellow-flowered Virgilia. Fl. June, July. Cl. 1812. Tree 10 to 16 feet. 6 V. robinoides (D. C. prod. 2. p. 98.) leaves with 3 pairs of leaflets and an odd one, obovate, obtuse, glaucescent, smooth; racemes axillary, length of leaves, clothed with adpressed pubescence; pedicels very short. ♀. G. Native of the Cape of Good Hope. Robinia Capensis, Burtn. fl. cap. 22. Branches glabrous, terete. Stipulas callous, small. Flowers yellow.

Robinia-like Virgilia. Fl. June, Aug. Cl. 1818. Shrub 6 ft. 7 V. ? rupinina (D. C. in ann. sc. nat. 4. p. 98.) stamens permanent; ovaries tomentose; leaflets oval-oblong, acuminate, opposite, glabrous; racemes panicled, and are, as well as the branches, rusty and velvety. ♀. S. Native of Guadalupe. Flowers violaceous. Leaflets 3-4 inches long. Young legumes compressed, oblong, not moniliform.

Rusty Virgilia. Tree.

Cult. Virgilia lutea being an elegant hardy tree, is well adapted for shrubberies or pleasure-grounds, as it is covered with innumerable pendulous racemes of flowers early in summer. It is generally propagated by laying down the shoots in autumn or spring, and sometimes by seeds, which are annually received from the places of its natural growth by some nurseries. It may also be propagated by young cuttings planted in a shady situation under a hand-glass. The green-house kinds are elegant plants when in flower; they will grow freely in a mixture of loam, peat, and sand, and young cuttings will root readily if planted in a pot of sand, with a hand-glass placed over them.

VI. MACROTROPIS (from macropos, macros, long, and tropis, a keel; keel of flower long). D. C. leg. mem. v. prod. 2. p. 98.—Anagrydis, Lour. cochin. p. 260, but not of Lin. Lin. syst. Decandria, Monogynia. Calyx cup-shaped or inflated, 5-toothed. Keel petals 2, equal in length to the wings, but much exceeding the vexillum. Legume straight, compressed or somewhat terete, many-seeded.—Shrubs, with imparipinnate glabrous leaves, and racemes of white flowers.

Scentless Macrotopis. Shrub 10 feet.

Cult. Beautiful shrubs, which will thrive in a mixture of loam, sand, and peat; and young cuttings will strike root if planted in a pot of sand placed under a hand-glass. The shrubs only require to be protected from frost.

VII. ANAGYRIS (from ara, ana, backwards, and gýros, a circle; in allusion to the pods being curved backwards at their extremities). Tourn. inst. t. 415. Lin. gen. no. 509. Lam. ill. t. 525. Lin. syst. Decandria, Monogynia. Calyx 5-toothed, somewhat bilabiate. Wings longer than the vexillum, but shorter than the 2-petalled keel. Legume on a short stipe, compressed, many-seeded, 2-valved, irregularly interrupted by a kind of spongy substance.—Shrubs, with trifoliolate leaves and entire leaflets. Stipulas 2, concretè in one, placed opposite the leaves. Flowers disposed in short racemes, yellow.

1 A. fœtida (Lin. spec. 534.) leaflets lanceolate, acute; legume acuminate. ♀. F. Native of the south of Europe, on hills in dry places. Loddd. bot. cab. 740. D. C. leg. t. 4. f. 3. germ.—Clus. hist. 1. p. 93. with a figure. The shrub is fœtid in every part when bruised. The flowers hairy, like those of the Laburum.

Var. β. glaucà (Hortul. D. C. prod. 2. p. 99.) leaves more glaucescent on both surfaces.

Fœtid Bean-Trefoil. Fl. May, June. Cl. 1570. Sh. 6 to 8 ft. 2 A. latifolia (Wild, enum. 480.) leaflets elliptic, obtuse; legume tomentose, obtuse, apiculèd by the style. ♀. F. Native of Tenerife.

Broad-leaved Bean-Trefoil. Fl. April, May. Cl. 1815. Shrub 6 to 10 feet.

Cult. See Macrotopis for culture and propagation.

VIII. PIPTANTHUS (from πιπτο, pîpto, to fall, and ἄνθος, anthos, a flower; the teeth of the calyx fall off, as well as the petals and stamens very soon). Sweet fl. gard. 264.

Lin. syst. Decandria, Monogynia. Calyx bilabiate, lower lip trîfid, with the middle segment reflexed, upper lip 2-lobed; all the segments soon falling off. Petals deciduous. Vexillum large, obcordate, rufescent. Wings cuneate, somewhat cordate at the base. Keel cuculate, accumbent. Stamens 10, free, deciduous. Stigma minute. Legumina broad-linear, compressed, 6-seeded, stipitate.—An elegant shrub, with trifoliolate leaves, young ones rather silky; leaflets elliptical-oblong, acute, broad. Stipulas 2, large, joined together, entire, bicuspidate at the apex, placed opposite the leaves. Peduncles tern, 1-flowered. Flowers large, yellow.

1 P. niâpuleînis (Sweet, fl. gard. 264.) ♀. H. Native of Nipaul, on Shreenagur. Thermopsis laburnifôlia, D. Don, prod. fl. nep. p. 239. Anagrydis In'dica, Wall. mss. Baptisia Nipaulensis, Hook. exot. fl. t. 131.

Nipaul Piptanthus. Fl. May, June. Cl. 1821. Sh. 8 to 10 fl.
**Leaves simple.**

**Leaves trifoliate.**

2 B. lanceolata (Ell. sketch. 167.) leaves sessile, and are, as well as the branches, rather pubescent; leaflets stalked, cuneate-lanceolate, obtuse; flowers axillary, solitary, on short pedicels, upper ones disposed in a raceme. *H.* Native of Carolina and Georgia, in sandy places. Sophora lanceolata, Br. car. 135. P. uniflora, Mich. fl. bor. amer. 1. p. 283. Flowers yellow.

Lanceolate-leafletted Baptisia. Pl. 1 foot.

3 B. leucophila (Nutt. gen. amer. 1. p. 282.) leaves sessile, and are, as well as the stem, somewhat villous; leaflets rhomboid-obovate; stipulas and bracteas obtuse, acute, broad, leafy; racemes many-flowered, lateral, with the flowers leaning to one side; legumes acuminate. *H.* Native of Georgia and Louisiana, abundant about St. Lewis. Flowers cream-coloured. Plant divaricate, but not very high, dichotomous.

Cream-coloured-flowered Baptisia. Pl. 1 foot.

4 B. bracteata (Muhl. ex Ell. sketch. 469.) leaves stalked, and are, as well as the branches, pubescent; leaflets broad-lanceolate, rather obtuse; stipulas longer than the petioles; racemes axillary, reclinate; bracteas large, broad-subulate, permanent. *H.* Native of Georgia, in a bog about Withersborough. Flowers rather large, greyish.

Bracteate Baptisia. Pl. 1 to 2 feet.

5 B. australis (R. Br. in Ait. hort. kew. 3. p. 6.) stem branched, diffuse; leaves stalked, and are, as well as the branches, smooth; leaflets oblong-cuneate, obtuse, 4 times longer than the stem; stipulas lanceolate, acute, twice the length of the petioles; racemes few-flowered, elongated, shorter than the branches; calyx quadridiaph, lower segment obtuse; legumes apiculate. *H.* Native of Western Carolina, along rivulet banks. D. C. leg. t. 4. f. 4. germ. Sophora australis, Sims, bot. mag. 509. Podažyria australis, Vent. cels. t. 56. P. carnelia, Pursh, fl. sept. amer. 1. p. 307. Flowers blue.

6 B. confusa (Sweet, fl. gard. ined.) stem branched; leaves stalked, and are, as well as the branches, smooth; leaflets oblong-cuneate or ovate; stipulas linear-lanceolate, twice the length of the petioles; racemes elongated; flowers alternate, bracteate; bracteas permanent, lanceolate, acuminate, a little longer than the petioles. *H.* Native of North America. Like B. australis. Flowers dark-blue.

7 B. exaltata (Sweet, fl. gard. 97.) stem erect, branched; leaves ternate, stalked; leaflets lanceolate-ovate, 5 times longer than the petioles; stipulas lanceolate, acuminate, 3 times longer than the petioles; racemes many-flowered, elongated, twice the length of the branches; flowers scattered, distinct; calyx 4-cleft, lower division acute. *H.* Native of North America. Flowers deep-blue.

**LEGUMINOSE. IX. THERMOPSIS. X. BAPTISIA.**

Cult. This is an elegant shrub when in flower, being clothed with beautiful yellow flowers during the months of May and June. It is sufficiently hardy to stand our climate without any protection, and therefore is a great acquisition to hardly flowering shrubs. It is increased by laying down the shoots, or young cuttings will root if planted in sand under a glass-hand.
XI. CYCLOPIA. XII. PODALARIA.

Cult. An elegant genus of greenhouse shrubs, which will thrive in an equal mixture of loam and peat, and very young cuttings, planted in a pot of sand with a bell-glass placed over them, will root.

XII. PODALARIA (Podalysgus was the son of Esculapius in mythology). Lam. ill. t. 327. exclusive of some species. Salisb. par. 7. R. Br. in hort. kew. ed. 2. vol. 3. p. 6. but not of Michx.—Aphôra, Neck. elem. no 1370.

LIN. SYST. Decándria, Monogygâ. Calyx 5-cleft, with unequal lobes, thrust in at the base. Vexillum large, covering the keel and wings. Stamens 10, permanent, somewhat connate at the base. Stigma capitata. Legume sessile, ventricose, many-seeded.—Cape shrubs, usually clothed with silky hairs, with simple alternate leaves, and with narrow apressed stipulas. Peduncles axillary, 1 or many-flowered. Bracteas caducous. Flowers purplish, rose-coloured or white.

* Peduncle 1-flowered.

1 P. Burchelli (D. C. prodr. 2. p. 101.) leaves elliptic or oblong, obtuse or emarginate, pubescent above, and rather hairy beneath; peduncles very short, 1-flowered, and are, as well as the calyxes, very hairy; wings of flower longer than the calyx. ʃ. G. Native of the Cape of Good Hope. Burch. cap. no. 5475. Sophôra cordâtâ, Thunb. prod. 79. Hypocalypus cor-dâtus, Thunb. fl. cap. 569. Flowers of a rose-purple colour. Calyx clothed with straight rufous hairs.

Burchell's Podalaria. Fl. May, July. Clt. 1816. Sh. 4 to 8 ft. 2 P. hisropta (Wild. spec. 2. p. 505.) leaves villous, stalked, upper ones ovate, lower ones roundish; peduncles 1-flowered; segments of calyx villous, length of wings. ʃ. G. Native of the Cape of Good Hope. Sophôra hisropta, Ait. hort. kew. 2. p. 46. Flowers red.

Flairy Podalaria. Fl. July, Aug. Clt. 1774. Shrub 2 to 4 ft. 3 P. sericea (R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 6.) leaves oblong-ovate, mucronate, silky on both surfaces; pedicels 1-flowered, much shorter than the leaves, and are, as well as the calyxes, clothed with appressed silky pubescence. ʃ. G. Native of the Cape of Good Hope. Sophôra sericea, Andr. bot. rep. t. 416. Hypocalypus sericeus, Thunb. fl. cap. 569. Flowers pale-purple.

Silky Podalaria. Fl. May, July. Clt. 1776. Shrub 4 to 6 ft. 4 P. cucubáulâ (Vent. cels. 99.) leaves cuneiform, obtuse, somewhat emarginate, silky on both surfaces, nearly sessile;
pedicels 1-flowered, one-half shorter than the leaves, and are, as well as the calyxes, clothed with appressed silky pubescence.

G. Native of the Cape of Good Hope. Flowers white.

5 P. myrtillifolia (Willd. spec. 2. p. 505.) leaves oblong-ovate, bluntish, silky on both surfaces; pedicels 1-flowered, about equal in length to the leaves, and are, as well as the calyxes, clothed with silky appressed pubescence. G. Native of the Cape of Good Hope. Flowers white.

6 P. buxifolia (Willd. spec. 2. p. 505) leaves ovate or oblong-ovate, bluntish, glabrous above, and silky beneath; pedicels 1-flowered, about equal in length to the leaves; calyx clothed with rusty villi. G. Native of the Cape of Good Hope. Flowers white.

7 P. styrahichôla (Sims, bot. mag. 1580.) leaves ovate or oblong-ovate, mucronate, pubescent, reticulated beneath; pedicels 1-flowered, much longer than the leaves.

G. Native of the Cape of Good Hope. Flowers white.

Flower-leaved Podalyria. Fl. May, July. Clt. 1792. Sh. 6 ft.

8 P. glauca (D. C. prod. 2. p. 102.) leaves ovate, glabrous above, and silky beneath; pedicels 1-flowered, much longer than the leaves.

G. Native of the Cape of Good Hope. Flowers white.

9 P. coruscans (Reichb. ex Spreng. syst. append. p. 171.) leaves nearly sessile, crowded, ovate-lanceolate, acute, clothed on both surfaces with silky villi; flowers axillary, nearly sessile.

G. Native of the Cape of Good Hope.

10 P. argentea (Sāliāb. par. lond. t. 7.) leaves ovate, acute, silky on both surfaces, marginate; pedicels 2-3-flowered, longer than the leaves; calyxes tomentose, rather scabrous.

G. Native of the Cape of Good Hope. Flowers white.

11 P. lippardæ (D. C. prod. 2. p. 102.) leaves ovate, acute, silky on both surfaces; pedicels 2-flowered, much longer than the leaves; calyx clothed with appressed silky pubescence.

G. Native of the Cape of Good Hope. Flowers white.

12 P. subflorâla (D. C. prod. 2. p. 105.) leaves ovate, mucronate, pubescent on both surfaces, and reticulated beneath; pedicels 1-2-flowered, longer than the leaves; calyxes clothed with rusty appressed pubescence.

G. Native of the Cape of Good Hope. Flowers pale-purple. Perhaps the three last species are merely varieties of one plant.

13 P. cordata (R. Br. in hort. kew. ed. 2. vol. 3. p. 8.) leaves orbicular, roundish, nearly sessile, very villous; pedicels 2-flowered, calyxes villous, with the segments shorter than the wings.

G. Native of the Cape of Good Hope. Flowers purple.

14 P. racemulosa (D. C. prod. 2. p. 102.) leaves ovate, mucronate, clothed with appressed silky pubescence on both surfaces; pedicels twice the length of the leaves, 2-4-flowered; calyxes clothed with appressed, silky, rusty pubescence.

G. Native of the Cape of Good Hope. Flowers purple.

15 P. parviflora (D. C. prod. 2. p. 102.) leaves ovate, acute, tomentose; pedicels very short, 1-2-flowered; legume ovate, tumid.

G. Native of the Cape of Good Hope. Flowers purple.

Cult. A genus of elegant silky shrubs. The species thrive best in a mixture of loam and peat, and young cuttings will root if planted in a pot of sand, with a bell or hand-glass placed over them, but they are usually increased by seeds.

XIII. CHORIZEMÆ (derived from χορος, choros, a dance, and ζημα, zema, a drink.) This plant was originally discovered by LaBillardiere upon the south-west coast of New Holland, at the foot of the mountains near a spot where, after being taint- lized with finding many salt springs, his party had just met with an ample supply of fresh water. This welcome refreshment, of which he speaks feelingly in his book, seems to have suggested the name).

Lin. syst. Decandria, Monogynia. Calyx half 5-cleft, bilaterately opposite, with lower 3-parted. Keel of flower ventricose, shorter than the wings. Style 3-cleft, hooked by an obliquely-ovate stigma. Legume ventricose, 1-celled, many-seeded, sessile or subsessile.—Australian subshrubs, with alternate, simple, sinuately-toothed, or entire leaves.

1 C. ilicifolia (Labill. voy. 1. p. 405. t. 21.) leaves pinnatifid-toothed, spinose, oblong-lanceolate, with an entire acumen, which is longer than the teeth; bracteoles at the top of the pedicels.

G. Native of New Holland, on the south-west coast. A diffuse spreading shrub, pubescent on the branches and lower surface of the leaves. Flowers red, with the vexillum yellow at the base.

2 C. na'na (Sims, bot. mag. 1032.) leaves sinuately-toothed, spinous, oblong, with an entire acumen, which is equal in length with the teeth, rather obtuse; bracteoles below the apex of the pedicel.

G. Native with the first. Pulter'ea na'na, Andr. bot. rep. 294. Flowers red, with the vexillum yellow at the base.

3 C. rhomb'ea (R. Br. in hort. kew. 3. p. 52.) leaves quite entire, flat, mucronate, lower ones rhomboidal-orbicular, upper ones elliptic-lanceolate; pedicels few-flowered; legumes large, oblong, reticulated.

G. Native with the two preceding.
and keel, and with the vexillum orange-coloured, with a yellow base.

4. *C. platyloboides* (D. C. prod. 2. p. 193.) leaves quite entire, flat, ovate, acuminate, reticulated, smooth above, younger ones as well as calyces clothed with hoary villi; flowers 2-3, axillary, nearly sessile; ovary very villous. ½. G. Native of New Holland. Platyllobium reticulatum, Sieb. exsic. nov. holl. no. 392. not but of Smith. Flowers yellow.

Silky-calyced *Podolobium*. Shrub cl.

### XIV. **Podolobium.** XV. **Oxylobium.**

#### § 1. Leaves alternate.—False *Oxylobiums.*

**Coriaceus**-leaved *Podolobium*. Fl. April, June. Clt. 1824. Shrub 1 to 2 feet.

7. *P. ? acicula’re* (D. C. in ann. sc. nat. 4. p. 98.) leaves alternate, linear, with a pungent taper-point, and with revolute edges, glabrous, reticulated with transverse veins above; branches and pedicels subpeltate. ½. G. Native of New Holland, on the eastern coast. A much-branched shrub, with stiffly spreading leaves, bearing small branches and leaves in the axille, hence the leaves appear ternate. Legume stipitate, ovate, 12-16-seeded, pubescent outside and smooth inside. Calyx 5-cleft, tapering to the base, bifracteolate. Perhaps a proper genus, but the corolla is unknown. Perhaps a species of *Oxylobium.*

**Acicula’re**-leaved *Podolobium*. Shrub 1 foot.

**Cult.** An elegant genus of small shrubs. The species will thrive best in an equal mixture of peat, loam, and sand, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them. Seeds sometimes ripen, by which the plants may also be propagated. The plants grow much better and flower more freely if planted in the ground in a conservatory, than if grown in pots.

#### XV. **OXYLOBIUM** (from εὐκαλύξ, a pod; in allusion to the stigmatic portion of the flower.)

**Aricula’re**-leaved *Podolobium*. Fl. April, July. Clt. 1792. Shrub 1 to 2 feet.

2. *P. staurophylllum* (Sieb. pl. exsic. nov. holl. no. 393.) leaves opposite, spiny-toothed, somewhat 3-lobed, with a transverse base; lateral lobes much shorter than the terminal one, which is entire or toothed; ovary silky. ½. G. Native of New South Wales. Chorozema trilobatum, Smith, in Lin. trans. 9. p. 253. Pultensea ilicifolia, Andr. bot. rep. 320. Racemes axillary, shorter than the leaves. Flowers yellow, with the keel and vexillum red at the base. Leaves coriaceous, usually pubescent beneath.

**Three-lobed-leaved Podolobium**. Fl. April, July. Clt. 1822. Shrub 1 to 2 feet.

2. *P. staurophylllum* (Sieb. pl. exsic. nov. holl. no. 393.) leaves opposite, spiny-toothed, somewhat 3-lobed, with a transverse base; lateral lobes much shorter than the terminal one, which is entire or toothed; ovary silky. ½. G. Native of New Holland, on the eastern coast. Lindl. bot. reg. 939. P. aquifolium, Lodd. Cat. Leaves coriaceous, quite smooth. This plant is sometimes confused with the preceding in herbarium.

**Cross-leaved Podolobium.** Fl. Mar. April. Clt. 1822. Sh. 1 to 3 feet.

pedicels having permanent bracteas at their apex; corymbs of flowers crowded; legume hardly longer than the calyx. \( h. \) G. Native of Van Diemen's Land. Ker. bot. reg. 392. Lodde. bot. cab. 163. Sims. bot. mag. 2442. Flowers yellow.

**Arborescent Oxylobium.** Fl. April, June. Cl. 1805. Shrub 3 to 6 feet.

2 O. **ellipticum** (R. Br. l. c.) leaves oval-oblong, mucronate; pedicels having caducous bracteoles beneath their apex; corymbs crowded; legume twice the length of the calyx on a short stipe. \( h. \) G. Native of Van Diemen's Land. Comphellium ellipticum, Labill. nov. holl. spec. 1. p. 166. t. 135. Callistachys elliptica, Vent. malm. 115. Flowers yellow. Legume villous.

**Elliptic-leaved Oxylobium.** Fl. May, Sept. Cl. 1805. Shrub 2 to 3 feet.

3 O. **reutum** (R. Br. in bot. reg. 913.) leaves oblong, retuse, coriaceous, reticulated, glabrous; corymbs axillary, stalked, crowded, shorter than the leaves. \( h. \) G. Native of New Holland. Flowers orange-coloured. Chorozema coriaceum, Smith, Podolobium, D. C. ?

**Retuse-leaved Oxylobium.** Fl. April, May. Cl. 1823. Sh. 1 to 3 feet.

4 O. **cordifolium** (Andr. bot. reg. 492.) leaves ovate, coriaceous, rather pilose; umbels terminal, sessile. \( h. \) G. Native of New South Wales. Sims, bot. mag. 1544. Lodd. bot. cab. 937. Flowers of a coppery-red colour.

**Cordate-leaved Oxylobium.** Fl. April, Sept. Cl. 1807. Shrub 1 to 2 feet.

5 O. **obtusifolium** (Sweet, fl. austr. 5.) leaves oblong-linear, obtuse, smooth above, but clothed with silky tomentum beneath, with revolute edges; corymbs loose, verticillately racemose; pedicels with permanent bracteoles at the apex; calyx clothed with silky tomentum; wings of corolla reflexed. \( h. \) G. Native of New Holland, at King George's Sound. Flowers with carina and wings crimson, and with the vexillum deep orange-coloured, and yellow at the base.

**Obtuse-leaved Oxylobium.** Fl. April, May. Cl. 1825. Shrub 1 to 3 feet.

6 O. **spinum** (D. C. prod. 2. p. 104.) leaves broadly-ovate, with the middle nerve terminating in a long spine; stipulas spiny, short. \( h. \) G. Native of New Holland. Leaves 3 in a whorl, glabrous. Bracteoles 2, pressed to the base of the 5-cleft calyx. Keel, wings, and vexillum about equal in length. *Spinum Oxylobium.* Fl. April, July. Cl. 1825. Sh. 1 to 2 ft.

7 O. **Pultenese** (D. C. leg. mem. 5. prod. 2. p. 104.) leaves 3 or 4 in a whorl, or alternate, linear, rather obtuse, with revolute margins, glabrous, but with the middle nerve as well as branches pubescent; flowers pedicellate, umbellate; pedicels furnished with deciduous bracteoles in the middle. \( h. \) G. Native of New Holland. Pultenaea sylvatica, Sieb. pl. exsic. nov. holl. no. 403. Calyx 5-cleft, permanent, with the short tube girding the fruit, the lobes reflexed. Stamens and petals deciduous, hypogynous. Ovary sessile, containing 8 ovula. Funicle dilated into a strophia. Perhaps a species of Podolobium. Flowers dark-orange.

**Pulteney's Oxylobium.** Fl. Mar. Cl. 1824. Sh. 1 to 2 ft. *Cult.* Elegant shrubs, requiring the same treatment as that recommended for Podolobium, see p. 116.

**Lin. Syst.** Decandria, Monogynia. Calyx bilabiate; upper lip free, lower one 3-parted. Vexillum erect, longer than the keel and wings, which are about equal in length. Stamens inserted in the disk. Style incurved. Stigma simple, acute. Legume stipitate, woody, dehiscing at the apex, young ones many-celled, but with the transverse dissections at length vanishing.—Elegant Australian shrubs, with entire leaves, which are either either scattered or disposed in whors, silky on the under surface, and with long terminal racemes of yellow flowers. Calyces and fruit very villous.

1 C. **lanceolata** (Vent. malm. t. 115.) leaves lanceolate, acuminate, scattered, opposite, or 3 or 4 disposed in a whorl. \( h. \) G. Native of New Holland, on the eastern coast. Ker. bot. reg. 210. **Lanceolate-leaved Callistachys.** Fl. June, Aug. Cl. 1815. Shrub 3 to 4 feet.

2 C. **ovata** (Sims, bot. mag. 1925.) leaves obovate, mucronate, usually disposed 3 in a whorl. \( h. \) G. Native of New Holland.

**Ovate-leaved Callistachys.** Fl. June, Aug. Cl. 1815. Shrub 3 to 6 feet.

3 C. **linearifolia** (Hortulan.) leaves linear-lanceolate, scattered, or disposed in whors. \( h. \) G. Native of New Holland. **Toad-flat-leaved Callistachys.** Fl. June, Aug. Cl. 1824. Shrub 3 to 4 feet.

4 C. **cuneata** (Smith, in Lin. trans. 9. p. 267.) leaves wedge-shaped, margineate; peduncles axillary, solitary, longer than the leaves. \( ? \) G. Native of New Holland. An herbaceous dwarf plant. Calyx pilose. Flowers large, yellow, but with the keel purple. This species, according to Mr. R. Brown, should be removed from this genus, but its real situation in the order is uncertain.

**XVII. BRACHYSEMA.** (from βράχυς, brachus, short, and σεμα, semen, a standard; the standard of the flower is very short). R. Br. in hort. kew. vol. 3. p. 10. D. C. prod. 2. p. 105.

**Lin. Syst.** Decandria, Monogynia. Calyx 5-cleft, a little unequal, with a ventricose tube. Vexillum shorter than the wings and keel, which are compressed and about equal in length. Ovary with its pedicel girded by a little sheath at the base. Style filiform, elongated. Legume ventricose, many-seeded.—Elegant Australian, procumbent, or climbing shrubs, with alternate, oval, or ovate, entire, mucronate leaves, which are silky on the under surface, and axillary and terminal few-flowered racemes.

1 B. **latifolium** (R. Br. l. c.) leaves ovate, flat, silky beneath; calyx bractless at the base, 4-times shorter than the petals; vexillum oblong-ovobrate. \( h. \) G. Native of New Holland, on the south-west coast. Ker. bot. reg. 118. Sims, bot. mag. 2008. Flowers large, scarlet. **Broad-leaved Brachysema.** Fl. April, July. Cl. 1803. Shrub procumbent or climbing.

2 B. **undulatum** (Ker. bot. reg. 642.) leaves elliptic, undulate; calyx bracteolate under the base, 3-times shorter than the petals; vexillum oblong, corotate, convolute, and blunting above. \( h. \) G. Native of New South Wales, in the interior of the country. Lodd. bot. cab. 778. Ker. bot. reg. 642. Flowers greenish-yellow, inconspicuous. **Waved-leaved Brachysema.** Fl. Mar. May. Cl. 1820. Sh. pr.
Cult. For culture and propagation see *Podolobium*, p. 116. however, the species of this genus are easiest propagated by layers.

**XVIII. Gompholobium** (from γομφος, *gymnos*, a club, and λυξ, *lykos*, a pod; in reference to the shape of the pod being like that of a club or wedge). Smith, in Lin. trans. 4. p. 293. 1820. Fl. 3. p. 124. R. Br. in hort. kew. ed. 2. vol. 3. p. 11.

1 G. olivaceum (Cung. in Field's *New south wales*, p. 346.) leaves ternate; leaflets linear, mucronate, with revolute margins; branchlets angular, glabrous; keel of flower bearded; calyx length of corolla before the expansion of the vexillum.

2 G. Native of New Holland, the Blue Mountains.

3 G. Barbigera (D. C. prod. 2. p. 165.) leaves ternate; leaflets linear, acute; stem erect; branchlets angular; keel bearded along the suture; vexillum large, longer than the calyx and keel. G. Native of New Holland. G. flabellatum, Sieb. pl. exsicc. nov. holl. no. 36. but not of Smith. Flowers golden-yellow, about an inch in length, larger than those of *G. grandiflorum*.

**Bearded-keeled Gompholobium.** Fl. April, Aug. Ct. 1824. Shrub 1 to 2 feet.

3 G. Grandiflorum (Smith, in Lin. trans. 9. p. 248. exot. bot. t. 5.) leaflets 5, linear, acute; stem erect; branchlets angular; keel bearded; vexillum twice the length of the calyx and carina. G. Native of New Holland, on the eastern coast. Kew. bot. reg. 484. Flowers large, yellow. Leaflets hardly a line broad, but nearly an inch long.

4 Var. betis (Sieb. pl. exsicc. nov. holl. no. 363.) leaflets narrow-linear, somewhat revolute and bristle-formed. G. Native of New Holland, on the eastern coast.

5 G. Virgatum (Sieb. pl. exsicc. nov. holl. no. 300.) leaflets 3, linear, obtuse; stem erect; branchlets nearly terete; carina of flower beardless; vexillum hardly longer than the calyx and keel. G. Native of New Holland, on the eastern coast. The habit of the plant is that of *G. latifolium*, but the keel of the flower is beardless.

6 G. Latifolium (Smith, in Lin. soc. trans. 9. p. 249.) leaflets 3, cuneate-linear, or oblong-linear; stem erect; keel fringed; calyx reflexed when in fruit. G. Native of New Holland, on the eastern coast. R. Br. in hort. kew. 3. p. 11. Labill. nov. holl. t. 133. G. flabellatum, Sieb. exot. bot. t. 58. G. psoraleaflorum, Salisb. par. t. 6. Leaflets 1-2 lines broad, and 6-12 lines long. Flowers large, yellow.

6 G. MarginaTum (R. Br. l.c.) leaflets 3, obovate, margined, flat; stipules equal in length to the petiole; corolla length of calyx. G. Native of New Holland, on the southern coast.

7 G. Pedunculare (D. C. prod. 2. p. 105.) leaflets 3, with somewhat revolute margins, lower ones obovate, mucronate, upper ones lanceolate-linear, acuminate; stipules length of petioles; stems diffuse; pedicels much longer than the leaves, and bibracteolate at the apex; corolla longer than the calyx. G. Native of the eastern coast of New Holland. Stems somewhat herbaceous. Legume oval, rather compressed. This plant, along with the following species, will probably form a distinct genus. (Conspicuous Gompholobium).

**Bibracteolate-flowered Gompholobium.** Fl. April, July. Ct. 1824. Pl. ½ foot.

8 G. tetraphylloides (Sieb. pl. exsicc. nov. holl. 329.) leaflets 3, linear, with subrevolute margins; branches terete, hispid from short down; pedicels scarcely longer than the leaves; corona beardless, and is as well the vexillum hardly longer than the calyx. G. Native of New Holland, on the eastern coast. Leaves on short stalks; leaflets 2 lines long.

**Tetraphylloides Gompholobium.** Fl. April, July. Ct. 1824. Shrub ¾ to 2 feet.

9 G. Polyornophus (R. Br. in hort. kew. ed. 2. vol. 3. p. 11.) leaflets 3-5, linear, or oblong-cuneate, mucronate, with recurved margins; stem procumbent, weak, twining; stipules shorter than the petioles; pedicels much longer than the leaves, bibracteolate, both at the base and the apex or in the middle. G. Native of New Holland, on the south-west coast. Vexillum large, scarlet on the inside with a yellow base, and purplish on the outside. *G. grandiflorum*, Andr. bot. rep. 442. ex Sims, bot. mag. 1533.

**Leaves impari-pinnate.**

10 G. Tomentosum (Labill. nov. holl. 1. p. 106. t. 134.) leaves impari-pinnate, with 2-4 pairs of leaflets; leaflets awl-shaped-linear, mucronate, scabrous above; pedicels usually solitary; calyx hairy, shorter than the legume; keel ciliated, with silky hairs. G. Native of New Holland, on the south coast, and in Van Diemen's Land. R. Br. in hort. kew. 3. p. 12. Shrub tomentose.

**Tomentosum Gompholobium.** Fl. April, Jul. Ct. 1803. Sh. 1 ft.

11 G. Lanatum (Cung. & Don. in Lodd. Hort. brit. p. 163.) branches and leaves villous; leaves impari-pinnate; leaflets linear-subulate, with revolute edges; pedicels solitary, shorter than the leaves, terminal or axillary at the tops of the branches; keel bearded. G. Native of New Holland. Corolla twice the length of the calyx, of a coppery-yellow colour.

12 G. Glabratum (D. C. prod. 2. p. 106.) leaves impari-pinnate, with 2-3 pairs of linear-subulate leaflets; leaflets erect, with revolute edges; pedicels usually solitary; calyx glabrous, one-half shorter than the legume. G. Native of New Holland. Branches lepidotis with tubercles. Leaflets approximate along the petiole. Legume ovate. Calyx glabrous on the outside, ciliated along the margins of the lobes with fine wool. Corolla unknown.

**Smooth Gompholobium.** Fl. April, Aug. Ct. 1820. Sh. ¾ to 1 foot.

13 G. Heterophylleum (Cung. mss.) leaves trifoliolate or impari-pinnate, usually with 3-5 or 7 leaflets, which are obovate, lanceolate, or linear, all mucronate, terminal one broadest, perfectly glabrous; racemes short, terminal; pedicels rather longer than the bracteas, which are linear. G. Native of New Holland. Keel beardless? Flowers reddish.

14 G. Veneatum (R. Br. in hort. kew. ed. 2. vol. 3. p. 12.) leaves impari-pinnate, with many pairs of leaflets; leaflets awl-
shaped, veiny, with revolute margins, and are as well as the calyxes glabrous; corymb stalked, many-flowered. 六. G. Native of New Holland, on the south-west coast. Corolla pale.

**Beautiful Gompholobium.** Fl. April, July. Clt. 1803. Sh. 1 to 3 feet.

15 G. pinna'tum (Smith, in Lin. soc. trans. 9. p. 251) leaves impari-pinnate, with many pairs of smooth leaflets; stem terete, flexuous, glabrous. 六. G. Native of New Holland, near Port Jackson. Plant very small, and probably an annual.

**Cult.** Gompholobium is a genus of most elegant plants; its species thrive well in an equal mixture of loam, peat, and sand, but care must be taken not to give them too much water, as they are extremely tenacious of moisture, and difficult to preserve in a living state. Young cuttings will root freely if planted in a pot of sand, with a bell-glass placed over them, but some of the species produce seed in abundance, which is the best way of increasing them, as they make better plants from seeds than from cuttings.

**Lin. syst. Decandria, Monogynia.** Calyx, profoundly 5-cleft. Petals 5, deciduous, about equal in length, 2 of which are concrete into a 'keel on the back. Ovary 2-seeded. Style subulate, dilated at the base. Stigma obtuse, bearded. Legume roundish, ventricose. Seeds without a strophiloia.—Australian shrubs, with subulate leaflets or leaves; branches usually puberulous, and pedicels solitary. Flowers of all yellow.

**Scabrous Burtonia.** Fl. May, July. Clt. 1803. Sh. 3 to 1 ft.

**Sessile-leaved Burtonia.** Fl. May, Jul. Clt. 1824. Sh. 4 to 1 ft.

4 B. confé'ra (D. C. prod. 2. p. 106) leaves simple, crowded very much, linear-subulate, with revolute margins, and are as well as the branches smooth. 六. G. Native of New Holland, on the southern coast. Calyx glabrous, with the lobes much acuminate. Leaves 6-8 lines long, usually incurved. The plant is in habit like Dilíwnia, but the calyx is that of Burtonia.

**Crowded-leaved Burtonia.** Shrub 1 foot.

**Cult.** See Gompholobium for culture, propagation, and management.

**Lin. syst. Decandria, Monogynia.** Calyx 5-parted, nearly equal. Petals and stamens deciduous. Ovary 2-seeded. Style filiform and subulate, crowned by a simple stigma. Legume a little ventricose, ovate, or oblong; valves pubescent inside. Seeds without a strophiloia.—Australian shrubs, and when in an adult state they are usually leafless; branches usually angular, and with the branchlets branched, very like leaves in form. Flowers of all yellow.

2 J. spínósá (R. Br. l. c.) shrubby; branches pubescent, dichotomous, and trichotomous, spreading, angular; flowers usually solitary; bracteoles at the tops of the pedicels, adpressed and very short. 六. G. Native of New Holland, on the southwest coast. Gompholobium spinósum, Labill. nov. holl. 1. p. 107. t. 136.

**Spinose Jacksonia.** Fl. April, Sept. Clt. 1803. Sh. 2 to 4 ft.

3 J. hórbridá (D. C. prod. 2. p. 107) shrubby; branches angularly compressed, branched, spinescent, leaf-formed; racemes terminal; pedicels furnished with bracteoles in the middle. 六. G. Native of New Holland, on the eastern coast. Branches terete, furnished with prominent angles; branchlets glabrous or pubescent at the flowers. Rachis angularly compressed.

**Horrid Jacksonia.** Shrub 1 to 3 feet.

4 J. furcélítá (D. C. prod. 2. p. 107) shrubby; branches terete; branchlets compressed and striated, forked, linear, unarmed; racemes terminal; pedicels furnished with bracteoles at the apex. 六. G. Native of New Holland, on the eastern coast. Gompholobium furcellátum, Bonpl. nav. p. 90. t. 11. Branches and branchlets pubescent.

**Forked-branched Jacksonia.** Fl. April, Sept. Clt. 1824. Shrub 1 to 2 feet.

5 J. reticúlatá (D. C. prod. 2. p. 107) shrubby; branches and branchlets terete; leaves lanceolate, pungent, reticulately-veined on both surfaces; flowers axillary, solitary. 六. G. Native of New Holland, on the eastern coast. Davésia reticulátá, Smith, in Lin. soc. trans. 9. p. 256. In this and the two preceding species the legumes are villous on the outside, and clothed with velvety pubescence on the inside.

**Reticulated-leaved Jacksonia.** Fl. April, Sept. Clt. 1829. Shrub 1 to 2 feet.

**Cult.** Loam and peat is the best mixture for the species of this genus, and young cuttings are easily struck in sand under a bell-glass, or ripened ones under a hand-glass.
Naked Viminaria. Fl. June, Sept. Ct. 1780. Sh. 2 to 4 ft. 2 V. lateriflora (Link, enum. 1. p. 403.) flowers subraceemose; teeth of calyx lanceolate, reflexed. \( g \). Native of New Holland. Flowers larger than those of \( F. \) denudata. Leaves wanting. Fruit unknown.

Cult. Elegant shrubs when in flower. For culture and propagation see Jacksowia, p. 119.

1 S. vimsxeum (Smith, l. c.) tube of calyx a little shorter than the lips; style inclosed, arched at the base. \( g \). Native of New Holland and Van Diemen’s Land. Sims, bot. mag. 969. S. minus, Labill. nov. holl. t. 138. Flowers yellow.

Tiwissgyl Sphero lobium. Fl. May, Aug. Ct. 1802. Sh. 1 ft. 2 V. medinum (R. Br. l. c.) tube of calyx one-half shorter than the lips. \( g \). Native of New Holland, on the southwest coast. Flowers red.

Cult. The species of this genus are elegant when in flower; their culture and propagation are the same as that for Jacksowia, p. 119.

XXIII. AOUTUS (from a priv. and \( \omega \)r, \( \omega \), ears; in allusion to the want of appendages in the calyx, which in \( Pultenaea \) are very distinct, a genus which is most nearly allied). Smith, ann. bot. 1. p. 504. Lin. trans. 9. p. 249. R. Br. in hort. kew. ed. 2. vol. 3. p. 14. D. C. prod. 2. p. 108.

1 A. villosa (Smith, l. c.) leaves smoothish on the upper surface; flowers axillary, disposed in racemose spikes along the branches. \( g \). Native of New Holland. Calyx clothed with silky appressed villi. Legume pedicellate. Seeds covered with wrinkled dots.

Villosus Aoutus. Fl. April, June. Ct. 1790. Sh. 1 to 2 ft. 2 A. ericoides; leaves linear, very acute, hairy; flowers solitary, axillary, appearing in axillary racemose spikes along the branches; branches clothed with cinereous spreading hairs. \( g \). Native of New Holland. Pultenaea ericoides, Vent. malm. t. 35. A. villosa, Sims, bot. mag. 949. Pultenaea rosmarinifolia, Sieb. pl. exsic. nov. holl. no. 387? A. villosa var. \( \alpha \), ericoides, D. C. prod. 2. p. 108.

Heath-like Aoutus. Fl. April, June. Ct. 1810. Sh. 1 to 2 ft. 3 A. ferruginez (Labill. nov. holl. 1. t. 132.) leaves linear, obtuse, scabrous from tubercles above; flowers twin, axillary, rising along the branches; branches clothed with rusty down, when young with silky rusty down. \( g \). Native of Van Diemen’s Land. A. villosa var. \( \beta \), ferruginea, D. C. prod. 2. p. 108.

Rusty Aoutus. Fl. April, June. Ct. 1829. Sh. 2 to 4 ft.

Twiiggy Aoutus. Fl. April, June. Ct. 1834. Sh. 1 to 2 ft.

Cult. Elegant little shrubs when in flower. For culture and propagation see next genus.

Sect. I. Dillwyniástrum (see genus for derivation). Petals and stamens deciduous.

1 D. floribunda (Smith, exot. bot. t. 26.) flowers crowded, axillary, twin; leaves crowded, subulate, mucronulate, scabrous from tubercles. \( g \). Native of New Holland, on the south and east coasts. D. ericifolia, Sims, bot. mag. 1544.

Bundle-flowered Dillwynia. Fl. April, July. Ct. 1794. Sh. 2 to 6 ft.

2 D. ericifolia (Smith, exot. bot. t. 25.) corollas of flowers terminal; leaves subulate, pungent, scabrous from points, divaricate, scattered; branches pubescent. \( g \). Native of New Holland, on the eastern coast. Pultenae'a retorta, Wendl. hort. larenrein. 2. p. 13. t. 9.

3 D. Juniper'ika (Lodd. bot. cab. 401.) leaves nearly filiform, smooth, ending in a pungent mucrone, spreading, straight, serrated; heads of flowers terminal; pedicels bifracteate; branches twiggy, spreading, pubescent. \( g \). Native of New Holland and Van Diemen’s Land. Corolla orange-coloured, with the vexillum and wings streaked in their lower part with red.

5 D. Far'éfoila (R. Br. in Sims, bot. mag. t. 1527.) corollas terminal, few-flowered, rather capitulate; leaves short, crowded in a capitate manner, and spreading; pedicels bifracteate; stigma capitata. \( g \). Native of New Holland. Lodd. bot. cab. 559. D. microphylla, Sieb. c. c. no. 410 and 553.

6 D. Acula'lius (Sieb. pl. esix. nov. holl. no. 401.) racemes naked, terminal; branches and pedicels covered with adpressed canescent down; leaves acuminate, straight, rather mucronate, smooth. \( g \). Native of New Holland. Leaves 8-10 lines long. Racemes 8-12-flowered. Calyx rather pubescent.
Acicular-leaved Dillwynia. Fl. April, June. Clt. 1826. Sh. 1 to 4 feet.

7 D. ru'dis (Sieb. pl. exsic. nov. holl. no. 400.) racemes terminal, leafy; branches villous; leaves acicular, straight, rather incuronate, and sebaceous from tubercles, glabrous.  h. G. Native of New Holland. Flowers axillary, on short pedicels, approximate, and therefore disposed in racemose spikes. Bracteoles 2 at the base of each pedicel, and 2 smaller along the pedicels, all deciduous. Leaves 5-6 lines long. Flowers yellow, but with the base of the vexillum purple.

Var.  h. brevifolia (D. C. prod. 2. p. 100.) leaves a little shorter, and distinctly mucronate. Sieb. l. c. no. 402.

Var.  h. tereifolia (D. C. prod. l. c.) leaves evidently tubercled, glabrous; branches with a few hairs; calyx glabrous.  h. tereifolia, Sieb. l. c. no. 404.

Var.  h. hispida (D. C. prod. l. c.) leaves distinctly tubercled; tubercles for the most part bearing tufts of hairs; calyx pubescent.

Rustie Dillwynia. Fl. April, June. Clt. 1824. Sh. 2 to 4 ft.

8 D. tenui'folia (Sieb. pl. exsic. nov. holl. no. 409.) flowers subterminal, and usually solitary; leaves linear, very slender, rather obtuse, straight; branches puberulous.  h. G. Native of New Holland. Legume pubescent. Leaves much less stiff and acute than in the rest of the species.

Fine-leaved Dillwynia. Fl. April, June. Clt. 1824. Shrub 1 to 3 feet.

9 D. phyl'licoides (Cung. in Field's new south wales, p. 347.) flowers corymbose, terminal, pedicellate; leaves linear, short, mucronate, erectly-spreadling, with reflexed, somewhat twisted margins; calyxes and branches villous; stem reclinate.  h. G. Native of New Holland, on hills about Baturst. This species is nearly allied to D. eri'cifolia.

10 D. ser'cica (Cung. l. c.) canescent; flowers usually twin, axillary; leaves linear, straight, rather terete.  h. G. Native of New Holland, around Baturst.

Silky Dillwynia. Fl. April, June. Clt. 1824. Sh. 2 to 3 feet.

Sect. II. Xero'pe'taleum (from xeropsis, xeros, dry, and petalone, petalon, a petal; in reference to the petals and stamens being permanent, even when dry). R. Br. in bot. mag. 2247. Petals and stamens permanent even when dry.

11 D. cineras'cens (K. Br. ex Sims, bot. mag. t. 2247.) corollas terminal, sessile; leaves filiform, spreading, ending in a short, innocuous mucrone; branches and calyces silky.  h. G. Native of Van Diemen's Land. Lodg. bot. cab. 527. D. juniperina, Sieb. pl. exsic. nov. holl. no. 411. Mucron of leaves straight.

Var.  h. revutura; leaves erect, mucron of leaves somewhat recurved.  R. Br. l. c.

† A species not sufficiently known, and the genus to which it should be referred is extremely doubtful.

12 D. glycinifolia (Smith in Lin. trans. 9. p. 264.) flowers disposed in racemes; leaves ovate and linear, reticulated, with revolute edges.  h. G. Native of New Holland, at King George's Sound. Flowers purple. Style curved so much as to form a circle. Stems decumbent. Leaves pungent. Fruit unknown. Perhaps a species of Chortizema, or perhaps a proper genus.

Glyicine-leaved Dillwynia. Pl. procumbent.

Cult. The species of Dillwynia are very elegant shrubs when in flower, and deserve to be cultivated in every collection of vol. II.
Cult. A pretty plant when in flower. For its culture and propagation see Pultenaea.

XXVIII. ECHIUMUS (from ev., ev., well or good, and χελος, cheilos, a lip; well-lipped, the upper lip of the calyx is very large). R. Br. in hort. kew. ed. 2. vol. 3. p. 17. D. C. prod. 2. p. 110. 
Lin. syst. Dechandria, Monogynia. Calyx profusely 5-crenate, bicaudate at the base, bilabiate; lobes of the upper lip ovate and large, of the lower one secteaceous. Carina length of wings. Ovary 2-seeded, pedicellate. Style subulate, ascending. Stigma simple. Legume compressed. Seeds strophi-olate, with the lobes of the strophiola entire behind.—An Australian shrub, with opposite, simple, minutely-stipulate leaves. Flowers axillary, pedicellate. Pedicels furnished with 2 see-cesious bracteoles at their base.
1 E. acródatæ (L. Br. l. c.) %. G. Native of New Holland, on the south-west coast. Ker. bot. reg. t. 493. Lodd. bot. cab. t. 60. Branches terete, canescent. Leaves oblong or wedge-shaped, villous beneath. Flowers yellow, with a pur- plish keel.  
Cult. A very elegant plant when in flower. For its culture and propagation see Pultenaea.

Sect. I. Hymenota (from ἡμένων, a membrane, ovς oρω, ovς oτος, an ear; in reference to the membranous stipulas). D. C. prod. 2. p. 110. Stipulas secteaceous, scarious or membrana- nous, upper ones usually concrete or dilated. Bracteoles con- forming to the upper stipulas.
1 P. daphnoïdeæ (Smith, l. c.) heads of flowers terminal; leaves obovate-oblong, flat, quite glabrous, smooth, 3 times longer than broad, ending in a pubescent mucrone. %. G. Native of New Holland, on the eastern coast. Andr. bot. rep. 98. Wendl. hort. herrenh. 3. t. 17. Sim. bot. mag. 1394. Leaves nearly an inch long. 
2 P. obcordata (Andr. bot. rep. t. 574.) heads of flowers terminal; leaves cuneate and obcordate, retuse, flat, quite glabrous, smooth, scarcely twice longer than broad, ending in a pubescent mucrone. %. G. Native of Van Diemen’s Land and New Holland, on the south coast. Leaves half an inch long. R. Br. in hort. kew. ed. 2. vol. 3. p. 18. 
Obovate-leaved Pultenaea. Fl. May, July. Clt. 1805. Sh. 1 to 3 feet. 
3 P. bīōhra (R. Br. in bot. mag. 2091.) heads terminal, few-flowered; leaves cuneiform, dilated and 2-lobed at the apex, scabrous from tuberces on the upper surface, but silky beneath, ending in a short mucrone, and with the margins recurved. %. G. Native of New Holland, on the eastern coast. P. scabra, R. Br. in hort. kew. ed. 2. vol. 3. p. 18. P. deltoides, Sieb. pl. excis. nov. holl. no. 388. Flowers yellow, with a purplish keel. 
Var. β, scabra (Sieb. pl. excis. nov. holl. no. 386.) branches and calyces clothed with hairy down, not with adpressed villi. %. G. Native of New Holland. Leaves a little larger than those of the species.

Two-lobed-leaved Pultenaea. Fl. April, May. Clt. 1817. Shrub 1 to 3 feet. 
Rusty-haired Pultenaea. Fl. April, June. Clt. 1810. Shrub 1 to 3 feet. 
5 P. incusvata (Cunn. in Field’s new south Wales, p. 346.) heads of flowers terminal, and are, as well as the branches, villous; leaves lanceolate, obtuse, concave, incurved. %. G. Native of New Holland, on the margins of pest bogs, on King’s Table Land. A slender shrubby plant. 
Incurved-leaved Pultenaea. Fl. May, June. Clt. 1823. Sh. 1 to 2 feet. 
6 P. racemulosa (D. C. prod. 2. p. 111.) flowers axillary, forming a leafy raceme; leaves obovate-elliptic, obtuse, smooth beneath, but scabrous above; branches hairy-pubescent. %. G. Native of New Holland. The leaves appear full of dots under a microscope, hardly 2 lines long. Like P. ferruginea, but differs from it in the disposition of the flowers, as well as from all the rest. Sieb. pl. excis. nov. holl. no. 594. 
Racemulose-flowered Pultenaea. Fl. April, June. Clt. 1820. Shrub 1 to 3 feet. 
7 P. carphitòra (Sieb. pl. excis. nov. holl. no. 399.) heads terminal, few-flowered; leaves obovate-cuneated, almost vein- less, glabrous, younger ones clothed with adpressed villi; as well as the branches, all terminating in a short, callose, somewhat recurved point. %. G. Native of New Holland. Stipulas rufous, oblong, membranous, adpressed, a line or more long. Leaves 2-3 lines long. 
Small-flowered Pultenaea. Fl. April, July. Clt. 1824. Sh. 1 to 3 feet. 
8 P. strīcta (Sims, bot. mag. 1588.) heads of flowers termi- nal; leaves obvate, mucronate, quite glabrous; stem straight; calyces and legumes pilose. %. G. Native of Van Diemen’s Land. Lodd. bot. cab. 974. 
Straight Pultenaea. Fl. April, July. Clt. 1803. Sh. 1 to 3 ft. 
9 P. elliptica (Smith in Lin. trans. 9. p. 246.) heads of flowers terminal, roundish, and with oblong ones along the branches; stem straight; leaves elliptic or obovate-oblong, concave, rather pilose; stipulas 2, joined in one; bracteas and calyces membranous and dilated; legume glabrous. %. G. Native of New Holland, on the eastern coast. Rudge in Lin. trans. 1. t. 24. Sieb. pl. excis. nov. holl. no. 394. P. tuberculata, Pers. ench. 1. p. 454. 
Var. β, oblongifolia (Sieb. l. c. no. 397.) leaves oblong. 
Elliptic-leaved Pultenaea. Fl. April, June. Clt. 1810. Sh. 1 to 3 feet. 
10 P. ëlumosa (Sieb. pl. excis. nov. holl. no. 355.) heads of flowers terminal, roundish; stem straight, clothed with velvety villi between the leaves; leaves oblong, concave, veinless, lower ones nearly glabrous, superior ones, especially the floral ones, clothed with silky velvety villi. %. G. Native of New Hol-
land. Stipulae brown, membranous, erect, adpressed. Like P. elliptica.

13 P. _puncti-folia_ (Sieb. pl. exsic. nov. holl. no. 599.) heads of flowers terminal, leafy, protruding beyond the branches, and somewhat verticillate; leaves elliptic-oblong, stalked, rather acute, usually 3-nerved, shining below, and glabrous on both surfaces; floral ones ciliated, with long white hairs. "G. Native of New Holland. Stipulae round, membranous, longer than the petiole, pressed to the stem, hiding the branches. Consistence and form of leaves very much that of *Eutidixia myrtifolia*.

**Bright leaf Pultenia.** Fl. April. Clt. 1824. Shrub 1 to 3 ft.

13 P. _villifera_ (Sieb. pl. exsic. no. 399.) flowers axillary or subcapitate at the tops of the branches; leaves lanceolate-oblong, acuminate, somewhat 3-nerved, shining beneath, bearing long white hairs on the margins. "G. Native of New Holland, near Port Jackson. Leaves rusty.

**Hair-bearing Pultenia.** Fl. April. Clt. 1824. Shrub 1 to 3 ft.

14 P. _polymastia_ (Rudge in Lin. trans. 11. p. 503. t. 25.) flowers axillary and terminal; leaves linear-oblong, obtuse, mucronate, concave above, and glabrous, rather pilose beneath, as well as the calyxes; stipulae lanceolate-subulate, adpressed; branches and branchlets clothed with rusty villi; bracteas subulate, shorter than the calyx. "G. Native of New Holland, in the neighbourhood of Sydney. Sweet, fl. aust. 37.

**Polygala-leaved Pultenia.** Fl. April. Clt. 1824. Sh. 2 to 4 ft.

15 P. _flexilis_ (Smith in Lin. trans. 9. p. 248.) racemes terminal, rather leafy; leaves obovate-linear, mucronate, flat, glabrous above, and rather glaucous; calyx glabrous on the outside, bifractate at the base, with the segments ovate, acute, and ciliated; stipulae setaceous, longer than the petioles. "G. Native of New Holland. Sweet, fl. austral. t. 33. Dilwynia teucrioides, Sieb. l. c. no. 423. (f. 24.)

**Object-Pultenia.** Fl. April. Clt. 1601. Sh. 1 to 2 ft.

16 P. _eucnella_ (D. C. prod. 2. p. 112.) flowers axillary and racemose; leaves cuneate-linear, obtuse, pale beneath, and 1-nerved, glaucous above, glabrous on both surfaces, as well as the branches and calyxes; upper lobes of calyx ovate, obliquely and bluntly apiculate; stipulae and bracteas small and setaceous. "G. Native of New Holland. Calyx almost like that of *Eucnella*. Corolla and style of *Pultenia*. Pedicels length of calyx. Dilwynia cuneata, Sieb. pl. exsic. nov. holl. 422.

**Well-lipped Pultenia.** Fl. April. Clt. 1824. Sh. 1 to 3 ft.

18 P. _capitellata_ (Sieb. pl. exsic. nov. holl. no. 413.) stems of flowers terminal, imbricated with bracteas, villous; leaves cuneate, rather acute, glabrous above, and ciliate beneath with villous hair. "G. Native of New Holland. Flowers broader and heads smaller than that of *Linophyllum*.

**Capitellate-flowered Pultenia.** Fl. April. Clt. 1823. Shrub 1 to 2 ft.

19 P. _linophyllum_ (Smith in Lin. trans. 9. p. 248.) bracteas shorter than the few-flowered terminal head; leaves linear, with edges and mucron recurved, silky beneath; stipulae shorter than the petiole; calyces villous. "G. Native of New Holland, on the eastern coast. Schrad. sett. holl. 5. t. 18. Vibraceous. Sieb. pl. exsic. nov. holl. no. 417. Stem much branched. Leaves half an inch long.

**Var. _beta_ amena_ (Sieb. l. c. no. 414.) leaves more loose; heads few-flowered.

**Flex-leaved Pultenia.** Fl. May, July. Clt. 1789. Shrub 1 to 3 ft.

20 P. _canescens_ (Cung. in Field's new south wales, p. 346.) flowers many-flowered; bracteas a little shorter than the calyx; leaves linear-oblong, concave and glabrous above, but ciliate beneath, as well as the bracteas and calyx; stems villous. "G. Native of New Holland, on the Blue Mountains, in barren woods on the verge of swamps.

**Canescend Pultenia.** Fl. April. May. Clt. 1822. Sh. 1 ft.

21 P. _polystria_ (Cung. l. c.) heads many-flowered; leaves ovate-lanceolate or oblong-linear, mucronate, with revolute margins; branches and heads of flowers villous; bracteas a little shorter than the calyx. "G. Native of New Holland, on bushy hills.

**Pulina-leaved Pultenia.** Fl. April. Clt. 1824. Sh. 1 to 2 ft.

22 P. _microphyllum_ (Sieb. pl. exsic. nov. holl. no. 418.) flowers axillary and somewhat capitate at the tops of the branches; leaves linear and somewhat ciliate, terminated by a short, callous, somewhat incurved mucron, glabrous above, but clothed with minute, pressed pubescence beneath as well as the calyces; bracteas hoary from adpressed down. "G. Native of New Holland.

**Small-leaved Pultenia.** Fl. April. Clt. 1810. Shrub 1 to 3 ft.

23 P. _paleaera_ (Smith, in Lin. trans. 9. p. 246.) heads terminal, few-flowered; bracteas membranous, very much acuminate, exceeding the calyx; leaves linear, glabrous, with revolute margins, ending in a recurved point; stipulae concretes, membranous, somewhat sheathing. "G. Native of New Holland, on the east coast. Lodd. bot. cab. 3. t. 291.

**Chaffy Pultenia.** Fl. May, July. Clt. 1789. Sh. 1 to 2 ft.

24 P. _arista_ (Sieb. pl. exsic. nov. holl. no. 283.) heads of flowers terminal; leaves linear, convolute, nerveless, scabrous from tubercles beneath and ciliate at the base, bracteae at apex, and each as well as the calyceae lobes ending in a stiff bristle; calyces villous. "G. Native of New Holland. Leaves crowded, erect. Stipulae long, subulate, and are as well as the bristles fuscous.

**Awned-leaved Pultenia.** Fl. April. Clt. 1824. Shrub 1 to 2 ft.

25 P. _echinula_ (Sieb. pl. exsic. nov. holl. no. 384.) heads of flowers terminal; leaves crowded, rather incurved, terete, and r 2
LEGUMINOSÆ. XXIX. PULTENEA. XXX. DAVIESIA.

subulate, mucronate, sebaceous from tubercles, with one furrow above, floral ones bearing long hairs. ’h  G. Native of New Holland. Stipulae subulate, permanent, black, and stiff, particularly on the old heads, in which they appear like spines. Stipulae and bracteae crowded.

26 P. argentea (Cunn. in Field's new south wales, p. 347.) heading terminal, villous; leaves linear-lanceolate, mutic, acute, rather concave above and glabrous, but silky beneath. ’h  G. Native of New Holland, on exposed hills on the western interior. Allied to P. villulosa. A reclining shrub.

Toothed-bracteate Pultenaea. Shrub 1 foot.

30 P. juniperina (Labill. l. c. t. 130.) flowers axillary and terminal; bracteae entire, hardly longer than the pedicels; leaves linear, somewhat trigonous, acuminate, pungent, glabrous; stipulae subulate, a little longer than the petioles. ’h  G. Native of Van Diemen's Land and New Holland. Leaves 3 or 4 lines long.

Juniper-like Pultenaea. Fl. April. Ju. Clt. 1824. Sh. 2 to 8 ft. 31 P. tenutifolia (R. Br. in bot. mag. t. 2086.) heads terminal, usually 2-flowered; fruit flat; leaves linear-subulate, mutic, concave above and convex beneath, and are as well as the branches rather pilose. ’h  G. Native of New Holland, on the eastern coast.

Villos Pultenaea. Fl. April. May. Clt. 1790. Sh. 1 to 3 ft. 33 P. stipulaeis (Smith, l. c. et nov. holl. spec. t. 12.) heads many-flowered; bracteae about equal in length to the calyxes; leaves linear, flat, acute, younger ones ciliate; stipulae 2 joined in one, which is biform at the apex, flat, imbricate, much longer than the petioles. ’h  G. Native of New Holland, on the eastern and southern coast. Curt. bot. mag. 435. P. protocoidea, Sieb. pl. exsic. nov. holl. no. 382.

Stipular Pultenaea. Fl. April. Jul. Clt. 1792. Sh. 1 to 3 ft. 34 P. pedunculata (Hook. bot. mag. 2560.) pedicells axillary, twin, elongated; stipulas setaceous, twin at the base of the leaves; leaves linear-lanceolate, flat, and are as well as the branches clothed with adpressed pil. ’h  G. Native of New Holland. A weak shrub. Flowers yellow, but with the keel and edges of calyx reddish.

36 P. staphyleoides (Cunn. mss.) flowers sessile, solitary, axillary; leaves ovate, acute, stiff, ending in a pungent mucron, reflexed, rather villous beneath when young, but only at the edges in the adult state; stipulas twin, linear; branches pubescent or villous. ’h  G. Native of New Holland. Habit of Sprengelèa incarnata.

Sect. II. Phyllota (φολλος, phyllos, a leaf, and ους φορος, ous phoros, an ear; in allusion to the twin leafy bracteae). D. C. prodr. 2. p. 113. Stipulae wanting. Flowers bearing opposite or twin, leafy bracteae at the base, which are usually longer than the calyx. Pods unknown. Perhaps a proper genus.

37 P. aspera (Sieb. pl. exsic. nov. holl. no. 407.) flowers axillary at the tops of the branches, disposed in terminal, capitate, leafy spikes; bracteoles length of calyx; leaves linear, with revolute margins, smoothish above but sebaceous from tubercles, without stipulae; branches and calyxes pubescent. ’h  G. Native of New Holland, on the eastern coast. Bracteoles oval-oblong, glabrous. Lobes of calyx acute. Shrub, with the habit of Dillwynia floribunda.

Rough Pultenaea. Fl. April. Jul. Clt. 1824. Sh. 1 to 3 ft. 38 P. coaosa (Sieb. pl. exsic. nov. holl. no. 407.) flowers axillary, disposed in a somewhat terminal leafy spike; bracteoles longer than the calyx; leaves extipulate, linear, with revolute margins, sebaceous from tubercles above, but clothed beneath with adpressed pubescence as well as the calyxes and branches. ’h  G. Native of New Holland. Shrub almost with the habit of Aitius virgata.

Tufted Pultenaea. Fl. April. June. Clt. 1825. Sh. 1 to 3 ft. 39 P. squarrrosa (Sieb. pl. exsic. nov. holl. no. 407.) flowers axillary, disposed in a leafy terminal head; leaves extipulate, linear, acute, with revolute margins, sebaceous from tubercles above, young and floral ones villous and mucronate; bracteoles longer than the calyx; lobes of calyx ending in spiny mucrones. ’h  G. Native of New Holland.

Squarrose Pultenaea. Fl. April, July. Clt. 1825. Sh. 1 to 3 ft. 40 P. phylleia (Sieb. pl. exsic. nov. holl. no. 405.) heads terminal, roundish; leaves linear, bluntish, with revolute margins, sebaceous from tubercles above, but pubescent beneath on the nerves and on the branches; bracteoles length of calyx; lobes of calyx short, bluntish. ’h  G. Native of New Holland.

Phylléa-like Pultenaea. Fl. April. Ju. Clt. 1822. Sh. 1 to 3 ft. 41 P. caudata (Lodd. bot. cab. 1236.) flowers axillary, very small; leaves linear, obtuse, crowded, beset with long hairs, as well as the branches, giving the whole plant a white or hoary aspect. ’h  G. Native of New South Wales. Flowers yellow, tinged with red.

Cult. Pultenaea is a genus of elegant small shrubs; they succeed best in an equal mixture of loam, peat, and sand, and cuttings root readily in a pot of sand, with a bell-glass placed over them. The species shew to most advantage when planted out into a border or conservatory.

Lin. syst. Decandria, Monogynia. Calyx angular, bracteless, 5-toothed, somewhat bilabiate. Carolina shorter than the
vexillum. Ovary pedicellate, 2-seeded. Style straight. Stigma simple. Legume compressed, angular, bursting elastically at the lower suture, which is dilated, almost semi-trapezoidal. Strobila of seeds entire behind.—Smooth Australian, spiny, or unarmed shrubs, with the appearance of furze. Leaves either simple or wanting. Pedicels axillary, bracteate at the base. Flowers usually yellow.

* Leaves oval, oblong, or lanceolate, unarmed.

1 D. latifolia (R. Br. in hort. kew. 3. p. 20.) leaves elliptic or oval, veiny, rather tapering to the base, mucronate, and unarmed as well as the branches; racemes axillary, many-flowered, a little shorter than the leaves. \( \pi \). G. Native of Van Diemen's Land. Sim's, bot. mag. 1737. Flowers yellow, with the vexillum copper-coloured, spotted. Bracteoles numerous along the peduncles under the raceme.

** Leaves lanceolate or linear, spiny at the apex.

2 D. coriophora (Smith, in Lin. trans. 9. p. 258.) leaves linear-oblong, flat, apiculated by a callous mucrone, and as well as the branches unarmed; racemes solitary or twin, 3-times shorter than the leaves, having many bracteas at the base, and bearing a corymb of flowers at the apex. \( \pi \). G. Native of New Holland, on the eastern coast. Flowers white, with a violet keel. Leaves 1-2 inches long and 4 lines broad, with few veins.

3 D. miniosodes (R. Br. in hort. kew. 3. p. 20.) leaves linear, lanceolate, apiculated by an immoinous point, and are as well as the branches unarmed; racemes solitary or twin, 4-times shorter than the leaves, having many bracteas at the base, and corymbiferous at the apex. \( \pi \). G. Native of New Holland, on the south coast. Andr. bot. rep. 526. D. glauca, Lodd. bot. cab. t. 43. Flowers yellow. Leaves nervet at the base; the nerves irregularly pinnate.

** Leaves lanceolate or linear, spiny at the apex.

4 D. leptophylla (Cung. ms.) leaves linear-lanceolate, strongly nervet, obtuse and mucronate, quite smooth, coriaceous; branches furrowed; peduncles few-flowered, axillary. \( \pi \). G. Native of New Holland.

Blaundery Daviesia. Fl. April, June. Clt. 1824. Sh. 1 to 3 feet.

5 D. physodes (Cung. ms.) leaves sessile, somewhat falcate, broadest at the apex and blunt, having 2 strong nerves, and furnished with a spiny beak on the lower side; branches furrowed. \( \pi \). G. Native of New Holland.

Blaundery Daviesia. Fl. April, Jul. Clt. 1824. Sh. 2 to 4 feet.

6 D. racemulosa (D. C. prod. 2. p. 114.) leaves sublanceolate-linear, acuminate, pungent; racemes solitary, bracteate, shorter than the leaves and somewhat corymbous at the apex. \( \pi \). G. Native of New Holland. Leaves 9-10 lines long and 2 lines broad.

** Leaves lanceolate-linear, acuminate, pungent; racemes solitary, bracteate.

7 D. umbellulata (Smith, in Lin. trans. 9. p. 258.) leaves lanceolate, terminated by a pungent point; branches spinose at the apex; peduncles axillary, very short, bearing a few-flowered umbel at the apex. \( \pi \). G. Native of New Holland, on the eastern coast.

8 D. incarnata (Smith, in Lin. trans. 9. p. 253.) leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.

** Leaves cuneate-linear, compressed, vertical, oblique, thick, spiny; flowers axillary, solitary. \( \pi \). G. Native of New Holland, at King George's Sound.
2 M. reticulata; leaves lanceolate, acute, serrated, stiff, 3 in a whorl; flowers terminal, capitate, and axillary verticillate. \textit{h}. G. Native of New South Wales. Flowers bluish-purple. Pultenae rubrefolia, Andr. bot. reg. 351.

3 M. speciosa (Sieb. pl. exsic. nov. holl. no. 367) leaves linear, acutish, with revolute quite entire margins; flowers disposed in a terminal, interrupted, leafy spike. \textit{h}. G. Native of New Holland. Flowers purple.

5 M. grandiflora (Cung. mss. Sieb. Hook. bot. mag. 3271.) pubescent; leaves alternate, ovate, lanceolate; flowers axillary, twin. \textit{h}. G. Native of New Holland. Perhaps Chorizema platylobioides, D. C. prod. and Platylbium reticulatum. Flowers yellow, having a red zonate mark on the upper side of the vexillum, and streaked with the same on the outer surface, and the wings have a red blotch on one side.

Great-flowered Mirbelia. Fl. May, Jun. Ct. 1823. Sh. 1 to 2 ft. 6 M. ru'gens (Cung. mss.) leaves linear, ending in a long, spiny mucronate, scattered; flowers nearly sessile, axillary, smooth. \textit{h}. G. Native of New Holland.

Puget' Mirbelia. Fl. May, July. Ct. 1823. Sh. 1 to 2 ft. Cult. Elegant plants when in flower, the flowers of all being purplish or deep orange. Their culture and propagation are the same as that for \textit{Pultenaea}, p. 126; the cuttings require to be young.

 Tribe II.

LO'TEE (plants agreeing with \textit{Lotus} in important characters). D. C. Leg. mem. vi. — Genista, et Astragal, Adams, fam. 2. p. 320, 324.— Genistee, Trifolium et Galégea, Brunn. 1. c. Embryo with its radicle curved back upon the edge of the cotyledons. Corolla papilionaceous. Stamens monadelphous, or diadelphous, 9 joined and 1 free. Legume continuous, 1-celled, rarely 2-celled, in consequence of the upper sutures being bent. Cotyledons flatish, furnished with cortical pores, and changing at once into leaves at the time of germination, for the purpose of elaborating food for the young plants. However, the germination of some of the genera contained in this tribe being unknown, a few of them may at some future time be placed in tribe Phaseolee.

XXIII. Hovea (in honour of Anthony Pantelone Hove, a Polish botanist, who travelled in the Crimea and Persia, whence many plants were sent to Kew Gardens). R. Br. in Hort. Kew. ed. 2. vol. 2. p. 275. D. C. prod. 2. p. 115. — Poiretia, Smith, Lin. trans. 9. p. 304, but not of Cav. — Physicarpus, Poir. suppl. Linn. Syst. Diadelphe, Decandria. Calyx bilabiata (f. 25, a); upper lip semilunul, broad, and retuse, lower one 3-parted. Keel obtuse (f. 25, c). Stamens all connate (f. 25, c), the tenth or upper one only more or less free. Legume sessile (f. 25, d), roundish, venetiose, 2-seeded. Seeds spherioptate. — Australian shrubs, with alternate simple leaves, and axillary, purple, or villose flowers, which stand on short pedicels.
1 H. longifolia (R. Br. 1. c) leaves linear and elongated, mucronate, with somewhat revolute margins, veiny beneath, and are as well as the legumes tomentose. \textit{h}. G. Native of New Holland, on the eastern coast. Ker. bot. reg. 614. Flowers purplish-violet.

3 H. elliptica (D. C. prod. 2. p. 115.) leaves elliptic-oblong, emarginate, rather pubescent beneath, shining above, reticulated on both surfaces; pedicels 3-times shorter than the leaves, twin. \textit{h}. G. Native of New Holland, at King George's Sound. Poiretia elliptica, Smith, l. c. Flowers purplish-violet.

5 H. mucronata (Cung. mss.) leaves lanceolate, with revolute edges, tomentose beneath, but smooth above, coriaceous, with a strong middle nerve, tapering to the apex and mucronate. \textit{h}. G. Native of New Holland. Flowers purplish-violet.

7 H. acutifolia (Cung. mss.) leaves lanceolate, tapering to both ends, mucronate at the apex, clothed with a kind of rusty tomentum on the under surface as well as on the branches, but glabrous above; peduncles short, 2-3-flowered, with the pedicels longer than the peduncles. \textit{h}. G. Native of New Holland. Flowers purplish-blue.

Purple-leaved Hovea. Fl. May, June. Ct. 1820. Sh. 2 to 4 feet.
8 H. purpurea (Sweet, fl. aust. 13.) leaves oblong-linear, obtuse, mucronate, with revolute margins, smooth above, but reticulately veined and tomentose beneath; stipules subulate, small; peduncles axillary, twin; branches clothed with rusty tomentum as well as the calyces. \textit{h}. G. Native of New Holland. Flowers purple, the vexillum having a pale base.

Purple-flowered Hovea. Fl. May, June. Ct. 1820. Sh. 2 to 4 feet.
9 H. paniculata (Cung. mss.) leaves lanceolate, obtuse, terminating in a tuft of hairs, coriaceous, with rather revolute edges, smooth above, but clothed with dense long tomentum beneath; branches villous, as well as the pods and calyx; peduncles very short, almost sessile, 1-2-3-flowered. \textit{h}. G. Native of New Holland. H. lanigera, Lodd. cat. A very woolly shrub, with small pale-purple flowers.

10 H. latifolia (Lodd. bot. cab. t. 30.) leaves elliptic-oblong, acute, and as well as the branches, smooth; pedicels axillary, solitary, hardly longer than the pediolo.  G. Native of New Holland, on the east coast.  Flowers with a large yellow vexillum, and a purple keel.

11 H. Celesi (Bonn. nat. t. 51.) leaves lanceolate, and somewhat rhomboid, bluntish, mucronate; pedicels axillary, many-flowered; branches, calyces, and bracteas rather pilose.  G. Native of New Holland.  Ker. bot. reg. 280.  Platechilium Celsiannum, Delann. herb. amat. t. 187.  Flowers beautiful blue. Filaments monadelphous with a dorsal fissure, or diadelphous.  This is a most elegant plant when in flower.

12 H. rosmarinifolia (Cung. in Field’s new south wales, p. 318.) leaves linear, reticulated, revolute, covered with rusty tomentum beneath, as well as on the legumes.  G. Native of New Holland, frequent on the rocky pine hills north-west of Bathurst.

Cult. Hovea is a genus of very elegant plants when in flower. The species are most readily increased by seeds, which usually ripen in our greenhouses; they also may be propagated by young cuttings planted in a pot of sand, with a bell-glass placed over them. A mixture of sand, loam, and peat is the soil best adapted for them.

XXXIII. PLAGIOLOBIUM (from πλαγιος, plagios, transverse or oblique, and λοβος, lobos, a pod; in reference to the shape of the pod).  Sweet, fl. austr. no. 2.

1 P. CHORIZEMELEOLUM (Sweet, fl. austr. no. 2.) leaves oblong-lanceolate, spinous-toothed, mucronate, coriaceous, glabrous; pedicels axillary, usually 2 or 4 together; legume transverse, glabrous both inside and outside.  G. Native of New Holland, on the eastern coast, as well as at King George’s Sound.  Hovea chorisemeleola, D. C. prod. 2. p. 116.  Branches thickly clothed with rusty pubescence.  Calyx and pedicels villos.  Flowers large, bluish-purple, the vexillum having a white base.

2 P. TRIANGULARE (Sweet, l. c. in a note,) leaves ovate or elliptic, spinous-toothed, mucronate, glabrous; pedicules axillary, twin; legume somewhat kidney-shaped, pubescent both on the inside and outside.  G. Native of New Holland, at King George’s Sound.  Flowers purplish-blue.  Hovea ilicifolia, Cung. mes.

3 P. PARVIFLORUM (Smith, novit. holl. 17. t. 6.) leaves ovate, somewhat cordate; ovary villos; bracteas silky; stipe of legume shorter than the calyx.  G. Native of New Holland.  Native of New Holland.

4 P. OVA'TUM (Andr. ex Sieb. pl. exsic. novit. holl. no. 374.) leaves ovate-lanceolate, acuminate, glabrous on both surfaces, pale beneath; bracteas and ovaries glabrous; ovary with a very short stipe.  G. Native of New Holland.  Very like P. parviflorum, but it differs in the leaves being more ovate-oblong, paler beneath, and by the ovary being perfectly smooth, about twice the length of the stipe.

5 P. TRIANGULAR (R. Br. in hort. kew. 4. p. 266.) leaves deltoid, somewhat hastate, with the angles spinose; peduncles bracteate both at the base and apex, but naked in the middle; legume exceeding the calyx.  G. Native of Van Diemen’s Land, as well as of New Holland.  Sims, bot. mag. 1508.

6 P. ? OBDERATUM (D. C. prod. 2. p. 116.) leaves obdeterminate, acuminate, pubescent both on both surfaces, as well as the branches.  G. Native of New Holland.  Leaves 4 lines long.  Very like Bossiaea microphylla, but the leaves are opposite.

Obovate-leaved Plagiolobium.  Shrub 1 to 2 feet.

Cult. See Hovea, and Pultenæa, p. 127, for culture and propagation.

Lin. syst. Monadelpha, Decandria.  Calyx bilatiate (f. 27. a.), upper lip large, semi-bifid, obtuse.  Stamens all connected (f. 27. d. f. 28. b.).  Legume compressed (f. 27. c. f. 28. c.), flat, pedicellate, many-seeded, with the margins thickened on both sides.  Seeds strophiolate.—Australian shrubs, with
usually compressed (f. 27.), rarely with terete branches (f. 27. f. 28.). Leaves absent, but when present simple and alternate. Flowers yellow, with the keel usually purplish or dark-brown.

* Branches compressed, leafless.

1 B. scolopendria (Smith, et R. Br. l. c.) branches flat, linear, leafless, toothed, with the teeth bearing the flowers; keel naked; superior bracteas permanent, imbricate, equal in length to the peduncles. & G. Native of New Holland, on the eastern coast. Platylobium scolopendrium, Andr. bot. rep. 191. Vent. malm. t. 55. Stems erect. Calyxes very smooth. Flowers yellow, with the back of the vexillum and keel brownish red. The leaves when present are ovate and smooth.

Plank-plant Bossiæa. Fl. May, July. CIt. 1792. Shrub 3 to 10 feet.

2 B. ensata (Sieb. pl. exsic. nov. holl. no. 434.) branches flat, linear, leafless, toothed, the teeth bearing the flowers; keel almost naked; upper bracteas distant from the lower ones, shorter than the pedicel. & G. Native of New Holland. Sweet, fl. austr. 51. B. rufa, Lodd. bot. cab. 1119. but not of others. Flowers yellow, with the back and base of the vexillum of a brownish orange-purple colour, and with the keel brownish-purple.

Sword-branched Bossiæa. Fl. April, June. CIt. 1825. Sh. 1 to 2 feet.

3 B. rupestris (R. Br. l. c.) branches flat, linear, leafless, toothed, with the teeth bearing the flowers; keel fringed; upper bracteas caducous, remote from the lower ones. & G. Native of New Holland, on the south-west coast. Sims, bot. mag. 1508. Calyxes quite smooth. Flowers colour of the preceding.

** Branches compressed, leafy.

4 B. limophyllæa (R. Br. l. c.) branches compressed, leafy; leaves linear, with recurved margins; legume 1-seeded. & G. Native of New Holland, on the south-west coast. Lodd. bot. cab. 174. Sims, bot. mag. 2491.

5 B. heterophyllæa (Vent. hort. cels. t. 7.) branches flat, leafy; leaves obovate, linear or lanceolate, flat; legume many-celled, in consequence of spongy transverse dissepiments. & G. Native of New Holland, on the eastern coast. Platylobium lanceolatum, Andr. B. lanceolata, Sims, bot. mag. 1144.

Variable-leaved Bossiæa. Fl. May, Dec. CIt. 1792. Shrub 1 to 4 feet.

6 B. rotundifolia (D. C. prod. 2. p. 117.) branches and branchlets leafy, compressed; leaves roundish or broadly ovate, somewhat mucronate, flat. & G. Native of New Holland, on the eastern coast. Leaves 4-5 lines long, and 5-6 broad, reticulately-veined. The whole plant very smooth.

Round-leaved Bossiæa. Fl. May, June. CIt. 1824. Shrub 1 to 2 feet.

7 B. rhombifolia (Sieb. pl. exsic. nov. holl. no. 354.) branches compressed, leafy; branches terete; leaves rhomboidal-orbicular, somewhat emarginate and mucronate; legume on a long stipe, falcate. & G. Native of New Holland. Plant quite smooth, and rather glaucous. Flowers yellow, the vexillum having a red zonate mark at the base. Wings red at the base. Keel brownish-purple.

Rhomb-leaved Bossiæa. Fl. April, June. CIt. 1820. Shrub 1 to 3 feet.

** * * Branches terete, leafy.

Small-leaved Bossiæa. Fl. May, Aug. CIt. 1803. Shrub 1 to 2 feet.

9 B. lentiscus (Sieb. pl. exsic. nov. holl. no. 425.) branches terete, leafy, at length spinescent; leaves glabrous, exactly orbicular. & G. Native of New Holland. Lodd. bot. cab. 1235. Leaves hardly 2 lines in diameter. Flowers like the rest in colour.

Lentil-leaved Bossiæa. Fl. May, June. CIt. 1820. Sh. 1 to 3 feet.

10 B. foliosa (Cung. in Field's new south wales, p. 347.) branches straight, terete, villous; leaves alternate, small, orbicular, retuse, scabrous, with revolute margins, silky beneath; stipulas permanent, hooked, longer than the petioles. & G. Native of New Holland, in brushy forest land near Bathurst.

Leafy Bossiæa. Fl. May, June. CIt. 1824. Sh. 1 to 3 feet.

11 B. ovata; branches straight, terete, smooth; leaves ovate, distich, alternate, quite glabrous. & G. Native of New South Wales. Platylobium ovatum, Andr. bot. rep. 266. The flowers yellow, but with the keel purple.

Ovate-leaved Bossiæa. Fl. May, Dec. CIt. 1792. Shrub 1 to 3 feet.

12 B. nuxifolia (Cung. in Field's new south wales, p. 348.) branches leafy, attenuated, procumbent; leaves broad-elliptic, obtuse, mucronate, rather villous, with recurved margins, cuneous beneath, as well as the branches; stipulas longer than the petioles. & G. Native of New Holland, upon rocky bushy hills. A diffuse reclining shrub.

Box-leaved Bossiæa. Fl. April, June. CIt. 1824. Sh. diffuse.

13 B. cordifolia (Sweet, fl. austr. no. 20.) branches terete, crowded with leaves, villous; leaves nearly sessile, cordate, acute, ending in a spiny mucrone, scabrous above, but pilose on the nerves beneath, with recurved margins; pedicels bifractate, about equal in length to the leaves. & G. Native of New Holland. Flowers yellow, the vexillum furnished with a purple circle at the base, and the keel is dark-purple.

Cordate-leaved Bossiæa. Fl. May, June. CIt. 1824. Sh. 1 to 3 feet.

14 B. cineerea (R. Br. l. c.) branches terete, leafy, clothed with woolly villi; stem erect, much branched; leaves ovate-lanceolate, scabrous above, and pubescent beneath, with recurved margins. & G. Native of Van Diemen's Land. Ker. bot. reg. 306.

Grey Bossiæa. Fl. May, July. CIt. 1802. Sh. 1 to 3 feet.
LEGUMINOSAE. XXXVI. Goodia. XXXVII. Scottea. XXXVIII. Templetonia. XXXIX. Rafnia.

15 B. prostrata (R. Br. l.c.) branches filiform, leafy; stems procumbent; leaves ovate, glabrous; stipules shorter than the petioles; legumes 1-seeded. ʃ. G. Native of New Holland, on the eastern coast. Sims, bot. mag. 1493.

16 B. lineolata; branches terete, leafy, prostrate, puberulous; leaves elliptic, mucronate; pedicels solitary, 1-flowered, elongated; bracteas puberulous; corolla about twice the length of the calyx. ʃ. G. Native of New Holland. Flowers yellow. Keel dark-brown.

Cult. The species of Bossiea are neat elegant plants when in flower; they thrive best in a mixture of turf, loam, peat, and sand, but the pots in which they are grown must be well drained with sherd, as nothing injures them more than too much water. Cuttings, neither too ripe, nor too young, will strike root if planted in a pot of sand with a bell-glass over them.

XXXVI. GOOGIA (in memory of Peter Good, a diligent botanical collector, who was employed in collecting seeds in New Holland for the botanical garden at Kew, where he died). Salisb. p. t. 41. R. Br. in hort. kew. ed. 2. vol. 4. p. 269. D. C. prod. 2. p. 117.

1 G. lotusflora (Salisb. p. t. 41.) leaflets obovate, and are, as well as the calyxes, smooth; legume varicosse, 2-4-seeded. ʃ. G. Native of Van Diemen’s Land. Sims, bot. mag. 958. Flowers yellow, but with the base of the vexillum red. Gland 5 between the stamens and pistil, they are sessile and glabose. Stamens monadelphous, with the sepal cleft in front.

Pubescent Goodia. Fl. April, July. Clt. 1805. Sh. 1 to 3 ft. 3 G. foliusflora (D. C. mem-soc. hort. gen. 2. p. 2. p. 138.) leaflets oval, acutish at both ends, and are, as well as the calyxes, pubescent; legume 8-10-seeded. ʃ. G. Native of Van Diemen’s Land or New Holland. Cythus tomentosus, Andr. bot. rep. 237. The plant is frequently to be met with in gardens under the name of Goodia lotusflora, but differs from that plant in the legume being many-seeded and linear. Upper lip of calyx bipartite, lower lip tridentate. Flowers pure yellow, with the stamens monadelphous, and with the habit of the other species of this genus.

Many-seeded Goodia. Fl. Ap. July. Clt. 1798. Sh. 1 to 2 ft. Cult. A mixture of sandy loam and peat suits the species, and young cuttings will root if planted in a pot of sand with a bell-glass placed over them. Seeds usually ripen in this country, by which young plants may be raised in abundance.

Scottea, R. Br. in hort. kew. ed. 2. vol. 4. p. 268.

Lin. syst. Monadelphia, Decandria. Calyx 5-toothed, imbricated with bracteas, with the teeth rather unequal. Vexillum complicated, short. Wings equal in length to the keel. Stamens all connected. Legume pedicellate, compressed, with the margin thickened on both sides. Seeds 3-4, strophiolute.

1 S. dentata (R. Br. in hort. kew. ed. 2. vol. 4. p. 268.) leaves opposite, sessile, cordate, triangular, toothed; flowers solitary, axillary, on very short pedicels. ʃ. G. Native of New Holland, on the south-west coast. Lindl. bot. reg. 1233. Flowers mixed with red and green. A diffuse shrub.

Cult. Scottea is a genus of elegant shrubs, usually flowering in the winter; their culture and propagation is the same as that for Goodia.

XXXVIII. TEMPLETONIA (in honour of John Templeton, of Orange Grove, near Belfast, a gentleman to whom the editor of English Botany was under frequent obligations for Irish plants during the progress of that work). R. Br. in hort. kew. ed. 2. vol. 4. p. 269.

Lin. syst. Monadelphia, Decandria. Calyx 5-toothed, with the teeth rather unequal. Keel oblong, a little longer than the wings. Stamens all connected, the tenth one sometimes rather shorter, and nearly free; anthers uniform. Legume pedicellate, phosphiolute, many-seeded. Seeds strophiolute.—Smooth Australian shrubs, with alternate, simple, cuneiform, retuse, mucronate leaves. Flowers axillary, solitary, large, crimson.

1 T. retusa (R. Br. l. c.) bracteoles rather remote from the calyx; stamens all connected. ʃ. G. Native of New Holland, on the south-west coast. Sims, bot. mag. 2338. Ráňia retusa, Vent. malm. t. 53. Leaves coriaceous, green.

2 T. glauca (Sims, bot. mag. 2088.) bracteoles approximating the calyx; uppermost stamen shorter than the others, and nearly free. ʃ. G. Native of New Holland, on the south-west coast. Lodd. bot. cab. 644. Lindl. bot. reg. 859. Leaves glaucescent.

Glaucous Templetonia. Fl. Ap. May. Clt. 1818. Sh. 1 to 3 ft. Cult. This is a genus of very shewy shrubs when in bloom; their culture and propagation is the same as that for Goodia, which see. p. 129.

Lin. syst. Monadelphia, Decandria. Calyx cleft into 5 to the middle, & upper lobes broadest, sometimes distinct, sometimes variously connected, lower lobe setaceous and very acute. Corolla smooth, with an obtuse keel, and a roundish vexillum. Stamens monadelphous, with the sepal cleft in front. Legume lanceolato, compressed, many-seeded.—Smooth Cape shrubs, usually becoming of a lurid black colour on drying. Leaves simple, entire, not stem-clasping, alternate, but with the floral ones sometimes opposite. Flowers of all yellow.

1 R. cordata (Mart. acad. mun. 6. p. 189.) leaves rather orbicular, cordate, ciliated, nearly sessile; stipulas scarious; S.
flowers axillary, shorter than the leaves. \( \beta \) G. Native of the Cape of Good Hope.

Cordate-leaved Rafinia. Shrub 2 to 3 feet.

2 R. Elliottika (Thunb. l. c.) leaves ovate-elliptic, acute, cauleine ones alternate, floral ones opposite. \( \beta \) G. Native of the Cape of Good Hope. Flowers axillary. Legume drooping.

4 R. trifólia (Thunb. l. c.) leaves ovate; branches angular; peduncles usually turn in the axils of the upper leaves, 1-flowered, and bibracteate. \( \beta \) G. Native of the Cape of Good Hope. Vent. malm. t. 48. Crotalária trifólia, Berg. cap. 193. Lin. spec. 1004. Borbonia cordâta, Andr. bot. rep. t. 31. exclusive of the synonym, Sim's, bot. mag. 859. Flowers large, yellow, sometimes only 1 or 2 together in the axils of the leaves.

5 R. Lancea (D. C. prod. 2. p. 119.) leaves lanceolate, erect, imbricuated; stems ascending, terete; flowers axillary, solitary, on short pedicels; the 4 upper lobes of the calyx connected into a bident 4-toothed lip, lower lobe secapaceous. \( \beta \) G. Native of the Cape of Good Hope. Edmânnia lancea, Thunb. prod. 2. fl. cap. 501. act. holm. 1800. p. 281. t. 4.

6 R. opposita (Thunb. l. c.) leaves linear-lanceolate, alternate; branches terete; branches axial, bearing at the apex 2 opposite leaves and 1-2-flowers. \( \beta \) G. Native of the Cape of Good Hope. Cythius Capénsis, Berg. cap. 217. Spiréum Capénsis, Lin. spec. 995. Crotalária opposita, Lin. fil. suppl. 322. Lipária opposita, Murr. syst. 554.

7 R. axilla (Thunb. l. c.) leaves lanceolate, alternate and opposite; flowers terminal, solitary; branches axillary. \( \beta \) G. Native of the Cape of Good Hope. Leaves like those of hyssop. Legume drooping.

Axillary-branched Rafinia. Shrub 1 to 2 feet.

8 R. angustulata (Thunb. l. c.) leaves lanceolate, alternate; peduncles lateral, 1-flowered; stem angular. \( \beta \) G. Native of the Cape of Good Hope. Rafânia, Burch. cat. 177. has a terete stem and angular branches. Leaves lanceolate, acute, 6-9 lines long, and 1-2 broad. Pedicels naked, reflexed after flowering. Legume pedicellate, compressed, mucronate by the style.

Angular-branched Rafinia. Shrub 2 to 3 feet.

9 R. specâ (Thunb. l. c.) leaves lanceolate, alternate; flowers axillary, racemose. \( \beta \) G. Native of the Cape of Good Hope. Stem somewhat herbaceous. Spikes or racemes of flowers leafy, therefore the flowers may be called axillary.

Spiked-flowered Rafinia. Shrub 1 to 3 feet.

10 R. angustifolâ (Thunb. l. c.) leaves lanceolate, alternate; pedicels lateral, 1-flowered; stem terete. \( \beta \) G. Native of the Cape of Good Hope. Stem purplish.

Narrow-leaved Rafinia. Shrub 1 to 3 feet.

11 R. filifolâ (Thunb. l. c.) leaves linear-lanceolate, alternate; flowers axillary. \( \beta \) G. Native of the Cape of Good Hope. Rafânia, no. 238. Burch. cat. is perhaps referable to this species, of which the branches are roundish, and the leaves linear, also having axillary floriferous branchlets, bearing 2-3 leaves, and 1 flower each; legume pedicellate, inflexed, pendulous.

Thread-leaved Rafinia. Shrub 1 to 3 feet.

12 R. retroflexa (Thunb. l. c.) leaves obovate; branches reflexed and retroflexed. \( \beta \) G. Native of the Cape of Good Hope. Stem much branched. Branches flexuous. Leaves opposite, sessile, obtuse. Flowers axillary, on very short pedicles. There is a specimen in the Linnaean Herbarium from Thunberg, which answers to the above name and character, but the leaves are rather more linear-lanceolate than obovate, and their colour is somewhat glaucous, and the flowers mostly terminal.

Retroflex-branched Rafinia. Shrub 1 to 3 feet.

13 R. erecta (Thunb. l. c.) leaves oblong; flowers lateral; stem erect. \( \beta \) G. Native of the Cape of Good Hope. Stem branched, terete. Leaves ovate. Flowers axillary, pedicellate.

Erect Rafinia. Shrub 2 to 3 feet.

14 R. difusa (Thunb. l. c.) leaves ovate; stems decumbent. \( \beta \) G. Native of the Cape of Good Hope. Root fusiform. Branches diffuse. Leaves axillary. Flowers axillary. Legume pedicellate, crowned by a recurved style.

Diffuse Rafinia. Shrub procumbent.

Cult. The species are all worth cultivating, as they are rather elegant when in flower; their culture and propagation is the same as that recommended for the species of Borbonia. See p. 131.

XL. VASCOA (in honour of Vasco de Gama, the celebrated Portuguese circumnavigator). D. C. leg. mem. vi. prod. 2. p. 119.—Rafinia et Borbonia, spec. Thunb. and Willd.—Crotaliâric, spec. Lin.

Lin. syst. Monadelphâ, Decândria. Calyx semi-5-cleft, with the lobes nearly equal, broadest at the base, and rather acute at the apex, but not spinose. Corolla smooth, with an obtuse keel, and a roundish vexillum. Stamens monadelphous, with the sheath cleft in front. Legume compressed, sessile, many-seeded.—Smooth Cape subshrubs, with simple, sessile, stem-clasping leaves, which are coriaceous at the base, the cauline ones alternate, and the floral ones opposite. The flowers disposed in fascicles in the upper axils of the leaves, and somewhat corymbose, on short pedicels, all yellow, and without any bracteas.

2 V. Perfoliata (D. C. l. c.) leaves coriaceous, orbicular, bluntly-mucronated. \( \beta \) G. Native of the Cape of Good Hope.—Sch. thes. 1. t. 24. f. 5. Borbonia perfoliata, Thunb. prod. f. cap. 122. Crotalária amplexicâulis, Lam. dict. 2. p. 194. This species differs from the preceding in the leaves being one half smaller, more rigid, distinctly reticulated, and mucronate at the apex.

Cult. For culture and propagation see Borbonia. The plants are rather elegant when in flower.

XLI. BORBONIA (in memory of Gaston de Bourbon, duke of Orleans, son of Henry IV. of France, a great lover and patron of botany; see also Gasîomnia). Lam. gen. no. 857. Lam. ill. 619. D. C. leg. mem. vi. but not of Plum, prod. 2. p. 120.

Lin. syst. Monadelphâ, Decândria. Calyx attenuated at the base, 5-cleft, with the lobes about equal in length, terminating each in a spiny acumen. Corolla villous on the outside, with the vexillum emarginate at the apex, and the keel obtuse.
LEGUMINOSÆ. XII. ACHYRONIA.

Stamens all connected into a sheath, which is left in front. Stigma capitate, somewhat emarginate. Legume linear, plano-compressed, much longer than the calyx, many-seeded.—Cape shrubs, with simple, alternate, exstipulate, pungent leaves, which are stem-clasping, and many-nerved at the base. Flowers of all yellow, disposed in heads at the tops of the branches or axillary.

4. B. cordata (Linn. spec. 994.) leaves cordate, many-nerved, quite entire, glabrous, but the branches are villous. G. Native of the Cape of Good Hope. Jacq. schræbr. 2. t. 218. B. cordifolia, Lam. dict. 2. p. 436. Burm. prod. fl. cap. 21. Corolla densely villous, with the vexillum obcordate.

5. B. recurvollia (Sims. bot. mag. t. 2128.) leaves cordate, many-nerved, minutely-ciliated, but are otherwise glabrous, as well as the branches. G. Native of the Cape of Good Hope. Cler. thes. 1. t. 24. f. 3. and Lam. ill. t. 610. f. 1. Flowers sparingly villous.

6. B. parvifolia (Lam. dict. 2. p. 437.) leaves cordate, many-nerved, minutely denticulated, and are, as well as the branches, glabrous. G. Native of the Cape of Good Hope. Flowers small, sessile, few, usually terminal.

Small-flowered Borbonia. Shrub 2 to 3 feet.

7. B. crena (Linn. spec. 994.) leaves cordate, roundish, acute, denticulated, many-nerved, and reticulated between the nerves, and are, as well as the branches, glabrous. G. Native of the Cape of Good Hope. Curt. bot. mag. 274. Burm. cap. 21. Lois. herm. amat. t. 222. Flowers less villous than in the rest of the species.

8. B. cilia (Willd. spec. 3. p. 923.) leaves cordate, rather orbicular, obtuse or acute, many-nerved, reticulated, denticulated, with the nerves and margin ciliated with long hairs; branches piliferous. G. Native of the Cape of Good Hope. Flowers small, few. The hairs on the leaves when young are frequently long and spreading.

† Species not sufficiently known.

XLIII. LIPARIA. XLIV. PRIESTLEYA.

9. B. monosperma (D. C. prod. 2. p. 120.) leaves lanceolate, 3-nerved, very acute; pedicels 1-flowered, reflexed after flowering; legume 1-seeded, pendulous. G. Native of the Cape of Good Hope.

One-seeded Borbonia. Shrub.

10. B. undulata (Thom. prod. 122.) leaves stem-clasping, undulated, ending in a reflexed mucrone. G. Native of the Cape of Good Hope. Perhaps this is a species of Rosa allied to V. amplipetala or V. perfoliata.

Waved-leaved Borbonia. Shrub 2 to 4 feet.

11. B. villosa (Thom. fl. cap. 560.) leaves lanceolate, veinless; stem hairy; flowers terminal, sessile; corolla hairy. G. Native of the Cape of Good Hope. Perhaps a species of Priestleya.

Villos Borbonia. Shrub 2 to 3 feet.

Cult. The species of Borbonia are showy when in flower. They thrive best in a mixture of loam and peat, and young cuttings strike root freely in sand, under a bell-glass.

XLIII. ACHYRONIA (from axypor, achyron, chaff; in reference to the branches and leaves being covered with chaffy hairs). Wendel. obs. bot. 30. D. C. prod. 2. p. 120.

Linn. syst. Diadelphia, Decandria. Calyx 5-toothed, lower tooth elongated and bifid. Stamens diadelphous. Legume compressed, many-seeded.—A shrub, with the appearance of Borbonia.

1. A. villosa (Wendel. l. c. et herrenh. 1. t. 12.) G. Native of New Holland. Erect, with the branches beset with silky hairs. Leaves lanceolate, acute, smooth, with the margins beset with silky villi. Yellow flowers, axillary, pedicellate.

Cult. See Borbonia for culture and propagation.

XLIII. LIPARIA (from λεπόρις, liparos, brilliant; in allusion to the surface of the leaves being shining). Lin. munt. 156. exclusive of numerous species. D. C. leg. mem. vi. prod. 2. p. 121.

Linn. syst. Diadelphia, Decandria. Calyx thrust in at the base, with a short tube and a 3-lobe limb, the 4 superiior lobes lanceolate and acute, and about equal in length, lower one very long, elliptic, and petaloid. Corolla glabrous, with an oval-oblong vexillum and oblong wings, the one involving the other in aestivation. Keel straight, acute, narrow, 2-edged. Stamens diadelphous. Ovary sessile, very short. Style filiform. Legume ovate, few-seeded. Cape shrubs, smooth in every part except the pedicels, which are very short, and the ovary, which is very villous. Leaves lanceolate, exstipulate, quite entire, thin, many-nerved, pungent at the apex. Flowers disposed in subpherical heads, of a yellowish-brown colour, drying black.

Cult. See Priestleya for culture and propagation.

XLIV. PRIESTLEYA (in honour of M. Priestley, a physiological botanist). D. C. leg. mem. vi. D. C. prod. 2. p. 121.—Liparia, spec. of authors.

Linn. syst. Diadelphia, Decandria. Calyx nearly equally 5-lobed, somewhat bilabiate. Corolla glabrous, with a roundish vexillum, which stands on a short stipe, falcate obtuse wings, and a 2-edged convex keel which is curved on the back. Stamens diadelphous. Style filiform. Stigma capitata, sometimes furnished with an acute tooth behind. Legume sessile, plano-compressed, oval-oblong, apiculated by the style, 4-6-seeded. Cape shrubs, with simple, quite entire, exstipulate leaves, and
with yellow flowers, which are disposed either in heads, umbels, or spikes. This genus differs from *Borbonia* and *Aspödathas* in the stems being diaphalous, and from *Liparia* in the caly-
cine lobes being nearly equal, and in the form and aestivation of
the petals.

**Sect. I. Eiso** thea (from *eiso*, *ciso*, within, or in, and *theo*, to
run; in reference to the calyx being run or thrust in at the base,
and therefore becoming in consequence diminished). D.C. prod.
2. p. 121. Calyx thrust in at the base.

1 P. **myrtifolia** (D. C. l. c. t. 29.) leaves quite smooth,
ovate-lanceolate, acute, almost nervelless; bracteas shorter than
the pedicels, and involving them at the base, and are as well
as the calyces glabrous; legumes clothed with adpressed villi.

g. G. Native of the Cape of Good Hope. Liparia myrtifolia,
Thumb. fl. cap. 555. Calyx yellowish when dry, very much
thrust in at the base, having equal, ovate, rather acute lobes.
Heads of flowers rather loose; pedicels elongating after flowering.

**Myrtle-leaved** Priestleya. Fl. April, Dec. Cl. 1823. Sh.
2 to 4 ft.

2 P. **hirsa** (D. C. 1. c.) leaves obovate-oblong, acute,
glabrous, but with the branches, bracteas, and calyces hairy;
stigma bifurcate. 
g. G. Native of the Cape of Good Hope. Liparia hirsuta,
Thumb. fl. cap. 557. Ker. bot. reg. t. 8. but not of Mench.
Racemes of flowers somewhat capitulate, usually twin.
Bracteas inclosing the pedicels and longer than them,
spaceate at the apex.

**Hairly** Priestleya. Fl. April, Dec. Cl. 1792. Sh. 2 to 4 ft.

3 P. **levigata** (D. C. l. c. t. 30.) leaves oblong-linear,
acute, nerved, lower ones glabrous, the upper and floral ones
clothed with adpressed silky pubescence; flowers disposed in
capitate umbels; calyces obtuse, clothed with adpressed villi;

ovary villous. 
g. G. Native of the Cape of Good Hope. Liparia levigata,
Thumb. fl. cap. 556. Borborhia levigata, Lin. manti. 100. L. umbellata, Lin. manti. 110. Calyx at length
thrust in at the base, with obtuse lobes.

**Smooth** Priestleya. Fl. July, Aug. Cl. 1820. Sh. 2 to 4 ft.

**Sect. II. Axels** thea (from a pr. *eiso*, *ciso*, within or in,
*theo*, to run; the calyx in the species of this section are
not thrust in at the base, as in the preceding). D.C. prod.
2. p. 121. Calyx not thrust in at the base but ovate or obco-
nically attenuated.

4 P. **capita** (D. C. prod. 2. p. 121.) leaves oblong-linear,
acute, somewhat convolute, nervedless, and are as well as
the branches quite glabrous; bracteas, calyces, and legumes very
hairy. 
g. G. Native of the Cape of Good Hope. Liparia capita,
Thumb. prod. 124. fl. cap. 556. Burch, cat. no. 591. Flowers
capitate. Calyx ovate at the base. Stamens diaphalous,
permanent around the fruit.

**Capitate**-flowered Priestleya. Fl. July, Aug. Cl. 1812.
Shrub 2 to 4 feet.

5 P. **graminifolia** (D. C. prod. 2. p. 122.) leaves lanceolate,
and are as well as the angular stems glabrous; flowers spicate,
hairy. 
g. G. Native of the Cape of Good Hope. Liparia graminifolia,
Lin. mant. 268. Thumb. fl. cap. 556. Leaves 1-nerved
beneath. Perhaps sufficiently distinct from *P. capitata*.

6 P. **tères** (D. C. 1. c.) leaves oblong-oblong, and are as
well as the stem glabrous; stem terete; flowers racemose, hairy.

g. G. Native of the Cape of Good Hope.

2 to 4 feet.

7 P. **bicefælia** (D. C. 1. c.) leaves linear-lanceolate, rather
acute, with somewhat revolute margins, hairy beneath, but
at length glabrous above; branches and calyces silky; flowers
capitate, terminal, or in fascicules in the upper axis of the leaves.

g. G. Native of the Cape of Good Hope. Borborhia ericifolia,
colour at the apex. Ovary very villous. Leaves 3 lines long.

Fur. b ; leaves silky on the upper surface. 
g. G. The plant, when dry, has the habit of *Chenélia* diffusa, D. C. leg-
mem. t. 31.

8 P. **sericea** (D. C. 1. c.) leaves ovate, acute, flat, 1-nerved,
clothed with silky adpressed pubescence on both surfaces as
well as on the branchlets; flowers disposed in a short terminal
spike, clothed with adpressed pubescence; legumes hairy. 
g. G. Native of the Cape of Good Hope. Liparia sericela, Lin. syst.
388. f. 3. Indigofera serica, Lin. mant. 271. ex Lam. dict.
1014. 7.

**Silky** Priestleya. Fl. June, July. Cl. 1794. Sh. 2 to 3 ft.

9 P. **axillaris** (D. C. leg. vi. t. 32.) leaves ovate, acute,
flat, 1-nerved, clothed with adpressed villi on both surfaces as
well as on the branchlets; flowers solitary in the axis of the
upper leaves; calyx and legumes hairy. 

**Axillary**-flowered Priestleya. Fl. June, July. Cl. 1822.
Shrub 2 to 3 feet.

10 P. **elliptica** (D. C. leg. mem. vi. t. 33.) leaves elliptic,
flat, 1-nerved, ending in a callous mucrone, covered with
adpressed villi on both surfaces; flowers capitulate, and are as
well as the calyces and branchlets velvety. 
g. G. Native of the Cape of Good Hope. Flowers 5-6, umbellately capitate at the

tops of the branches. Calyx clothed with silky pubescence.
Branches rather hairy. Leaves rather canescent.

**Elliptic**-leaved Priestleya. Cl. 1825. Shrub 2 to 4 feet.

11 P. **villo**sa (D. C. prod. 2. p. 122.) leaves ovate-elliptic,
acuté, 1-nerved, flat, hairy on both surfaces, as well as the
branchlets, calyces, and legumes; flowers capitulate. 
g. G. Native of the Cape of Good Hope. Borborhia tomentosa, Lin.
spec. 994. Liparia villosa, Lin. mant. 438.—Seba, thes. 1.

**Villos** Priestleya. Fl. June, July. Cl. 1774. Sh. 2 to 4 ft.

12 P. **vestita** (D. C. prod. 2. p. 122.) leaves ovate, concave,
obtuse, nervedless, glabrous above, but clothed with hairy wool
beneath as well as the calyces and branches; flowers capitulate.

g. G. Native of the Cape of Good Hope. Liparia vestitia,
Thum. fl. cap. 558. Sims, bot. mag. 5222. Liparia villosa,
Andr. bot. rep. 382.—Seba, thes. 1. t. 24. f. 1.

**Clothed** Priestleya. Fl. May, June. Cl. 1800. Sh. 2 to 4 feet.

† The calyx of the following species being unknown, conse-
quently are not arranged in any section.

13 P. **tecla** (D. C. prod. 2. p. 122.) leaves ovate, concave,
sprecatum; flowers axillary, stalked. 
g. G. Native of the Cape of Good Hope. Liparia tecla, Thum. prod.
124. fl. cap. 558.

**Covered** Priestleya. Shrub 2 to 3 feet.

14 P. **tomentosa** (D. C. prod. 2. p. 122.) leaves lanceolate,
and are as well as the calyces tomentose; flowers capitulate.

g. G. Native of the Cape of Good Hope. Liparia tomentosa,
Thum. l. c. Corolla glabrous.

15 P. **umbelliforma** (D. C. l. c.) leaves lanceolate, villous;

branches umbellate; flowers somewhat umbellately capitulate,
tomentose. 
g. G. Native of the Cape of Good Hope. Liparia umbelliforma,
Thum. l. c.

**Umbelliferous** Priestleya. Shrub 2 to 4 feet.

**Cult.** The species of this genus thrive very well in a mixture

104.
of sandy loam and peat, but they do not require to be watered so freely as many other plants of this order; for if they are watered too much over their leaves, it is certain to kill them. The very young tops taken off and made into cuttings, and planted in a pot of sand, with a bell-glass placed over them, are not difficult to root, if the bell-glasses are taken off and wiped regularly to prevent damp. They are all elegant plants when in flower.

Lin. syst. Monadelphus, Decandria. Calyx 5-cleft, with the segments about equal. Keel obtuse. Stamens monadelphous, with the sheath complete. Legume compressed, membranous, 2-valved, 1-seeded.—Cape herbs or subshrubs, with simple leaves and with the stipules adhering to the petiole, and purple flowers standing on solitary axillary pedicels. This genus is allied to Psoralea or Anthyllis, not to Hedysarum.

1 H. ala'ata (Thunb. fl. cap. 593.) stem 2-edged; stipules rather deciduous, adnate to the petioles and longer than them; leaves lanceolate or oblong, younger ones rather villous and complicated, adult ones glabrous; flowers on short pedicels, ultimate ones according to Thunberg disposed in a terminal raceme. Υ. G. Native of the Cape of Good Hope beyond Cape Town, a little to the westward.

Winged-stemmed Hallia. Fl. July, Aug. Fl. Cap. 1818. Pl. 1 ft. 2 H. Flaccida (Thunb. l. c.) stem filiform, trilobal at the apex; stipules ovate, acute, striated, hardly adnate to the petioles at the base, and rather longer than them; leaves lanceolate, mucronate, glabrous; peduncles 1-flowered, length of leaves. Υ. G. Native of the Cape of Good Hope. The stipules according to Thunberg are reflexed, but in the specimen they are obviously erect.

3 H. angustifolia (D. C. prod. 1. p. 123.) stem filiform; stipules lanceolate, erect, adnate even to the middle of the very short petioles and longer than them; leaves linear, acute, glabrous; pedicels 1-flowered, a little shorter than the leaves. Υ. G. Native of the Cape of Good Hope.

4 H. virga'ta (Thunb. fl. cap. l. c.) stem terete; stipules lanceolate, erect; petioles very short; leaves lanceolate, mucronate, glabrous; pedicels much shorter than the leaves. Υ. G. Native of the Cape of Good Hope.

Twiggv Hallia. Pl. 1 foot.

5 H. corda'ta (Thunb. l. c.) stem filiform, trilobal, pilose; stipules laciniate, spreading, reflexed, about equal with the petioles in length; leaves cordate, acuminate, pilose; pedicels 1-flowered, 3-times longer than the petioles. Υ. G. Native of the Cape of Good Hope, in grassy places. Hedysarum cor' dados, Thunb. nov. act. imp. 6. p. 41. t. 11. Glycine mono'phylla, Jaeg. scheinbr. 3. t. 296.

6 H. asa'rina (Thunb. l. c.) stem filiform, striated, pilose; stipulas ovate, acute, reflexed, longer than the very short petioles; leaves cordate, rounded, mucronate, villous; pedicels 1-flowered, length of leaves. Υ. G. Native of the Cape of Good Hope. Crotalaria asarina, Berg. cap. 194.

7 H. imbre'ca'ta (Thunb. l. c.) stems terete, striated; branches villous; stipulas ovate-oblong, acute, mucronate, deflexed; leaves nearly sessile, cordate, acute, complicated. Υ. G. Native of the Cape of Good Hope. Sims. bot. mag. 1850. Hedysarum imbricatum, Lin. fl. suppl. 330. Thunb. nov. act. imp. p. 42. t. 1. f. 2. Flowers sessile.

Imbricate-leaved Hallia. Fl. Aug. Fl. Cap. 1812. Pl. 1 to 2 ft. Cult. The species of Hallia are very pretty plants, with purple flowers; they thrive well in a mixture of sandy loam and peat, and young cuttings strike freely in sand under a bell-glass, or they may be raised from seeds, which sometimes ripen.

XLVI. HEYLANDIA (in honour of M. Heyland, an artist employed by De Candolle). D. C. leg. mem. vi. prod. 2. p. 123.

Lin. syst. Monadelphus, Decandria. Calyx 5-cleft, with the lobes about equal. Keel obliquely truncate and acuminate, as in Ononis. Stamens monadelphous, with the sheath cleft in front. Style filiform, bent, almost forming a straight angle. Legume compressed, 1-celled, 1-seeded.—East Indian herbs or subshrubs, slender, dichotomous, and hairy, without stipules. Leaves on short petioles, cordate, roundish. Flowers axillary, solitary, nearly sessile, yellow, and small.

1 H. hebre'ka (D. C. leg. mem. vi. t. 54.) legumes covered with long scattered hairs; leaves on very short stalks, roundish and cordate. Υ. S. Native of Ceylon, in the interior of the country. Ovary very hairy. Leaves 4-5-lines long.

Latebrosea Heylandia. Shrub procumbent.

Cult. The culture and propagation of this genus is the same as that recommended for Hallia, but being stone plants require heat.

XLVII. CROTALaura (from kropolv, krotalon, a castant; the pods of this genus are inflated, and the seeds rattle when the pods are shaken.). Lin. gen. 862. Gaert. fruct. 2. t. 148. Linn. ill. t. 67. D. C. prod. 2. p. 124.

Lin. syst. Monadelphus, Decandria. Calyx 5-lobed, somewhat bilabiata, upper lip bifid, lower one trifid. Vexillum large, cordate. Keel falcate, acuminate. Filaments all connected with the sheath, cleft in front. Style bearded laterally, pubescent. Legume turbid, with the valves ventricose, usually many-seeded, pedicellate.—Herbs or subshrubs, with simple or palmately compound leaves, these last have usually 3 leaflets, very rarely 5-foliolate. Flowers usually yellow, with small bracteas along the pedicels, or at the base of the calyx. The greater number of the species being not sufficiently known, the whole are disposed in an artificial order.

§ 1. Leaves simple.

* Stipulas decurrent. Flowers disposed in racemes, the va-
ceous terminal or opposite the leaves. Stems all herbaeous. 
Corolla smaller than the calyx, or about equal in length to it.

1 C. alata (Hamilt. ex Roxb. in D. Don, prod. fl. rep. 211.) stipulæ ovate, acute, rather convex on the inner side, running down the stem a great way in a wing; leaves ovate or oval-oblong, retuse, pubescent as well as the stem, which is ascendent; bractæ ovate. ♀. F. Native of Nipauli, at Sambuli. Racemes few-flowered. Bractæ and bracteoles ovate. Calycine lobes acuminate. Flowers pale-yellow.

2 C. stipulata (Desv. journ. bot. 1814, p. 76.) stipulæ ovate, acuminate, rather cut on the inner side, ending in a long broad wing; leaves oval, obtuse, and are villous as well as the stem, which is erect; bractæ linear, acuminate. ♀. S. Native of Cayenne. Legume smooth, an inch long. Var. suber, serpyllifolia (D. C. prod. 2. p. 124.) leaves oval-oblong, smaller than those of the species. ♀. S. Native of South America. Serpyllifolia, herb. Lamb.

3 C. genistella (H. B. et Kunth, nov. gen. amer. 6. p. 398.) plant covered with strigose silky hairs, herbaeose, erect; stipulæ short, deciduous, acute; leaves lanceolate, acute, silvery beneath; racemes axillary and terminal, many-flowered, panicled; legume many-seeded, smooth. ♀. S. Native on the Andes, about Popayan.

Genista-like Crotalaria. Pl. 1 ft.
4 C. petrocaulis (Desf. 1. c.) stipulæ obtuse, deciduous; leaves linear-lanceolate, acute, silky from adpressed hairs; legume oblong, smooth. ♀. S. Native of South America.

Winged-stemmed Crotalaria. Pl. 1 ft.
5 C. platycarpa (Link. numm. 2. p. 227.) branches winged from the, the deciduous stipulae, lower leaves oblong, upper ones lanceolate, acute, hairy; racemes lateral, bracteoles linear. ♀. 3. Native of North America. Corolla yellow, but with the vexillum brownish.

7 C. fariniflora (Roth. cat. 2. p. 83.) stipulæ oblong, acute, short, superior ones deciduous; leaves linear-lanceolate, very hairy as well as the stem, which is erect and branched. ♀. H. Native of North America, from New York to Carolina. Wild. spec. 3. p. 973. Pursh, l. c.

8 C. sagittata (Lin. spec. 1003. var. a.) stipulæ lanceolate, acuminate, deciduous; leaves oblong-lanceolate, hairy as well as the stem which is branched and erect; racemes usually 2-flowered. ♀. H. Native of North America, from Virginia to Georgia, in pine barrens. Herrm. lugd. bot. p. 203. icon. C. blainii, Schrank. ex Rausch.

9 C. espadilla (H. B. et Kunth, l. c.) stipulæ large, acuminate, triangularly falcate, deciduous; leaves lanceolate or oblong, obtuse, younger ones golden-yellow, and are as well as the erect stem beset with strigose silky hairs; racemes opposite the leaves, few-flowered; legume many-seeded, glabrous. ♀. S. Native of South America, in sandy places near Carienana, where it is called Espadilla. Very like C. sagittata. Espadilla Crotalaria. Pl. 1 ft.

10 C. ovalis (Pursh, l. c.) stipulæ acuminate, upper ones deciduous; leaves almost sessile, oval, hairy as well as the stems, which are diffuse; racemes elongated, 4-6-flowered, opposite the leaves. ♀. F. Native of Georgia and Carolina, in pine barrens. Hook. bot. meg. 300. C. sagittalis, var. ovalifolius, Michx. fl. bot. amer. p. 55. Anon youths rotundifolius, Walt. no. 278. C. rotundifolius, Poir. suppl. 2. p. 402. The leaves are sometimes exstipulate, as has been noticed by Nuttall.

11 C. ervigiosa (Willd. spec. 3. p. 573.) stipulæ linear, acuminate, upper ones deciduous; leaves oval-lanceolate, mucronate, villous, as well as the stem, which is branched and diffuse; racemes usually 3-flowered and elongated. ♀. S. Native of the East Indies. This is very like the preceding species.

•• Stipulæ not deciduous, and sometimes wanting altogether. Flowers disposed in racemes, which are either terminal or opposite the leaves.

12 C. verrucosa (Lin. spec. 1005.) stipulæ lunate, decurrent; leaves oval, obtuse; branches acutely tetragonal; racemes terminal; ovaries villous. ♀. S. Native of the East Indies. Andr. bot. rep. t. 308. Lindl. bot. reg. 1137. Hook, bot. mag. 3034. C. coriacea, Jaccq. icon. rar. t. 144. C. angulosa, Lam. dict. 2. p. 195. Cav. icon. 4. t. 321. Corolla with the vexillum greenish-white, streaked with pale-blue inside and with the wings obovate, yellowish-white at the base, the rest blue, and with the keel whitish, but yellowish at the point. Anthers yellow.

13 C. acuminata; stipulæ lunate, decurrent; leaves ovate, but rather hasteate at the base, and acuminate at the apex; branches tetragonal; racemes terminal; ovaries villous? ♀. S. Native of the Mauritius and the islands in the East Indies. C. verrucosa, var. a, acuminata, D. C. prod. 2. p. 125.—Burm. zeyl. t. 34. Leaves acute at both ends. Flowers bluish.

14 C. semperfloræns (Vent. hort. cels. t. 17.) stipulæ lunate, nearly lanceolate, decurrent; leaves oval, emarginate, mucronate; stems terete, striated, suffruticose at the base; ovaries clothed with adpressed pubescence. ♀. ? S. Native of the East Indies. Flowers golden-yellow, crowded at the tops of the racemes. Leaves clothed with adpressed pubescence beneath, and usually a little warts, as in C. verrucosa.

15 C. retusa (Lin. spec. 1004.) stipulæ sessile, straight; leaves oblong-cuneiform, retuse, full of very minute, pellucid dots; racemes terminal; ovaries glabrous. ♀. S. Native of the East Indies, from whence it has been introduced to the Mauritius and to the West India Islands. Ker. bot. reg. 253. Flowers yellow but with the vexillum usually purplish. Leaves variable, more or less villous beneath, sometimes mucronate at the apex, with the mucron either straight or recurved.—Rumph. amb. 5. t. 96. f. 1.—Rheed. mal. 9. t. 25. Burm. ind. 155.

16 C. leschenaultii (D. C. prod. 2. p. 125.) stipulæ triangular, acuminate, cuneate-elliptic, mucronate, clothed with silky villi beneath and full of pellucid dots; racemes terminal; ovaries glabrous. ♀. S. Native of the East Indies, on the Nelligery mountains, where it is called Gault-guedje by the natives. Flowers yellow. This is an intermediate species between C. retusa and C. spectabilis.
Lechenault's Crotalaria. Pl. 3 to 9 feet.
17. C. spectabilis (Roth. nov. spec. 341.) stipular lanceolate, coriaceous, somewhat sagittate; leaves cuneate, mucronate, clothed with hoary tomentum beneath, full of pellucid dots; lower leaves obovate and obtuse, middle ones oblong-elliptic, superior ones nearly linear; stem obtuse-angled; ovaries glabrous.  S. Native of the East Indies. Flowers of a dusky-purple colour. Allied to C. retusa, but differs in the stipules being dilated at the base, not setaceous.

18. C. pulcherrima ( Roxb. cat. calc. 54. ex Sims, bot. mag. 1827.) leaves cuneate-ovate, clothed with silky pubescence on both surfaces; bracteas and calyxes coloured; legume sessile, few-seeded, covered by the permanent calyx; stem shrubby, with the branchlets terete.  S. Native of Mysore. Flowers yellow, very like those of Spadrinitum juncaceum.

Fairer Crotalaria. Fl. June, July. Clt. 1814. Sh. 1 to 3 ft.
19. C. Bengalensis (Lam. dict. 2. p. 196.) leaves lanceolate, mucronate, almost sessile, pubescent; stem twiggy; racemes loose, elongated, terminal; legume clothed with villous tomentum or villi.  S. Native of Bengal.—Pluk. alm. t. 169.  S. Native to C. juncaceum, and perhaps the C. tenusilfa of Horn. cat. hort. binn. suppl. 151. Flowers yellow.

20. C. juncacea ( Lin. spec. 1004). stipular setaceous, almost wanting; leaves cuneately lanceolate, on short petioles, clothed with adpressed pubescence, as well as the furrowed stems; racemes terminal; legume clothed with villous tomentum.  S. Native of the East Indies. Roxb. cor. 2. t. 193. Andr. bot. rep. 442.—Burm. ind. 155.—Rheed. mal. 9. t. 26. Flowers yellow, resembling those of Genista juncacea. Legume pendulous, 12-15 lines long and 6 broad, 6-10-seeded. This plant is cultivated in India for its fibre, as a substitute for hemp; it is prepared in the same way. It is also very nourishing food for cows, when young.

Var. β, punctulata (D. C. prod. 2. p. 126.) vexillum and wings marked at the apex with black lines and dots.

22. C. peskisatara ( Sims, bot. mag. 1933.) stipular setaceous; leaves ovate-lanceolate, silky beneath and ciliated; stems pubescent, furrowed; vexillum rather orbicular, acuminate.  S. Native of the East Indies. Lower segments of the calyx cohering at the apex.

23. C. sericea ( Retz. obs. 3. p. 26.) stipular semi-cordate; leaves lanceolate, acute, silky beneath as well as the legumes; stem furrowed; racemes terminal, elongated.  S. Native of the East Indies. Allied to C. juncacea. Flowers yellow.

24. C. teetata ( Roth. nov. spec. 343.) plant exsativate, clothed with silky pubescence; leaves oblong, mucronate, approximate, sessile, lower ones ovate, superior ones linear; stem straight, divided at the apex; legumes and styles glabrous.  S. Native of the East Indies. Flowers about the size of those of C. parvisilfa, yellow and striped with blackish-brown.

Covered Crotalaria. Pl. 1 to 2 ft.
25. C. Burmanii (D. C. prod. 2. p. 126.) stipular and bracteae setaceous; branches and leaves villous or clothed with silky pubescence beneath; lower leaves obovate, emarginate, superior ones oblong, mucronate; stem straight, divided at the apex; racemes usually terminal, simple.  S. Native of the East Indies. C. sericea, Burm. ind. 156. t. 35. f. 1. but not of Retz. Flowers yellow, one half smaller than those of C. juncacea, pubescent on the outside.

26. C. hirsutata (Willd. spec. 3. p. 978.) stipular subulate, reflexed; leaves ovate, acute, glabrous above and pubescent beneath; stem hairy; raceme subterminal; legume hairy.  S. Native of the East Indies, near Hyderabad. Flowers yellow.

27. C. Mysorensis (Roth. nov. spec. 338.) plant hairy; stipular linear-lanceolate; leaves oblong, obtuse, stalked; racemes terminal, elongated; bracteas length of calyx; legumes ovate, glabrous.  S. Native of Mysore, in the East Indies. Flowers yellow.

Var. β, pauciflora (D. C. prod. 2. p. 126.) stems slenderer, having a few long hairs as well as the leaves. Roth. l. c.

Var. γ, angustifolia (D. C. prod. 2. p. 126.) leaves narrower, and are as well as the stem densely clothed with rusty silky hairs. Roth. l. c.

Mysore Crotalaria. Pl. 1 to 2 ft.
28. C. montana (Roth, l. c.) plant exsativate, covered with silky brown strigae; leaves oblong, obtuse, almost sessile; stem terete; racemes terminal; legume nearly globose, dotted, glabrous, one half shorter than the style, which is pilose at the apex.  S. Native of the East Indies. Corolla length of calyx.

Mountain Crotalaria. Pl. 1 to 2 ft.
29. C. a/bida (Roth, l. c.) plant exsativate; leaves oblong-obtuse, mucronate, petiolate, clothed with hoary tomentum beneath; stem terete; racemes elongated; calyx strigose; legume oblong-ovate, longer than the pilose style.  S. Native of the East Indies. Corolla white, a little smaller than the calyx.

White-flowered Crotalaria. Pl. 1 to 2 ft.

Paniced Crotalaria. Fl. June, July. Clt. 1820. Sh. 2 to 3 ft.
31. C. pulchra (Andr. bot. rep. t. 601. Ait. hort. kew. 4. p. 272.) stipular setaceous, erect; leaves ovate-oblong, acute, silky on both surfaces, as well as the calyxes and vexillum; racemes terminal, bracteate.  S. Native of the East Indies. Flowers large, yellow. Legume, according to Andrews, length of calyx, and 4-seeded, and hence perhaps the same as C. tetrasperma, Dietr. Ovary villous. Vexillum acuminate. Bracteas 2, ovate.

32. C. nitens (H. B. et Kunth, nov. gen. amer. 6. p. 359.) suffruticoso, silky; branches rather angular; leaves oblong, obtuse, cuneated at the base, younger ones clothed with golden rusty down; racemes terminal or opposite the leaves, many-flowered; legume many-seeded, glabrous.  S. Native of New Granada, near Mariquita and Honda. The plant from Honda is more densely pilose, the bracteas smaller, and the flowers larger than those of the plant from Mariquita.

Shining Crotalaria. Shrub 1 to 3 feet.
**LEGUMINOSÆ.**

*Berterio's Crotalaria*. Fl. May, July. Cl. 1818. Sh. 2 to 3 ft. 34 C. Növe-Holländis (D. C. prod. 2. p. 137.) stipulas wanting; leaves elliptic-obovate, tapering to the base, obtuse at the apex, clothed beneath with adpressed silky pubescence, as well as the petioles and branches; racemes terminal. 2. C. Native of New Holland, on the eastern coast. Branches terete. Petioles nodose and articulated at the apex; hence its affinity to the trifoliate species of the genus. The flowers purplish in the dried state, and middle-sized.

*New Holland Crotalaria*. Fl. May, July. Cl. 1823. Pl. 1 to 2 feet.

35 C. Paulina (Schrank, pl. rar. mon. t. 88.) stipulas wanting; leaves oblong-lanceolate, attenuated at the base, bluntish, mucronate, hoary and sericeous beneath; racemes terminal; bracteas linear, much shorter than the pedicel. 2. S. Native of Brazil, at the town of St. Paulo. Link, enum. 2. p. 227. Flowers yellow, about the size of those of *Spárum júncum*.

36 C. breviflóra (D. C. prod. 2. p. 137.) stipulas wanting; leaves elliptic, attenuated at both ends, acute and mucronate, pubescent on both surfaces, palest beneath, the nerves and branches silky-villous; racemes terminal; bracteas linear, about equal in length to the pedicels. 2. S. Native of Brazil. Very like the preceding species, but the corolla is very much smaller, hardly exceeding the calyx in length.

*Short-flowered Crotalaria*. Pl. 1 to 2 feet.

37 C. bifábia (Lin. fil. suppl. 422.) stipulas reflexed; lower leaves orbicular, superior ones oblong; peduncles terminal, 1-flowered; stems diffuse, pubescent. 2. S. Native of the East Indies, where it is cultivated in gardens. The stipulas, according to Linnaeus the younger, are ovate-subulate, and the legume oblong and hispid or pubescent. Corolla large, bluish.

38 C. dichótoma (Roth. nov. spec. 340. but not of Graham,) stipulas linear-subulate, horizontal; leaves ovate, acuminate, rather scabrous, petiolate, superior ones lanceolate; stem erect, dichotomous; peduncles opposite the leaves, usually 2-flowered; flowers nodding; legumes ovate, pilose. 2. S. Native of the East Indies. Like C. bifária.

*Dichotomous-stemmed Crotalaria*. Shrub 1 to 3 feet.

39 C. Rothía-na (D. C. prod. 2. p. 127.) plant excistipulate, pilose; leaves ovate, obtuse, rather mucronate, ditich, petiolate; stems prostrate; peduncles opposite the leaves, 2-flowered; legume subglobose, hairy. 2. S. Native of the East Indies. C. hirta, Roth. nov. spec. 339. but not of Willd. Flowers yellowish.

*Var. β. ferruginea* (D. C. l. c.) plant beset with long, spreading, rusty pili.

*Roth's Crotalaria*. Shrub prostrate.

40 C. diffusa (Link, enum. 2. p. 228.) leaves lanceolate, obtuse, hairy, on short petioles; flowers terminal; calyx pilose, about equal in length to the corolla. 2. S. Native of? Flowers yellow.

41 C. Säna (Burm. fl. ind. 156. t. 48. f. 2.) leaves oblong, nearly sessile, glabrous, obtuse, mucronate; stems diffuse; peduncles opposite the leaves, 2-flowered; calyx pilose; legume subglobose, hairy. 2. S. Native of Malabar. Flowers yellow. Lam. dict. 2. p. 196. C. Malahárica, Garcin, in herb. Burm. C. bifóra, Lin. mant.

*Dwarf Crotalaria*. Pl. 1/2 foot.

42 C. biélo'ka (Lin. mant. 370.) stem prostrate, herbaceous; leaves oval-oblong, obtuse or suborbicular, pilose; peduncles opposite the leaves, and terminal, and longer than the stem, 2-8-flowered; legume tumid, globose, rather villous. 2. S. Native of the East Indies. Pet. gæz. t. 30. f. 10. Astrágalus bilobus, lin. mant. 273. This species differs from the preceding in the legumes being globose, not oblong. Corolla yellow.

43 C. glauca (Wild. spec. 3. p. 574.) stem glabrous, erect; leaves linear-lanceolate, glabrous; peduncles opposite the leaves, usually 3-flowered, rather shorter than the leaves, filiform. 2. S. Native of Guinea. Flowers yellow.

44 C. pusílla (Roth. nov. spec. 355.) plant excistipulate, clothed with greyish hairs; leaves linear, obtuse, rather mucronate, petiolate; stem much branched from the base, filiform; branches approximate; racemes terminal, rather secund; legume oblong-oval, obtusely-mucronate, hairy. 2. S. Native of the East Indies. Flowers small.

*Small Crotalaria*. Pl. 1/4 foot.

45 C. pú'mila (Schrank, acad. mun. 6. p. 188.) plant somewhat hairy; leaves linear-lanceolate, almost sessile; stems nearly simple, decumbent; flowers axillary, disposed in a terminal few-flowered raceme. 2. S. Native of? Legume ovate, erect, minute, terete.

46 C. tetragó'na (Andr. bot. reg. 593.) leaves long, lanceolate, pubescent; stem tetragonal; raceme terminal; legume villous. 2. S. Native of the East Indies. Ait. hort. kew. ed. 2. vol. 4. p. 271. Stipulas lanceolate, horizontally deflexed, deciduous. Flowers pubescent, large, yellow; the vexillum dotted with black outside, and lined on the inside. Ovary and style villous.

47 C. ellínto'lia (Lin. fil. suppl. 328.) leaves linear, oblong, obtuse, mucronate, nearly sessile, pilose beneath, as well as the stem; raceme terminal; stem somewhat striated, erect; legume glabrous, hardly larger than the calyx. 2. S. Native of the East Indies and Nipali, ex D. Don. prod. p. 241. Flowers yellow, in long racemes, second. Willd. spec. 4. p. 975. Stems diffuse, simple, and branched. Stipulas and bracteas small. Calyx silky.

48 C. Peltíla (Bert. ined. ex D. C. prod. 2. p. 128.) leaves oblong-linear, mucronate, young ones hairy; stem terete, very much branched; racemes terminal; bracteas and calyceae lobes callous, somewhat revolute; legume ovate, villous, length of calyx, 1-2-seeded. 2. S. Native of Jamaica, in gardens. Peduncles, pedicels, and tube of calyx hispid. Bracteas and calyceae lobes partly callous and glabrous.

49 C. genístoides (Lam. dict. 2. p. 196.) leaves linear-lanceolate, mucronate, glabrous, scattered, sessile; racemes short, few-flowered; branches filiform, twiggy, glabrous; calyces and legumes hairy. 2. G. Native of the Cape of Good Hope. The racemes are said to be both axillary and lateral.

*Genista-like Crotalaria*. Shrub 1 to 2 feet.

50 C. veigó'ltalin (Burch. cat. no. 1752.) plant excistipulate; leaves oblong-linear, mucronate, stalked, young ones, calyces, and branches clothed with adpressed silky pubescence; racemes opposite the leaves, elongated; flowers erect; legume pendulous, young ones clothed with adpressed villi. 2. G. Native of the Cape of Good Hope. Flowers resembling those of *Spárum júncum*, but a little smaller.

*Twiggy Crotalaria*. Shrub.

51 C. acuminá'ta (D. C. prod. 2. p. 128.) stipulas ovate, lanceolate, shorter than the petioles, acuminate; leaves stalked, linear, mucronately-acuminated, silky pubescent beneath, as well as the calyces and branches; peduncles opposite the leaves, 1-
2-flowered; ovaries glabrous. \( \text{H. G.} \) Native of the Cape of Good Hope. Burch. cat. afr. aust. no. 2327. Flowers smaller than in the preceding species.

_Accuminate-leaved_ Crotalaria. Shrub.

52 C. _spartoides_ (D. C. prod. 2. p. 128.) plant exstipulate; leaves linear-subulate, acute, distant, the young ones and branches pubescent, the adult ones glabrous; branches twiggly, striated; racemes terminal; ovaries pubescent. \( \text{H. G.} \) Native of the Cape of Good Hope. Burch. cat. no. 2336. Flowers yellow, about the size of those of _Spartium juncaceum_. Bracteoles 2, small, deciduous at the base of the calyx.

_Spartium-like_ Crotalaria. Shrub 2 to 3 feet.

53 C. _Perrottetii_ (D. C. prod. 2. p. 128.) plant exstipulate; leaves linear-subulate, very few; branches and calyces villously-hairy; stems much branched, twiggly, at length smooth and leafless; racemes crowded; corolla length of calyx; legume 3-4 seeded, ovate, somewhat compressed, villous. \( \text{H. G.} \) Native of Senegal. C. tomentosa, Perr. but not of Thunb. Stanens 10, 5 alternate others sterile. Style thick at the base, bent abruptly. Perhaps a distinct genus between _Hedysarum_ and _Crotalaria._

_Perrottet's_ Crotalaria. Shrub 2 feet.

54 C. _Thebaica_ (D. C. prod. 2. p. 128.) plant exstipulate, pubescent, much branched; old branches spiny; leaves oval or oblong, villous, undulated; flowers few at the tops of the branches, distant, disposed in something like a spike; legume ovate, pubescent, 1-2 seeded. \( \text{H. G.} \) Native of the island of Phuk, by way sides, and about _Theba._ Flowers yellow, lined with brown. _Spartium_ Thebæicum. Del. fl. egyp. p. 107. t. 37. f. 1.

_Theba_ Crotalaria. Fl. May, July. Clt. 1818. Sh. 2 to 3 ft.

*** Stipulas not decurrent, or wanting. Flowers disposed in terminal heads.

55 C. _speciosa_ (Roth. nov. spec. 356.) plant exstipulate, clothed with silky rusty villi; leaves oblong, obtuse, nearly sessile; heads of flowers dense, ovate, roundish; bracteas broad-lanceolate, length of flowers, and are covered with silky hairs, as well as the calyces, vexillum, and keel. \( \text{H. G.} \) Native of the East Indies.

_Shenvy_ Crotalaria. Shrub 2 to 3 feet.

56 C. _? reflexa_ (Thunb. fl. cap. 571.) leaves ovate, acute, tomentose, reflexed; heads of flowers crowded; branches reflexed. \( \text{H. G.} \) Native of the Cape of Good Hope. Calyx woolly. Corolla purple, glabrous. Leaves imbricated downwards.

_Reflexed_ Crotalaria. Shrub 2 to 3 feet.

57 C. _capitata_ (Lam. dict. 2. p. 195. ill. t. 617. f. 3.) villous; leaves lanceolate, scattered, crowded, sessile; heads terminal; ovaries villous. \( \text{H. G.} \) Native of the Cape of Good Hope. The stamens are said by Lamarrak to be diadelphous, and therefore the plant ought, perhaps, to be removed from this genus. Flowers white or violet.

_Capitate-flowered_ Crotalaria. Shrub 1 to 2 feet.

**** Stipulas not decurrent, or wanting. Flowers axillary, pedunculate or sessile.

58 C. _scaenensis_ (Lour. coch. p. 483.) stem shrubby, scandent; leaves oblong, acuminated, glabrous; peduncles many-flowered, axillary. \( \text{H. G.} \) Native of Cochín-China. Flowers white. Legume turbid, tapering to both ends.

_Climing_ Crotalaria. Shrub cl.

59 C. _procumbens_ (Moc. et Sesse, fl. mex. icon. incl. D. C. prod. 2. p. 129.) stems procumbent, herbaceous; leaves ovate, rather mucronate, pubescent; peduncles axillary, 2-flowered, 3 times longer than the leaves. \( \text{Y. G.} \) Native of Mexico. Flowers yellow. Legume cylindrical.

_Procumbent_ Crotalaria. Fl. May, July. Clt. 1823. Pl. pr. 60 C. _nummularia_ (Willd. spec. 3. p. 979.) procumbent; leaves roundish-ovate or lanceolate, obtuse, pilose beneath; peduncles axillary, 1-2 flowered, hairy, 4 times longer than the leaves. \( \text{Y. G.} \) Native of the East Indies. Legume roundish, ovate.

_Monkey-wort-leaved_ Crotalaria. Pl. procumbent.

61 C. _lanata_ (Thunb. fl. cap. 571.) leaves ovate, sessile, acute, woolly; flowers axillary, nearly sessile; legume ovate, acute. \( \text{H. G.} \) Native of the Cape of Good Hope.

_Woolly_ Crotalaria. Shrub.

62 C. _sensuflora_ (Lin. spec. 1004.) erect, herbaceous; leaves lanceolate, almost sessile, glabrous above, and pilose beneath; flowers sessile, axillary or lateral. \( \text{O. G.} \) Native of China. Flowers blue.

_Sessile-flowered_ Crotalaria. Pl. 1 foot.

63 C. _tuberosa_ (Hamilt. in D. Don. prod. fl. nep. 241.) root tuberous; stem branched, villous; leaves lanceolate-linear, acute, very villous at the base and beneath; pedicels axillary, 1-flowered, adpressed to the stem; legume compressed, villous. \( \text{Y. G.} \) Native of Nipaul. Flowers bluish-purple in a dried state.

***** Stipulas not decurrent or wanting. Flowers lateral and terminal. Calyx 5-parted, very hispid, with two of the lobes or segments wing-formed.

64 C. _antliyloides_ (Lam. dict. 2. p. 195.) leaves linear, acute, clothed with adpressed villi beneath; flowers subsessile, disposed in a short terminal raceme; pedicels and calyces rusty, and very hispid. \( \text{O. S.} \) Native of Java. Leaves 2 lines broad, and 2 inches long. Sepals of calyx unequal in breadth, the 2 superior ones broadest, obtuse, and mucronate. Legume glabrous, many-seeded, length of calyx.

65 C. _calycina_ (Schrank. pl. rar. mon. t. 12.) leaves lanceolate, acute, canescently-pubescent beneath; flowers lateral, on short pedicels; calyx rusty and very hispid. \( \text{O. S.} \) Native of Bengal. C. ramosissima, Roxb. hort. beng. p. 54. Corolla sulphur-coloured, a little shorter than the calyx. Leaves 4-5 lines broad, and 2 inches long.

_Large-calyx_ Crotalaria. Pl. 1 foot.

66 C. _n.spallensis_ (Link. enum. p. 228.) leaves lanceolate; flowers almost sessile, disposed in a short terminal raceme; calyx very hispid, and rusty. \( \text{O. S.} \) Native of Nipaul. Corolla blue, hardly larger than the calyx.

67 C. _roxburghiana_ (D. C. prod. 2. p. 129.) leaves oblong-linear, acute, clothed with adpressed pubescence beneath, as well as the branches; flowers lateral, on short stalks; calyx and bracteas very hispid and acuminate. \( \text{H. G.} \) Native of the East Indies and Nipaul. C. stricta, Roxb. hort. beng. p. 54. but not of Roth. C. antliyloides, D. Don. prod. fl. nep. 241. but Lamarrak's plant from Java appears to be distinct.

68 C. _chinensis_ (Lin. spec. 1003.) leaves ovate, on short petioles, bluish, rather pilose on both surfaces; racemes few-flowered; calyx hairy. \( \text{H. G.} \) Native of China. Corolla yellow, length of calyx. Perhaps this and the two following species are referable to the present division, but they are too imperfectly known to speak with certainty.

69 C. _hirta_ (Willd. enum. 747.) leaves linear-lanceolate, pilose; peduncles subterminal, disposed in something like a raceme; stem branched, diffuse, pilose. \( \text{O. S.} \) Native of the T...
LEGUMINOSÆ.

East Indies. C. pilosa, Roxb. Rottl. nov. act. nat. enr. 1808. C. hirta, Mart. acad. jun. 6. p. 156. t. F. Calyx densely clothed with rusty villi, hardly shorter than the corolla. 71

Fl. Ju. Aug. Clt. 1816. Pl. 1 to 2 feet. 70 C. prostrata (Rottl. in Willd. enum. 747.) leaves elliptic-lanceolate, obtuse, pubescent beneath; racemes opposite the leaves on long peduncles, few-flowered; stem prostrate, pubescent. O. S. Native of the East Indies. Mart. acad. jun. 6. p. 155. t. F. Calyx tomentose, about the length of the corolla, which is white. Legume glabrous, sessile. Perhaps C. prostrata of D. Don, in prod. fl. nup. 241. is the same plant.

§ 2. Leaves composed of 3-7 leaflets.

Stipules broad, leafy.

71 C. arborescens (Lam. dict. 2. p. 198.) stipulas on short petioles, obovate, emarginate, deciduous; leaflets obovate; petioles and branchlets canescent; legume pedicellate. 7. G. Native of the Mauritius and of the Cape of Good Hope. C. incanescens, Lin. fil. suppl. C. Capensis, Thumb. fl. cap. 572. Jacq. hort. vind. t. 64. Flowers yellow, about the size of those of Colutea.

Moon-shaped-stipled Crotalaria. Pl. 73 C. tuberculata (Delaun. herb. amat. t. 238.) stipulas roundish; leaflets ovate, pubescent; flowers terminal, somewhat corymbose. 7. G. Native of ?

* * * Leaves trifoliate. Racemes opposite the leaves, rarely terminal. Stipulas setaceous or wanting.

74 C. obovata; suffruticoso, branched; leaflets obovate, entire, somewhat emarginate at the apex, and rather pilose beneath; racemes terminal, spike-formed; legume hairy. 7. G. Native of Guinea. Flowers yellow.

Obovate-leafletted Crotalaria. Shrub 1 to 2 feet. 75 C. ochroleuca; shrubby, erect, branched; leaflets linear-lanceolate, entire, acuminate, clothed beneath with silky pili; racemes terminal, spike-formed, few-flowered. 7. G. Native of Guinea. Flowers cream-coloured.

Cream-coloured-flowered Crotalaria. Shrub 2 to 3 feet. 76 C. laburnioides (Lin. spec. 1005. fl. zeyl. p. 278.) stipulas wanting; leaflets oval, acute, glabrous; racemes opposite the leaves; legumes pendulous, on long stipites, which are 4-times longer than the calyx. O. S. Native of Malabar and Ceylon.—Rheed. mal. 9. t. 27. Burm. zeyl. t. 35. Legume cylindrical, glabrous, length of stipite. Corolla large, yellow. Keel acuminate, much longer than the wings.

Laburnum-leaved Crotalaria. Fl. July, Sept. Clt. 1739. Shrub 5 to 6 feet. 77 C. pendula (Bert. ined. D. C. prod. 2. p. 150.) stipulas wanting; leaflets oval, obtuse, glabrous; racemes opposite the leaves; legumes pendulous, on stipitate; stipite twice the length of the calyx, but one-half shorter than the legume. O. S. Native of Jamaica. Very like the preceding species.

87 C. foliacea (Willd. enum. 747.) leaflets obovate, emarginate, covered beneath with strigose pil; racemes terminal, usually 4-flowered; stem diffuse, branched. ț. S. Native of the East Indies. Indigofere foliacea, Rottl.

88 C. HAYAKAWA (Guss. ex Schlecht. Linn. 4. p. 36.), smooth; leaflets oblong, emarginate, tapering to the base; flowers racemose; legume oblong, cylindrical. ț. S. Native of Cuba, about the Hawaiian.

Havanenh Crotalaria. Shrub.

89 C. ORIHES (Rottl. in Willd. enum. 747.) stipulas lanceolate, and bracteate ovate, both reflexed; leaflets obvate, covered beneath with strigose pil; racemes terminal; stems diffuse; legume stipitate, ovate, obtuse, glabrous. O. S. Native of the East Indies. Flowers more minute than in any other species of the genus. Mart. in acad. mun. 6. p. 157. t. H.

90 C. VIRGATA (Roxb. ex Mart. acad. mun. 6. p. 157. t. G.) stipulas small; leaflets obcordate, destitute of a mucrone, glabrous; racme few-flowered, opposite the leaves, lateral; branches diffuse, rather twiggy. ț. S. Native of Coromandel. Legume unknown.

91 C. CUBE (D. C. prod. 2. p. 131.) stipulas linear-sessile; leaflets obovate-roundish; racemes nearly opposite the leaves; stem erect, hairy. O. S. Native of Cuba. C. hirta, Lag. nov. spec. Hort. madr. p. 22. but not of Willd.

92 C. SERTIFERA (Moc. et Sesse, fl. mex. incl. D. C. prod. 2. p. 131.) stipulas linear-sessile; leaflets obovate, mucronate; racemes opposite the leaves, and hairy, as well as the petals and branches; legume pendulous, cylindrical, hairy, nearly sessile. O. H. Native of Mexico. Flowers yellow. Keel acute, shorter than the vexillum and wings.

Bristle-bearing Crotalaria. Pl. 1 to 2 feet.

93 C. COLUTTOIDES (Lam. dict. 2. p. 200.) leaflets obovate, obtuse, mucronate, rather pilose beneath, longer than the petals; racemes terminal, loose; legume glabrous, stipitate, bladdery, destitute of a style. ț. S. Native of Africa. Pluk. t. 185. f. 3.

Colutea-like Crotalaria. Shrub 3 to 4 feet.

94 C. PURPURASCENS (Lam. dict. 2. p. 200.) stipulas setaceous, villous; leaflets obovate-cuneiform, retuse, mucronate, glabrous; racemes opposite the leaves almost terminal; calyx villous, about equal in length to the corolla; legume pendulous, sessile, oblong, bladdery. O. S. Native of Madagascar, and the Mauritius. Vexillum purplish above. Branches and petals clothed with hispid villi.

95 C. INCANEA (Lin. spec. 1005.) stipulas and bracteae setaceous, villous, deciduous; leaflets oval or obvate, villous beneath; racemes spike-formed, opposite the leaves; calyxes glabrous; keel with a tomentose margin; legume pendulous, sub-sessile, hairy. O. S. Native of the Caribbee Islands. Flowers yellow. Jacq. obs. 4. t. 82. Cav. icon. 4. t. 322. Ker. bot. reg. 377. C. pubescens, Meench.

96 C. DOMBEYANA (D. C. prod. 2. p. 152.) stipulas and bracteae setaceous, villous, deciduous; leaflets oval-oblong, acute, pubescent beneath; racemes spike-formed, opposite the leaves; ovary fine pubescent; legume pendulous, sessile, glabrous. ț. S. Native of Peru. C. incana β, Lam. dict. 2. p. 200. Very near to C. incana, but the flowers are double the size, and disposed in dense spikes.

Dombey's Crotalaria. Shrub 2 to 3 feet.

97 C. PUJERA (Vahl. eclog. 2. p. 55.) stipulas subulate, deciduous; leaflets oblong, obtuse, clothed beneath with adpressed crenate villi; racemes terminal and axillary; legume pendulous, oblong, villous. ț. S. Native of the island of St. Martha. Branches rather villous. C. pujera, Schrank. pl. rar. mon. t. 14. differs from Vahl's plant in the racemes being opposite the leaves, and therefore the plant is more nearly allied to C. incana.

Downey Crotalaria. Shrub 2 to 3 feet.

98 C. APPERTIS (D. C. prod. 2. p. 132.) stipulas and bracteae setaceous and deciduous; leaflets obovate-cuneate, truncate, smoothish; petals, branches, and legumes villous; racemes opposite the leaves. ț. S. Native of the Mauritius. Allied to C. incana. Calyces villous. Legume sessile, very hairy.

Allied Crotalaria. Shrub 2 to 3 feet.

99 C. VUILLA (Ort. decc. 2. p. 23.) stipulas subulate, spreading; leaflets obvate, emarginate, glabrous, rather fleshy; racemes opposite the leaves and lateral; legumes nearly sessile, pubescent, pubescent; stem ascending. O. S. Native of Cuba. Flowers yellow, smaller than those of C. incanum, to which the plant is very nearly allied. Stem and petals hardly pubescent.

100 C. FALCATA (Vahl. ed. ex herb. Puer. D. C. prod. 2. p. 132.) stipulas small, deciduous; leaflets elliptic, somewhat conate at the base, clothed with minute pubescence beneath, but glabrous above; racemes opposite the leaves: vexillum shorter than the keel, which is falcate. ț. S. Native of Guinea. Flowers small. Young legumes pendulous and tertec.

Falcate-keeled Crotalaria. Shrub 2 feet.

101 C. MUCRONATA (Desv. journ. bot. 1814. vol. 1. p. 76.) leaflets ovate, mucronate, clothed beneath with powdery pubescence; flowers sessile, spicate, terminal. ț. S. Native of the Antilles.

Mucronate-leaved Crotalaria. Shrub.

102 C. Micanus (Link, enum. 2. p. 228.) stipulas wanting; leaflets ovate, acute, becat with scattered shining hairs; racemes opposite the leaves: filaments of stamens hairy. ț. S. Native of? Legume unknown.

103 C. CURRATA (Link. l. c.) leaflets ovate, obtuse, becat with scattered hairs; the nerves, petioles, and branches hoary; racemes terminal, elongated; keel shorter than the vexillum. O. S. Native of?

104 C. PEDUNCULOSA (Desv. journ. bot. 1814. vol. 1. p. 76.) leaflets somewhat ovate, acute; flowers in racemose spikes; racemes opposite the leaves, on long peduncles. ț. S. Native of the East Indies.

Peduncled Crotalaria. Shrub.

105 C. MOLLICULA (H. b. et Kunth, nov. gen. amer. 6. p. 403.) branchlets terete; stipulas linear-subulate; leaflets lanceolate, obtuse, clothed with soft pubescence on both surfaces, but crenate beneath; racemes many-flowered, opposite the leaves, almost terminal; calyx clothed with adpressed pubescence. Ovary 16-ovulate, stipitate. ț. G. Native of Mexico, near Guanaxauto. Flowers about the size of those of C. incana.

Soft Crotalaria. Shrub 2 feet.

106 C. MAYPURASIS (H. b. et Kunth, nov. gen. amer. 6. p. 403.) branchlets angular; stipulas capillary; leaflets lanceolate, obtuse, somewhat mucronate, glabrous above, and clothed with adpressed pubescence beneath; racemes many-flowered, almost terminal; calyxes clothed with adpressed pubescence; legume many-seeded, hairy. ț. S. Native on the banks of the river Oriocu, near Maypures.

Maypures Crotalaria. Shrub 2 to 3 feet.
LEGUMINOSÆ

107. C. vitellina (Ker. bot. reg. t. 447.) plant extispulate, pubescent; leaflets oval-lanceolate, acute, twice the length of the petioles, which are covered with hairs; legume oblong, pendulous, silky-pubescent. ♀. S. Native of Brazil. Racemes 3-5 inches long. Flowers of a fulvous-yellow colour, but with the vexillum spotted with violet at the base.

Yolk-like Crotalaria. Fl. May, June. Ch. 1819. Sh. 2 to 3 ft. 188 C. holosericea (Nees et Mart. nov. act. bonn. 12. p. 26.) the whole plant clothed with silky villi; stipules subulate; leaflets rhomboidal, oval, obtuse, mucronate; racemes opposite the leaves; vexillum hialaceous at the base; legume villosus, elliptic, 5-6-seeded. ♂. S. Native of Brazil, in fields. Flowers yellow. An intermediate species between C. vitellina and C. purpurascens.

Whole-silky Crotalaria. Shrub 5 to 6 feet.

109. C. cylindrica (?) (D. C. prod. 2. p. 133.) stipulas dimidiate-oblong, acute at both ends, rather falcate; leaflets elliptic-oblong, rather pubescent beneath as well as the branchlets; racemes opposite the leaves; legumes sessile, cylindrical, 26-30-seeded, rather pubescent, apiculated by the style, rather spreading; stem erect, somewhat panicked. ♀. S. Native of Senegal. C. paniculata, Pers. in litt. but not of Wild. Cylindrical-fruited Crotalaria. Shrub.

110. C. senegalis (Baede in litt. 1820.) stipulas small, subulate, spreading, deciduous; leaflets oval, obtuse, smoothish; racemes opposite the leaves; legumes sessile, pendulous, pubescent, obovate, 8-10-seeded, crowned by the hooked style; stem erect, much branched, pubescent. ♂. S. Native of Senegal. C. uncinata, Lam. Pers. l.c. C. gracilis, Perr. in litt. 1825.

111. C. Podocarpa (D. C. prod. 2. p. 133.) plant erect, hispid all over from spreading hairs; stipulas dimidiate, oval-oblong, erect, leafy; leaflets obvate, obtuse, mucronate; racemes opposite the leaves; legume stipitate, turged, ovate, glabrous, apiculated by the style, 12-18-seeded. ♂. S. Native of Senegal, in the Sahara desert. The plant has the habit of Lotus hirsutus.

Foot-fruited Crotalaria. Pl. 1 to 2 feet.

112. C. Unguiculata (Lam. dict. 2. p. 200.) stipulas small or wanting; leaflets oval, mucronate, pubescent beneath; racemes opposite the leaves; legume stipitate, somewhat globose, hooked from the style, silky-velvety, 2-4-seeded; stem erect, much branched, pubescent. ♂. S. Native of the island of Bourbon.

Var. β, glabra (D. C. prod. 2. p. 133.) leaves and legumes glabrous; leaflets oblong, somewhat elliptic. ♂. S. Native of Bourbon. Perhaps a species.

Hooked-styled Crotalaria. Pl. 1 to 2 feet.

113. C. spicopera (Perr. in litt. 1825.) stipulas small; leaflets oblong-obovate, pubescent beneath; racemes opposite the leaves; legumes sessile, ovate-globose, clothed with fine pubescence, apiculated by the filiform style, 2-4-seeded; stem erect, much branched, pubescent. ♀. S. Native of Senegal. An intermediate species between the preceding and the following. Stamens permanent, at the base of the legume.

Round-fruited Crotalaria. Shrub 1 to 2 feet.

114. C. medicaginea (Lam. dict. 2. p. 201.) stipulas subulate, spreading; leaflets obvate-ennate, emarginate, clothed beneath with adpressed pubescence, shorter than the petioles; racemes opposite the leaves or terminal, elongated, and with some of the flowers disposed in axillary bundles; legume sessile, roundish, hooked from the thick base of the style, 2-4-seeded, minutely pubescent. ♂. ♀. S. Native of the East Indies. C. trifoliástrum. Willd. spec. 3. p. 583. Lupinus trifoliatus, Rotd. nov. act. nat. cur. 4. 1803. p. 223. t. 5.

Medick-like Crotalaria. Fl. June, July. Ch. 1816. Pl. 1 ft. 115. C. lupulina (D. C. prod. 2. p. 133.) stipulas setaceous, small; leaflets lanceolate, acute, mucronate, clothed with adpressed pubescence beneath as well as the calyces; racemes 9-10-flowered, opposite the leaves; legume ovate, many-seeded, puberulous. ♂. G. Native of Mexico, on the burning Mount Jorullo.

Hop Crotalaria. Pl. 1 foot.

116. C. arqueótea (Roth. nov. spec. 342.) stipulas setaceous, adpressed; leaflets cuneate, emarginate, mucronate, cuneiform beneath, length of petioles; stem straight; lower flowers axillary, in fascicles, upper ones disposed in a terminal raceme; legume pilose, globose, hooked at the apex. ♂. ♀. S. Native of the East Indies. Perhaps sufficiently distinct from the preceding species.

Straight Crotalaria. Pl. 1 to 2 feet.

117. C. nigida (Roth. l.c.) stipulas lanceolate-subulate; leaflets cuneiform, emarginate, covered with hoary pili beneath, length of petioles; stem divaricate; lower flowers axillaries, in fascicles, upper ones disposed in terminal racemes. ♂. S. Native of the East Indies.

Stiff Crotalaria. Shrub 1 to 2 feet.

118. C. purpurcea (Vent. malm. t. 66.) stipulas subulate; leaflets obvate, retuse, somewhat emarginate, glabrous above, and minutely pubescent beneath; racemes terminal; legume ovate, glabrous, apiculated by the style, on a very short style, many-seeded. ♂. ♀. G. Native of the Cape of Good Hope. Ker. bot. reg. 123. C. elegans, Hortul. Flowers deep purple.

Purple Crotalaria. Fl. Mar. May. Ch. 1820. Sh. 3 to 6 ft. 119. C. littoralis (H. B. et Kunth, nov. gen. amer. 6. p. 401.) suffruticoso, procumbent; stipulas subulate, very minute; leaflets 3, obvate-oblong, emarginate, beset with adpressed pili; peduncles 5-7-flowered, opposite the leaves and terminal; legume usually 2-seeded, clothed with adpressed pubescence as well as the calyces. ♂. S. Native of Cuba, near Havana?

Shore Crotalaria. Shrub 2 to 3 feet.

120. C. microphylla (Vahl. symb. l. p. 52.) stipulas setaceous, spreading; leaflets oblong, glabrous, thickish, length of petioles; peduncles opposite the leaves and terminal, 2-flowered; legume glabrous, oblong, on a short style; stem decumbent. ♂. ♀. G. Native of Arabia Felix. Leaflets 2 lines long.

Small-leaved Crotalaria. Fl. June, Aug. Ch. 1820. Pl. 1 ft. 121. C. microcarpa (Link, enum. 2. p. 229.) leaflets oblong, obtuse, mucronulate, beset beneath with scattered adpressed pili; racemes short, terminal; calyces silky. ♂. ♀. S. Native of Ceylon.

Silvery Crotalaria. Fl. June, July. Ch. 1823. Sh. 2 feet. 124. C. pulchella (Andr. bot. rep. t. 417.) leaflets linear-lanceolate, acute, longer than the petioles, clothed with adpressed pubescence, as well as the branches and petioles; racemes terminal; legume cylindrical, many-seeded, tapering into a stipe at the base. ♂. G. Native of the Cape of Good Hope. Sims. bot. mag. t. 1699. Flowers large, yellow, about the size of those of Spartium juncaceum.

Next Crotalaria. Fl. July, Aug. Ch. 1800. Sh. 2 to 4 ft. 125. C. angustifolia (Jacq. hort. schenbr. 2. p. 49. t. 219.) stipulas wanting; leaflets lanceolate, hoary, and silky, shorter
than the petioles; racemes terminal, elongated. G. Native of the Cape of Good Hope. Flowers cream-coloured, 6 lines long.

Let. G. elongata (Thunb. fl. cap. 571.) leaves ovate, obtuse; flowers yellow.

**Narrow-leaved** Crotalaria. Fl. May, Sept. Clt. 1815. Sh. 4 to 6 feet.

126 C. macle'enta (Gailliard, fl. meroc. 2. t. 62.) branches somewhat dichotomous, slender; petiole about the length of the leaves; leaves 3, ovate, clothed with short hairs beneath; spike elongated, not much crowded with flowers; fruit few-seeded. G. Native of Egypt, at the White River. The Chamos at Semnar eat the herb.

**Lean** Crotalaria. Pl. 1 to 2 feet.

127 C. Willdenow'ia (D. C. prod. 2. p. 134.) pubescent; stipulas subulate; leaflets linear, cuneate, emarginate; petioles very short; racemes terminal, 4-6-flowered; legume roundish-ovate, acuminate. G. Native of the Cape of Good Hope. Legumes of a species of Genista.

Willdenow's Crotalaria. Shrub 2 to 4 feet.

128 C. Aspalathoides (Lam. dict. 2. p. 202.) plant extipulate; leaflets linear, cuneate, hairy; racemes pedunculate, terminal, 3-6-flowered; ovary very villous. G. Native of the Cape of Good Hope. Leaves very small. Aspalathus-like Crotalaria. Shrub 1 to 2 feet.

130 C. villósa (Thunb. fl. cap. 572.) herbaceous, decumbent; branches villous, densely reflexed; leaflets obovate, mucronulate, hairy; stipulas lanceolate; spikes terminal; legume oblong, pubescent. G. Native of the Cape of Good Hope. Fillosa Crotalaria. Pl. decumbent.

132 C. decum'bens (Pers. enq. no. 50.) herbaceous, decumbent, hairy; leaflets ovate-oblong, pubescent above, and clothed beneath with silky tomentum, nervell; flowers terminal, somewhat spicate; legume pubescent. G. Native of the Cape of Good Hope. C. Linéata, Thunb. fl. cap. 572. but not of Lam. Decumbent Crotalaria. Pl. decumbent.

*** Leaves trifoliate. Flowers all axillary.***

133 C. lottrélié (Lin. spec. 1005.) leaflets oblong-cuneate, emarginate, clothed with silky villi beneath; peduncles axillary, solitary, 1-flowered; legume sessile. S. Native of Jamaica and Santa Cruz.—Sloane, hist. 2. t. 176. f. 1-2.—Dill. elth. t. 102. f. 131. The plant is said by many authors to be glabrous, but by Vahl the leaves are said to be silky beneath. Lotus-leaved Crotalaria. Fl. June, July. Clt. 1732. Shrub 2 to 4 feet.

134 C. volu'bils (Thunb. fl. cap. 572.) plant glabrous, between decumbent and twining; leaflets obovate, obtuse; flowers axillary, solitary, on short pedicels; legume ovate, pedicellate, glabrous. G. Native of the Cape of Good Hope. Twining Crotalaria. Shrub decumbent.

135 C. axilla'ris (Ait. hort. kew. ed. 2. vol. 3. p. 20.) leaflets oblong-lanceolate, acute, covered beneath with silky pili; pedicels axillary, twin, 1-flowered. S. Native of Guinea. Willd. spec. 3. p. 984. Stipulas small, lanceolate-subulate. Flowers yellow. Legume piliose. In a specimen of this plant sent to M. De Candolle from the English gardens, the leaves were pubescent beneath, and the pedicels 2-4 together, not all twin.

*** Leaves having 5 or 7 leaflets.***

137 C. quinquefoliá (Lin. spec. 1006.) leaflets 5, narrow-lanceolate, obtuse, young ones silky-pubescent; racemes opposite the leaves, terminal; bracteas linear, at length reflexed; legumes glabrous, apiculate by the style, on a short stipe. G. Native of Malabar and Java.—Burman. fl. ind. 157, exclusive of the 3-leaved variety.—Rheed. mal. 9. t. 28. Habit of a lupine. Five-leaved Crotalaria. Fl. Ju. Jul. Clt. 1792. Pl. 1 to 2 ft.

† Species not sufficiently known.

138 C. pilósá (Mill. dict. no. 2.) leaves simple, lanceolate, pilose; pedicels decurrent. Native of New Spain, at Vera Cruz.

Pilosa Crotalaria. Clt. 2. Pl. 1 to 2 feet.

139 C. frutícósá (Mill. dict. no. 4.) leaves simple, linear-lanceolate, hairy; pedicels deciduous, stem fruticosus. G. Native of Jamaica. Shrubby Crotalaria. Fl. June, July. Clt. 1716. Tr. 28 ft.

140 C. angula'ta (Mill. dict. no. 9.) leaves simple, ovate, sessile; branches angular, hairy; flowers lateral. G. Native of Campechey. Angular-stemmed Crotalaria. Fl. June, July. Clt. 1700. Pl. 2 to 3 feet.

141 C. styracífólía (Horn. hort. basn. suppl. 151.) leaves simple, broad-ovate, nearly sessile, pubescent on both surfaces, hoary; stipulas subulate. G. Native of the Cape of Good Hope. Perhaps the same as C. styracifólia of Desf. hort. par. Perhaps a species of Podalýria. Styrox-leaved Crotalaria. Shrub 2 to 4 feet.

142 C. hefaphýlla (Lour. coch. p. 433.) leaves imparipinnate, with 5 pairs of leaflets; leaflets ovate-oblong, rather tomentose; spikes elongated, axillary, and terminal, legume stipitate, tufted, villous. G. Native of Cochinchina. Flowers white. Stamens monadephous. This plant ought certainly to be removed from the genus in consequence of its pinnate leaves.

Seven-leaved Crotalaria. Shrub 10 feet.

143 C. macró styloa (D. Don, prod. fl. nep. 242.) leaves trifoliolate; leaflets obovate, retuse, coriaceous, mucronulate, clothed with silky villi beneath as well as the branches; racemes axillary; legume ovate, compressed, 1-seeded, very villous. G. Native of Shrenagar. In consequence of the stamens being diadelphous, and the style being very long and plumose, it recedes from the present genus.

Long-styled Crotalaria. Shrub 2 to 4 feet.

**Cult.** All the species of this genus are free flowerers, and several of them are very handsome when in bloom. All of them thrive well in any light rich soil, and young cuttings of the shrubby kinds root freely in a pot of sand, with a bell-glass placed over them, but this is generally unnecessary, as most of
them ripen their seeds in abundance. The seeds of the annual kinds should be sown on a hot-bed in spring, and when the plants have attained the height of 2 or 3 inches, they may be placed separately in pots, and some may be planted out into the open border in summer, especially those natives of colder countries.

XLVIII. CLAVULUM (duminative of clavus, a club; form of legume). Desv. obs. legum. ex Schlecht. Linnaea. 2. p. 510.

Lin. syst. Monadelphía, Decándria. Calyx 5-lobed, somewhat bilabiata; teeth broad, acute; vexillum somewhat plicate. Keel large, short. Wings short. Stamens monadelphous, with the sheath cleft in front. Style long, acute. Ovary stalked. Legume oblong, inflated, many-seeded. Shrubs, with trifoliolate leaves and racemes of flowers, which are either opposite the leaves or terminal.

Mucronate-leaved Clavulum. Shrub.

2 C. Pedunculós (Desv. l. c.) leaflets obovate, acute; flowers disposed in racemose spikes, which are opposite the leaves, and on very long peduncles. h. S. Native of the East Indies. Crotalaria pedunculosa, Desv. Journ. bot. 1814. vol. 1. p. 76.

XLIX. HYPOCALYPTUS (i.e., hypo, under, and calýptos, calypto, to veil, meaning not evident). Thunb. prod. 124.

D. C. prod. 2, p. 135.

Lin. syst. Monadelphía, Decándria. Calyx with 5 short lobes, thrust in at the base. Stamens monadelphous. Legume compressed, lanceolate.—A smooth shrub, with trifoliolate leaves and purple flowers. All the species of Hypocalypthus of Thunberg have been discovered to be either species of Podolía or Viríólla, except the present plant.

1 H. obcordáta (Thunb. l. c.). h. G. Native of the Cape of Good Hope. Spártium spathophóridae, Berg. cap. 198. Crotalaria corídfiá, Lin. mant. 266. The plant has the habit of a species of Podolía or Réfia. Leaflets obcordate, mucronate, complicated, longer than the petiole.

Shrub 1 to 2 feet.

Cult. For culture and propagation see Lodigèsia.

Lin. syst. Monadelphía, Decándria. Calyx campanulátetubular, permanent, 5-toothed, with the reesces round. Vexíllum obovate. Keel 2-edged, obtuse. Stamens monadelphous, with the sheath at length cleft in front. Style filiform, smooth, crowned by a simple terminal stigma. Legume stipitate, compressed, ovate, indistinct, mucronate from the style, 1-seeded, subulate at the upper suture; valves rather ventricose, coriaceous, transversely nervet.—Cape shrubs, about 2 or 3 feet high, with trifoliolate leaves, the leaflets rather longer than the pectioles. Flowers yellow, disposed in racemes, with the pedicels reflexed. Stipulas wanting or very small. Perhaps all the three species are sufficiently distinct from each other.

1 V. obcordáta (Thunb. fl. cap. p. 560.) leaflets glabrous, oblong-cuneated, obtusely subcordate; racemes elongated; branches loose. h. G. Native of the Cape of Good Hope, in sandy places. Hedysarum Capense, Burm. cap. p. 22. Cro-

2 V. rúscà (Thunb. l. c.) leaflets glabrous, ovate, mucronate; branches twiggy, erect. h. G. Native of the Cape of Good Hope.

Brown Viborgia. Shrub 2 to 3 feet.

3 V. seéética (Thunb. l. c.) leaflets clothed with silky pubescence, obovate, obtuse; branches twiggy. h. G. Native of the Cape of Good Hope. Leaves about a line long.

LI. LODDIGÉSIA (in honour of Conrad Loddiges, nurseryman at Hackney, near London; died 1820). Sims, bot. mag. t. 556.

Lin. syst. Monadelphía, Decándria. Calyx somewhat inflated, acutely 5-toothed. Vexillum much smaller than the wings and keel. Stamens all connected. Ovary oblong, 2-4-ovulate, compressed.—A Cape shrub, with trifoliolate leaves, and pinkish flowers.

Cult. Loddigèsia is an elegant plant when in flower. An equal mixture of sandy loam and peat suits it best, and young cuttings strike freely if planted in a pot of sand, with a bell-glass placed over them.

LII. DICHILUS (from δίς, dis, twice, and χείλος, cheilos, a lip; in reference to the calyx being deeply two lipped). Lin. syst. Monadelphía, Decándria. Calyx attenuated at the base, profusely bilabiate, upper lip bilobate, lower one tridentate, the teeth all acute. Vexillum shorter than the ob- tuse keel. Wings nearly equal, longer than the calyx. Stamens monadelphous, with the sheath cleft above. Style filiform. Ovary linear, erect, 8-ovulate.—Smoothish Cape subshrubs, with terete branches, and with hardly any stipulas. Leaves ternate. Pedicles 1-flowered, bibracteate.

1 D. labeckióides (DC. l. c. t. 35.) stem suffrutescet, erect, smooth; leaves ternate, on short petioles, smooth; pedicels 1-flowered, bibracteate. h. G. Native of the Cape of Good Hope.

Lebeckia-like Dichilus. Shrub 1 to 2 feet.

2 D. serícum (Spreng. syst. tent. suppl. p. 20.) stem suffrutescet, erect, silky; leaves ternate, stalked; leaflets obovate, smooth above, but with the margins fulvous and ciliated, and clothed with silky silvery-pubescent beneath; racemes stalked; legume linear-ensiform. h. G. Native of the Cape of Good Hope. Zeyher, no. 10.

Silky Dichilus. Shrub 1 to 2 feet.

3 D. cíliátum (Spreng. l. c.) stem herbeosseus, erect, smoothish; leaves ternate, on long stalks; leaflets ovate-robmboéd, rather oblique, ovate, acute, mucronate, smoothish above, ciliated with silky hairs, sparingly pilose beneath; peduncles axillary, leafy in the middle; racemes few-flowered. h. G. Native of the Cape of Good Hope. D. hypétrichium, Spreng. cur. post. p. 273. no. 2.

Ciliated-leaved Dichilus. Fl. 1 foot.

Cult. For culture and propagation see Loddigèsia.

LEGUMINOSÆ.

2 A. ACULEATA (Thumb. fl. cap. 584.) leaves in fascicles, linear, hairy; flowers capitulate; buds prickly. h. G. A villosus shrub, with very short branches. Prickles yellowish under the fascicles of leaves. Flowers yellow, hairy.

Prickly Aspalathus. Shrub 2 to 3 feet.

3 A. ACUMINATA (Lam. dict. 1. p. 287. Ill. 620. f. 4. but not of Thurnb.) leaves in fascicles, very short, lanceolate, ending in a pungent acumen, rather puberulous; branchlets spinose; flowers axillary, solitary. h. G.—Pluk. alm. t. 297. f. 6. Teeth of calyx spiny. Petals silky on the outside. Keel and vexillum about equal in length, but longer than the wings.

Acuminated-leaved Aspalathus. Shrub 1 foot.

Spinose Aspalathus. Shrub 2 to 4 feet.

Larch-leaved Aspalathus. Shrub 2 to 4 feet.

6 A. VERNECOSA (Linn. syst. veg. 537. Thumb. fl. cap. 353.) leaves in fascicles, filiform, mucronate, incurved, fleshy, glabrous; flowers lateral; buds warted. h. G. Calyx pubescent, acutely 5-cleft. Vexillum pilose. Legume villous, ovate-lanceolate, acuminate.

Warted Aspalathus. Shrub 2 to 3 feet.

7 A. CAPITATA (Linn. amoen. 6. p. 92.) leaves in fascicles, subulate, acute, much crowded, rather pilose; branches hairy; flowers capitulate, terminal, glabrous. h. G.—Pluk. t. 397. f. 6. Lam. ill. 620. f. 2. A. glomerata, Lam. fil. suppl. 321. Bracteoles 3, deciduous, the middle one concave and largest. Calyx villous, 5-cleft, with the lobes broad and acute.

8 A. ASTROIDES (Linn. spec. 1000.) leaves in fascicles, subulate, pungent, stiffly divaricate, glabrous; branchlets hairy; flowers lateral and terminal, somewhat capitulate, smoothish. h. G.—Pluk. alm. t. 413. f. 2.—Seb. thes. t. 24. f. 6. Bracteoles spinose. Calyx 5-cleft, the lobes subulate and spiny. Ovary glabrous.

9 A. CHINOPODA (Linn. spec. 1000.) leaves in fascicles, subulate, trigonial, ending in a pungent mucrone, stiff, pilose; flowers capitulate, and are, as well as the branches, hairy. h. G.—Breyn. cent. 11.—Seb. thes. 1. t. 24. f. 4. Sims, bot. mag. 2225. Lodgd. bot. cab. t. 316. Bracteoles subulate, villous. Calyx 5-ribbed, cleft into 5 beyond the middle; the lobes subulate and villous. Wings straight, rather adnate to the keel. Legume terete, with short pili at the apex. Style long, permanent.

10 A. SÆBENS (Thumb. fl. cap. 576.) leaves in fascicles, filiform, mutic, silvery from adpressed silky down; racemes leafy. h. G. Corolla glabrous, according to Thunberg, but in the specimen examined by M. De Candolle it is obviously tomentose. Calyx hoary from silky down. Flowers white.

White-leaved Aspalathus. Fl. July, Aug. Cl. 1774. Sh. 3 to 4 feet.

IV. ASPALATHUS.

11 A. ARGYREA (D. C. prod. 2. p. 139.) leaves in fascicles, filiform, awnless, silky from adpressed down; flowers axillary, subterminal, solitary; calyx 5-toothed, and is, as well as the corolla, clothed with silky pubescence. h. G. Perhaps the same as A. albicus, Lam. mant. 251.

Silvery Aspalathus. Shrub 2 to 4 feet.

12 A. ARMATA (Thumb. fl. cap. 572.) leaves in fascicles, filiform, silky, mucronate; racemes leafless; corolla tomentose. h. G. Flowers white. Branches silky. Racemes terminal.

Armed Aspalathus. Shrub 2 to 4 feet.

13 A. HYSTRIX (Linn. fil. suppl. 322. Thumb. fl. cap. 557.) leaves in fascicles, filiform, silky, mucronate, stiff; flowers lateral, solitary; corolla villous. h. G. Lam. dict. 1. p. 287. ill. t. 620. f. 1.

14 A. SPECIA (Thumb. fl. cap. 578.) leaves in fascicles, subulate, rather pilose; flowers disposed in ovate, terminal spike; calyx hairy, with the lobes acuminate. h. G. Spike-flowered Aspalathus. Shrub 2 to 4 feet.

15 A. MICROCARPA (D. C. prod. 2. p. 139.) leaves in fascicles, subulate, pilose; flowers axillary, solitary; legume ovate, pubescent, a little longer than the calyx. h. G. Burch. cat. no. 265 and 284. Branches rather hairy. Calyxes rather villous, 5-cleft, with the lobes awl-shaped. Corolla small. Wings oblong, shorter than the smooth keel and silky vexillum. Legume 1-2-seeded. Leaves 1-2 lines long.—Pluk. alm. t. 413. f. 3.

Small-fruited Aspalathus. Shrub 2 to 4 feet.

16 A. THYMIFOLIA (Linn. spec. 1000.) leaves in fascicles, filiformly-subulate, pilose; flowers lateral, pubescent, solitary; branches incurved, hairy. h. G.—Pluk. alm. t. 413. f. 1. Bracteoles villous. Calyx villous, 5-cleft, with the tube striated, and the lobes subulate. Corolla small, the wings very small, and oblong.

17 A. ERICEFOLIA (Linn. spec. 1000.) leaves in fascicles, filiform, rather obtuse, covered with soft hairs; flowers alternate, disposed in something like racemes; segments of the calyx linear, about the length of the corolla. h. G.—Pluk. alm. t. 413. f. 6. A. mollis, Lam. dict. 1. p. 290. Corolla with oblong smooth wings, equal in length to the keel, which is villous, as well as the vexillum. A. ericefolia, Berg. cap. 205. differs in segments of the calyx being obtuse.

18 A. FRANKENHOIDES (D. C. prod. 2. p. 139.) leaves in fascicles, terete, pubescent-hairy; branches concenest and velvety; flowers terminal and axillary, usually solitary, silky. h. G. Burch. cat. no. 3173. Calyx 5-toothed, 3 times shorter than the corolla. Leaves hardly more than a line long.

Franken-like Aspalathus. Shrub.

20 A. FLEXOCOSA (Thumb. fl. cap. 579.) leaves in fascicles, filiform, obtuse, hispid from pili; flowers axillary; segments of the calyx longer than the flower. h. G.

Flexuous Aspalathus. Shrub 2 to 3 feet.

21 A. PARVIFLORA (Thumb. fl. cap. 579. but not of Berg.) leaves in fascicles, filiform, obtuse, pubescent; flowers terminal. h. G. Shrub pubescent. Corolla with the helmet tomentose.
Leguminosae.

Small-flowered Aspalathus. Shrub 2 to 4 feet.
22 A. inscepta (Thunb. fl. cap. 579.) leaves in fascicles, filiform, obtuse, silky, flowers lateral. $\gamma$. G. Branches retroflexed, clothed with very fine pubescence. Leaves a nail long. Flowers yellow; the vexillum hairy.

Unisegy Aspalathus. Shrub 2 to 4 feet.
23 A. asparagoïdes (Lin. fl. suppl. 321. Thunb. fl. cap. 579.) leaves in fascicles, subulate, trilobal, mucronate, rather pilose; flowers axillary; calyceine segments subulate, rather pilose, about equal in length to the corolla. $\gamma$. G. Vexillum and keel densely clothed with silky-velvety down, but with the wings glabrous. Hairs on the calyx tuberculate at the base.

24 A. corruertexta (Berg. cap. 207.) leaves in fascicles, filiform, mucronate pungent, smoothish, stiff; branches pubescent; flowers axillary; solitary; bracteas and calyceine segments ending in a spiny mucrone. $\gamma$. G. Vexillum and keel rather pubescent.

Wild Asparagus-like Aspalathus. Shrub 2 to 4 feet.
25 A. incisea (Thunb. fl. cap. 578.) leaves in fascicles, subulate, mucronate, rather pilose; flowers axillary, solitary; legume ovate-lanceolate, rather oblique, very hairy. $\gamma$. G. Leaves sometimes almost smooth, 4 lines long. Legume 5 lines long, rather turbid. Calyx villous, with the teeth subulate.

Inveined-leaved Aspalathus. Shrub 2 to 4 feet.
26 A. nigra (Lin. mant. 262.) leaves in fascicles, filiform, glabrous; branches pubescent; flowers capitate, at length disposed in an ovate spike; calyx and corolla villous. $\gamma$. G. Flowers yellow. Leaves bluntish.

Black Aspalathus. Shrub 2 to 4 feet.
27 A. multiformis (Lin. fl. cap. 580.) leaves in fascicles, terete, obtuse, glabrous; flowers disposed in something like spikes; calyces bracteate; branches, calyx, and corolla pubescent. $\gamma$. G. Leaves hardly a line in length. A. multiflora, Sieb. exsic. cap. no. 40, is very different.

Var. a, birta (D. C. prod. 2. p. 140.) leaves hairy, much crowded; flowers smaller.

Var. b, pubescens (D. C. l. c.) leaves pubescent, rather distant; flowers larger.

Boat-shaped-sepalated Aspalathus. Shrub 2 to 4 feet.
29 A. uniflora (Lin. spec. 1001. But not of Lam. ex mus. hort. par.) leaves in fascicles, filiform, mucronate, glabrous; flowers lateral, solitary; calyceine segments ovate, boat-shaped, obtuse. $\gamma$. G. —Pilc. mant. 83, t. 413, f. 7. ex Lin. Stipulas permanent, according to Lin. Kzel of corolla tomentose.

30 A. carnosa (Lin. mant. 261.) leaves in fascicles, fleshy, terete, obtuse, glabrous; flowers terminal, in fours, capitate, bracteate; calyceine segments ovate, obtuse. $\gamma$. G. Berg. cap. 206. Sims, bot. mag. 1829. Flowers very smooth, yellow. This species is allied to the two preceding in the calyceine segments being obtuse.

31 A. ficous (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, ovate, trilobal, obtuse; flowers lateral, glabrous.

Vol. II.
LV. Aspalathus.

G. Branches tomentose. Leaves hardly 1 line long. Flowers yellow.

Fat Aspalathus. Shrub 2 to 4 feet.
32 A. cassinifolia (Andr. bot. rep. 351.) leaves in fascicles, fleshy, terete, glabrous, setaceous at the apex; flowers capitate, terminal; calyx bracteate. $\gamma$. G. Ait. hort. kew. ed. 2. vol. 4. p. 263. Flowers yellow.

33 A. affinis (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, terete, glabrous; flowers lateral, bracteless; branches twiggy. $\gamma$. G. Flowers yellow. Legume ovate, glabrous.

34 A. sanguinea (Thunb. fl. cap. 580.) leaves in fascicles, fleshy, terete, glabrous; flowers lateral, bracteless; branches fastigate. $\gamma$. G. Flowers blood-coloured, smooth, on very short pedicels. Leaves one line long.

Blood-coloured-flowered Aspalathus. Shrub 2 to 4 feet.
35 A. lactea (Thunb. fl. cap. 580.) leaves in fascicles, filiform, glabrous, retuse; flowers lateral, bracteless, $\gamma$. G. A pubescent shrub, with spreading leaves, and whitish-yellow, smooth flowers.

Milk-coloured-flowered Aspalathus. Shrub 2 to 4 feet.
36 A. genistoides (Lin. mant. 261.) leaves in fascicles, filiform, glabrous; flowers terminal, subracemose, glabrous; calyceine teeth short. $\gamma$. G. Flowers yellow. Leaves half an inch long. Calyx and corolla pubescent. Thunb. fl. cap. 581.

Genista-like Aspalathus. Shrub 9 feet.

39 A. retroflexa (Lin. spec. 1001.) leaves in fascicles, subulate, glabrous; branchlets filiform, retroflexed, or much spreading; flowers terminal, usually solitary. $\gamma$. G. Calyx pubescent, 5-cleft; lobes subulate. Corolla glabrous; petals about equal. Legume 1-2-seeded, obliquely lanceolate, young ones rather villous, at length pubescent.

Retroflexed Aspalathus. Shrub 2 to 4 feet.
40 A. vulturans (Thunb. fl. cap. 582.) leaves in fascicles, filiform, mucronate, spreading, glabrous; flowers lateral, drooping. $\gamma$. G. Corolla yellow, smooth. Branches and calyces pubescent.

Healing Aspalathus. Shrub 2 to 4 feet.
41 A. pinae (Thunb. l. c.) leaves in fascicles, filiform, mucronate, erect, glabrous; flowers lateral, tufted. $\gamma$. G. Shrub smooth. Calyx and vexillum hairy.

Fine-like Aspalathus. Shrub 2 to 4 feet.
42 A. divaricata (Thunb. l. c.) leaves in fascicles, terete, acutely mucronate, glabrous; flowers in terminal racemes. $\gamma$. G. Branches brown, divaricate. Branchlets pubescent. Flowers yellow, pubescent.

Divaricate Aspalathus. Shrub 2 to 4 feet.
43 A. subulata (Thunb. l. c.) leaves in fascicles, rather fleshy, trilobal, mucronate, glabrous. $\gamma$. G. Shrub branched above; branches tomentose. Flowers terminal, sessile, usually tern, glabrous, yellow. Calyx pubescent.

LV. Aspalathus.

46. * A. ciliaris* (Lin. mact. 262.) leaves in fascicles or trifoliolate, oblong, acute, ciliolate; heads terminal; calyx equal in length to the corolla. G. Sims, bot. mag. 2235. Flowers yellow. Corolla tenement. This and the following species are perhaps more correctly referable to the following division, with the trifoliolate leaves.

57. * A. quinquefolia* (Lin. mact. 6. p. 92.) leaves in fascicles, trifoliolate, linear-oblong, flat, rather hairy; heads of flowers hairy; corolla glabrous. G. Pluk. alm. t. 278. f. 4. ex Thunb. fl. cap. 575. The heads of flowers in *D. C. S* .pecimen are large and round.

58. * A. canadensis* (Ait. hort. kew. ed. 2. vol. 4. p. 264.) leaves in fascicles, trifoliolate, silky; flowers sub-lateral with the vexillum naked. G.

56. * A. ciliaris* (Lin. mact. 262.) leaves in fascicles or trifoliolate, oblong, acute, ciliolate; heads terminal; calyx equal in length to the corolla. G. Sims, bot. mag. 2235. Flowers yellow. Corolla tenement. This and the following species are perhaps more correctly referable to the following division, with the trifoliolate leaves.

57. * A. quinquefolia* (Lin. mact. 6. p. 92.) leaves in fascicles, trifoliolate, linear-oblong, flat, rather hairy; heads of flowers hairy; corolla glabrous. G. Pluk. alm. t. 278. f. 4. ex Thunb. fl. cap. 575. The heads of flowers in *D. C. S* .pecimen are large and round.

60. * A. cinerea* (Thunb. fl. cap. 575.) leaves in fascicles or trifoliolate, linear, pilose; flowers spicate; calyx and corolla villos. G. Leaves of branches in fascicles, of branchlets trifoliolate. Vexillum tenement on the back. Flowers yellow. Leaves and calyce sections acuminate, rather spinose.

Variable-leaved Aspalathus. Shrub 2 to 4 feet.

Twirgy Aspalathus. Shrub 2 to 4 feet.

Tridentate-spined Aspalathus. Shrub 2 to 4 feet.

Lotus-like Aspalathus. Shrub 1 to 2 feet.

64. * A. pitosa* (Lin. mant. 263.) leaves trifoliolate, linear, clothed with adpressed silky villi; heads terminal, stalked, very pilose; petals all pubescent. G. A. villosa, Thunb. prod. 125. fl. cap. 574. Branches with a few leaves at the apex.

Pilose Aspalathus. Shrub 2 to 4 feet.

65. * A. scabra* (Thunb. prod. 125. fl. 574. but not of Berg.) leaves trifoliolate, oblong, acute, silky; racemes oblong, terminal; flowers silky-hairy. G. Perhaps the species in Lin. fil. suppl. 321. is the same as that of Thunb.

Grey Aspalathus. Shrub 2 to 4 feet.

67. * A. linearifolia* (D. C. prod. 2. p. 142.) leaves trifoliolate, sessile, ending in callous mucrones, equal, covered with very fine pubescence; heads terminal; bracteas ovate-lanceolate, and
are as well as the branches hairy. \( \text{G.} \) G. \( A^\prime \text{ster} \) linearifolius, Burn. cap. 27. \( A^\prime \text{nthth} \) lineifolia, \( \text{Lin.} \) \( \text{matt.} \) 265. Heads of flowers similar to the anthodium of an \( A^\prime \text{ster}. \)

**Linear-leaved Aspalathus.** Shrub 2 to 4 feet.

68 A. \( \text{anththlo} \text{ides} \) (\( \text{Lin.} \) spec. 1002.) leaves trifoliate, ovate, rather pubescent; heads terminal. \( \text{G.} \) G. \( A^\prime \text{nthth} \) linioides, \( \text{Lin.} \) \( \text{amo} \) \( \text{en}. \) 4. p. 425. A. \( \text{anththlo} \text{ides} \), \( \text{Thunb.} \) fl. cap. 574, according to which the flowers are globose. Corolla yellow, with the vexillum rather pubescent.

**\( \text{A}^\prime \text{nthth} \) linioides-like Aspalathus.** Shrub 2 to 4 feet.

69 A. \( \text{lax}^\prime \text{ata} \) (\( \text{Lin.} \) \( \text{matt.} \) 263.) leaves trifoliate, linear, villous; flowers terminal, 5 in a fascicle; calyxes woolly; stems prostrate, terete. \( \text{G.} \) G. Corolla smooth, yellow. Bracteoles wanting.

**Lax Aspalathus.** Shrub decumbent.

70 A. \( \text{agdhr}^\prime \text{ana} \) (D. \( \text{C.} \) prod. 2. p. 143.) leaves trifoliate, linear-subulate, acute, clothed with adpressed silky down; branches pubescent; racemules terminal, few-flowered; calyx and corolla villous. \( \text{G.} \) G. Calyx not attenuated at the base, but obutose, and with 5 short teeth. Corolla a little longer than the calyx.

\( \text{A}^\prime \text{g}^\prime \text{dhr}^\prime \text{a} \) \( \text{s}^\prime \text{hr} \) 2 to 4 feet.

71 A. \( \text{call}^\prime \text{osa} \) (\( \text{Lin.} \) spec. 1002.) leaves trifoliate, subulate, erect, equal, glabrous, with the cicatrices round and callous; spikes ovate, terminal; flowers glabrous. \( \text{G.} \) G. Sims, bot. mag. 2329.—Pluk. aln. t. 345. f. 4. Flowers yellow. Bracteoles 3, subulate.

**Calous Aspalathus.** Fl. July, Aug. \( \text{Cht.} \) 1812. Sh. 2 to 4 ft.

72 A. \( \text{am}^\prime \text{bi}^\prime \text{g}^\prime \text{a} \) (D. \( \text{C.} \) prod. 2. p. 143.) leaves trifoliate, ovate, obtuse; branches and branchlets spinescent. \( \text{G.} \) G. A. acuminata. \( \text{Thunb.} \) fl. cap. 578. but not of Lam. A smooth shrub. Leaflets 3, concave, rising from the nodi.

**Ambiguous Aspalathus.** Shrub 2 to 4 feet.

73 A. \( \text{ru}^\prime \text{g}^\prime \text{osa} \) (\( \text{Thunb.} \) prod. 125. fl. cap. 574.) leaves trifoliate, elliptic, rugose, glabrous; umbels terminal. \( \text{G.} \) G. Flowers whitish. Calyx and corolla clothed with grey pubescence.

**Wrinkled-leaved Aspalathus.** Shrub 2 to 4 feet.

74 A. \( \text{fu}^\prime \text{c}^\prime \text{a} \) (\( \text{Thunb.} \) l. c.) leaves trifoliate, lanceolate, acute, spreading, crowded, and are as well as the branches glabrous; flowers terminal; calyces minute subulate, rather spiny, and are as well as the corolla smooth. \( \text{G.} \) G. Ovary linear; glabrous. Style incurved. Wings and keel equal. Cicatrices roundish, callous. This species is usually to be seen in herbacia under the name of A. \( \text{call}^\prime \text{osa} \), but it is not the A. \( \text{call}^\prime \text{osa} \) figured in Sims, bot. mag. 2329.

**Brown Aspalathus.** Shrub 2 to 4 feet.

75 A. \( \text{mucr}^\prime \text{ora} \text{na} \) (\( \text{Lin.} \) fl. suppl. 320. \( \text{Thunb.} \) prod. 125. fl. cap. 573.) leaves trifoliate, somewhat petiolate; leaflets lanceolate, obtuse; branches spinescent; racemes terminal; flowers glabrous. \( \text{G.} \) A. A smooth shrub, with yellow flowers.

**Mucronate-leaved Aspalathus.** Fl. June, July. \( \text{Cht.} \) 1796. Shrub 2 to 4 feet.

76 A. \( \text{cy}^\prime \text{thi}^\prime \text{oid}^\prime \text{a} \) (\( \text{Lin.} \) \( \text{dct.} \) 1. p. 292.) leaves trifoliate, lanceolate, mucronate, pubescent on both surfaces; stems and branches panicked; flowers terminal, fascicled, villous. \( \text{G.} \) G. Leaves 3-4 lines long.

**Cythisis-like Aspalathus.** Shrub 1 to 2 feet.

77 A. \( \text{mic}^\prime \text{ro}^\prime \text{phy}^\prime \text{lla} \) (D. \( \text{C.} \) prod. 2. p. 143.) leaves small, trifoliate, trigonal, mucronate, glabrous; branches somewhat pubescent; flowers scattered, solitary; segments of the calyx glabrous, subulate, rather pungent; legume oblong and lanceolate, pubescent. \( \text{G.} \) G. Stamens with a permanent tube, about equal in length to the legume.

**Small-leaved Aspalathus.** Shrub 2 to 4 feet.

78 A. \( \text{orient}^\prime \text{a} \text{lis} \) (\( \text{Lin.} \) \( \text{matt.} \) 263.) leaves trifoliate, lanceolate, pubescent; flowers 5 in a fascicle; calyxes pubescent; stems erect, angular. \( \text{G.} \) G. Native of the Levant. Corolla yellow, about the size of those of \( \text{Labur}^\prime \text{urn} \). Stamens connate. Perhaps a species of \( \text{Crotal}^\prime \text{aria} \).
Arborescent Aspalathus. Tree.

Cult. All the species are rather ornamental when in flower. A mixture of loam, peat, and sand is the soil best adapted for them, and young cuttings of all will strike in sand, under higgles, but the higgles must be wiped occasionally or the cuttings are very liable to damp off.

LVI. ULEX (said to be derived from ac, a point, in Celtic, in reference to the prickly branches). Lin. gen. no. 881. Lam. ill. t. 621. D. C. prod. 2. p. 144.

Lin. syst. Monadelphus, Decandria. Calyx bibracteate, bipartite, one of the lips 3-toothed, the other bidentate. Stamens all connected. Legume oval-oblong, turbid, many-ovulate, but few-seeded, hardly longer than the calyx.—European much-branched shrubs, with the branchlets and leaves spinescent. Flowers solitary, yellow. Legumes villous.

1 U. Europæus (Lin. spec. 1045. var. a.) erect; leaves lanceolate-linear, and with the branchlets rather villous; bracteas ovate, loose; calyx pubescent, with the teeth nearly obsolete and converging. H. Native of commons, heaths, and waste places throughout Europe. Smith, engl. bot. t. 742. U. grandiflorus, Pourr. U. vernáulis, Thore.

Provence appears to be the boundary, south, of furze; northwards it does not grow in Sweden or Russia. Linneus lamented that he could hardly preserve it alive in a greenhouse. Many parts of Germany are perfectly destitute of this plant. The furze is either called wilm or gorse in England. In France it is called ajonc or jonc-marine, contracted to jamaire.

Some years ago the seeds of furze were sown for hedges, and if the soil was light it soon became strong enough for a fence against cattle, but in a few years these hedges become naked. Duhamel speaks much in favour of furze as fodder for cattle. It has also been used for fodder in Scotland. Team horses may be supported by this shrub, if the tops are cut young and bruised in a mill to break the thorns. Goats, kine, sheep, and horses feed upon the tender tops. In some parts of Britain it is cultivated for fuel, where peat or coals are dear.

Tar. december; flowers double. This is a very showy plant when in flower, being profusely clothed with elegant double yellow flowers. It is well adapted for ornamenting shrubberies.

2 U. Naucus (Smith, fl. brit. 757. engl. bot. t. 743.) decumbent; leaves linear, and as well as the branches smooth; bracteas minute, adpressed; calyx glabrous, with spreading, lanceolate teeth. H. Native of England on heaths, and in the western parts of France. U. minor, Roth. cat. 1. p. 83. U. Europæus β, Lin. spec. 1045. U. autumnaus, Thore.

3 U. Provinciaus (Lois. not. 105. t. 6. f. 2.) erect; leaves lanceolate, linear, and as well as the branches glabrous; bracteas minute, adpressed; calyx rather pubescent, with lanceolate distant teeth, hardly exceeding the corolla. H. Native of Provence, Andegavany, and Mauritania. D. C. fl. fran. suppl. no. 3799. The characters of this species, as well as the size, are intermediate between the two preceding.

Provincial Furze. Fl. Aug. Dec. 1820. Sh. 2 to 4 ft. 4. U. Hibisceus (G. Don, in Loud. hort. brit. p. 280.) erect; leaves linear, adpressed; spines branched, pubescent as well as the branches, both furrowed. H. Native of Ireland. H. stricta, Hortul. This is a very upright plant, the spines more mild than in the other species. It is an excellent plant for forming hedges.

Cult. This, although a very elegant genus of plants, is seldom cultivated unless for hedges, except the double variety of U. Europæus, which is a very elegant plant when in bloom, and is increased by young cuttings, planted under a hand-glass. The rest are usually increased by seeds.

LVII. STAUARCANTHUS (from σταυρός, staurus, a cross, and acardia, akantha, a spine; in reference to the spines each having 2 small spines at the side, giving the appearance of a cross). Link. in Schrad. neue journ. 2. p. 1 and 52.

Lin. syst. Monadelphus, Decandria. Calyx bibracteate; upper lip bifid, lower one tridentate. Stamens all connected. Legume compressed, many-seeded, exserted, a long way beyond the calyx. A leafless shrub, with the habit of Ulex, and from it not probably distinct.

1 S. Amylilus (Link. l. c.). H. Native of Portugal in sandy pine woods. Ulex genistoides, Botr. fl. ins. 2. p. 78. Bracteoles small, under the calyx. Branches divaricate. Legume quite smooth.

Leafless Stauracanthus. Fl. May, June. Clt. 1823. Shrub 2 to 3 feet.

Cult. This is a very elegant plant when in flower, and well suited for the front of shrubberies. It may be either increased by young cuttings planted in sand under a hand-glass, or by seeds.

Lin. syst. Monadelphus, Decandria. Calyx membranous, spathaceous, cleft above, 5-toothed at the apex, somewhat bilabiate. Corolla with a roundish, complicated vexillum, and an acuminate keel, and the petals a little agglutinated, but partable. Stamens monadelphous. Legume compressed, many-seeded, glandless.—A smooth shrub, with twiggy terete branches, and a few lanceolate leaves. Flowers large, distant, yellow, disposed in terminal racemes.

1 S. Junceum (Link. spec. 995.). H. Native of the South of Europe, in rugged dry places. Duham. arbr. ed. nov. 2. t. 22. Sims, bot. mag. 58. Genista juncæa, Lam. G. odoræta, Mænch. Spartanthus juncæus, Link. Flowers sweet-scented; sometimes the plant is to be found with double flowers in gardens. Bees are very fond of the flowers, and the same qualities which are attributed to the common broom belong also to this, although in an inferior degree. In Languedoc they make thread of it, and it is there used as a green food for sheep.

Cult. Spanish Broom is a very ornamental plant when in bloom, and therefore well fitted for shrubberies. It is usually increased by seeds, which ripen in abundance; young cuttings will root if planted under a hand-glass.

Lin. syst. Monadelphus, Decandria. Calyx bilabiate, upper lip bipartite, lower one tridentate, or 5-lobed, the 3 lower lobes nearly joined to the apex. Vexillum oblong-oval (f. 29. a.). Carina oblong, straight (f. 29. b.), not always containing the genials. Stamens monadelphous (f. 29. c.). Legume compressed, rarely rather turged (f. 29. d.), many-seeded, rarely few-seeded, glandless. Shrubs with yellow flowers.

* Unarmed. Leaves all, or for the most part, trifoliate.

1 G. parviflora (D. C. prod. 2. p. 145.) leaves trifoliate, on very short petioles; leaflets linear-lanceolate, glabrous, usually
deciduous; racemes terminal, elongated; legumes compressed, 1-3-seeded, rather pubescent from small adpressed down, erectly spreading. \( H \). Native of the Levant, near the Gulph of Mundania. Spärtium parviflorum, Vent. hort. cels. t. 87. Flowers yellow.

2 G. CLAVATA (Poir. suppl. 2. p. 717.) leaves trifoliate; leaflets linear-lanceolate, silky beneath; flowers terminal, capitate; legume compressed, 1-2-seeded, attenuated at the base. \( H \). Native of Mogador. Spärtium seriecum, Vent. hort. cels. t. 17. but not of Ait. Flowers yellow, larger than those of the preceding species. Perhaps a species of *Cytisus*.

**Clavate-calyxed Genista.** Fl. May, Aug. Clt. 1812. Sh. 2 to 4 feet.

3 G. CANARIENSIS (Lin. spec. 997.) lower leaves on short petioles, upper ones sessile, trifoliate, and are as well as the branches and calyces clothed with pubescence; leaflets obovate-oblong; branches angular; heads of flowers terminal, legume clothed with white villi. \( H \). Native of the Canary Islands and Spain. Ker. bot. reg. 217.—Comm. hort. anat. 2. t. 53.—Plnt. t. 277. f. 6. Spärtium albicans, Cav. ann. 1801. p. 64. Cytisus paniculatus, Lois. in Duham. ed. nov. et Cytisus ramossissimus, Poir. suppl. 2. p. 440. does not appear to differ from this species.

**Canary Island Genista.** Fl. April, Sept. Clt. 1656. Shrub 6 to 10 feet.

4 G. MOLLIS (D. C. prod. 2. p. 145.) leaves on short petioles, trifoliate, and are as well as the calyces, branches, and legumes clothed with soft villi; flowers axillary, crowded. \( H \). Native of Mogador. Spärtium mollé, Cav. ann. 1801. p. 57. Soft Genista. Shrub.

5 G. CANDICANS (Lin. amm. 4. p. 284.) leaves stalked, trifoliate; leaflets obovate, clothed with adpressed down; branches angular; heads terminal, few-flowered; legume hairy. \( H \). Native of Mogador, Italy, and the Levant. Wats. edinb. Oct. Cytisus candelans, Lin. spec. 740. Cyt. pubescens, Moench. Allied to G. Canariensis, but the leaves are larger and the flowers scentless.

**Whitened Genista.** Fl. April, July. Clt. 1735. Sh. 4 to 5 ft. FIG. 29.

6 G. PATENS (D. C. prod. 2. p. 145.) branches striated, twiggy, glabrous; leaves stalked, trifoliate; leaflets obovate, pubescent beneath; flowers in fours, pedicellate, nearly terminal; legume glabrous, 3-6-seeded. \( H \). Native of Spain, on mountains near Albayda. Spärtium patens, Cav. icon. 2. p. 58. t. 176. exclusive of the synonymous. It differs from *Cytisus patens* in the upper lip of the calyx being acutely bipartite, lower lip of 3 bristles, not with the lips nearly equal and entire.

**Spreading Genista.** Fl. April, July. Clt.? Shrub 4 to 8 feet.

7 G. LINIFOLIA (Lin. spec. 405.) leaves sessile, trifoliate; leaflets linear, silky beneath, at length with the margins revolute; racemes terminal, crowded; legumes hairy; branches terete, furrowed. \( H \). Native of the south of France, and of Spain, Canary Islands, north of Africa, and the Levant. Sims. bot. mag. 442. Spärtium linifolium, Desf. atl. 2. p. 134. t. 181. Cytisus linifolius, Lam. Genistoides linifolia, Moench.

8 G. PILÔRA (D. C. prod. 2. p. 146.) leaves trifoliate, on short petioles; leaflets glabrous, linear, rather cuneiform; flowers terminal, usually twin; legume glabrous; branches angular. \( H \). Native of the north of Africa, near Tlemcen. Spärtium bifiôrum, Desf. fl. atl. 2. p. 133. t. 179. Two-flowered Genista. Shrub 1 to 3 feet.

9 G. TRIGETRA (Alt. hort. kew. 3. p. 14. Lher. stirp. 183.) leaves trifoliate, the upper ones simple; leaflets ovate-lanceolate, villous; racemes terminal, short; branches triflöstern, decumbent, young ones villous. \( H \). Native of Corsica. Curt. bot. mag. 314. G. trigetra, Lam.?

**Trigetrous-stemmed Genista.** Fl. May, June. Clt. 1770. Shrub 2 to 4 feet.

10 G. BRACETOLOATA (Link, num. 2. p. 224.) leaves trifoliate; leaflets obovate; racemes short; branches striated, and are as well as the leaves pubescent. \( H \). The native country of this plant as well as the legume are unknown. Calyx hairy.

**Braceolate Genista.** Fl. Mar. May. Clt. 1823. Sh. 2 to 4 ft.

11 G. MICROPHYLLA (D. C. prod. 2. p. 146.) leaves trifoliate, on short stalks; leaflets oblont-linear, and are as well as the terete branches covered with hoary-silky pubescence; flowers few, almost terminal. \( H \). Native of the Grand Canary Island, on mountains about Ayacata. Spärtium microphyllum, Cav. ann. 1801. p. 63. Legume unknown.

**Small-leaved Genista.** Shrub 1 to 3 feet.

12 G. SESILOPA (D. C. leg. mem. VI.) leaflets 3, rising from the same spot on the branches, linear-subulate, silky, sometimes solitary; spike terminal, elongated, loose-flowered; corolla silky; legume ovate, acuminate, pubescent, 1-2-seeded. \( H \). Native of Galatia, on hills. Flowers nearly like those of G. pilôsa, but the vexillum is shorter than the carina. Habit of G. virgáta, but the leaves are trifoliate.

**Sessile-leaved Genista.** Shrub 1 to 2 feet.

13 G. UMBELATA (Poir. suppl. 2. p. 715.) leaves trifoliate, on short stalks; leaflets linear-lanceolate, rather silky; flowers in terminal, aggregate heads; calyx clothed with silky hairs; corolla and legume silky. \( H \). Native of Barbary, on arid hills near Azurco. Spärtium umbellatum, Desf. atl. 2. p. 133. t. 160. Lher. stirp. 183. Branches glabrous. Spärtium um-

**Umbellate-flowered Genista.** Fl. April, June. Clt. 1799. Shrub 1 to 2 feet.

14 G. RADIA (Scop. carn. no. 871.) leaves trifoliate, nearly sessile, opposite; leaflets linear, rather silky; branches angular, crowded, glabrous; heads 2-4-flowered, terminal; corolla and legumes silky. \( H \). Native of Italy, Carniola, and Valais. Spärtium radiatum, Lin. spec. 996. Mill. icon. t. 249. f. 1. Sims. bot. mag. 2260. G. ilvensis, Dalech. Legume oval, short, compressed, 2-seeded, mucronate by the style. Old branches rather spinescent.

**Rayed Genista.** Fl. June, July. Clt. 1758. Sh. 1 to 3 ft.

15 G. CASPARRINA (Guss. ex Scheldt. Linneae 4. p. 38. under Spärtium) a beautiful shrub with slender branches, the lower leaves terete and the upper ones simple. \( H \). Like G. radiatum.

**Casparrine Genista.** Shrub.

* * Spinose. Leaves all or some of them trifoliate.

16 G. NOBRIDA (D. C. fl. fr. 4. p. 500.) leaves trifoliate, stalked, opposite; leaflets linear, complicated, rather silky; branches angular, spiny, crowded, opposite; flowers almost terminal, few; calyx pubescent. \( H \). Native of the Pyrenees.

**Horrid Genista.** Fl. May, July. Cité 1821. Sh. 2 to 4 ft.

17. G. Lusitana (Linn. spec. 999. exclusive of the synonynmes of Clus. and J. Bauh.) leaves trifoliate, on short stalks, opposite; leaflets linear, complicated, rather silky; branches spinous, thorny, at length striated; flowers terminal, few; calyx very hairy. H. Native of Portugal. Lam. dict. 3. p. 622. exclusive of the synonynmes. Andr. bot. rep. 419.

**Portugali Genista.** Fl. March, May. Cité 1771. Sh. 2 to 4 ft.

18. G. acanthoclada (D. C. leg. mem. vi.) leaves trifoliate, nearly sessile; leaflets linear, complicated, rather silky; branches spinose, stiff, thorny, at length striated; flowers almost opposite, disposed along the branches in a kind of interrupted spike; calyx pubescent. H. Native of the Levant, in exposed places in the island of Melos. D'Urv. enum. p. 85. Branches usually opposite, floriferous ones also spinous. Flowers silky. Ovary silky. Vexillum replicate laterally.

**Spiny-branched Genista.** Shrub 2 to 3 feet.

19. G. erythrodes (D. C. leg. mem. vi. t. 36.) leaves few, sessile, trifoliate, and simple; leaflets linear, smoothish; branches spinose, stiff, thorny, at length striated; flowers alternate, spicate; calyx rather pubescent. H. Native of Sardinia, on the sea shore. A smooth shrub, like Ephedra distichoides. Calyx rather silky. Vexillum shorter than the keel. Legume compressed, ovate, acute, 1-seeded, clothed with silky-pubescent.

**Ephedra-like Genista.** Shrub 2 to 3 feet.

**Lobei's Genista.** Shrub 1 to 2 feet.

21. G. Farnivola; hairy; leaves alternate, trifoliate, upper ones simple; leaflets oblong-linear, acute, complicated, smooth above, lower ones obovate; branches crowded, spiny, alternate, younger ones furrowed; flowers racemose. H. Native of Sardinia. G. microphylla, Moris, cnech. p. 13. Legeme 4-5 seeded, linear, villous.

**Small-leaved Genista.** Fl. June, July. Shrub 1 to 2 feet.

22. G. Salzmanni (D. C. leg. mem. vi.) leaves sessile, trifoliolate or simple, oblong, obtuse, clothed with adpressed pubescence; branches at length striated, loose, spiny; flowers somewhat racemose along the branches, twin, pedicellate, clothed with adpressed silky-pubescent; the 3 lower lobes of the calyx about equal in length to the upper ones, and narrower. H. Native of Corsica, on rocks near Corle. Gumbellata, Salzaum.

**Salzmann's Genista.** Shrub 2 to 3 feet.

23. G. Aspalathoides (Lam. dict. 2. p. 620.) leaves few, lower ones sessile, trifoliate, the rest nearly all simple, scattered, linear-oblong, rather silky; branches lozen, somewhat recurved, spiny, terete, at length striated; flowers twin, subracemose along the branches, pedicellate, clothed with adpressed silky pubescence; calyx trid, the 3 lower lobes concretes into a tridentate lip. H. Native of Barbary, on rocks near Bonne. Spartium aspalathoides, Desf. atl. 2. p. 136.

**Aspalathus-like Genista.** Shrub 2 to 3 feet.

24. G. Feerox (Poir. suppl. 2. p. 708.) leaves trifoliate, or for the most part simple, oblong, smoothish; branches striated, spinose at the apex; flowers racemose; calyx rather pubescent; corolla smooth. H. Native of Barbary, on mountains near Lacalle. Spartium heterophyllum, Lher. str. 183. Spartium ferox, Desf. atl. 2. p. 136. t. 182. Legume linear, 8-10 seeded. Seeds rather torulose, clothed with adpressed pubescence.

**Fierce Genista.** Fl. Ju. July. Cité 1800. Sh. 3 to 4 feet.

**Cypiani's Genista.** Shrub 2 to 3 feet.

26. G. Triaca'nthos (Brot. phyt. 130. t. 54. fl. lus. 2. p. 89.) leaves sessile, trifoliolate, and simple, glabrous; leaflets linear-lanceolate; branches spiny; spines rather long; racemes terminal, few-flowered; calyx, corolla, and 1-seeded legume glabrous. H. Native of Portugal, on mountains and in woods about Combara, and elsewhere in Beira. G. rostrata, Poir. suppl. 2. p. 719. Spines simple, trifid or branched.

**Var. β, interrupita (D. C. prod. 2. p. 147.) leaves linear; branches usually simple and shorter. H. Native about Tangiers. Spartium interruptum, Cav. anal. 1801. vol. 4. p. 58.

**Var. Three-spined Genista.** Fl. May, July. Shrub 2 to 3 feet.

27. G. Infesta; branches striated, spiny; leaves ternate; leaflets obovate, silky beneath; legumes compressed, and are, as well as the bracteas, covered with adpressed silky pili. H. Native of Calabria, in bushy places by the sea side. Spartium infestum, Gussone, pl. var. p. 290.

**Troublesome Genista.** Fl. May. Shrub 2 to 3 feet.

**Cuspidate Genista.** Shrub 2 to 3 feet.

*** Spinose. Leaves all simple.

29. G. hisbura (Vahl. symb. 1. p. 51.) leaves lanceolate, and are, as well as the branches, hairy; spines trifid, striated; spines terminal, hairy; corolla pilose, having the calyx twice the length of the keel; legume pubescent, 1-seeded. H. Native of Spain and Portugal.

**Var. γ, orientalis (D. C. prod. 2. p. 148.) spines hardly longer than the leaves, trifid or simple. H. Native of the Levant, near Tchecesne.

**Heary Genista.** Shrub.

31. G. Triecuspida (Desf. atl. 2. p. 138. t. 183.) leaves lanceolate, and are, as well as the branches, hairy or glabrous; spines somewhat tetragonal, stiff, for the most part trifid; racemes spike-formed, terminal; calyx rather hairy; corolla glabrous; keel twice the length of the vexillum and wings. H. Native of Algiers, on hills. Spartium tricuspidatum, Cav. l. c.

**Triecuspidate-leaved Genista.** Shrub 1 to 3 feet.

32. G. Girbalta'rica (D. C. prod. 2. p. 148.) leaves linear-lanceolate, glabrous, as well as the branches, calyxes, and corol- lars; branches decumbent, flexible; spines trifid and simple,
usually leafy; racemes terminal, somewhat spicate; carina longer than the vexillum and wings. \( \checkmark \). H. Native on the rocks of Gibraltar, about St. Roque. This plant differs from \( G. \ triestis \) in the habit being looser, and in the calcylic lobes being very acute and spinescent.

**Gibraltar Genista.** Shrub decumbent.

33. **G. triestis** (Cav. anal. scienc. nat. 1801. 4. p. 59.) leaves lanceolate-oblong, glabrous; spines tridif, stiff; racemes terminal; calyces and corollas glabrous; keel a little longer than the wings. \( \checkmark \). F. Native of the north of Africa, about Tangiers. Leaves become concave when drying.

**Trident-spined Genista.** Shrub 2 feet.

34. **G. sylvetris** (Scop. carn. no. 875.) leaves linear-lanceolate, glabrous above, but clothed with adpressed villi beneath; spines axillary, branched, slender; raceme spicatula, terminal; flowers glabrous; calycine teeth rather spiny; carina longer than the vexillum and wings. \( \checkmark \). H. Native of Carniola and of Croatia on hills. G. Hispánica. Jacq. icon. rar. t. 557.

35. **G. \textit{Europaea}** (Spreng. nov. prov. 20.) leaves linear-lanceolate, ending in a spiny mucrone; spines branched; stem furrowed, bony with spreading hairs; racemes second; corollas smooth. \( \checkmark \). F. Native of Egypt. This species comes very near \( G. \textit{sylvetris} \), but differs in having spreading hairs, not adpressed ones, and therefore referable to \( G. \textit{Hispanica} \).

**Egyptian Genista.** Shrub 1 to 2 feet.

36. **G. \textit{Falcata}** (Brot. phyt. 133. t. 55. fl. lis. 2. p. 89.) leaves ovate-lanceolate, upper and cauleine ones roundish, having the margins, middle nerve, and branchlets rather villous; spines stiff, and for the most part tridif; racemes few-flowered; carina longer than the vexillum and wings; flowers glabrous; legumes falcate, many-seeded. \( \checkmark \). H. Native of Portugal, in Biera and Estranadura.

**Falcate-leguminous Genista.** Shrub 2 to 3 feet.

43. **G. \textit{ramossissima}** (Poir. suppl. 2. p. 715.) much branched, erect; branches straight, tuberculated; leaves few, lanceolate, villous; flowers nearly sessile along the branches, crowded; petals silky, about equal in length. \( \checkmark \). H. Native of Mount Atlas, near Tlemess. Spáràtium \textit{ramossissimum}, Desf. fl. atl. 2. p. 132. t. 178. Fruit unknown.

**Much-branched Genista.** Shrub 2 to 4 feet.

44. **G. \textit{cinerea}** (D. C. fl. fr. 4. p. 494.) erect, much branched; branches straight; leaves lanceolate, clothed with adpressed pubescence; flowers almost sessile along the branches, solitary; petals silky, about equal in length; legume clothed with adpressed villi, 4-6-seeded. \( \checkmark \). H. Native on arid hills and mountains, from Arragon to Nice, in the limits of olives. Spáràtium \textit{cinereum}, Vill. prosp. 40. G. \textit{scopária}, Vill. dauph. 3. p. 430. exclusive of synonyms. G. \textit{florida}, Assz. ar. 94.

**Cinereous Genista.** Fl. Ju. July. Shrub 2 to 6 feet.

45. **G. \textit{virginiana}** (D. C. prod. 2. p. 140.) branches twigg, terete, straited; leaves oblong-lanceolate, rather silky; flowers disposed in something like racemes; petals silky, about equal in length; legume villous, 1-3-seeded, compressed, rather torose between the seeds. \( \checkmark \). F. Native of Madeira. Spáràtium \textit{virginatum}, Ait. hort. kew. 3. p. 11. \textit{Cytisus} \textit{tener}, Jacq. icon. rar. t. 147. G. \textit{gracilis}, Poir. suppl. 2. p. 715.

46. **G. \textit{congesta}** (D. C. prod. 2. p. 149.) branches terete, straited, much crowded; leaves lanceolate, silky; flowers terminal, racemose, on very short pedicels; vexillum glabrous; carina pubescent. \( \checkmark \). G. Native of Tenerife. Spáràtium \textit{congestum}, Willd. ennum. 2. p. 744. Allied to \( G. \textit{virginiana} \).

47. **G. \textit{stylosa}** (Spreng. syst. 3. p. 176.) branches slender, angular, flexuous, and are, as well as the leaves, linear and smooth; flowers in terminal racemes; calyx bracteolate; style elongated, permanent. \( \checkmark \). H. Native of Portugal. \textit{Génista} \textit{bracteoidea}, Willd. herb. Flowers yellow.

**Long-styled Genista.** Shrub 2 to 4 feet.

48. **G. \textit{schiedea}** (Wulff. in Jacq. coll. 2. p. 167.) decumbent; branches erect, terete; leaves linear-lanceolate, silky beneath; flowers 3-4, terminal, sub-racemose; petals silky, about equal in length; calyceine lobes oblong, acuminate. \( \checkmark \). H. Native

of Austria and Croatia, in subalpine places near the shore.—Jacq. icon. rar. S. t. 556. Floral leaves about equal in length to the calyx.

50 G. humifusa (Lin. spec. 998. Vill. dauph. 3. p. 421. t. 44.) procumbent; branches twisted, tubercled, as stiff as spines at the apex, hairy, as well as the leaves, which are linear-lanceolate; flowers axillary, solitary, nearly sessile; petals silky, about equal in length; calyces lobes ovate, acute. ɸ. H. Native of the Levant and of Dauphinie, near Gap.

51 G. monosperma (Lam. dict. 2. p. 616.) branches erect; leaves very few, linear-oblong, clothed with adpressed pubescence; racemes lateral, few-flowered; petals silky, about equal in length; legume ovate, inflated, unmembranous, glabrous, 1-2-seeded. ɸ. H. Native of Portugal, Spain, Barbary, and Egypt. Spártium monospérmum, Lin. spec. 995. Curt. bot. mag. 685.—Clus. hist. 1. p.103. G. Retam, Forsk. Flowers white. Branches slender, twiggy, flexible. The use of this shrub along the shores of Spain is very great in stopping the sand. It converts the most barren spot into a fine odoriferous garden by its flowers, which continue a long time. The leaves and young branches are delicious food for goats. The twigs are used for tying handle. Forskal found the plant in Arabia, and Desfontaines in Barbary. The Spaniards call it Retamas from its Arabian name Retáum.

52 G. sphaerocarpa (Lam. dict. 2. p. 616.) twiggy branched; leaves few, linear, smoothish; racemes lateral, many-flowered; petals glabrous, equal in length; legume ovate, rather flabby, 1-2-seeded. ɸ. H. Native of the south of Europe and Barbary. Spártium sphaerocarpum, Lin. mant. 571.—Clus. hist. 1. p. 102. f. 2. Flowers small, yellow.

53 G. Éthenésis (D. C. prod. 2. p. 150.) erect, much branched; leaves few, linear, silky; racemes terminal; petals rather glabrous, about equal in length; legume obliquely ovate, compressed, 2-3-seeded, young ones pubescent. ɸ. H. Native of Mount Etna, in the wooded region. Spártium Éthénése, Biv. st. sic. mant. 2. Rafin. speecl. 1. p. 17. Sims. bot. mag. 2674. Spártium trispérmum, Smith in Rees’ cyclo. vol. 32. no. 5. Flowers yellow, twice the size of those of G. sphaerocarpum, but one-half smaller than those of G. fáncéa.

54 G. multicaulis (Lam. dict. 2. p. 617.) humbly 4 branches erect, twiggy; leaves linear-oblong, rather glabrous, tapering into the petiole at the base; flowers solitary, on short pedicels; calyx clothed with adpressed silky pubescence; corolla glabrous. ɸ. H. Native of the Balearic Islands.

Many-stemmed Genista. Shrub 1 to 2 feet.

55 G. tetragóna (Besser. enum. cont. 2. p. 73. no. 887.) stem tetragonal, furrowed, decumbent; branches ascending; leaves nearly opposite, lanceolate, young ones and calyces rather silky; flowers somewhat racemose; corolla glabrous. ɸ. H. Native of the south of Podolia, in high fields at Tyra.

56 G. tenutíólia (Lois. nat. 169.) stems weak; branches terete, striated, erectish; leaves linear, 1-nerved, glabrous; flowers disposed in terminal racemes, and as well as the legumes glabrous. ɸ. H. Native of Piedmont. This species is nearly allied to G. tinctoria and G. depressa, from which it is hardly distinct, unless in the flowers being smaller.

Fine-leaved Genista. Shrub 1 to 2 feet.

57 G. depressa (Bieb. fl. turc. suppl. p. 460.) stems decumbent; floricorous branches triquetrous, ascending; leaves lanceolate, acute, clothed with adpressed pil; flowers in the upper axils of the leaves on short pedicels, disposed in such a manner as to appear a leafy raceme; corolla glabrous. ɸ. H. Native of Turin, on mountains, and about Constantinople. Very like G. mániegium.

Depressed Genista. Shrub decumbent.

58 G. scaríosa (Viv. ann. bot. 1. p. 2. p. 175. fragm. fl. ital. 1. p. 5. t. 8.) quite smooth; stem ascending; young branches triquetrous; leaves, lanceolate or the lower ones are obovate, with scarious margins; flowers racemose; corolla twice the length of the calyx. ɸ. H. Native of Liguria, on hills from Genoa to Sarzana, and in the margins of Naples, ex. Tenore, fl. nup. 2. p. 127. G. Jannénsia, Viv. cat. p. 10. Bert. pl. G. Jenénsis, Pers. ench. no. 5. Legume linear, 4-7-seeded, somewhat coricate.

59 G. Anxánícæa (Ten. fl. nap. prod. 41. fl. nap. 2. p. 127. t. 66.) quite smooth; stems diffuse; branches angular; leaves ovate-elliptical, rather coriaceous, veiny; flowers racemose; corolla 3-times longer than the calyx. ɸ. H. Native of valleys of Naples, called Amsantea. Corolla 8 lines long. Legume 8-10-seeded. The name is called by the author Añántica in his prod. fl. nap. p. 41. and Amsánctica in his fl. nap. text.

60 G. Tintórita (Lin. spec. 998.) root creeping; stems erect; branches terete, striated, erect; leaves lanceolate, smoothish; flowers disposed in spicate racemes, and as well as the legumes smooth. ɸ. H. Native of Europe, frequent in fields and woods; in England in pastures, thickets, and dry borders of fields. Smith, engl. bot. 44. Fuchs. hist. 809. Genistoides tintoría, Ménch. 132. The G. tintoría is called Base-broom, Green-weed, Green-wood, Dyers’-weed, and Wood-waxen. When cows feed on it their milk and the butter made from it are said to be very bitter. A bright yellow colour may be prepared from the flowers, and for wool that is to be dyed green with woad the dyers prefer it to all others. A drachm and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore has proved serviceable in dyspepsial cases, and a salt prepared from the ashes is recommended to be used in that disorder.

Var. ξ., protéssis (Poll. pl. ver. 19.) leaves oblong-lanceolate, rather hairy; branches ascending. ɸ. H. Native of Italy, on the upper mountains.

61 G. Sibírica (Lin. mant. 571.) stems erect; branches terete, striated, erect; leaves lanceolate, glabrous; flowers disposed in spicate racemes; spikes disposed in panicles, and are as well as the legumes smooth. ɸ. H. Native of Siberia. Jacq. hort. vind. t. 190. Genistoides élata, Ménch. mth. 132. The plant is very like G. tintoría, but altogether smooth, erect, more slender, and usually taller.
**LEGUMINOSÆ.**

**LIX. Genista.**

153.

64 G. flórida (Lin. spec. 998.) stem erect; branches striated, terete; leaves lanceolate, and are as well as the legumes clothed with adpressed silky down; branches secund; corolla glabrous. ꞌH. Native of Spain. Legume 2-4-seeded, somewhat irregularly coarctate.

**Flórida Genista.** Fl. June, Aug. Clt. 1752. Sh. 2 to 4 ft.

65 G. pelchellá (Visiani, pl. daum. ex. bot. zeit. jan. 1830. p. 51.) silky; stems diffuse, much branched; branches furrowed, young ones striped, tubercled at the buds, and rufescent at the apex; leaves simple, lanceolate, entire, small; flowers in crowded racemes, the pedicels all leaning to one side; wings smooth, shorter than the keel; legumes pendulous, 2-3-seeded. ꞌH. Native of Dalmatia. Like G. Æthénésis and G. flórida, but more silky.

**Neat Genista.** Shrub diffuse.

66 G. mántrica (Poli. fl. ver. 2. p. 458. t. 4. f. 7.) stems numerous, prostrate, angularly striated, hairy-pubescent; leaves linear-lanceolate, pubescently-hairy; peduncles axillary, shorter than the leaves; corolla glabrous; legume clothed with silky villi. ꞌH. Native of Italy, in woods near Mantua. Spreng. aug. 2. p. 73. Horn. hort. hafn. suppl. p. 151. Allied to G. ováta and G. tinctória, of which last it is probably a variety.

67 G. ováta (Walstd. et Kit. pl. hung. 1. t. 84.) stems numerous, hairy, erectish, somewhat herbaceous, striated, terete; leaves ovate, or ovate-oblong, and are as well as the legumes hairy; racemes short; corolla smooth. ꞌH. Native of Salévia and Hungary, and on the hills of Italy, from Piedmont to Naples. G. ováta, Balz. Bert. Sav. Ten. G. nervata, Kit. in litt. 1815. is hardly distinct.

68 G. patúla (Bieb. fl. taur. 2. p. 148.) much branched, quite smooth; branches terete, striated, panicled, spreading; leaves linear-lanceolate, acuminate; flowers and legumes glabrous. ꞌH. Native of Tauria, on hills at the river Cyrus, near Tiffis. This species is nearly allied to G. tinctória, but the flowers are one-half smaller.

69 G. tôngulae (Willd. spec. 3. p. 929.) smooth; branches triquetrous, and as well as the stems ascending; leaves lanceolate, mucronate; flowers axillary; legume compressed, mucronate. ꞌH. Native of Hungary, on calcareous rocks. G. tríquebra, Walstd. et Kit. hung. 2. p. 165. t. 153. but not of Aiton. Legume glabrous.

70 G. sagitáta (Lin. spec. 938.) stems prostrate; branches herbaceous, ascending, 2-edged, membranous, somewhat articulated; leaves ovate-lanceolate; flowers disposed in an ovate terminal, leafless spike; corolla smooth, but the keel is furnished with a villous line on the back. ꞌH. Native of Europe, in mountain pastures. Mill. icon. t. 259. f. 2. Jacq. fl. austr. t. 209. G. herbández, Lam. fl. fr. Genistála racemosa, Monch. meth. Saltzweleda sagittális, fl. wet. 2. p. 498.

Varr. β, minor (D. C. prod. 2. p. 151.) a small shrub, having the branches clothed with adpressed pubescence at the apex as well as the leaves.

71 G. tôngulae (Lin. spec. 998.) branches shrubby, triquetrous, membranous, somewhat articulated; leaves ovate, trifid and bristle-like at the apex, glabrous; flowers disposed into crowded, terminal and lateral clusters; carina and legumes clothed with silky wool. ꞌH. Native of Portugal, on uncultivated hills and among bushes. Brotl. fl. lus. 2. p. 86. Wings of stem rather undulate, with the margins rather denticulated.

**Tridentate-leaved Genista.** Shrub 1 foot.

72 G. deféiusa (Willd. spec. 3. p. 942.) branches procumbent from the neck, triquetrous; leaves lanceolate, glabrous, a little ciliated; peduncles axillary, erect, disposed in interrupted fascicles; corolla and legumes glabrous. ꞌH. Native of Italy and Styria in exposed places. G. humífusa, Willd. in Jacq. coll. 2. p. 169. Spartium decímbens, Jacq. icon. rar. 3. t. 553. but not of Aiton.

**Diffuse Genista.** Fl. May, June. Clt. 1815. Sh. procumbent.

74 G. procumbéns (Walstd. et Kit. in Wildl. spec. 3. p. 940.) branches procumbent, terete, striated, rather pubescent; leaves lanceolate, acute, pubescent beneath as well as the calyxes; flowers pedicellate, axillary, tern; corolla glabrous. ꞌH. Native of Hungary in woods, and of Moravia. Vexillum a little shorter than the keel. Legume unknown.

75 G. A'rédá (Willd. spec. 3. p. 942.) stems procumbent, striated, branched; leaves lanceolate or linear, clothed with white villi; flowers axillary, sessile; calyx and corolla clothed with silky villi; legume tomentose. ꞌH. Native of Tauria and Bessarabia, on stony mountains. Bieb. fl. taur. 2. p. 149. 3. p. 459. Allied to G. pilósís.

**Whitened Genista.** Shrub procumbent.

76 G. pilósís (Lin. spec. 999.) stems procumbent, striated, branched, tuberuléated; leaves ovobérate-lancéolate, obtuse, complicated, clothed beneath with adpressed silky down; flowers axillary, on short pedicels; calyx and pedicels silky; legumes pubescent, 3-4-seeded. ꞌH. Native of the south of France, Switzerland, Germany, &c.; in Britain on dry elevated downs or heaths, on high sandy ground about Bury, Suffolk. About Tornham, on the north side of Bury, also on rocks near the Lizard Point, Cornwall. At the foot of Cader Idris, North Wales. Jacq. fl. austr. t. 208. Smith, engl. bot. 208. Fl. dan. 1225.—Clus. hist. 1. p. 103. f. 2. G répens, Lam. fl. fr. Genistoides tuberculata, Monch. meth.

77 G. micrēntha (Ort. dec. 6. p. 68. t. 10. f. 1.) stems procumbent, smooth, angular; leaves linear-lancéolate; flowers disposed in terminal spikes, distant. carina rather villous; legume 2-3-seeded. ꞌH. Native of Spain, in humid places in the wood called Corazo, near Silos.
78. G. Brotetii (Poir. suppl. 2. p. 720.) stems erect; branches angular, twiggy, glabrous; leaves linear-lanceolate, smoothish on both surfaces; racemes short, terminal; bracteas, calyces, corollas, and legumes glabrous; carina longer than the vexillum, and the vexillum longer than the wings. 2. H. Native of the north of Portugal, in glens of mountains. G. parviflora, Brot. fl. lus. 2. p. 87.

Brotero's Genista. Shrub 4 to 6 feet. 79. G. Pilocarpa (Link. enum. 2. p. 223.) erect; branches angular, pubescent; leaves lanceolate, clothed with silky pubescence; flowers racemose, on short pedicels; legume pilose. 2. H. Native of?

† Species not sufficiently known.
80. G. heterophylla (D. C. prod. 2. p. 152.) stems erect; branches angular, sterile ones villous; leaves simple, oblong, on short petioles, clothed with silky villi; flowers usually ternate, axillary, pendunculate; calyces campanulate, villous; legume silky. 2. H. Native of the Pyrenees, at Monney. Cytisus heterophyllus, Laeypey. abr. 422.

Variable-leaved Genista. Shrub 2 to 4 feet. 81. G. angulata (Rafin. prec. dec. oni. p. 37, under Spartium,) unarmed; branches pentagonal, glabrous; leaves simple and trifoliolate, stalked; leaflets thin, oblong, mucronate, almost smooth; legume solitary, pendunculate, oblong, compressed, pubescent. 2. H. Native of Maryland, in woods.

Angular-branched Genista. Shrub 2 to 3 feet. 82. G. desiderata (D. C. prod. 2. p. 152.) branches unarmed, terete; leaves trifoliate, petiolate; leaflets linear-subulate, pungent at the apex, clothed with adpressed silky pubescence; flowers solitary, pedicellate; calyces and many-seeded legumes pubescent. 2. H. Native of Port Desideratum. Calyx, stamens, and legumes nearly like Genista, but the corolla is unknown. Probably a distinct genus.

Port Desideratum Genista. Shrub.

83. G. scandens (Lour. coh. p. 428.) stem scandent; spines simple; leaves bipinnate. 2. H. Native of Cochinchina, on the banks of rivers. Flowers very numerous, golden yellow. This plant should certainly be removed from Genista. It is perhaps a species of Caesalpinia.

Climbing Genista. Shrub cl.

Cult. All the species of this genus are very elegant when in flower. The hardy species are well fitted for the front of shrubberies, as they are generally of low growth; they are usually increased by seeds or layers. The greenhouse and frame kinds thrive well in a mixture of loam, peat, and sand, and young cuttings of them root readily if planted in a pot of sand, with a bell-glass placed over them, but the glasses must be taken off and wiped occasionally, otherwise the cuttings are apt to damp off.

LX. CYTISUS (from Cytisus, one of the Cyclades, some one of the species was first found there). D. C. l. c. prod. 2. p. 153. Calyx campanulate. Legume 1-4-seeded, not dilated at the upper suture. Flowers white. Leaves very few. Branches unarmed.

1 C. subincanus (Link. enum. 2. p. 240.) branches terete, striated; leaves very few, petiolate; leaflets lanceolate, pilose; flowers lateral, in fascicles; legumes many-seeded, glabrous. 2. G. Native of Teneriffe, on the sides of the Peak. Spartium nubigenum, Ait. hort. kew. 3. p. 13. Spartium supranubium, Lin. fl. suppl. 319. Cytisus aegranis, Lam. dict. Flowers very sweet-scented. Habit of Genista porgans.

3 C. laburnum (Lin. spec. 1041.) branches terete, whitish; leaves petiolate; leaflets ovate-lanceolate, pubescent beneath; racemes pendulous, simple; pedicels and calyces clothed with adpressed pubescence; legume linear, many-seeded, clothed with adpressed pubescence. 2. H. Native of Europe, frequent on the lower mountains. Jacq. ang. t. 306. Carri. bot. mag. 176. Dohum. arbr. ed. nov. 5. t. 44. C. alpinus, Lam. fl. fr. 2. p. 621. — J. Bamb. hist. 1. p. 2. p. 361. icon. Laburnum is usually cultivated for ornament. The wood is hard, of a fine colour, and will polish very well; it approaches near to green ebony, and is called by the French ebony of the Alps, and is there used for many kinds of furniture, but in England there are few of the trees which have been suffered to stand long enough to arrive at any considerable size. Haller observes that Laburnum is very bitter, that the seeds are violently purgative and emetic. He also remarks that the Latin name Laburnum was evidently formed from the Alpine name L'Aubours. In German it is called Bohsenbaum, and in French Cytise des Alpes, Aubours, and Faus Ebenier. The seed of Laburnum is frequently sown in plantations infested with hares and rabbits, who will touch no other tree as long as a twig of Laburnum remains. Though eaten to the ground every season, it rises again in the spring, thus affording a constant supply for these animals, so as to save the other trees till of a size to resist their attacks. The tree grows best in light loam, or sandy soil.

1 fr. 3. quercifolia (Hortul.) leaflets sinuated.

4 C. alpinus (Mill. dict. no. 2.) glabrous; branches terete; leaves petiolate; leaflets ovate-lanceolate, rounded at the base; racemes pendulous; pedicels and calyces puberulous; legumes glabrous, few-seeded, marginate. 2. H. Native of Carinthia, in groves (Hoppe), in Pannonia (Wildl.). In the Alps of Jura on Mount Dole and near Moret, also on the Alpenmiss and on Mount Cenis. Waldst. et Kit. huing. 3. p. 288. t. 260. C. laburnum 3, Ait. Lam. D. C. fl. fr. Cytisus angustifolius, Mеч. meth. 145. This species is nearly allied to the preceding, but is still truly distinct. The tree or Scotch Laburnum, or Cytisus alpinus, is a native of Switzerland and Scotland; it is cultivated chiefly for ornament, but affords also a valuable timber; for this purpose the C. alpinus is decidedly preferable to the common kind, as being more of a tree. The wood of both
the Scotch and common Laburnum is much used by cabinet-makers and turners, for its hardness, beauty of grain, and durability.

**Alpine or Scotch Laburnum.** Fl. June. Ct. 1596. Tree 15 to 20 feet.

5 C. nigréans (Lin. spec. 1041.) branches terete, twiggy; leaves stalked, clothed with adpressed pubescence beneath, as well as the branches, calyces, and legumes; leaflets elliptic; racemes elongated, terminal, erect; calyces bractless. *H.* H. Native of Piedmont, Vallais, and Bohemia, on hills and along waysides. Jacq. *H. norman. t. 387. Ker. bot. reg. 802. Lam. ill. t. 618. f. 3. Duh. arb. ed. nov. 8. t. 46. f. 1. This plant turns truly black on drying.

**Three-flowered Cytisus.** Fl. June, July. Ct. 1640. Shrub 3 to 4 feet.

8 C. molle (Willd. enum. suppl. 51.) leaflets oblong, clothed with soft pubescence, acute at both ends; peduncles axillary, usually tern; calyces subglobose, bifid, scarios. *H.* H. Native of Spain. Perhaps sufficiently distinct from C. triflorus.

10 C. arbores (D. C. prod. 2. p. 154.) branches striated, glabrous; leaves stalked; leaflets obvate, clothed with fine pubescence beneath; flowers axillary, aggregate, pedicellate, nodding; legumes clothed with adpressed silky villi. *H.* H. Native of valleys about Algiers. *Spártium arboresum,* Desf. atl. 2. p. 131. t. 177. Genista pítentum, Poir. voy. 2. p. 208. A shrub 8 to 10 feet high, with a trunk about the thickness of a man's arm.

**Arboreous Cytisus.** Shrub 8 to 10 feet.

11 C. Velde ni (Visiani, pl. dalm. ex bot. zcit. jan. 1830. p. 52.) erect; leaves ternate, petiolate; leaflets elliptic, entire, cuneated at the base, and obtuse at the apex; smooth; racemes terminal, stalked, pyramidal, straight; pedicels hoary and villous; calyces campanulate, 3-lobed; lobes tomentosely ciliated; corolla glabrous, but the carina is clothed with silky villi; legume glabrous, mucronate by the style. *H.* H. Native of Dalmatia, in woods on mountains Grab and Krivosee. Flowers fragrant, yellow.

**Welden's Cytisus.** Shrub 2 to 4 feet.

12 C. grandiflorus (D. C. prod. 2. p. 154.) branches angular, usually glabrous; leaves in fascicles, petiolate, trifoliolate, but for the most part simple, and are, as well as the leaflets, ovate-lanceolate, but the primary ones are roundish; flowers lateral, pedicellate, solitary or twin; legume woolly. *H.* H. Native of Portugal, on hills, in heidges, and in woods. *Spártium grandiflorum,* Broc. fl. lus. 2. p. 80. *Great-flowered Cytisus.* Fl. June, July. Ct. 1816. Shrub 3 to 4 feet.

13 C. scorpiiácus (Link. enum. 2. p. 241.) branches angular, smooth; leaves trifoliolate, petiolate, upper ones simple, and are oblong, as well as the leaflets; flowers axillary, pedicellate, solitary; legume pilose on the margins. *H.* H. Native of Europe, in woods and on commons; plentiful in Britain. *Spártium scópárium,* Lin. spec. 996. Oed. fl. dan. t. 313. Smith. engl. bot. 1339. Genista scopária, Lam. dicht. 2. p. 623. but not of Vill. Gen. hirsuta, Moench. meth. 144.—Duham. arb. t. 84. The common broom is used in many parts of Britain for besoms, and in some places it serves for thatching cottages, corn, and hay ricks. The flower-buds before expansion are sometimes pickled in the manner of capers. The branches are said to be capable of tanning leather, and of being manufactured into coarse cloth, when tender they are mixed with hops in brewing, and in some places used as fodder. The old wood furnishes the cabinet-makers with the most beautiful material for veneering. The plant when burnt affords a most beautiful alkaline salt, and on this salt the efficacy of broom in droptics must depend. The seeds of broom have a very bitter taste, and when given in decoction prove considerably diuretic. The branches have similar properties.

**Var. ß, albus; flowers white.**

**Common-Broom.** Fl. April, July. Britain. Sh. 3 to 10 ft.

**Sect. III. CALYCÔTOME (from kalyx, calyx, and tome, tome, a cutting; in reference to the calyx at length falling off in part, giving it the appearance of being cut off).** Link, in Schrad. neune. journ. 2. p. 50. D. C. prod. 2. p. 154.—Calyctómone, Hoffmans. verz. plant. 1824. p. 196. Calyx campanulate, somewhat bilabiáté, at length circumscissely truncate. Legume thickened on the upper suture. Shrubs, with spiny branches and yellow flowers.

**Spiny Cytisus.** Fl. June, July. Ct. 1596. Sh. 5 to 6 feet.

**Sect. IV. Tubociyètis (from tubus, a tube, and cytisus; in reference to the tubular shape of the calyx).** D. C. L. c. prod. 2. p. 155.—Vibórgia, Moench. meth. 152. but not of Thunb. Calyx tubular, bilabiáté at the apex.—Unarmed shrubs.

* Flowers white or whitish.

16 C. prolíferus (Lin. suppl. 328.) stems erect; branches terete, velvety; leaflets elliptic, and are, as well as the calyces silky; flowers lateral, umbellately aggregate; legume villous. x 2
LEGUMINOSÆ. IX. CYTISUS.

Many-flowered Cytisus. Fl. May, June. Cl. 1800. Shrub 2 to 3 feet.

23. C. FALCATUS (Waldst. et Kit. hong. 3. p. 264. t. 238.) stems decinate; branches terete, twiggy, young ones, as well as the leaves clothed with adpressed villous pubescence; petioles hairy; flowers usually tern, lateral, on short pedicels; calyxes clothed with adpressed villi.  h. H. Native of Croatia, Valonia, Podolia, and Galicia. Lodd. bot. cab. 520. The plant cultivated in the garden of Geneva differs from the wild plant in the flowers being almost sessile, and in the leaves being pubescent, not silky-villous.

24. C. AUSTRIACUS (Lin. spec. 1042.) stems erect; branches twiggy, terete, and are, as well as the leaves, clothed with adpressed striospic pubescence; leaflets lanceolate, attenuated at both ends; flowers terminal, somewhat umbellate; calyxes and legumes sparingly villous.  h. H. Native of Austria, upper Italy, the Ukraine, and Siberia, in woods and rough places. Mill. icon. 117. f. 2. Pall. ill. ed. gall. t. 100. f. 3. Jacq. austr. 1. t. 21.

25. C. SUPINUS (Jacq. fl. austr. 1. t. 20.) stems decumbent, branched; branches terete, young ones rather hairy, adult ones smooth; leaflets obovate, obtuse, rather hairy beneath; flowers 2-4, usually terminal, pedunculate; calyxes and legumes sparingly villous.  h. H. Native of Belgium, Austria, Pannonia, Siberia, Turkey, and Dauphiny, on exposed hills and in bushy places.—Chus. hist. p. 96. No. 71. Icon. C. lotoides. Pourr. act. toul. 3. p. 315. Flowers pale-yellow, with the vexillum reddish.

26. C. HIRSUTUS (Lin. spec. 1042. Jacq. obs. 4. t. 96.) stems decumbent; branches twiggy, terete, young ones hispid, adult ones smooth; leaflets obovate, villous beneath; flowers lateral, on very short pedicels, aggregate; calyxes and legumes hairy.  h. H. Native from Genoa to Hungary, in rough places. C. supinus, Bertol. pl. gen. but not of Limneus. C. triflorus, Lam. dict. 2. p. 250.—Chus. hist. 95. no. 4.

27. C. SÉRÓTINUS (Kit. in litt.) stems ascending; branches terete, hairy; leaflets obovate, glabrous above, rather villous beneath; flowers axillary, 2-3, pedicellate; calyces hairy.  h. H. Native of Hungary. This plant is sufficiently distinct from the two preceding.

Late-flowering Cytisus. Shrub 5 to 3 feet.

28. C. CAPITATUS (Jacq. fl. austr. t. 33.) stems erect; branches straight, hispid; leaflets ovate-elliptic, villous; flowers numerous, capitulate at the tops of the branches; calyxes and legumes covered with hispid villi.  h. H. Native of Burgundy, Italy, and Austria, on the edges of woods. Lodd. bot. cab. 497. C. supinus, Lin. spec. 1040. C. hirsutus, Lam. dict. 2. p. 250. Flowers sometimes lateral in the autumn.

Capitate-flowered Cytisus. Fl. June, July. Cl. 1774. Sh. 2 to 4 feet.

29. C. CILIA'TUS (Wahlenb. fl. carp. 219.) stems erect; young branches hispid, adult ones glabrous; leaflets obovate, clothed beneath with adpressed villi; flowers approximate, tern, at length lateral; legumes glabrous, ciliated.  h. H. Native of the Carpathian mountains, on the plains of Litou.

30. C. POLYTRICHUS (Biebl. fl. taur. suppl. 477.) stems decinate; branches hispid; leaflets obovate-elliptic; and are, as well as the calyxes, villous; flowers lateral, usually two, pedicellate; legumes hairy.  h. H. Native of southern Tauria, on the higher mountains in pine forests. This species is more hairy

17 C. LEUCANTHUS (Walds. et Kit. hong. 2. p. 141. t. 132.) stems erect; branches terete, and are, as well as the leaves, clothed with adpressed pubescence; leaflets elliptic, acute, flowers at the tops of the branches; heads of flowers bracteate, by two leaves.  h. H. Native of Croatia, in woods. Wildl. spec. 3. p. 1124. Sims, bot. mag. 1438. This species differs from C. AUSTRIACUS in the flowers being white, not yellow.

Var. β, pallidus (Schrad. in litt.) flowers cream-coloured.

18 C. A. LINDUS (D. C. cat. hort. monsp. 101. no. 85.) stems erect; branches divaricate, terete, rather glabrous; leaflets oblong, pubescent beneath, as well as the calyxes; flowers axillary, usually tern, pedicellate; calyx with both lips entire.  h. H. Native of the south of Europe and north of Africa. Flowers white. Ovary pubescent.

Whitish-flowered Cytisus. Fl. June, July. Specimen 3 to 4 feet.

19 C. PURPUREUS (Scop. carn. no. 905. t. 43.) stems procumbent, twiggy; leaves, calyxes, and legumes glabrous; leaflets oblong, pubescent, pubescence sessile, as well as the calyxes; flowers axillary, shortly on short pedicels.  h. H. Native of Carniola and Croatia, in exposed places. Jacq. austr. append. t. 48. Lodd. bot. cab. 892. Sims, bot. mag. 1176. Flowers purple. This plant is very beautiful when in flower, but has a better effect when grafted on a rather tall laburnum.

Var. β, albiflorus; flowers white.

Flowers purple.

20 C. BIFLORUS (Lher. stirp. 184. Ait. hort. kew. 3. p. 52.) stems diffuse; branches terete, and are as well as the leaves rather pubescent; leaflets oblong-lanceolate; flowers on short peduncles, axillary, and usually with, leaflets and legumes clothed with adpressed pubescence.  h. H. Native of Austria, Pannonia, Podolia, Tauria, and Siberia. Wildl. et Kit. hong. 2. p. 106. Duham. arb. ed. nov. 5. p. 45. f. 2. C. supinus, Jacq. fl. austr. 1. t. 20. C. hirsutus, Giné. sib. 4. p. 17. t. 5. f. 2. C. hirsutus and C. supinus, Biebl. fl. taur. ex Stev. in litt. C. macrocarpus, Bess. in litt.

Var. β, glaber (Linn. fl. suppl. 325.) branches and leaves glabrous; leaflets obovate.

Var. γ, subspinosum (D. C. prod. 2. p. 155.) branches rather hoary, more diffuse, somewhat spineous at the apex.  h. H. Native of Naples and Hungary.

21 C. ELONGATUS (Waldst. et Kit. hong. 2. p. 200. t. 183.) stems erect; branches elongated, terete, young ones villous; leaflets obovate, clothed beneath with adpressed villi; flowers lateral, usually in fours on short pedicels; calyxes villous.  h. H. Native of Hungary, in woods. Petoles of the upper leaves longer than the calyxes. Flowers few.

Elongated Cytisus. Fl. May, June. Cl. 1804. Sh. 3 to 4 ft.

22 C. MULTIFLORUS (Lindl. bot. reg. t. 1191.) stems erect; branches elongated, terete, younger ones villous; leaflets oblong, tapering to the base, villous beneath, the same colour on both surfaces; flowers usually tern; pedicels about equal in length to the petioles; vexillum emarginate, undulated.  h. H. Native of Europe. C. elongatus, Hortul, but not of Kit. C. elongatus β, multiflorus, D. C. prod.
than *C. capitatus*, and the disposition of the flowers is that of *C. hirsutus*, and the habit that of *C. supinus*.

**Sect. V. Lotoïdes** (from λωτος, lotos, lotus, and ιδεο, form; resemblance to the genus *Lotus*). D. C. L. c. prod. 2. p. 156. Tube of calyx short, oblong, the upper lip binate, the lower one tridentate. Corolla hardly longer than the calyx. Many-stemmed decumbent subshrubs. Flowers few, somewhat capitulate, of all yellow.

31 **C. ARGÉSTÉUS** (Lin. spec. 1043.) stems decumbent; leaves, calyxes, corollas, and legumes clothed with appressed silky down; leaves petiolate, trifoliate; legumes obovate-lanceolate; flowers 3-4, terminal. γ. H. Native of Portugal, Spain, south of France, Italy, Carniola, and Mauritania, in rugged places. Desf. ad. 2. p. 139. Lotus argentéus, Broth. fl. loc. 2. p. 119.—Lob. icon. 2. p. 41. f. 2.

32 **C. PYGMÆUS** (Willd. spec. 3. p. 1127.) stems decumbent, suffruticose; leaves petiolate, trifoliate; legumes obovate-lanceolate; silky; flowers usually terminal; legumes obovate, villous. γ. H. Native of Galatia.

**Pygmy Cytisus.** Fl. June, July. Shrub decumbent.

33 **C. CALVICUS** (Bieb. fl. taur. 2. p. 166.) stems ascending; leaves, calyxes, and legumes rather hairy from spreading down; leaves petiolate, trifoliate; leaflets roundish-ovate; flowers 2-8, terminal. γ. H. Native of Caucasus, in stony places. C. pauciflorus, Willd. spec. 3. p. 1126.

34 **C. LOTOIDES** (Willd. spec. 3. p. 1127.) stems decumbent, herbaceous, simple, and are, as well as the leaves, pubescent; leaves petiolate, trifoliate; leaflets roundish-elliptic, mucronate; flowers 7-8, capitulate. γ. H. Native of Galatia.

**Lotus-like Cytisus.** Shrub decumbent.

35 **C. NIANUS** (Willd. enum. 769.) stems erect; leaves trifoliate, obovate, clothed with strigose pubescence beneath and smooth above; raceme terminal, second, usually 4-flowered; calyx deeply 3-parted; hairs on the stems and peduncles adherent. Wats. dend. brit. 51. γ. H. Native of the Levant.

**Dwarf Cytisus.** Fl. May, June. Clt. 1816. Sh. deciduous.

**Sect. VI. CHRONA'NTHUS** (χρονάνθος, chronos, a year, and ἄνθος, a flower; in reference to the permanent petals, which remain all the year). D. C. L. c. prod. 2. p. 157. Upper lip of calyx bifid, lower one trifid; lobes acute, length of the tube. Petals permanent. Legume oval, much compressed, 2-seeded. Perhaps a proper genus.

36 **C. ORIENTÁLIS** (Lois. in Duham. arbr. ed. nov. 3. p. 136.) stems erect, hairy; leaves almost sessile, trifoliate, villous; leaflets linear, acut; flowers sub-terminal, few, and are, as well as the legumes, glabrous. γ. H. Native of the Levant. C. orientalis, &c. Sherard and Vaill. herb. Flowers large, on short pedicels, yellow. Calyx villous, more 5-cleft than bilabiate.

† **Species not sufficiently known.**

37 **C. PONTICUS** (Willd. spec. 3. p. 1120. exclusive of the synonyme of Tourn.) branches few-flowered, ascending, and are, as well as the leaves, pubescent; leaves trifoliate; leaflets elliptic, obtuse; branches erect, terminal; calyxes villous. γ. H. Native of Pontus. According to Willd. this plant is allied to *Adenocarpus Hispánicus*. C. Ponticus humifusus magno flore, Tourn. cor. 44. According to Willd. the branches are terebin, not sultatic, and the leaflets obovate, not elliptic.

**Pontic Cytisus.** Shrub ascending.

38 **C. CANESCENS** (Lois. in Duham. arbr. ed. nov. 5. p. 151.) the whole plant is clothed with silky hoary pubescence; leaves trifoliate; leaflets linear-oblong; racemes few-flowered, terminal; calyxes short, campanulate, canescence, 5-toothed. γ. H. Native of? Legumes unknown.

**Canescous Cytisus.** Shrub.

39 **C. AFRICÁNUS** (Lois. in Duham. arbr. ed. nov. 5. p. 154.) branches erect, hairy; leaves trifoliate, petiolate; leaflets linear, pilose; umbels terminal, pedunculate; calyx hairy, hardly shorter than the corolla. γ. H. Native of the north of Africa. C. Africáns hispánicus angustifolius, Tourn. inst. 618. This plant is said to be allied to *Adenocarpus*. 

**African Cytisus.** Shrub.

40 **C. PAUILLIDUS** (Poir. suppl. 2. p. 412. but not of Schrad.) branches few-flowered, glabrous; leaves sessile, trifoliate; leaflets oblong-lanceolate; flowers axillary and terminal, somewhat capitature. γ. G. Native of the Canary Islands. Corolla pale-white. Perhaps a variety of *Genista linifolia*.

**Pale-flowered Cytisus.** Shrub 2 to 3 feet.

41 **C. PROCURUS** (Link, enum. 2. p. 241.) branches terete, striated; leaves lanceolate, pilose; flowers solitary, axillary; legumes villous. γ. H. Native of Portugal. Spártium pro- cérum, Willd. enum. 742.

**Tall Cytisus.** Shrub 6 to 8 feet.

42 **C. P. HISPÁNEUS** (Burm. in. p. 136. t. 51. f. 1.) branches straight, divaricate, and are as well as the leaves finely pubescent; leaves petiolate, trifoliate; leaflets linear, the middle one twice the length of the others; racemes elongated, loose-flowered, opposite the leaves; ovaries villous. γ. H. Native of Persia. Spártium Pérseicum, Willd. spec. 3. p. 931. Habit almost of *Indigofera psoraleoides*, and if the stamens, as is suspected, are diadelphous, it is certainly referable to *Indigofera*.

**Persian Cytisus.** Shrub 3 to 4 feet.

43 **C. ANTILLÁNUS** (D. C. prod. 2. p. 157.) spines under the origin of the leaves, shorter than the petioles; leaves trifoliate; leaflets rhomboidal-oblong, silky beneath; flowers axillary, solitary, on short pedicels. γ. S. Native of the Caribbean Islands. C. spinosus, Descour. fl. med. ant. 1. t. 8. but not of Limnæus. C. spinosus, with yellow flowers rising from the wings. Plum. gen. p. 19. ex Desc. Calyx campanulate, bilabiate. Legume an inch long, somewhat inflated, 5-6-seeded. Stamens, according to the description, diadelphous, but from the figure monadelphous.

**Antilles Cytisus.** Shrub.

**Cult.** The species of this genus are very elegant when in flower, the Hardy kinds are well adapted for ornamenting shrubbery, the trailing kinds of them are well fitted for rock-work, or to be planted on dry banks; the *C. purpuræus* is one of the handsomest of this description, and has a very beautiful appearance when grafted on a tall *Laburnum*. The larger kinds, such as the *Laburnum*, should be planted in conspicuous places. All are readily increased by seeds or layers, or by grafting the rarer on the commoner kinds. The greenhouse and frame kinds thrive best in a mixture of loam, peat, and sand, and young cuttings of them root freely if planted in a pot of sand, with a bell-glass placed over them, the glasses to be taken off and wiped occasionally.

**Unlike.**

45 **ADENOCA’RPUS** (from αδην, aden, a gland, and κάρπος, karpos, a fruit; in reference to the legumes being beset with pedicellate glands). D. C. fl. fr. suppl. 549. Leg. mem. VI. prod. 2. p. 158.

**LIN. Syst. Monadelphía, Decándria.** Calyx obconical, usually beset with glands, bilabiate, upper lip bipartite, lower one longer and tridí. Carina obtuse, inclosing the germinis. Stamens monadelphous. Legume oblong, compressed, bearing on all sides pedicellate glands.—Shrubs with divaricate branches, trifoliate,
usually aggregate leaves, having petiole stipulas, complicated leaflets and terminal racemes of yellow flowers, with the pedicles bracteate.

1 A. Hispánica (D. C. l. c.) calyx set with glands and villi; lower lip of calyx with 3 equal segments, hardly longer than the upper lip; branchless hairy; flowers crowded; vexillum smoothish. ɣ H. Native of Spain and Portugal, in shady humid places. Cytisus Hispánicus, Lam. dict. 2. p. 248. Cytisus angústýrus, Lür. stirp. 184.

Spanish Adenocarpus. Fl. June, Jul. Clt. 1816. Sh. 2 to 4 ft. 2 A. intertempus (D. C. l. c.) calyx set with glandular pubescence, with the lower lip trifid, the lateral segments shorter than the middle one, and much exceeding the upper lip; branches rather villous; flowers remotish; vexillum smoothish. ɣ H. Native of Sicily and Naples, on mountains. - Chus. hist. 1. p. 94. f. 1. Cytisus complicátus, Broth. fl. lus. 2. p. 92.

Intermediate Cytisus. Fl. May, July. Clt.? Sh. 3 to 4 feet. 3 A. parvífoliès (D. C. l. c.) calyx clothed with glandular pubescence, with the middle segment of the lower lip longer than the lateral ones, much exceeding the upper lip; branches glabrous; flowers remote; vexillum pubescent. ɣ H. Native of the west of France, on exposed heaths. Cytisus parvífoliès, Lam. dict. 2. p. 248. exclusive of the synonyms. Cytisus divaricátus, Lür. stirp. 184. Cytisus complicátus, D. C. fl. nov. 3821. Spártilum complicátum, Löüs. fl. gall. 411. Branches white.

Small-leaved Adenocarpus. Fl. May, July. Clt. 1800. Sh. 3 to 4 feet. 4 A. téloquíní (D. C. l. c.) calyx clothed with glandless pubescence, the segments of the lower lip about equal in length, a little longer than the superior lip; branches smooth; flowers remote; vexillum pubescent. ɣ H. Native of the Pyrenees, Cevennes, mountains of Provence and Rome. Cytisus Téléquíní, Löüs. fl. gall. 416. and in Duh. arb. ed. nov. 5. p. 155. t. 47. f. 2. Spártilum complicátum, Goun. hort. monep. 356. exclusive of the synonyme.

Telequiní Adenocarpus. Fl. Ju. Jul. Clt. 1800. Sh. 2 to 4 feet. 5 A. fränkénóiodes (Choisy, mss. in herb. D. C. prod. 2. p. 158.) calyx set with glandular pubescence, with the lower lip having the middle segment longer than the lateral ones, and exceeding the lower lip; branches velvety; leaves much crowded, hairy; flowers crowded; vexillum pubescent at the apex. ɣ F. Native of Teneriffe, on the declivities of the Peak, at the height of 3000 feet, where it is called Codesí. Genista viscosa, Wild. spec. 3. p. 837. It is usually confused with the following species, but differs in the calyx being glandular, as A. parvífoliès differs from A. Téléquíní.

Frankenwig-like Adenocarpus. Fl. April, July. Clt. 1815. Shrub 1 to 3 feet.

6 A. foliátemus (D. C. l. c.) calyx covered with glandless pubescence, with the lower lip elongated and trifid at the apex, the segments equal; leaves and branchs much crowded, hairy; vexillum pubescent. ɣ F. Native of the Grand Canary Island, among bushes, and in the woods of Laguía. Cytisus foliátemus, Ait. hort. kew. 3. p. 49. - Pl. alm. t. 277. f. 6. bad. Young legume furnished with a few glandular hairs, adult ones almost smooth.

Leafy Adenocarpus. Fl. May, Ju. Clt. 1629. Sh. 3 to 6 feet. Cult. Elegant plants when in flower, and well fitted for ornamenting the front of shrubberies. Their culture and propagation is the same as that for the hardy species of Cytisus. The two last species require protection in winter.

LXII. ONOÍNIS (said to be from őno, oino, an ass, and ővnp, oneni, to delight; some of the species are said to be grateful to asses). Lin. gen. no. 863. Lam. ill. t. 616. D. C. prod. 2. p. 158. - Anónis and Nátrix, Mœnch. meth. 157. and 158.

L. s. Monadelphía, Décandria. Calyx campanulate, 5-cleft, with linear segments. Vexillum large, striated. Stamina monadelphous, the tenth one sometimes almost free. Legume usually turgid, sessile, few-seeded. - Herbs or subshrubs, with trifoliate leaves, seldom simple, but more rarely impari-pinnate. Flowers rising from the axils of the leaves, sometimes pedunculate, sometimes sessile, yellow or purple, rarely white. Pedicles usually furnished with an awn, a floral leaf, or abortive petiole.

Sect. I. Eucónóis (cv, cv, good, and oánis; genuine species. D. C. prod. 2. p. 158.) Stipulas adnate to the petiole.

§ 1. Nátrix (the name of a plant which smells like a goat). Leaves simple or trifoliate. Flowers axillar, pedunculate, yellow.

1 O. críspa (Lin. spec. 1010. exclusive of the synonyme of Magn. shrubbery); leaves trifoliate; leaflets roundish, undulated, toothed, clothed with clammy pubescence; pedicles 1-flowered, a\\n\\nAWN. ɣ F. Native of Spain. Wendl. in Roem. arch. 1. p. 106. Stipulas spreadingly-deflexed. Vexillum striped with blood-colour on the outside.

2 O. Hispánica (Lin. fl. suppl. 324.) shrubbery; leaves trifoliate; leaflets channelled, recurved, with the margin serrated; pedicles 1-2-flowered, furnished each with an awn. ɣ F. Native of Spain, along the Mediterranean Sea, in the sand. Sims, bot. mag. 2450. exclusive of the synonyme of Tenere.- Bærr. icon. t. 775. Perhaps a variety of O. críspa.

3 O. vagínação (Vahl. symb. 1. p. 53.) shrubbery; leaves crowded, sessile, trifoliate, but the upper ones are simple; stipulas sheathing; leaflets obvate, serrated; pedicles elongated, 1-flowered, permanent, each furnished with an awn. ɣ F. Native of Egypt. Vent. hort. cels. t. 92. Viv. fl. lymb. 41. t. 4. f. 4. óst. Chełéri, Forsk. desc. 150. Leaves, branches, peduncles, and calyces clothed with clammy pubescence.

4 O. nátrix (D. C. fl. fr. 4. p. 514.) shrubbery; clothed with clammy pubescence; leaves trifoliate; leaflets oblong, serrated at the apex, upper ones sometimes simple; stipulas oval-lanceolate; pedicles 1-flowered, each furnished with an awn. ɣ H. Native of Europe, in places exposed to the sun.

5 O. arachnoida (Lapeyr. abr. 409.) shrubbery, villous, but not clammy; leaves pinnately trifoliate; leaflets oval-oblong, serrated at the apex, upper ones sometimes simple; pedicles 1-flowered, each furnished with an awn. ɣ F. Native of the Pyrenees, on the eastern side along the torrents. D. C. fl. fr. suppl. 552. Vexillum striated with red. Branches set with soft hairs.

Conecobbed Rest-harrow. Shrub 1 to 2 feet.

6 O. cuspidata (Desf. at. 2. p. 144.) herbaceous, villous, but not clammy; leaves trifoliate, but the upper ones are simple; leaflets elliptic, serrated; pedicles 1-flowered, each furnished with an awn, the awns broadest above. ɣ F. Native of Algers. Like O. nátrix, but the villi is longer and not clammy, and the corolla is not half the size.
7 O. ricta (Desf. fl. atl. 2. p. 144.) herbaceous, clothed with clammy villi; leaves trifoliolate; leaflets elliptic, serrated; pedicels 1-flowered, each furnished with an awn, shorter than the leaves; corolla hardly longer than the calyx. F. Native of Barbary, near Mascar. Vexillum painted with purple lines.

8 O. longifolia (Willd. enum. 750.) shrubby, clothed with clammy pubescence; leaves trifoliolate; leaflets linear-lanceolate, serrated at the apex; stipulas setaceous, linear; pedicels 1-flowered, each furnished with an awn. F. Native of Teneriffe and on the mountains in the Grand Canary Island.

9 O. falcata (Viv. fl. lyb. 41. t. 18. f. 3.) erect, hairy; stipules falcate, sheathing at the base; leaves all trifoliolate; leaflets almost linear, toothed at the apex; pedicels 1-flowered, each furnished with a very short awn, longer than the leaves. F. Native of Cyrenaica.

10 O. Ramosissima (Desf. fl. atl. 2. p. 142. t. 186.) plant suffruticose, much branched, clothed with clammy pubescence; leaves trifoliolate; leaflets linear-obovate, serrated; pedicels 1-flowered, longer than the leaves, each furnished with a long awn. F. Native of Barbary, Sicily, and Nice, in the sand by the sea side. D. C. fl. fr. 4. p. 515. Vexillum striped with purple veins.

Clothed Rest-harrow. Pl. ½ foot. 14 O. viscosa (Lin. spec. 1009. var. a.) herbaceous, pubescent, clammy; superior leaves simple, lower leaves trifoliolate, middle leaflet largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn, longer than the leaves; corolla longer than the calyceal lobes. F. Native of the south of France, Spain, and Portugal.—Barr. icon. t. 1239. Awn of pedicel shorter than the calyx.

Clammy Rest-harrow. Fl. Ju. July. Clt. 1759. Pl. ½ to 1 ft. 15 O. Brachya rea (D. C. prod. 2. p. 160.) herbaceous, pilose, rather clammy; superior leaves simple, inferior ones trifoliolate; middle leaflet largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn, longer than the leaves, permanent; corolla and legume length of calyx. F. Native of Spain, near Aranujez, as well as about Madrid.

Short-podded Rest-harrow. Fl. June, July. Clt. 1823. Pl. ½ foot. 16 O. breviflora (D. C. prod. 2. p. 160.) herbaceous, pilose, rather clammy, upper leaves simple, lower ones trifoliolate; leaflets elliptic, obtuse, serrated, middle one largest; stipulas serrated, about equal in length to the petiole; peduncles 1-flowered, each furnished with an awn, length of leaves; corolla shorter than the calyceal lobes. F. Native of Italy, Sicily, and Spain, and perhaps of the south of France. O. viscosa, Lin. D. C. fl. fr. 5. p. 515. Awn of pedicel about equal in length to the calyx. Legume twice the length of the calyx. Perhaps only a variety of the preceding.

Short-flowered Rest-harrow. Fl. Ju. July. Clt. 1800. Pl. ½ ft. 17 O. sicula (Guss. cit. 1821. p. 78.) herbaceous, diffuse, clammy, pubescent; upper leaves simple, the rest trifoliolate; leaflets linear-oblong, acute, serrated at the apex; stipulas nearly entire, about equal in length to the petiole; peduncles 1-flowered, each furnished with an awn; corolla shorter than the calyx; legumes shorter than the calyx, pendulous. F. Native of Sicily, on the Volcanic rocks near Palagonia. Stipulas lanceolate, acuminate. Flowers yellow, redinate. Stamens 7-18.

Sicilian Rest-harrow. Fl. Ju. July. Clt. 1817. Pl. 1 foot. 18 O. Cinitana (Brot. phyt. 138. t. 57.) herbaceous, pubescent; upper leaves simple, lower ones trifoliolate; leaflets oval-oblong or lanceolate, serrated; stipulas serrated, equal in length to the petioles; peduncles 1-flowered, awnless. F. Native of Portugal, on the lower region of the Cinita mountains.

Cintra Rest-harrow. Pl. 1 foot. 19 O. pubescent (Lin. mant. 267.) herbaceous, erect, clammy, pubescent; upper leaves simple, the rest trifoliolate; leaflets oval-oblong, serrated; stipulas large, acuminate, entire; calyxes broad, striated; peduncles 1-flowered, awnless, shorter than the leaves. F. Native of Portugal, Spain, Mauritania, and the islands of the Archipelago. D. C. fl. fr. suppl. p. 551. O. arthropodia, Brot. phyt. 140. t. 58. O. morisoni, Gourn. herb. 47. O. calycina, Lam. dict. 1. p. 506. Vexillum somewhat pubescent. Legume 2-seeded; shorter than the calyx, according to Brotero, but a little longer than the calyx, and containing 4 or 6 seeds in the specimen collected in Sicily contained in the herbarum of Moricand.

Pubescent Rest-harrow. Fl. Ju. Aug. Clt. 1680. Pl. 1 to ½ ft. 20 O. Polyomorphus (Guss. pl. rar. p. 291.) plant clothed with clammy pubescence; lower leaves ternate, superior ones simple; leaflets elliptic-oblong, serrulated from the middle to the apex; peduncles 1-flowered, mucil or awned, at length exceeding the leaves; calyx curved, equal in length to the corolla; legume pendulous, 4-6-seeded, mucronate by the reflexed style, rather longer than the calyx. F. Native of Calabria. Flowers yellow.

Polyomorphus Rest-harrow. Fl. April, May. Pl. ½ foot. 21 O. calycina (Viv. fl. lyb. 41. t. 18. f. 3, but not of Lam.) herbaceous, erect, clothed with glandular hairs; lower leaves trifoliolate, upper ones simple; leaflets ovate-cuneated, and are, as well as the stipulas, serrate-toothed; pedicels 1-flowered, awnless, shorter than the leaves; calyx equal in length to the corolla. F. Native of the north of Africa, on the sea shore.

Large-calyxed Rest-harrow. Fl. July, Aug. Pl. ½ foot. 22 O. ornithoporodes (Lin. spec. 1009.) herbaceous, clothed with clammy pubescence; leaves trifoliolate; leaflets oblong, serrated; peduncles 1-2-flowered, each furnished with an awn; legume linear, drooping, contracted between the seeds. F. Native of Spain, Italy, Sicily, and Mauritania. Cav. icon. 2. t. 192. Cup. parv. sic. ed. bon. t. 20. the outmost figure.

LEGUMINOSÆ. LXII. Ononis.

§ 2. Natriodium (from Natrix and idea, formed; the plants have the habit of the last division). D. C. prod. 2. p. 261. Leaves simple and trifoliate. Flowers axillary, pedunculate, purplish, rarely white.

24 O. tribracteata (D. C. fl. suppl. 553.) shrubby; leaves trifoliate; leaflets obovate, toothed; peduncles usually 3-flowered; calyx bracteate with 3 leaves. 9. H. Native of Carinthia. O. rotundifolia of Lin. spec. ed. 2. p. 1959. exclusive of the synonyms.

25 O. fruticosa (Lin. spec. 1010.) shrubby; leaves trifoliate; leaflets sessile, lanceolate, serrated; stipules connate in one, having 4 awns, leafless on the upper part; peduncles 3-flowered, disposed in a raceme. 9. F. Native of Provence and Dauphiné, on the Alps. Duh. ed. nov. 1. t. 58. Mill. dict. t. 36. Sims, bot. mag. 317.

Shrubby Rest-harrow. Fl. May, Ju. Clt. 1680. Sh. 1 to 2 ft.

Var. canescens (Lam. dict. 1. p. 505.) branches clothed with hoaryomentum; leaflets pale, wedge-shaped, 5-toothed. 9. F. Native of Arragon. Asso, fl. arr. no. 671. var. 2.—Barr. icon. t. 416.

27 O. angustifolia (Lam. dict. 1. p. 508.) shrubby; leaves palmately-trifoliate; leaflets linear, acute, serrated at the apex; peduncles 1-flowered, each furnished with an awn, longer than the leaves. 9. F. Native of Spain, along way sides between Valentin and Demain.—Barr. icon. t. 299 or 300.

28 O. cenisia (Linn. mant. 267.) suffruticosum at the base, many-stemmed, tufted, prostrate, glabrous; leaves palmately-trifoliate; leaflets cuneate, and are, as well as the stipulas serrated; peduncles 1-flowered, without an awn, longer than the leaves. 9. H. Native of Piedmont, Provence, Dauphiné, and Savoy on rocks, in the Alps. All. fl. ped. no. 1173. t. 16. f. 2.—Barr. icon. t. 1104. O. cristata, Mill. dict.

29 O. foetida (Schousb. ex Balb. D. C. prod. 2. p. 261.) herbaceous; branchlets pilose; leaves smooth, upper ones simple, the rest trifoliate; leaflets elliptic, serrulated, middle one largest; stipulas about equal in length to the petioles; peduncles 1-flowered, each furnished with an awn. 9. F. Native of Morocco, in fields. Corolla nearly like that of O. Cenésia. Foetid Rest-harrow. Fl. June, July. Clt. 1818. Pl. 21/2 foot.

30 O. nemusiflora (Lagr. nov. spec. p. 22.) herbaceous, villous; leaves trifoliate; leaflets oblong, truncate, serrate-toothed at the apex; peduncles 2-flowered, each furnished with an awn, longer than the petioles. 9. H. Native of Spain, near Madrid, in arid places. Legumes drooping.

31 O. lamiiflora (Desf. fl. atl. 2. p. 146. t. 190.) herbaceous; leaflets pubescent, obovate, and are, as well as the stipulas, toothed; peduncles 1-flowered, without an awn, calyx about equal in length to the corolla, but 3 times shorter than the legume. 9. H. Native of Algiers, on uncultivated hills. Corolla bluish.

Lax-flowered Rest-harrow. Pl. 1/2 foot.

32 O. bromissoneti (D. C. prod. 1. p. 261.) herbaceous; leaves trifoliate; leaflets smoothish, oblong, and are, as well as the stipulas, serrated; peduncles 1-flowered, disposed in an almost leafless raceme; calyx one-half shorter than the corolla. 9. H. Native of Mogodor, in fields. Root simple. Stems numerous. Peduncles 8-10 lines long. Upper stipules joined into a bracteate-like acuminate leaf.

Bromissonet’s Rest-harrow. Pl. 1/2 foot.

33 O. Schiöchwi (D. C. prod. 2. p. 262.) herbaceous; leaves trifoliate; leaflets oblong-obovate, smoothish, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, disposed in an almost leafless raceme; calyx one-half shorter than the corolla; legume glabrous. 9. H. Native of Spain, in Estramadura, in sandy places. O. racemosa, Brof. fl. lus. 2. p. 97. but not of Thunb.

Brotero’s Rest-harrow. Pl. 1/2 foot.

35 O. Reclinata (Lin. spec. 1011.) herbaceous, diffuse; leaves trifoliate; leaflets obovate, serrated, covered with clammy pubescence; stipulas broad-ovate, acute, serrated; peduncles 1-flowered, length of leaves, somewhat bracteolate under the apex; calyx longer than the corolla. 9. H. Native of the south of France, by the sea side. D. C. fl. 4. p. 512.—Barr. icon. t. 761. Legume, according to Linnaeus, villous, and one-half longer than the corolla.

36 O. mollis (Lag. nov. spec. p. 23.) herbaceous, erectish; leaves trifoliate; leaflets oblong-obovate, serrated at the apex; stipulas nearly entire; peduncles 1-flowered, without an awn, length of leaves; calyx equal in length to the corolla, and at length also to the legume. 9. H. Native of Spain and Italy, on hills in exposed places. Stems and calyces rather hispid. O. Desfontainii, Dufour, in litt. O. mollis, Sav. mem. soc. ital. 9. p. 351. t. 8.

Soft Rest-harrow. Pl. 1/2 foot.

37 O. cherlebi (Lin. spec. 1007.) herbaceous, hairy; leaves trifoliate; leaflets oblong-cuneated, serrated at the apex; stipulas almost entire; peduncles 1-flowered, without an awn, shorter than the leaves, aggregate into a raceme; calyx longer than the corolla, but about equal in length to the legume. 9. H. Native of Montpelier, on rocks, Nice, and Barbary.—J. Bauh. hist. 2. p. 394. f. 2.
Leguminosae

Cherker's Rest-harrow. Fl. June, July. Cl. 1871. Pl. ½ ft. 37 O. pendula (Desf. ad. 2. p. 197. t. 191.) herbaceous, rather hairy; leaves trifoliate; leaflets oblong, obtuse, and are, as well as the stipulas, serrated; peduncles 1-flowered, without an awn, nearly the length of the leaves; calyx a little shorter than the corolla and legume. 0. H. Native of Barbary, in corn-fields near Mascar.

Pendulous Rest-harrow. Fl. June, Aug. Clt. 1818. Pl. 1 ft. 38 O. Sieberi (Beccari, in lett. D. C. prod. 2. p. 162.) stem herbaceous, hairy; leaves smooth, and for the most part simple, oval, serrated at the apex, rarely trifoliate with the lateral leaflets, oblong-linear, acute, and small; stipulas acute, entire; pedicels 1-flowered, awned, longer than the leaves; corolla length of calyx. 0. H. Native of Crete. O. pendula, Sieb. herb. but not of Desf. Legume 2-4-seeded, a little longer than the calyx. This species comes very near to O. Gussonian, but the flowers in the dried specimens appear red.

Sieber's Rest-harrow. Pl. ½ foot.

§ 3. Bugrania (Bugran as the French name of Rest-harrow). D. C. prod. 2. p. 162. Leaves simple or trifoliate. Flowers sessile or on very short pedicels, purple or rose-coloured, rarely white.

39 O. Arborescens (Desf. fl. atl. 2. p. 149. t. 193.) erect; branchlets unarmed, sparingly villous; leaves trifoliate; leaflets ovate, serrated; calyces lobes villous, 3-nerved, rather longer than the legume. 0. G. Native of Barbary, about Arzou on mountains. Flowers rose-coloured.

40 O. Altimisia (Lam. dict. 1. p. 506.) erect; branches unarmed, villous, rather viscid; leaves trifoliate; leaflets oblong-lanceolate, acute, serrated; flowers usually twin; calyces lobes villous, length of legume. 0. H. Native of Europe, in cultivated fields and sandy places. O. hircina, Jacq. hort. vnd. t. 95. O. retens, All. ped. no. 1164 t. 41. f. 1. O. arvensis, Retz. obs. 2. p. 21. O. spinosa a, Lin. spec. 1006. Flowers red.

41 O. Froebrens (Wallr. sched. crit. p. 381.) stems rooting at the base, creeping, diffuse; floriferous branches ascending, pubescent; leaves trifoliate; leaflets ovate-roundish, glabrous on both surfaces, somewhat serrated; calyces lobes exceeding the legume. 0. H. Native of Europe, in sandy fields frequent. O. arvensis, Lam. dict. 1. p. 505. D. C. fl. fr. 4. p. 509. Flowers purple or white.

42 O. Repens (Lin. spec. 1006.) stems prostrate, unarmed, hairy; lower leaves trifoliate, the upper ones simple, cuneate-elliptic, serrated at the apex; flowers usually solitary. 0. H. Native of Europe, in sandy places on the sea coast; plentiful in Britain.—Dill. hort. clt. t. 25. f. 28. O. inermis fl. Huds. 313. O. spinosas y, repetes, Smith, engl. fl. 3. p. 267. Flowers white or rose-coloured.

Var. bi. caduca (Vill. dauph. 3. p. 428.) branches clothed with clammy villi; leaflets oblong, pubescent. 0. H. Native of Dauphiny, on mountains.

43 O. spinosa (Wallr. sched. crit. p. 379. Lin. syst. veg. ed. 14. p. 651.) stems erect, and are, as well as the branches, spiny and hairy; lower leaves trifoliate, the rest simple; leaflets and leaves oblong, cuneated at the base, almost entire; flowers usually solitary; calyces lobes shorter than the legume. 0. H. Native of Europe, by way sides and in fields; plentiful in Britain on the borders of fields, and in barren pastures. O. spinosa, Lin. spec. 1006. Mart. rust. 129. Fl. dan. 783.—Tab. hist.
calycine lobes villous, about equal in length to the corolla. O. H. Native of Barbary and Mogador. Very like the preceding species.

52 O. striga (Poir. voy. barb. 2. p. 210.) stem erect, villous; leaves simple, oblong, and are, as well as the stigmas, serrated; flowers distantly, almost sessile, disposed in spicate racemes; calyx covered with soft villi, rather longer than the corolla. O. H. Native of Barbary and Naples. Vahl. symb. 2. p. 80. Desf. fl. atl. 2. p. 145. Flowers white.

53 O. oligophylla (Ten. prod. 69. cat. 1815. app. p. 62. fl. nap. 2. t. 67.) stem ascending; leaves glabrous, simple, orbicular, and are, as well as the stigmas, serrated; flowers pedicellate, racemose; calyx villous, shorter than the corolla. O. H. Native of Naples and of Sicily, near Palermo, &c. There are varieties of this plant with the stems and leaves glabrous on the upper part, and pilose. Allied to O. alba, and hardly to be distinguished from it unless in the flowers being on longer pedicels.

§ 4. Bugranoides (so called from the similarity of the species of this section to the last). D. C. prod. 2. p. 164. Leaves simple or trifoliate. Flowers sessile or sub-sessile, yellow.

54 O. Arragonensis (Asso, syn. arr. 96. t. 6. f. 2.) subhairy; leaves trifoliate, glabrous; leaflets roundish, serrated; flowers almost sessile, twin, disposed in a leafless raceme; calyx villous, one-half shorter than the corolla. F. H. Native of Spain, in the kingdom of Valencia, on mountains; also of Arragon, and in the Pyrenees on the confines of France, and about Venice. D. C. fl. fl. suppl. p. 552. O. dumosm, Lapeyr. arb. 410.—Magn. hor. monsp. 17. t. 21.

55 O. spectosa (Lag. nov. spec. 22. p. 294.) subhairy, pubescent; leaves trifoliate, leaflets ovate, doubly serrated; raceme sub-spicate, terminal, elongated, hairy; lower pedicels solitary, upper ones twin, shorter than the bracteae. F. H. Native of Spain, in Granada.

Shorey Rest-harrow. Shrub 1 to 2 feet.

56 O. juncacea (Asso, syn. arr. 96. t. 5. f. 2.) subhairy, glabrous; leaves trifoliate; leaflets ovate, and are, as well as the stigmas, serrated; flowers almost sessile, disposed in a long spike; bracteae stipular, and are, as well as the calyces, scarios; corolla length of calyx. F. H. Native of Spain, in Arragon. Very like O. minutissima, but the flowers are pale yellow, and the stems are suckling. Several species are on the base.

Rushy Rest-harrow. Shrub ½ to 1 foot.

57 O. capitata (Cav. icem. 2. p. 48. t. 154. f. 2.) glabrous; stems prostrate, branched, filiform; leaves trifoliate; leaflets ovate-oblong, toothed; flowers capitate; corolla a little longer than the calyx. F. H. Native of Spain, in the kingdom of Valencia.

58 O. striata (Gouan. ill. 47. D. C. fl. fr. 4. p. 511.) stems diffusely prostrate, branched; leaves trifoliate, rather scarious; leaflets obovate-cuneate, stipulated, and are, as well as the stipules, serrated; flowers capitate; corolla longer than the hairy calyces. F. H. Native of mountain pastures from Arragon to Provence, near the limits of olives. O. aggregata, Asso, syn. arr. 56. O. reclinata, Lam. fl. fr. exclusive of the synonyms. There are varieties of this plant almost smooth, and beset with rough glandular hairs.

Striated Rest-harrow. Pl. ½ to 1 foot.
LEGUMINOSÆ. LXII. ONONIS.

66. O. PINNATÁ (Brot. fl. lus. 2. p. 99.) herbaceous, and clothed with clammy villi; leaves with 3-4 pairs of cuneate, ciliate, somewhat serrated leaflets; spikes terminal. O. H. Native of Portugal, in sand. Corolla large, white, but with the vexillum rose-coloured.

Pinnate-leaved Rest-harrow. Pl. 1 foot.

+ Species belonging to section Eunonis, but are not sufficiently known.

67. O. MACRACA'NTHA (Clark. in Spreng. neue entd. 3. p. 16.) suffruticose, spiny; peduncles awned, 1-flowered; upper leaves simple, obovate, glandular, toothed at the apex; calyx glandular, shorter than the corolla. ñ F. Native of the Levant.

Long-spined Rest-harrow. Shrub.

68. O. PANICULATA (Cav. anal. scienc. nat. 1801. 4. p. 69.) villous; stem panicked; lower leaves trifoliate, middle leaflet larger; superior leaves simple; stipulas large, lanceolate, very acute. ñ F. Native of the north of Africa.

Panicled-flowered Rest-harrow. Shrub.

69. O. PYRAMIDALIS (Cav. l. c. p. 71.) stem pilose, terete; branches alternate, pyramidal; leaves trifoliate; leaflets linear-lanceolate, serrated; flowers sessile, capitate; legume 2-seeded. ñ F. Native of the north of Africa, near Salea.

Pyramidal-branched Rest-harrow. Shrub.

70. O. SUBCORDATA (Cav. l. c. p. 70.) erect, herbaceous; leaves all simple, and somewhat cordate, ovate-oblong, and arc, as well as the stipulas, serrated; peduncles awned, 1-flowered, shorter than the leaves. O. H. Native of the north of Africa, near Mogador.

Subcordate-leaved Rest-harrow. Pl. 1 foot.

71. O. COMPRESSA (Lag. anal. scienc. nat. 1801. 4. p. 261.) stem herbaceous, compressed; peduncles 1-flowered, each furnished with an awn; leave simple, lower ones trifoliate; stipulas entire. ñ ? F. Native of Spain.

Compressed-stemmed Rest-harrow. Pl. 1 to 1 foot.

72. O. PE'RSICA (Burn. ind. 157. t. 49. f. 1.) plant rather diffuse, small; peduncles without an awn, 2-flowered, racemose; leaves trifoliate, with linear, truncate, serrated leaflets; stipulas quite entire. O. H. Native of Persia. Flowers yellow, with the habit almost of Melilurus.

Persian Rest-harrow. Pl. diffuse.

73. O. RHINANTHODIES (Lapeyr. abr. 407.) erect, small, clothed with clammy villi; leaves trifoliate, with cuneate-emarginate leaflets, which are awnedly-toothed; stipulas acutely-toothed; flowers almost sessile, solitary, terminal; legume ovate, villous, awned, shorter than the calyx. ñ H. Native of the Pyrenees. Flowers having a purplish vexillum.

Rhinanthus-like Rest-harrow. Pl. 1 foot.

74. O. SCABRA (Lapeyr. abr. 407.) erect; leaves distant, trifoliate, dotted from points; leaflets cuneate, truncate, dentate at the apex; stipulas ovate, acute, entire; calyx equaling the corolla in length. ñ H. Native of the Eastern Pyrenees. Corolla white, with a rose-coloured vexillum.

Scabrous Rest-harrow. Pl. 1 foot.

75. O. PAL'LLIDA (Horn. hort. hafn. 2. p. 676.) peduncles 1-flowered; leaves trifoliate; leaflets roundish, cuneated at the base, toothed from the middle to the apex: calyces and legumes villous, drooping. ñ H. Native of?

Pule-flowered Rest-harrow. Pl. 1 foot.

SECT. II. LOTONÖNIS (from Lotus and Ononis; the plants appear intermediate between the two genera). D. C. Leg. mem. VI. prod. 2. p. 166. Stipulas hardly or not adnate to the petiole, leafy as in Lotus, but with the stamens monadelphous, as in the rest of Ononis. The species of this section are all from the Cape of Good Hope, but none of them are sufficiently known.

76. O. SPEC'ATA (Thumb. prod. 129. fl. cap. 584.) leaves simple, stipulate, ovate, silky; stem shrunny, erect; flowers spicete. ñ G. Leaves acute, sessile. Spikes a finger long.

Spicate-flowered Rest-harrow. Shrub.

77. O. NIRS'UTA (Thumb. l. c.) leaves simple, lanceolate, hairy; stem herbaceous, decumbent; racemes ovate, drooping. ñ G. Plant very hairy. Leaves imbricately spreading.

Hairy Rest-harrow. Pl. decumbent.

78. O. STI'PULATA (Thumb. l. c.) leaves trifoliolate, villous; leaflets oblong, obtuse, convolute; stipulas ovate; flowers spicate; stem, frutescent. ñ G. Flowers yellow. Superior stipula large, bact-forme.

Stipulate-leaved Rest-harrow. Shrub.

79. O. PARVIFLÓRA (Berg. cap. 214. Thumb. l. c. but not of Lam.) leaves trifoliolate, villous; leaflets lanceolate, intermediate one largest; umbels lateral; stem herbaceous, villous. ñ G. Branches twiggy.

80. O. MI'CROPHYLLA (Lin. fil. suppl. 324. Thumb. l. c.) leaves trifoliolate, scabrous; leaflets ovate, convolute; stipulas and bracteas ovate; flowers axillary; branches and branchlets spinose. ñ G. Petiole trigonal. Legume lanceolate, reflexed, scabrous.

Small-leaved Rest-harrow. Shrub.

81. O. CA'PILLÁSIS (Thumb. l. c.) leaves trifoliolate, glabrous; leaflets linear-lanceolate, mucronate; peduncles axillary, 1-flowered; stem erectish, suffrutescent. ñ G. Leaves appearing in fascicles at first sight.

Hair-leaved Rest-harrow. Shrub.

82. O. VILLOSA (Thumb. l. c.) leaves trifoliolate, villous; leaflets lanceolate; stipula length of petioles; peduncles lateral, 1-flowered, each furnished beneath the leaves with an acute, linear leaflet; stems hairy, decumbent. ñ G. Legume villous, turg. Perhaps a species of Cytisus or a proper genus.

83. O. HETEROPI'LLA (Thumb. l. c.) leaves trifoliolate, pilose beneath; lower leaflets ovate, superior ones lanceolate; flowers solitary, pedunculate, terminal; stem herbaceous. ñ G.

Variable-leaved Rest-harrow. Shrub.

84. O. FrO'STRÁ'TA (Lin. mant. 266. Thumb. l. c.) leaves trifoliolate, pubescent; leaflets ovate, obtuse; stipulas much shorter than the petiole; peduncles 1-flowered, lateral; stem decumbent. ñ G. Lotus prostratus, Lin. spec. 1090.

Prostrate Rest-harrow. Pl. prostrate.

85. O. DE'QUMÉNS (Thumb. l. c. but not of Miller) leaves trifoliolate, pubescent beneath; leaflets obovate, acute; stipulas oblong; flowers solitary, lateral, on short pedicels; stem decumbent. ñ G. Flowers yellow. Legume oblong, rather turg. Decumbent Rest-harrow. Pl. decumbent.

86. O. SER'ICA (Thumb. l. c.) leaves trifoliolate, clothed beneath with silky-villi; leaflets oblong, acute; stipulas ovate, pilose; flowers disposed in a second, 3-flowered, terminal spike. ñ G. Stems ascending.

Silky Rest-harrow. Pl. prostrate.

87. O. EXCI'SA (Thumb. l. c.) leaves trifoliolate, pubescent beneath; leaflets obovate, emarginate; flowers thin, terminal; stem decumbent. ñ G. Stein glabrous. Petiole longer than leaflets. Stipulas subulate (Wild.).

Cut-leaved Rest-harrow. Pl. decumbent.

88. O. GEMIN'ATA (Ait. hort. kew. 3. p. 28.) leaves trifoliolate; leaflets obovate; peduncles lateral, 2-flowered. ñ G. Allied to O. excisa according to Wild.

89. O. RACEMÓSA (Thumb. l. c. but not of Brot.) leaves trifoliolate, pubescent beneath; leaflets oblong, acute; flowers race-
mose; stem decumbent. 2. G. Flowers 4, yellow, remote, drooping.

Racemose Rest-harrow. Pl. decumbent.
30 O. LONGATA (Thumb. l. c.) leaves trifoliate, hairy; leaflets ovate, acute; peduncles lateral, 1-flowered; stem decumbent, hairy. 2. G. Peduncles 2 inches long.

Fascicled Rest-harrow. Pl. decumbent.
31 O. SUCRAN ANA (Thumb. l. c.) leaves trifoliate, finely pustulate beneath; leaflets oblong, obtuse; umbel of flowers terminal; stem glabrous, decumbent. 2. G. Corolla yellow, very minute.

Small-flowered Rest-harrow. Pl. decumbent.
32 O. INVOLVULATA (Lin. fil. suppl. 324.) leaves trifoliate, villous; leaflets oblong, obtuse; flowers umbellate, involucrated; stem hairless, decumbent. 2. G. Anthyllis involucrata, Lin. mant. 265. Lotus ononoides, Lam. dict. 3. p. 608. Flowers yellow.

Involute-flowered Rest-harrow. Pl. decumbent.
33 O. UMBELLA (Lin. mant. 266. Thumb. l. c.) leaves trifoliate, villous; leaflets oblong, acute; umbels terminal; stem decumbent, pilose. 2. G. Umbels involucrated, 6-flowered.

Second-flowered Rest-harrow. Pl. decumbent.
35 O. striaosa (Thumb. l. c. but not of Burm.) leaves trifoliate, villous beneath; leaflets ovate, obtuse; umbels terminal; stem decumbent, frutescence. 2. G. Leaflets longer than the petiole.

Strigose Rest-harrow. Shrub decumbent.
36 O. GLAERA (Thumb. l. c.) leaves trifoliate, glabrous; leaflets ovate, obtuse; flowers umbellate; stem decumbent, suffrutescent. 2. G. Petiole twice the length of the leaflets. Umbels many-flowered. Corolla yellow.

Glabrous Rest-harrow. Pl. decumbent.
37 O. labrosus (Thumb. l. c.) leaves trifoliate, villous; leaflets lanceolate, setaceous mucronate; spike leafy, hairy; stem erect, frutescence. 2. G. Leaves in fascicles.

Herb's-foot Rest-harrow. Shrub.
38 O. FASCICULATA (Thumb. l. c.) leaves in fascicles, lanceolate, crested; glabrous; flowers spike-like; stem erect, pubescent, shrubby. 2. G. Bracteas fasciculately-convolute. Vexillum flesh-coloured, pubescent on the back.

Fascicled-leaved Rest-harrow. Shrub.
39 O.iquina (Thumb. l. c.) leaves with 5 leaflets, somewhat pubescent; leaflets lanceolate, convolute; flowers lateral, usually twin; stem decumbent, glabrous, suffrutescent. 2. G. Legume oblong, glabrous.

Quinate-leaved Rest-harrow. Shrub decumbent.
100 O. CAPE SIS (Lin. amen. 6. afr. 41. Burm. cap. 21.) leaves trifoliate, with the leaflets orbicular, rather pilose and mucronate; racemes pedunculate, long. 2. G. Branches, peduncles, and petioles hairy. Teeth of calyx linear-subulate, rather villous. Flowers purplish.

Drooping Rest-harrow. Shrub 2 feet.

Vase, angustissima (D. C. prod. 2. p. 168.) leaflets linear-subulate. Cytisus hirtus, Burm. cap. 22. and is to be found in his herbarium, under the name of Anthyllis aspalthoides angustifolia. Flowers yellow.

Aspalthus-like Rest-harrow. Pl. 1/2 foot.
103 O. ANTHYLOIDES (D. C. prod. 2. p. 168.) leaves trifoliate; leaflets obovate, cuneate, retuse, glabrous; racemes opposite the leaves, subterminal, pedunculate; flowers pedicellate, at length drooping. 2. G. Anthyllis ononoides, Burm. fl. cap. 21. Psoralea herbacea, Sieb. pl. exs. cap. no. 52. Stamens monadelphous. Flowers yellow.

Anthyllis-like Rest-harrow. Shrub.

Viscid-flowered Rest-harrow. Shrub prostrate.
† Species not sufficiently known.
105 O. A Nil (Mill. dict. no. 14.) leaves trifoliate; leaflets ovate; petioles very long, pilose; spikes terminal; legumes very hairy. 2. G. Native of the American islands, where it is called Indigo-dare. Perhaps a species of Indigofera.

Anil Rest-harrow. Pl. 2 feet.
106 O. MILLE cap. (D. C. prod. 2. p. 168.) stem decumbent; leaves rather pilose, trifoliate; leaflets linear-lanceolate; flowers in lateral spikes, yellow. 2. S. Native of Vera-Cruz. O. decumbens, Mill. dict. no. 15. but not of Thunberg. Perhaps a species of Indigofera.

Miller's Rest-harrow. Pl. decumbent.
107 O. GLUTINOSA (Mart. acad. mnn. 6. p. 154.) shrubby, clothed with clammy pili; leaves simple, oblong, entire; stipulas subulate; flowers racemose. 2. S. Native of the East Indies. The colour of the flowers is unknown.

Clammy Rest-harrow. Shrub.

Cult. The greater part of the species of Ononis are rather handsome when in flower. The hardy shrubby kinds are increased by seeds and layers; the hardy perennial kinds by dividing the plants of the roots in spring; or by seeds; these are well fitted for flower-borders. The seeds of the hardy annual kinds only require to be sown in open borders in April. The greenhouse and frame species thrive well in a mixture of loam, peat, and sand; these are usually increased by seeds, which ripen in abundance; they may also be propagated by young cuttings, planted in sand under a bell-glass.

LIN. SYST. Monadelphia, decidnaria. Calyx acutely and almost equally 5-cleft, permanent, but not inflated after flowering. Carina obtuse; petals free. Stamens monadelphous, with the tube cleft in front. Anthers 5. Style filiform, hardly incurved. Legume compressed, oval, 1-seeded, hooked by the base of the style.—American subshrubs, with bispinate, simple, obovate, mucronate, feather-nerved leaves, and with small
flowers crowded in the axils of the leaves, almost sessile. This
species is very distinct from *Prel生态圈*, and is more nearly allied to
Hélitía, Anthyllis, and Heynåndia.

Section I. Dorycinóides (from *Dorycium*, and idea, like; plant
resembles species of *Dorycium*). D. C. Leg. mem. VI.
prod. 2. p. 168. Calyx hardly inflated. Legume 1-celled, 1-
seeded. Perennial herbs, with suffrutescent roots and peduncu-
late leafless heads of flowers. Leaves impari-pinnate, with
the leaflets about equal in size and form, the odd one sessile.

1 A. *Gephyrd* (Lin. 1806.) herbaeaceous, diffuse; leaves
pinnate, glabrous; leaflets 5-9, oblong-linear, mucronate; heads
15-20-flowered. 4 H. Native of Provence and Corsica, on
exposed rocks and in grassy woods. Ger. gallopro. 490. 18.
Flowers rose-coloured.

prostrate.

2 A. *onobrychoides* (Cav. 1806.) 150. herbaceous, erectish;
leaves pinnate, smoothish; leaflets 7-11, linear; heads
10-12-flowered. 4 H. Native of Spain at Valldigna. Very
like the preceding species, but the flowers are said to be yellow.

Section II. Aspalathóides (from *Aspalathus* and idea, form; plants
Calyx hardly inflated. Legume 1-celled, 1-2-seeded. Flowers
in interrupted spikes, or nearly sessile in the axils of the
superior leaves, few or solitary.—Humble, much-branched shrubs, usually
spiniflorous. Leaves trifoliate or simple.

3 A. *cytisoides* (Lin. spec. 1813.) shrubby, unarmed, much
branched, twigg; leaves simple or trifoliate; odd leaflet much
larger than the lateral ones; branches hoary from adpressed
velvety pubescence; flowers few, sessile in the axils of the
upper leaves, forming an interrupted spike; calyxes 
4 F. Native of Spain and the south of France, on hills and
among rocks.—Barr. icon. 1182. Calyx woolly. Flowers
yellow. The upper leaves are simple. Perhaps the leaves are
all simple, furnished with 2 leafy stipulas.

4 A. *Genista* (Du Four, in litt. D. C. prod. 2. p. 169.) shrubby,
unarmed, much branched, twiggy; branches hoary; leaves simple,
lanccolate, nearly sessile, glabrous; flowers few, almost
separate in the axils of the upper leaves, forming an interrupted
spike; calyxes pubescent. 4 F. Native of Spain, in Valenzia
on arid mountains, and in Murcia. Genista terrina, Lam. nov.
spec. 22. no. 290. Flowers yellow.

Genista-like Kidney-vetch. Shrub 1 to 2 feet.

5 A. *Herma'nie* (Lin. spec. 1814.) shrubby, much branched;
branches spiniflorous, smoothish; leaves almost sessile, simple, or
trifoliate; leaflets oblong-cuneated, glabrous or clothed with
adpressed pubescence; heads few-flowered, nearly sessile in
the axils of the upper leaves. 4 F. Native of Corsica, Crete,
Palestine, and in the islands of the Archipelago. Sims, bot.
Cretica, Lin. spec. 1002. Cytisus Græcus, Lin. spec. 1013. ex
Smith, prod. fl. grece. 2. p. 60. Aspalathus erinacea, Lam.
dict. 1. p. 291. Flowers small, yellow. Calyx shorter and less
villous.

2 to 4 feet.

6 A. *Aspalath* (D. C. prod. 2. p. 169.) shrubby, much
branched; branches spiniflorous, glabrous; leaves almost sessile,
oblong-cuneated, simple, smooth; flowers nearly sessile, soli-
dary along the tops of the branches. 4 F. Native of the
Levant and Crete. Aspalathus Creticus, Lin. spec. 1002. Spârtium
Creticum, Desf. cat. 213. Aspalathus spiniflorus, Lher. 
Very like the preceding species, but differs in the flowers
being smaller and solitary, the branches more spiniflorous.
The plants are also monadelphous, as in the rest of *Anthyllis*,
not having the vagina eleft in front, as in *Aspalathus*. Flowers
yellow. Lodl. bot. cab. 1169.

Shrub 2 to 4 feet.

Section III. Erinace'a (from erinacceus, a hedge-hog; in
with this name. D. C. prod. 2. p. 169. Calyx evidently inflated
and bladdery after flowering. Legume 1-celled, 1-2-ovulate,
compressed, lanceolate, longer than the calyx. A much-branched,
spiny, almost leafless shrub. Heads few-flowered, on short
peduncles, bracteate.

7 A. *erina'cea* (Lin. spec. 1014.) shrubby; branches spin-
iflorous; leaves very few, oval, or oblong; flowers somewhat
capitate. 4 F. Native of Spain and Barbary. Andr. bot.
rep. 1. t. 15. Sims, bot. mag. 676. Flowers bluish-purple.

1 1/2 to 1 foot.

Section IV. Vulnera'ria (from vulnerarius, for wounds; in
reference to reputed vulnerary properties in *A. vulnerarius*). D. C.
leg. mem. VI. prod. 2. p. 169. Calyx evidently inflated and
bladdery after flowering. Legume 1-celled, 1-2-seeded, shorter
than the calyx, or equal to it, ovate. Heads of flowers brac-
teate. Shrubs or perennial herbs with impari-pinnate leaves.

8 A. *Bârsza'jovis* (Lin. spec. 1015.) shrubby; leaves pin-
inate, and are as well as the branches clothed with silky to-
tomentum; leaflets 9-13, oblong-linear, equal in size and shape;
bractea about equal in length to the globose, many-flowered
head. 4 F. Native of Spain, Barbary, the Levant, and Italy,
arth. ed. nov. 2. t. 67. Vulneraria argentea, Lam. fl. fr. Bárba-
jovis argyrophylla, Mayen. Flowers pale-yellow.

Shrub 4 to 8 feet.
LEGUMINOSÆ.

9. A. splendens (Willd. spec. 3. p. 1018.) shrubby; leaves pinnate, and are, as well as the branches, clothed with silky tomentum; bractea longer than the few-flowered head. ¼. F. Native of Crete. Perhaps only a variety of the preceding. Flowers yellow.

_Splendens_ Kidney-vetch. Shrub 2 to 4 feet.

10. A. indica (Lour. coch. p. 429.) shrubby; leaves pinnate, smooth; leaflets ovate, nearly equal; racemes oblong. ¾. G. Native of Cochin-china, on mountains. Calyx red. Corolla white. Perhaps the head of flowers is bracteate. A large scandent shrub.

_Indian_ Kidney-vetch. Shrub cl.

11. A. heterophylla (Lin. spec. 1013.) shrubby, procumbent; leaves pinnate, silky; leaflets 17, lanceolate, acute; floral ones palmately-trifoliate; heads pendunculate, few-flowered. ½. F. Native of Portugal and Spain. Flowers small, variegated, according to Tournefort.

12. A. sativa (Lag. nov. gen. et spec. p. 22. no. 291.) but not of (Willd.) shrubby, erect; leaves pinnate, clothed with silky pubescence; leaflets linear-oblong, unequal; floral ones palmately 3-5-foliate; heads pendunculate, few-flowered. ½. F. Native of Spain, in the kingdom of Murcia.

_Silky_ Kidney-vetch. Shrub 1 foot.

13. A. polycyma (Desf. fl. atl. 2. p. 150 t. 195.) herbaceous, procumbent; leaves pinnate, and are, as well as the branches, white from vili; leaflets 15-19, oval-oblong; heads solitary, on long peduncles. ½. H. Native of the Alps of Europe. Jacq. fl. austr. t. 334. Lam. ill. t. 615. f. 5. Lodde bot. cab. 578.—Barr. icon. 722. Flowers pink or purplish.

_Fern-leaved_ Kidney-vetch. Pl. 1 foot.

14. A. montana (Lin. spec. 1012.) herbaceous, tufted; leaves pinnate, and are, as well as the branches, white from villi; leaflets 23-33, oval-oblong, equal; heads numerous, sessile, distinct, alternate. ½. F. Native of Algiers, in the fissures of rocks near Telissen. Flowers yellow.

15. A. vulgars (Lin. spec. 1012.) herbaceous, erectish; leaflets pinnate, with 5 or more unequal leaflets, the lower ones smallest, and the terminal one the largest; heads of flowers twin. ½. H. Native of Europe, in fields and pastures frequent, where the soil is dry and rather barren; plentiful in Britain. D. C. fl. fr. no. 3850. Smith, engl. bot. 104. Vulgaris rusticana. Lam. fl. fr. 2. p. 649. Viln. heterophylla, Moench. meth. 146. _Anthyllis vulgaris_ is recommended as an excellent pasturage for sheep. A Mr. Young informs us that it abounds greatly in the best meadows of the Pyrenees, at the same time he says that its produce is not large. With us the whole plant is dry, and looked upon as aspargirn; this is owing most probably to its affecting dry calcareous soils; cultivated in a rich soil it would doubtless become more succulent. Gesner, it seems, first raised the report of the vulgarly properties of this plant, which perhaps, like other soft and downy applications, may on an emergency staunch the blood of rustic wounds, and give nature and a good constitution time to perfect a cure.

Var. a. _lutea_; flowers yellow; leaves and stems villous or smooth. Lam. ill. t. 615. f. 1.

Var. b. _albiflora_; flowers white.—Tourn. inst. 291. A. rusticana, Mill. dict. no. 3.

Var. γ. _rubriflora_; flowers red; leaves and stems sparingly villous or smooth.—Dill. hort. clth. 320. f. 413. A. Dilleni, Schultes in herb. Balb. This plant is said to grow wild in Pembrokeshire.

Var. ζ. _hirsutissima_; flowers scarlet or red; plant very hairy.

LXIV. _Anthyllis._

_Var. e. Allioni;_ flowers yellow; leaves, stems, and heads very hairy. _Astragalus vulgaris._ All. _ed. no. 1275._ t. 19. f. 2. exclusive of the description of the fruit.

_Cat-leaved_ Kidney-vetch. Pl. ¾ to 1 foot.

_SECT. V. CORNICI'NA_ (from _cornu_, a horn; in reference to the shape of the pods). D. C. leg. mem. vi. prod. 2. p. 170. Calyxes inflated. Legume glabrous, 2 or many-celled, the seeds separated by small dissepiments.—Annual herbs, with pinnate leaves, and yellow, cupate, bracteate flowers. Perhaps a proper genus.

18. A. tetraphylla (Lin. spec. 1012.) herbaceous, procumbent; leaves pinnate, the terminal leaflets ovate and large, the other 3 small and acute; heads axillary, sessile, few-flowered; legume straight, 2-celled, 2-seeded, inclosed within the calyx. ¾. H. Native of the south of Europe, in exposed places. _Vulgaris_ vesicaria, Lam. fl. fr. 2. p. 650. Curt. bot. mag. 108.—Cun. hort. t. 47. Barr. icon. t. 554. Perhaps the leaves are trifoliate, furnished with a small acute stipule. Flowers white.

19. A. cornicata (Lin. spec. 1012.) herbaceous, erectish; leaves pinnate; leaflets 6-8, alternate, terminal one oblong, large, the rest oblong-linear; heads axillary, pedunculate; legume arched, 2-3-seeded, 2-3-celled, inclosed within the calyx. ¾. H. Native of Spain.—Cav. icon. 1. t. 39. f. 2. Flowers pale-yellow. Stems erect, but usually procumbent.

20. A. amosa (Desf. fl. atl. 2. p. 151.) herbaceous, procumbent; leaves pinnate; leaflets 7-11, lanceolate, superior one largest; heads pedunculate; legume hooked, 1-6-seeded, longer than the calyx. ¾. H. Native of Barbary, in corn-fields near Calle. A. cornicata, Poir. itin.

_Chihi_ Kidney-vetch. Pl. decumbent.
Cult. All the species of *Anthyllis* are very beautiful when in flower. The hardy, herbaceous, perennial kinds thrive best in dry light soil, and are very readily increased by seeds; they are well adapted for ornamenting rock-work. The seeds of the hardy annual kinds should be sown in a rather dry warm situation in the open ground. The green-house and frame kinds thrive best in a mixture of loam, sand, and peat, most of them produce perfect seed, by which they are readily increased. Young cuttings of them will also root if planted in a pot of sand with a bell-glass placed over them; the glasses to be taken off and wiped occasionally to prevent damp.

**L. pan/iculatum** (Ser. mss. D. C. prod. 2. p. 172.) legs pubescent; leaves trifoliolate; leaflets oblong, cuneiform, toothed at the apex, pubescent; peduncles usually 2-flowered; legume reniformly twisted, reticulated, hirsute; seeds rather ovate, brown; radicle hardly prominent. 2 C. Native of Tauria, among calcareous rocks. Allied to *M. prostrata*, but differs in the peduncles being few-flowered, in the flowers being smaller, and in the legumes being less twisted.

**L. Brachyta*** (Fisch. in Bieber fl. taub. suppl. p. 517.) pilose; stem ascending; leaves trifoliolate; leaflets obvolute, dentilicate, with numerous nerves; stipula lanceolate-linear; heads spherical; calyces segments 3 times longer than the tube; linear; legumes 1-seeded, with numerous transverse and parallel nerves; the seminiferous margin thick and straight; seeds ovate, cordate, compressed. 2 H. Native of Tauria, near Tiflis.

**Short-fruited Medick.** Fl. May, Jul. Cl. 1823. Pl. prostrate.

**L. lupulina** (Lin. spec. 1097.) stem prostrate; leaves trifoliolate; leaflets obvolute-cunated, dentilicate at the apex; stipulae lanceolate, acute, toothed; peduncles bearing ovate spikes of flowers; flowers sessile; legumes reniform, 1-seeded, arched, reticulated; seeds ovate, somewhat kidney-shaped. 2 H. Native of Europe, in meadows, pastures, and cultivated fields; plentiful in Britain. Smith, engl. bot. 971. Fl. dan. 992. Curt. fl. Lond. fasc. 2. t. 57. Mart. fl. rust. t. 19.—Fuchs. hist. 819. icon. M. Wildenowii, Mer. fl. par. 296. is a variety having the stem and leaves more or less pilose. This is one of the most valuable of artificial grasses, affording excellent food for sheep. For its culture and uses see *Trifolium pratense*.

**Var. p. polistacantha** (Ser. mss. D. C. prod. 2. p. 272.) heads aggregate into a terminal raceme; leaflets large. 2 H. Native of Switzerland, about Bern.

**Var. g. corymbosa** (Ser. mss. D. C. prod. 2. p. 172.) flowers almost abortive and corymbose; pedicels filiform, elongated.

**Hyp-Trefoil or Black Nonsuch.** Fl. May, Aug. Brit. Pl. tr. M. mioco/a (Wallr. in litt.) stems procumbent; leaflets obvolute-cunated, dentilicate at the apex; stipulae lanceolate, acute, almost entire; flowers apetalous, disposed in racemose spikes; legumes falcate, hardly nerved, stipulate, uniculinate. 2 H. Native of Switzerland about Longirod, and of Belgium.

**Moss-fruited Medick.** Fl. May, Aug. Cl. 1816. Pl. prostrate.

5 M. creta/ceae (Bieb. fl. taub. 2. p. 225. suppl. 517.) glabrous; stems ascending, suffrutescent; leaves trifoliolate; leaflets nearly orbicular, coriaceous, almost entire, having numerous nerves; stipulae lanceolate, acute, nerved; peduncles many-flowered; legume falcately-reniform, quite entire, rayed with numerous nerves. 2 H. Native of Tauria, in sterile cretaceous places. M. nummularia, Stev. in Bess. cat. hort. crem. 1816. p. 85. but not of D. C. Flowers the colour and form of those of *M. falcata*, but a little smaller. A very distinct species.

**Cretaceous Lucern.** Fl. July, Cl. 1805. Pl. 2 to 3 feet long.

5 M. corymsifera (Schmidt in Schlecht. Linnaea, 4. p. 74.) stems ascending; leaflets sessile, cuneiform, reticulated at the apex; stipulae toothed; corynus compound, dense; peduncles and pedicels best with glandular pilis; legume reniform, rugose, pilose, 1-seeded. 2 H. Native on the shores of the Baltic sea.

**Corymb-bearing Medick.** Pl. ascending.

7 M. falcata (Lin. spec. 1096.) stems prostrate; leaflets oblong, toothed at the apex; stipulae quite entire; peduncles racemose; legumes falcate, smoothish or pubescent; seeds oblong; radicle hardly prominent. 2 H. Native of Europe, in dry mountainous pastures. In Britain on dry gravelly banks and old walls; between Watford and Bushy-hill by the foot-way; in Cambridgeshire; common about Norwich in gravelly fields, and on many parts of the city walls, also about Bury St. Edmund. Smith, engl. bot. 1016. Flowers usually pale-yellow, but occasionally violet and green. This is said to be the kind of *Lucern* cultivated in Switzerland. For its culture see *M. sativa*.

**Var. a. annulata** (Ser. mss. D. C. prod. 2. p. 172.) leaflets narrower and smaller; legumes more arched. 2 H. M. annulata, Besser. in litt.

**Var. g. tumida** (Ser. mss. D. C. prod. 2. p. 173.) flowers tumid; carpels tumid. 2 H. About Geneva.

**Falcate-podded Lucern.** Fl. July. Britain. Pl. prostrate. 8 M. procumbens (Besser. prim. fl. galiz. 2. p. 127.) stems procumbent; leaflets oblong-linear, toothed at the apex; stipulae toothed at the base; peduncles racemose; legume falcate, almost naked, reticulated, 2-seeded; seeds irregularly cordate. 2 H. Native of Craconis, in dry fields and on hills. Perhaps only a variety of *M. falcata*, but differs in the legumes being a little broader, short and long in the same specimen.

**Procumbent Lucern.** Fl. Ju. July. Cl. 1818. Pl. prostrate. 9 M. cancellata (Bieb. fl. taub. 226. but not of Ten.) stems prostrate; leaflets oblong-cuneiform, toothed at the apex, quite smooth; stipulae subulate, lower ones dentilicate; peduncles many-flowered; legume coilexate, reticulately-veined, glabrous, with the veins radiating towards the margins. 2 H. Native of Caucasus. Flowers fewer and smaller than in *M. falcata*, always yellow.

**Latticed-veined Lucern.** Fl. June, July. Cl. 1818. Pl. prostrate.

10 M. suffruticosa (Ran. in D. C. fl. fr. 4. p. 341.) stems prostrate, suffrutescent; leaflets obvolute-roundish, almost entire or obcordate; stipulae lanceolate, broad, toothed; peduncles racemose, twice the length of the pedicles; legume pubescent, almost spiral, reticulated with arched veins; seeds irregularly
cordate, with a prominent radicle. 2. H. Native of the Pyrenees. Flowers at first rather violaceous, but at length becoming yellow.

11 M. arborea (Lin. spec. 1096.) Villous, shrubby; leaflets obovate-cordate, nearly entire; stipulas linear, acute, entire; peduncles racemose; legumes stipitate, twisted, reticulated from transverse veins, 2-3-seeded; seeds somewhat kidney-shaped. F. 2. Nat. of Italy.—Loth. icon. 2. p. 46.

Tree Medick. Fl. May, Nov. Cit. 1596. Shrubs 6 to 8 feet. 12 M. hircina (D. C. prod. 2. p. 178.) stems herbaceous, villous at the apex; leaflets obovate-roundish, ciliated, a little toothed; stipulas broad, semi-ovate, acuminate, toothed on the outside; spikes oblong, crowded; calyces segments setaceous, unequal; legume lenticular, rather villous. 11. Native of Siberia. Melähöus Siberica, Poir. suppl. 3. p. 647. Flowers small, yellow. Calyx at length cleft on the upper side.

13 M. meda (Pers. encl. 2. p. 326.) stems ascending; leaflets linear-cuneate, retuse, toothed at the apex, pilose beneath; peduncles corymbous; flowers pale-blue, at length yellow. 2. H. Native of Europe, in meadows, on hills, and in divisions of fields. M. felata, Linn. dict. 3. p. 639. Perhaps only a variety of M. sativa.

14 M. sativa (Lin. spec. 1096.) stems erect, glabrous; leaflets obovate-oblong, toothed, mucronate; stipulas lanceolate, somewhat toothed; peduncles racemose; legumes smooth, ciliate-twis-ted, finely reticulated; seeds flat, irregularly-ovate or irregularly cordate, brownish. 11. Native of Spain, but now cultivated throughout Europe in fields. In Britian, but hardly a native. Smith, engl. bot. 1749. Mart. rust. 48.—Claus. hist. 2. p. 242. Flowers large, violet.

Lucern or medick is highly extolled by Roman writers; it is much grown in Persia and Lima, and mown in both countries all the year round; it is also of unknown antiquity in old Spain, Italy, and the south of France. It was introduced, according to Miller, from the latter country in 1657. It is now only cultivated in a few places, and chiefly in Kent. Columella extols lucern as the choicest of all fodders, because it lasted many years, and bore being cut down 4 or 5 times every year. About three quarters of an acre of it is, he thinks, sufficient to feed three horses during the whole year. Though that it was so much esteemed by the ancients, and has been long cultivated to advantage in France and Switzerland, it has yet found no great reception in this country. Where the climate and soil suit, a field of it perhaps may be advantageously sown to afford early cutting or food for young or sick animals, for which it is said to be well adapted; but though it will produce good crops for 8 or 10 successive years, yet from the time the farmer must wait till this crop attains its perfection, and from the care requisite to keep it from grass and weeds, it is not likely that the plant will ever come into general culture in this country. Lucern has been observed to thrive best in dry, sandy, chalky, marly or gravelly soils; in short, all soils that are good enough for wheat, and dry enough for turnips, to be fed on the land, do well for lucern. The latter end of March is the best time for sowing lucern seed, which will allow the plants to be fully established before the hot months. If the plants be intended to be transplanted out in the garden method, it will also be the best practice to sow the seed-bed as early in the spring as the frosts will admit, in order that they may be strong enough and fit to set out early in August. Lucern may be either sown broad-cast or in drills, and either with or without an accompanying crop of corn the first year. Broad-cast and a very thin crop of barley or other spring crop is generally preferred. Drilling, however, at nine inches apart, perhaps has many advantages over the broad-cast method, especially as far as regards keeping the crop clean and free from weeds. The quantity of seed required in the broad-cast method is said to be 15 to 20 pounds per acre, and from 8 to 12 if drilled. The same depth of covering as for clover will answer. Transplanting is sometimes resorted to, but it does not seem to us advisable, unless for filling up blanks. The after culture of lucern, sown broad-cast, consists in harrow- ing to destroy weeds, rolling after the harrowing to smooth the soil for the sowing, and such occasional top-dressings of manure as the state of the plants may seem to require. Where lucern is drilled horse-hoeing may be substituted for harrowing, which is, as already observed, the only advantage of this mode of sowing. Lucern frequently attains a sufficient height for the sycy towards the end of April, and in soils that are favourable for its culture will be in a state of readiness for a second cutting in the course of six weeks longer, being capable of undergoing the same operation at nearly similar distances of time during the whole of the summer season. The application of lucern is nearly the same as the clover, the principal practice in its application is that of soiling horses, neat cattle, and hogs; but as a dry fodder it is also capable of affording much assistance, and as an early food for ewes and lambs may be of great value in particular cases. All agree in extolling it as a food for cows, whether in a green or dried state. It is said to be much superior to clover, both in increasing milk and butter, and improving their flavour. Care must be taken not to give the animals too much of it in a green state, as they may be hoven or blown with it as with clover. The produce of lucern may be estimated as equal in bulk and value to a crop of red clover. The nutritive product of lucern, according to Sir H. Davy, is 2 p. per cent.; as to that of clover and saintfoin, as 23 to 30. The diseases of lucern are the same as those of clover, and the manner of saving seed the same.

15 M. prostrata (Jacq. hort. vind. 1. p. 39 t. 89.) stems prostrate; leaflets linear, toothed at the apex; stipulas linear-subulate, toothed at the base, and having numerous parallel nerves; peduncles racemose; legumes smooth, ciliate-twisted, finely reticulated, 2-seeded; seeds exactly reniform, black. 2. H. Native of Hungary, Wildl. spec. 3. p. 1405. M. declinata, Kit. in litt. Allied to M. falcata, but the legume is more twisted and much smaller. Flowers yellow.

16 M. intermedius (Schult. obs. p. 160.) stem procumbent; leaflets linear, obcordate, rather serrulared at the apex; stipulas sagittate; peduncles bearing corymbose racemes; legumes falcate, rather pubescent. 2. H. Native of Galicia.

Intermediate Lucern. Pl. proeminent.

17 M. glomerata (Balb. elench. 93. D. C. fl. fr. 4. p. 540.) stems erect; leaflets obovate-oblong, cuneiform, emarginate, and mucronate, hardly toothed; stipulas lanceolate, acute, hardly toothed at the base; peduncles racemose; legumes twisted, obscurely and reticulated, pubescent; seed oblong-reniform, brownish. 2. H. Native of the mountains of Tenda, near Barin, and on hills about Turin.

18 M. olutnosa (Bieb. cesp. p. 191. append. no. 60. fl. tur. 2. p. 224. et suppl. 516.) clothed with clammy hairs; stems ascending; leaflets obovate-cuneiform, somewhat retuse, pilose, obsolescent toothed; stipulas lanceolate, toothed at a little at the base; peduncles racemose; calyces segments broad at the base, length of tube; legume twisted, cochlate, reticulately
LEGUMINOSÆ.

Veined, pubescent. 2. H. Native of Caucasus, in mountain meadows. Flowers violet and yellow. Calyx clamy.

**Sect. II. Stipoca* révs (from στῆφα, σπείρα, a spire, and κάρπος, karpas, a fruit; in reference to the fruit of all the species being spirally twisted (f. 30. e)). Ser. ms. in D. C. Prod. 2. p. 174. Legume twisted into an orbicular form (f. 30. e.), pilose, or glabrous, with the margins either wrinkled, or spiny. Leaves trifoliate.

§ 1. Legumes with thin, unaromed margins.

19 M. **obscura** (Retz, obs. fasc. 1. p. 24. t. 1.) stems decumbent; leaflets obovate-rhomboid, denticulated, having numerous prominent nervules; stipulas lanceolate, profusely toothed; peduncles racemose, many-flowered; legume reniform, or twisted into an orb, quite entire, glabrous, radiately veined, 2-seeded. O. H. Native of the south of France. M. lentulícaris, Dörsch. in Lam. dict. 3. p. 630. Seeds exactly reniform, brown.

*Var. ß, triloba* (Ser. in D. C. Prod. 2. p. 174.) peduncles 3-flowered; leaflets very acutely toothed; legume somewhat cochleate, twisted into a round form, having prominent nerves.

Obscure Medick. Fl. June, Aug. Clt. 1734. Pl. procm. 20 M. **intermedia** (D. C. herb.) the same as the last species, but differs in the legumes being furnished with warted nerves, and in the seeds being yellow. O. H. Native about Naples. M. obscura, var. ß, ruglosa, Ser. ms. in D. C. Prod. 2. p. 174.

Smooth Medick. Fl. July, Aug. Clt. 1816. Pl. tr. 22 M. **orbiculáris** (All. ped. no. 1150.) stems diffuse; leaflets obcordate, toothed at the apex; stipulas jagged, the segments very narrow and diverging; peduncles 1-2-flowered; legumes cocheolate, compressed, glabrous, irreguarily and reticulately veined, many-seeded; seeds subtriangular, rugose from dots. O. H. Native of the south of Europe. M. orbiculáris. J. Bauh. hist. 2. p. 384. Gærtn. fruc. 2. p. 155.—Mor. hist. 2. t. 15. f. 2. M. polymorpho a, Lin. spec. 1097.

*Var. ß, microcarpa* (Moricand, herb.) fruit smaller.

Orbiculáris-fruited Medick. Fl. Jul. Aug. Clt. 1688. Pl. diff. 23 M. **margaritá** (Willd. enum. p. 802.) procumbent; leaflets obovate, dentate; stipulas divided into many setaceous segments; peduncles usually 2-flowered; legume unarmed, twisted into an orbicular, flat form, the circles loose. O. H. Native of the south of Europe.—Moris, hist. sect. 2. t. 15. f. 2. This species is very like the preceding, but differs in the legumes being flat on both sides. It is perhaps only a variety of *M. orbiculáris*.

Margined Medick. Fl. June, Aug. Clt. 1816. Pl. trail. 24 M. **aplaná** (Willd. suppl. p. 52. ex Horn. hort. hafn. suppl. p. 85.) procumbent; leaflets obovate, toothed; stipulas divided into many setaceous segments; peduncles usually 1-flowered; legumes unarmed, orbicular, flatish on both sides, and ciliated on the margins, the circles distant and large. O. H. Native of? Perhaps only a variety of *M. orbiculáris*.

Flat-podded Medick. Fl. June, Aug. Clt. 1810. Pl. trail. 25 M. **scutellá** (All. ped. no. 1155.) pilose; stems difficult; leaflets obovate, toothed around; stipulas lanceolate, toothed; peduncles 1-2-flowered; legume cocheolate, many-seeded, hemispherically convex above, but flat below, beset with dense, oblique, reticulated veins; the veins thin at the margins, and anastomosing; seeds large, kidney-shaped, smooth, brown. O. H. Native of the south of Europe. Gærtn. fruc. 2. t. 155. f. 7.—J. Bauh. hist. 2. p. 384. with a figure.—Moris. hist. sect. 2. t. 15. f. 2. M. polymorpho ß, Lin. spec. 1097.

**Disk-like-podded Medick. Fl. Ju. Aug. Clt. 1502. Pl. diff. 26 M. **hucidea** (Lam. dict. 3. p. 652.) procumbent; leaflets obovate-rhomboid, denticulated towards the apex; stipulas lanceolate, toothed; peduncles 2-4-flowered; legume having 2-3 circles, obliquely and reticulately veined, the veins becoming thicker towards the margins, but the margin is smooth and thinner; seeds reniform, compressed, dark, truncate at the apex. O. H. Native of the south of Europe. M. elegans, Willd. spec. 3. p. 1408.—Moris. hist. sect. 2. t. 15. f. 4.

Wrinkled-fruited Medick. Fl. June, Aug. Clt. 1680. Pl. pr. 27 M. **saxatile** (Bieb. fl. taur. 2. p. 235.) procumbent; leaflets oblong-cuneiform, toothed at the apex, rather pubescent; stipulas subulate, a little toothed; peduncles few-flowered; legume cocheolate, veiny, with the margins beset with spiny denticulations, glabrous. ß. H. Native of Tauria, on rocks. Legume about the size of that of *M. rupestris*, but the form is different, the windings being only 3 or 4.

28 M. **tornata** (Wild. spec. 3. p. 1409.) stems diffuse; leaflets obovate, denticulated; stipulas ciliately-toothed; peduncles many-flowered; legume twisted into a cylindrical form, truncate at both ends, glabrous, with thick, smooth, nerveless margins, having the circles almost concrete; seeds kidney-shaped, truncate at the apex, smooth, orange-coloured. O. H. Native of the south of Europe. M. polymorpho ß, tornata, Lin. spec. 1098.

**Tubercled Medick. Fl. June, Aug. Clt. 1658. Pl. pr. 31 M. **olivaeformis** (Moris. elench. sard. 1827. fasc. 1.) pubescent; leaflets somewhat rhomboidal-obovate, denticulated; stipulas lanceolate, toothed; peduncles few-flowered; legumes ovate, pubescent, having 6-7 turnings, with very thick, reticulated, warded, or tubercled margins. O. H. Native of Sardinia.

**Olive-formed-podded Medick. Pl. prostrate. 32 M. **strícha** (Bast. journ. bot. 1814. 3. p. 19.) stems procumbent; leaflets obovate, denticulated; stipulas lanceolate, toothed; peduncles 5-6-flowered; legumes with 3-5 circles, twisted into a cylindrical form, having thickened margins, beset Z.
with mamillary dots above, and marked with lines beneath; seeds reniform, truncate at the apex, small, brownish. \(\odot \) H. Native of Scandinavia, in sand on the sea-shore. M. triflora, D. C. cat. monsp. 123.

33 M. apiculata (Willd. spec. 3. p. 1414.) stems prostrate; leaflets obovate, hardly denticulated at the apex; stipulas ciliately-toothed; peduncles 3-4-flowered; legumes cochlolate, flat at both ends, of 3 circles, reticulate and somewhat lacunose, having mucrinated, smooth margins; spines straight, diverging; seeds oblong-kidney-shaped, yellow. \(\odot \) H. Native about Nice, in corn-fields. M. coronata, Gaertn. fruct. 2. p. 155. f. 7, but not of Lam. M. muricata \(\gamma\), Lam. dict. 3. p. 635. M. polylepis, Willd. enun. suppl. 52. M. polycyphala, Hortul.

**Apiculated Medick.** Fl. June, Aug. Clt. 1800. Pl. prostr. 34 M. Cataloxica (Schrantsch. hort. mont. t. 28.) pubescent; stems elongated, diffuse; leaflets rhomboid-ovate, denticulated; stipulas toothed; peduncles many-flowered; legume cochlolate, compressed, having 4 mucrinated circles. \(\odot \) H. Native of Catalonia. Allied to *M. spinulosa.*

**Cataloxica Medick.** Fl. June, Aug. Clt. 1820. Pl. diff. 35 M. denticulata (Willd. spec. 3. p. 1414.) stems prostrate; leaflets obovate or obcordate, denticulated; stipulas ciliately-toothed; legumes flat at both ends, having 2 circles, obliquely reticulated, with prickly smooth margins, the prickles diverging and hooked; seeds oblong-kidney-shaped, rather truncate at the apex. \(\odot \) H. Native of the south of France, and about Conception, in Chili. This species comes very near to *M. apiculata*, but differs in the legumes being larger, and in the spines being longer and hooked.

**Denticulated Medick.** Fl. June, Aug. Clt. 1800. Pl. prostr. 36 M. ciliolata (Desv. journ. bot. 1814. 1. p. 77.) stems procumbent, hairy; leaflets somewhat rhomboid, crenated, rather pilose; peduncles usually 2-flowered; legume twisted into a globose form, glabrous, having 7 approximate circles, bearing remote incurved prickles on the back. \(\odot \) H. Native of Numidia.

**Globulose-fruited Medick.** Fl. June, Aug. Pl. procumbent. 37 M. flexuosa (Ten. cat. 1819. p. 54.) glabrous, procumbent; leaflets obovate, retuse, toothed; stipulas ciliately-toothed; peduncles many-flowered; legume cochlolate, flexuous, glabrous, having only 2 circles, which are reticulated and prickly, the prickles arched and short. \(\odot \) H. Native of Naples, in fields.

**Flexuous-podded Medick.** Fl. June, Aug. Clt. 1819. Pl. tr. 38 M. ciliolata (Poir. dict. suppl. 8. p. 526.) smoothish; stems erect; leaflets ovate, denticulated; stipulas pinnafally-jagged; peduncles 3-4-flowered; legume twisted into a globose form, usually with 3 circles, having short, hispid, straight prickles. \(\odot \) H. Native of? 

**Globe-bearing Medick.** Pl. 1 foot. 39 M. spinulosus (D. C. fl. fr. 5. p. 569.) pilose; stems prostrate; leaflets obovate or obcordate, sharply denticulated; stipulas lanceolate, toothed; peduncles 2-flowered; legume cochlolate, egg-shaped, having 3-4 circles, prickly beneath the margins, the prickles straight, converging, and adpressed, concrete, hardly longer than the lacunose margins; seeds reniform, brown, rather truncate at the apex. \(\odot \) H. Native of the south of France, and of the islands of the Archipelago. M. apiculata, Bast. ess. p. 280. but not of Willd. M. rugosa, D'Ur. enun. p. 98. but not of Lam.

**Spinulose Medick.** Fl. June, Aug. Clt. 1820. Pl. prostr. 40 M. pubescens (D. C. cat. monsp. p. 124.) not of Horn.) plant prostrate, clothed with soft pubescence or villi; stems elongated; leaflets broad, obovate, denticulated; stipulas lanceolate, acuminated, somewhat denticulated at the base; peduncles 5-8-flowered; legumes cochlolate, having 2-3 circles, smooth, hardly arately reticulated under the margin; the prickles thick, converging, straight, adpressed, longer than the margin. \(\odot \) H. Native about Montpellier. — J. Bauh. hist. 2. p. 385. with a figure. Very like *M. spinulosa*, but differs in the prickles being much longer than the margins.

**Pubescent Medick.** Fl. Ju. Aug. Clt. 1819. Pl. prostrate. 41 M. Saro (Moris. ench. sard. p. 15.) smoothish; leaflets rhomboid-ovate, denticulated, mucronate; stipulas jagged; peduncles many-flowered; legumes cochlolate, cylindrical, having 4 turnings, reticulately armed, prickly on the margins. \(\odot \) H. Native of Sardinia.

**Saro Medick.** Fl. June, Aug. Clt. 1800. Pl. 42 M. terrebellum (Willd. spec. 3. p. 1416.) stems prostrate; leaflets obovate, retuse, toothed; stipulas ciliately-toothed; peduncles many-flowered; legume twisted into a cylindrical form, flat at both ends, having 5 reticulated, smooth circles; the prickles very short, distinct, subulate, and spreading; seeds reniform and dark. \(\odot \) H. Native of the south of Europe. M. aculeata, Gaertn. fruct. 2. p. 349. t. 155. f. 7.

**Awl-spined Medick.** Fl. June, Aug. Clt. 1879. Pl. prostr. 43 M. marina (Lin. spec. 1097.) plant densely clothed with tomentum, procumbent; leaflets cuneiform, quite entire; stipulas lanceolate, entire; peduncles many-flowered; legumes cochlolate, obliquely nervcd, rather spinous; seeds exactly kidney-shaped, yellow. \(\gamma \) H. Native of Europe, by the sea-side. Gaertn. fruct. 2. p. 153. f. 7. Cav. icon. 2. t. 130.

**Sea-side Medick.** Fl. June, Aug. Clt. 1596. Pl. prostrate. 44 M. coronata (Lam. dict. 3. p. 634.) villous; stems prostrate; leaflets obovate or obcordate-rollmash, small, denticulated; stipulas lanceolate, entire; peduncles 4-7-flowered, much longer than the leaves; legume cochlolate, of 1 or 2 circles, villous, reticulated, the form of a crown, having divaricate, marginal, parallel, straight prickles; seeds reniformly-lunulate, small, brown. \(\odot \) H. Native of the south of Europe, Egypt, &c. — Moris. hist. sect. 2. t. 15. f. 16. M. coronata Cherleri, J. Bauh. hist. 2. p. 386. with a figure. M. polymorpha coronata, Lin. spec. 1098.

**Crown-formed-podded Medick.** Fl. June, Aug. Clt. 1668. Pl. prostrate. 45 M. tentaculata (Willd. spec. 3. p. 1413.) prostrate; leaflets obovate, toothed; stipulas subulate, toothed; peduncles usually 2-flowered; legume cochlolate, cylindrical, flat at both ends; prickles smooth, lanceolate, distich, closely adpressed. \(\odot \) H. Native of the south of Europe. M. tentaculata, Gaertn. fruct. 2. p. 356. t. 135. f. 7.

**Tentaculated Medick.** Fl. June, Aug. Clt. 1800. Pl. prostr. 46 M. hornemanniana (Ser. ess. D. C. prod. 2. p. 177.) stems hairy; leaflets rhomboid-ovate, toothed, pubescent; stipulas jagged; peduncles 2-3-flowered; legume twisted into a cylindrical form, rather pilose, small, with a few approximate circles; prickles strong, subulate, reflexed, hooked. \(\odot \) H. Native of Morocco. M. pubescens, Horn. hort. hafn. 2. p. 726. but not of D. C.

**Horneman's Medick.** Fl. June, Aug. Clt. 1818. Pl. trailing. 47 M. littoralis (Rhode in Lois. not. 118. but not of Tenore.) villous; stems procumbent; leaflets obcordate or obovate-cuneiform, toothed at the apex; stipulas lanceolate, toothed; peduncles 2-4-flowered; legumes twisted, subcylindrical, glabrous, with 4 circles, obliquely and flexuously reticu-

lated, and with prickly margins; circles thick, coriaceous; prickles stiff, rather hooked; seeds reniform, bay-coloured. \( \bigcirc \). 1. H. Native of Europe, by the sea side.—J. Bauh. hist. 2. p. 355. with a figure.

Var. \( b \), breviseta (D. C. fl. fr. 5. p. 568.) prickles short, straight. M. polymorpha rigidula, Bertl. pl. gen. 97. exclusive of the synonyms.

48 M. lappacea (Lam. dict. 3. p. 657.) smoothish; stems procumbent; leaflets obcordate, toothed; stipulas ciliately-toothed; peduncles 3–5-flowered; legumes twisted, smooth, obliquely and flexuously-nerved, having 3 circles, and with the margins prickly; prickles long, hooked; seeds kidney-shaped, rather truncate, yellow. \( \bigcirc \), 11. Native about Montpelier, and also about Naples. M. hispida, Gaert. fruct. 2. p. 155. f. 7. ? Allied to **M. littoralis**, but the legume and seeds are larger.

48 M. pentacysta (D. C. cat. monsp. p. 124.) rather pilose; stems procumbent; leaflets ovate, dentilicate; stipulas ciliately-toothed; peduncles many-flowered; legume coileate, glabrous, convex at both ends; circles 5, reticulated with lanceum above; spines long, diverging, hooked at the apex; seeds ovate-reniform, compressed, bay-coloured. \( \bigcirc \), 11. Native about Narbonne.—Moris. hist. sect. 2. t. 15. f. 19. ? Like the preceding, and perhaps not distinct.

50 M. strix (Ten. prod. p. 45. cat. 1819. p. 58.) glabrous, prostrate; leaflets ovate, retuse, dentilicate; stipulas petiolarly-mutilid; peduncles usually 2-flowered, longer than the leaves; legumes coileate, cylindrical, compressed at both ends; circles 5, rather distant; prickles subulate, diverging, hooked, rather pilose. \( \bigcirc \), 11. Native in fields about Naples. This plant differs from **M. ciliaris** in the legumes being glabrous, and from **M. lappacea**, Lam.

51 M. diffusa (Poir. suppl. 3. p. 524.) stems diffuse; leaflets obcordate, small; stipules broad, ciliated; peduncles usually 3-flowered; legume coileate, globose, having 5 circles; prickles straight, hooked at the apex. \( \bigcirc \), 11. Native of Teneriffe, on rocks. This plant differs from **M. lappacea** in the leaflets and fruit being smaller.

**Difuse Medick. Fl. June, Aug. Pl. diffuse.**

52 M. oscironias (D. C. cat. monsp. p. 124.) plant pilose; stems procumbent; leaflets obcordate, dentate; stipulas lanceolate, toothed; peduncles 4–4-flowered; legume coileate, glabrous, having 5 approximate circles, which are veiny beneath, and flat above, the 4 lower circles have their margins furnished with long sessile spines, which are hooked at the apex, the fifth circle naked from abortion; the margins of the whole channelled between the spines. \( \bigcirc \), 11. Native about Montpelier, in sterile places. The herb is like **M. minima**, but the form of the legume is very distinct from all the other species.

53 M. carstieenis (Jacq. icon. rar. 1. t. 156.) stem erect, branched; leaflets ovate, toothed; stipulas lanceolate, toothed; peduncles racemose; legume coileate, compressed at both ends, obliquely-nerved, having about 3 or 4 circles, green, but at length black; the margins thin, nerveles, and spiny; spines long, straight, hardly diverging; seeds rather reniform, bay-coloured. \( \bigcirc \), 11. Native of the Alps of Carinthia, about Carst. Sims, bot. mag. 908. M. Noceca, Balb. M. umbellata, Hortin. 

**Cord Medick. Fl. June, July, Clt. 1799. Pl. 1 and 2 figs.**

54 M. sicca (Willd. spec. 3. p. 1418.) leaflets obovate, toothed; stipulas ciliately-toothed; peduncles usually 2-flowered; legume coileate, cylindrical, the circles approximate; prickles subulate, straight, hooked. \( \bigcirc \), 11. Native of the south of France.—Moris. hist. 3. p. 134. sect. 2. t. 15. f. 19.

55 M. tribuloides (Lam. dict. 3. p. 635.) pilose; stems prostrate; leaflets obovate, toothed; stipulas profusely toothed; peduncles 2-flowered; legume coileate, cylindrical, flat at both ends, having 5 circles, wrinkled from lanceum; spines thick, diverging, rather hooked at the apex, lateral, not marginal, with the margins thick and elevated, not channelled; seeds kidney-shaped, bay-coloured, obliquely-truncate at the apex. \( \bigcirc \), 11. Native of Europe, particularly of France.

**Var. \( b \), narbonensis (D. C. prod. 2. p. 175.)** spines adpressed, short, and arar, as well as the circles, more turgid; legume with tumid warts. D. C. fl. fr. 5. p. 568.

56 M. crassiflora (Visiani, in bot. Zeit. March, 1829. p. 20.) pubescent; stems prostrate, tetragonal; leaflets obovate, sharply toothed at the apex; stipulas lanceolate, acuminated, cut at the base; peduncles 3-flowered; legumes coileate, ovate, depressed, and veiny; prickles stiff, conical, incurved, disposed in two rows. \( \bigcirc \), 11. Native of Dalmatia. This species is nearly allied to **M. tribuloides**.

**Thick-spined Medick. Fl. June, Aug. Pl. prostrate.**

57 M. cylindrica (D. C. cat. monsp. p. 123.) stems prostrate; leaflets obcordate, dentate; stipulas deeply-toothed; peduncles many-flowered; legume coileate, cylindrical, truncate at both ends; circles very thick, 5–6, nearly concreta, with a denticulate, 1-lined, flattish margin; seeds regularly kidney-shaped, bay-coloured. \( \bigcirc \), 11. Native of **M. ternata**, Lam. dict. 3. p. 633.

58 M. praecox (D. C. cat. monsp. 123.) stems prostrate; leaflets obcordate, dentilicate; stipulas ciliately-toothed; peduncles short, 1–2-flowered; legume coileate, glabrous, flat at both ends; circles thin, rather wrinkled from lanceum, with the margins thick, nerveless, and flat, bearing the spines laterally; spines rather diverging, hooked at the apex; seeds ovate-reniform, bay-coloured. \( \bigcirc \), 11. Native of Provence.

59 M. moliussima (Roth, cat. bot. 3. p. 74.) very soft; stipulas broadest at the base, toothed at the apex; peduncles 2-flowered; legume coileate, having 5 circles; spines long, hooked at the apex. \( \bigcirc \), 11. Native of Spain and France.

60 M. Crassica (Horn. hornh. fl. no. 1156.) stems prostrate; leaflets obovate, toothed at the apex, villous on both surfaces; stipulas obsoletely-serrate; peduncles many-flowered; legume coileate, rather pilose; prickles long, bent. \( \bigcirc \), 11. Native of Greece. Willd. enum. p. 805. Perhaps distinct from **M. minima** var. longiseta.

**Var. \( b \), canescens (Ser. mas. 1. D. C. prod. 2. p. 178.)** plant canescent; spines longish. About Geneva, in arid places.
Var. γ, longiseta (D. C. herb.) spines very long; stems elongated; peduncles many-flowered, elongated. M. mollissima, Roth, ed. bot. 3. p. 74. Trifolium echinatum arvense, C. Bauh. p. 329, no. 6.

62 M. arenaria (Ten. ed. 1819. p. 59.) stems prostrate; leaflets obovate, denticulated; stipulas rather dentate or quite entire; peduncles usually 2-flowered, shorter than the leaves; legumes coelate, somewhat cylindrical, flat at both ends; circles 4, approximate; prickles few, arched, diverging, hooked, glabrous. ○ H. Native of Naples, in sandy places. M. littoralis, Ten. prod. 45. but not of Rhode.

63 M. muriculète (Tineo, pl. sic. rar. pug. 1. p. 18. Tenore, app. 4. fl. necp. p. 29.) stems branched, diffuse, angular; leaves obovate or obcordate, small, serrulately at the apex; stipulas ciliately-toothed; peduncles usually 1-flowered, about equal in length to the leaves; legume usually solitary, coelate, compressed at both ends; circles 2-4, coarsely reticulated, prickly; prickles oblrong, setaceous, arched, marginal in two rows, very broad at the base; margins flat and thickish. ○ H. Native near Palermo, Calabria, &c. The habit of the plant is that of M. disectorum, but the legume in this species is much larger, reticulated, and the margins beset with long awns.

64 M. uncinita (Willd. spec. 3. p. 1417.) stems prostrate; leaflets obovate, toothed; stipulas toothed; peduncles many-flowered; legume coelate, cylindrical, flat at both ends; circles distant; prickles distich, reflexed, subulate, hooked. ○ H. Native of the south of Europe. Allied to M. rigidula and M. nigra. Perhaps not distinct from M. pentaeceata.

65 M. distans (Poir. dict. suppl. 2. p. 326.) stems prostrate; leaflets somewhat cordate, denticulated at the apex; stipulas dentately-ciliated; peduncles 2-4-flowered; legume coelate, ovate, having 3 distant circles, which are prickly; prickles straight, diverging, hooked at the apex. ○ H. Native of the south of Europe.—Moris. hist. sect. 2. t. 15. f. 21. Perhaps M. uncinita of Willd.

66 M. rēcta (Desf. fl. atl. 2. p. 212.) stem erect; leaflets cuneiform, toothed, pubescent; stipulas entire; peduncles 1-flowered; legume twisted into a globose form, almost nerveless, prickly, and rather pilose; prickles long, straight, hooked; circles of legume 3-5, flat, spines compressed, channelled, hooked. ○ H. Native of Barbary. Perhaps only a variety of M. minima.

67 M. aculea'ta (Willd. spec. 3. p. 1410.) prostrate; leaflets rhomboid-obovate, toothed; stipulas toothed; peduncles usually 2-flowered; legume coelate, cylindrical, flat at both ends, with the margins of the circles muricate. ○ H. Native of? Very like M. tuberculosis, but differs in the prickles of the legume being unequal, thick, very short and obtuse.

68 M. maculata (Willd. spec. 3. p. 1412.) stems prostrate; leaflets obcordate or obovate, toothed, spotted; stipulas dilated, toothed; peduncles 2-3-5-flowered; legumes coelate, compressed at both ends, white, having 3-5 circles, which are circularly and densely nervd, the margins fringed with 5 rows of long, spreading, slender, weak, partly hooked bristles; seeds kidney-shaped, yellow. ○ H. Native of Europe, in sand. In England, on gravelly soil in the southern parts.—Moris. hist. sect. 2. t. 15. f. 12. M. cordata, Desvres. in Lam. dict. 3. p. 636. M. polymorpha, Smith, engl. bot. 1616. Curt. fl. Lond. 3. t. 47. Mart. fl. rust. t. 76. (f. 30.)

70 M. areestis (Ten. prod. suppl. 2. et cat. 1819. p. 59.) pubescent; stems prostrate; leaflets cuneiform, toothed at the apex; stipulas with setaceous teeth; peduncles usually 2-flowered; legume twisted, muricate, flat at both ends, having 5 circles; prickles about equal in length to the breadth of the legume. ○ H. Native of Naples near Caserta, in fields.

71 M. kooidula (Lam. dict. 3. p. 654.) stems prostrate; leaflets obovate, denticulated at the apex; stipulas toothed at the base; peduncles 2-3-flowered; legume cylindrical, flat at both ends, beset with muricate-like spines on the back, which hardly diverge. ○ H. Native of the south of France. Allied to M. tornata according to Lamark.

72 M. muricata (All. pedem. no. 1158.) stems prostrate; leaflets rhomboid-obovate, toothed; stipulas ciliately-toothed; peduncles 1-3-flowered; legume twisted into an ovate form, glabrous, having 5 thick, somewhat nervd circles, the margin thick, marked by an evanescent narrow zone, not furrowed; spines disposed in a single row, stiff, conical, arched, tooth-formed; seeds irregularly kidney-shaped, of a bay colour. ○ H. Native of Europe, in fields. In England, at Orford, Suffolk, on the sea bank plentifully.—Vaill. bot. par. t. 39. f. 7. M. polymorpha muricata, Lin. spec. 1098.

73 M. spirekokia’pos (Bert. ital. pl. dec. 3. p. 60.) glabrous, prostrate; leaflets rhomboidal-obovate, sharply-eruculately; stipulas jagged; peduncles many-flowered; legume twisted into a globose form, with the circles so closely adpressed as to be almost concrete, the margin thick, and bisulate lengthwise; prickles short, thickish. ○ H. Native of Italy, on grassy hills about Sarzena. Seb. pl. rom. p. 15. t. 3.—Moris. hist. sect. 2. t. 11. f. 12? This species is distinguished from M. tercelbium of Willd. in the legumes being globose, not cylindrical.

74 M. muc‘nex (Willd. spec. 3. p. 1410.) stems prostrate; leaflets obovate, toothed, lower ones obcordate; stipulas ciliately-toothed; peduncles usually 2-flowered; legume coelate, cylindrical, rather convex at both ends, prickly, and transversely veined; prickles long, straight, and thick. ○ H. Native of? This species is very nearly allied to M. muricata, but the lower
peduncles are longer, the circles of the fruit thinner and nervéd, and the prickles longer.

Prickly Medick. Fl. June, Aug. Clt. 1802. Pl. procumbent. 75 M. laciniate (All. pedem. no. 1150.) stem erect; leaflets linear, deeply-toothed, truncate; stipulas ciliately-toothed; peduncles 1-2-flowered; legume twisted into a globose form, very spiny; prickles straight, subulate, hooked, compressed, channelled; margin thick, flatish, but neither sulcate nor zonate; seeds obov-oblong, bay-coloured. H. Native of the south of Europe, in corn-fields. M. polymorpha var. laciniate, Lin. spec. 1899.—Brey. cent. 81. t. 84. good.

Tenore's Medick. Fl. June, Aug. Clt. 1820. Pl. prostr. 77 M. gramineus (Willd. cmm. p. 803.) stems erect; leaflets obovate, toothed; stipulas pinnatifid; peduncles usually 2-flowered; legume twisted into a subglobose form, having 5 rather distant, reticulated circles, the margin rather cartilaginous, narrow, and convex; prickles conical, firm, and subulate, distich, and adpressed; seeds reniform, large, and black. H. Native of Spain, near Malaga. M. polymorpha pinnatifida, Jacq. coll. suppl. 143. t. 15. f. 2. Allied to M. intertexta and M. tenorea, but very distinct from either.

Interven Medick. Fl. June, Aug. Clt. 1829. Pl.proc. 79 M. ciliatis (Willd. spec. 3. p. 1411.) stems prostrate; leaflets obovate, toothed; stipulas ciliately-toothed; peduncles usually 2-flowered; legume coechlate, ovate-globose, pilose, membranous, much reticulated, having a thick, concave, somewhat cartilaginous margin; spines conical, firm, divericate; seeds reniform, large, black. H. Native of the south of Europe.—Moris. hist. 1. p. 153. sect. 2. t. 15. f. 7.

Ciliated-podded Medick. June, Aug. Clt. 1866. Pl.pr. 80 M. karpos (D. C. fl. fr. 4. p. 346.) stems prostrate; leaflets obovate or obcordate, obsoletely-toothed; stipulas lanceolate, rather ciliately-toothed; peduncles 5-6-flowered, longer than the petioles; legume twisted into an oval form, smooth, membranous, and much reticulated; spines compressed, channelled laterally, divericate, adpressed, very long, and very acute, having 6-7 circles; seeds reniform, black. H. Native of the south of France, about Nice. Moris. hist. sect. 2. t. 15. f. 9.

Wild-hog-loved Medick. Fl. June, Aug. Clt. 1820. Pl.pr. Cult. The seeds of the annual species of this genus only require to be sown in the open border in spring. The perennial herbaceous species may be increased by dividing the plants at the root in spring. The shrubby species, as M. arborea, are easily raised from cuttings.

1 H. circlinæus (Savi, l. c.) stem prostrate; leaves pinnately 5-folate; leaflets entire, ovate, the terminal one large and oblong; peduncles 2-4-flowered, subcorymbose; legume membranous, kidney-shaped, pilose, with the margins toothed but not winged; seeds kidney-shaped, compressed. H. Native of the Mediterranean, on the sea-shore, and of Corsica. Medicago circlinæa, Lin. spec. 1096.

2 H. summularius (Savi, l. c.) stem prostrate, lower leaves entire, upper ones pinnately 5-folate; leaflets ovate, entire, the terminal one largest and oblong; pedicles 3-flowered, rather shorter than the leaves; legume broad, compressed, somewhat membranous, of a reniform, orbicular figure, with the margins entire, and furnished with a narrow, winged stem. H. Native of the south of France and Egypt. Medicago summularia, D. C. cat. hort. mss. p. 124. but not of Steven. Medicago circlinæa, Gaertn. fruct. 2. p. 348. t. 155. f. 6. Medicago circlinæa, Fl. D. C. pl. 205.

3 H. radicatus (Willd. enum. p. 801.) stem erect; leaves trifoliate; leaflets obovate, sharply toothed; stipulas toothed; pedicles 1-flowered, longer than the leaves; legume membranous, broad, compressed, reniform, having broadly winged, toothed, reticulately veined margins. H. Native of Italy and the Levant. Medicago radicata, Lin. spec. 1096. Gaertn. fruct. 2. p. 345. t. 155. f. 7. M. lunata, J. Bauh. hist. 2. p. 386.—Moris. hist. sect. 2. t. 15. f. 3.

F. lasiurus (Ser. mss.) legume pilose. Native of the Levant.

Cult. The seeds of these plants only require to be sown in the open border in spring.

LXVII. TRIGONE'I.LA (from τρις, treis, three, and γωνία, gonia, an angle; the vexillum of the flower is flat, and the keel is very small and narrow, which gives the flower a triangular appearance). Lin. gen. no. 1213. Gaertn. fruct. 2. p. 332. t. 152. f. 3. D. C. prod. 2. p. 181.

Lin. syst. Diodēphila, Decandria. Calyx campanulate, 5-cleft. Corolla small, the wings and vexillum rather spreading, forming apparently a 3-petalled corolla. Legume oblong, compressed or cylindrical, acuminate, erectish, many-seeded.—Sweet-scented herbs, with trifoliate leaves, the middle leaflet stalked.

Sect. I. Grammoca'rpos (from γραμμα, gramma, writing, and καρπος, karpos, a fruit; in reference to the nervéd legumes). Ser. mss. in D. C. prod. 2. p. 181. Flowers capitate or umbellate. Legume ovate, longitudinally nervéd, ending in a long beak.
LEGUMINOSÆ.

LXVII. TRIGONELLA.

1 T. cœrulea (Ser. mss. in D. C. prod. 2. p. 181.) stem upright; leaflets ovate, lower ones ovate-roundish, denticulated; stipulas linear-subulate, teeth of calyx acute, length of tube; petals white, lined with blue; legume ovate, beaked, nerved lengthwise, 2-3-seeded; beak long, straight; seeds globose, olive-coloured, wrinkled from dots; radicle rather prominent. C. H. Native of Bohemia and Switzerland. Sturm, deutsch. fl. 1. fasc. 15. Trifolium melilotus cœrulea, Lin. spec. 1077. Melilotus cœerulea, Lam. dict. 4. p. 62. Sims, bot. mag. 2283. Flowers blue.

2 T. Besseriana (Ser. mss. in D. C. prod. 2. p. 181.) stem decumbent; stipulas membranous, lanceolate; racemes oblong, pedunculate; legume 2-seeded, short, pilose, veined, tapering into a mucron at the apex, 3-times longer than the calyx. C. H. Native of the south of Podolia, and Bessarabia. Melilotus proœmbens, Besser, enum. vol. 30. no. 944. Very like T. cœrulea, but differs in the decumbent habit, the narrower leaflets, the smaller flowers, the larger legumes, and the brown seeds.

3 T. Martima (Delil. in Poir. dict. suppl. p. 5. 361.) stem diffuse, glabrous; leaflets obliquely cordate, glabrous, denticulated; peduncles axillary, shorter than the leaves; flowers disposed in capitate umbels, reflexed; legume short, acute, turgd at the base, striated, straight. C. H. Native near Alexandria, on the sea-shore. Flowers yellow.

Sea-side Trigonella. Pl. diffuse.

5 T. litoralis (Guss. cat. 1821. p. 83.) stem branched, rather diffuse; leaflets cuneate, denticulated at the apex; legumes pedicellate, umbellate, decline, rather falcate, compressed, tapering to both ends, obliquely and reticulately veined; peduncles spinose. C. H. Native of Sicily, among stones by the sea-side. Corolla yellow. This species is allied to T. maritima, but it differs in the leaflets being cuneiform, not obcordate, and in the legumes being acute at both ends, not turgd at the base, somewhat falcate, not straight, as well as in being pilose, not glabrous.

6 T. caliceras (Fisch. in Bieb. fl. taur. suppl. p. 515.) stems ascending; leaflets ovate-cuneate, sharply toothed at the apex; stipulas linear-subulate; teeth of calyx acute, length of tube; legume falcate, somewhat spirally striated, having a long beak; seeds 5-6, ovate, wrinkled from dots. C. H. Native of Iberia. D. C. mem. soc. gen. 2. p. 153. hort. gen. fasc. 2. with a figure. Lütke medicaginoides, Retz. obs. 2. p. 38. no. 74. T. oxyrhyncha, Fisch. in litt. Flowers yellow.

Sect. II. Faœnum-Greœcum (from faœnum, hay, and Greœcum, Greek; Greek hay; the T. Faœnum-Greœcum was formerly made into hay in Greece). Ser. mss. in D. C. prod. 2. p. 182. Faœnum-Greœcum, Tourn. inst. 1. p. 408. t. 250. Flowers sessile, solitary, and twin. Legume elongated, compressed, ending in a long beak, and reticulated lengthwise.

7 T. proœstrata (D. C. fl. fr. 5. p. 571.) stems diffusely procumbent; leaflets obvolute-oblong, cuneiform, sharply serrated; calyx pilose; teeth of calyx subulate, length of tube; legume falcate, longer than the beak, 6-seeded; seeds small, ovate, and somewhat kidney-shaped, wrinkled from dots; radicle hardly prominent. C. H. Native of Provence and about Montpellier. T. Faœnum-Greœcum β, D. C. fl. fr. 4. p. 515.—J. Bauh. hist. 2. p. 365. f. 2. Flowers white.

8 T. gladiata (Stev. cat. hort. gor. 1808. p. 112. Bieb. fl. taur. 2. p. 222. and suppl. p. 516.) plant covered with rough pili; stems spreading; leaflets triangularly-obvolute, toothed at the apex; teeth of calyx linear, length of tube; legume falcate, about equal in length to the beak, tumescent, striated with veins.

9 T. Faœnum-Greœcum (Lin. spec. 1402.) stem erect, simple; leaflets obvolute, oblong-toothed; stipulas lanceolate, falcate, entire; calyx pilose; the teeth subulate, length of tube; legume falcate, twice the length of the beak, reticulated lengthwise, many-seeded; seeds large, ovate, wrinkled from dots; radicle rather prominent. C. H. Native of the south of France. Garth. fruct. t. 132. f. 3. Fæcul. handb. 2. t. 211. Woodyv. med. bot. t. 118. T. gladiata, Hortul. This plant was formerly cultivated by the Romans, and is still employed in the agriculture of the south of Europe. The seeds have a strong disagreeable smell, and an unctuous, farinaceous taste, accompanied with a slight bitterness. An ounce renders a pint of water thick and slimy. To rectify this spirit they give out the whole of their distinguishing smell and taste, and afterwards to water a strong flavourless mucilage. These seeds are never given internally, their principal use being in cataplasms and fomentations, for softening, maturating, and dispersing tumours, and in emollient glisters. They were also an ingredient in the oleum e mucilaginisibus; but this has no longer a place in the pharmacopœia. They are used by grooms and farriers for horses. Fenugreek has not been cultivated in any quantity for use in England, because it is an uncertain crop, occasioned by the inconstancy of our weather.

Sect. III. Bœeras (from bœw, bœn, an ox, and œeras, a horn; in reference to the form of the pods). Ser. mss. in D. C. prod. 2. p. 182.—Bœerœis, spec. Meœch. meth. p. 143. Flowers disposed in pedunculate or sessile racemose umbels. Legume cylindrically-compressed, a little arched, reticulated and murrionate.

§ 1. Racemes pedunculate.

10 T. spinosa (Lin. spec. 1094.) stems spreading; leaflets obvolute-cuneate, denticulated at the apex; stipulas disected; flowers in fasciciles, sessile; middle peduncle spinose, sterile; legume arched, compressed, decline, very long, transversely veined, glabrous, many-seeded; seeds irregularly oblong, wrinkled from dots; radicle rather prominent. C. H. Native of Crete. Bœeras spinosa, Meœch. meth. p. 143.—Bœren, cent. 79. t. 33. f. 1. Flowers pale-yellow.

11 T. stræta (Lin. fl. suppl. p. 340.) stems spreading; leaflets obvolute, denticulated at the apex, striped; stipulas linear, dilated at the base, and toothed; umbels pedunculate; legume arched, compressed, very long, glabrous, having trans-
vers, arched veins, many-seeded, assurgent; seeds oblong, somewhat truncate, having wrinkled lines. C. H. Native of Abyssinia. Wildl. spec. 3. p. 399. Flowers yellow.

12 T. hamosa (Lin. spec. 1094.) stems decumbent; leaflets obovate-cuneiform, demarcated at the apex; legumes disposed in racemes, decimate, hooked, terete; common peduncle spinose, longer than the leaves. C. H. Native of Egypt.—J. Bauh. hist. 2. p. 357.—Alp. egypt. t. 124. Flowers yellow. The seeds of this plant are said to be used by the Egyptians in fortifications for all kinds of pains.

13 T. torta (Smith, in Rees' cyc. vol. 36.) stem firm; leaflets obcordate, toothed, obscurely nervet; flowers umbellate; peduncles short; legume cylindrical, twisted, reticulated lengthwise, stiff, glabrous. C. H. Native of Egypt. Flowers yellow. Plant quite smooth.

Twisted-podded Trigonella. Pl. 3/4 foot.

14 T. flexuosa (Delil. ex Poir. suppl. 5. p. 362, but not of Fischer) stem firm; leaflets obcordate, toothed, obscurely nervet; legumes disposed in umbels, which are nearly sessile, compressed, reticulated, twisted. C. H. Native of Egypt. This plant comes near to T. torta, but differs in the umbels being nearly sessile, and in the teeth of the calyx being longer, the legume also is very different, ex Smith, in Rees’ cyc. vol. 36. Perhaps a variety of T. anguina, of Delil.

15 T. Fischera'na (Ser. ms. in D. C. prod. 2. p. 183.) stems spreading; leaflets obovate-cuneate, striated, serrulatet; stipulas straight, lanceolate-subulate; flowers disposed in racemes, each containing about 6; common peduncle awnless; floriferous peduncle exceeding the leaf; calycine segments subulate, length of tube; legume a little arched, crested, flexuose-torulose, many-seeded; seeds oblong, somewhat truncate, wrinkled. C. H. Native of Tauria, about Tiflis, flexuosa, in hort. ex Bibch. fl. taur. suppl. p. 515. but not of Delil. Flowers yellow.

16 T. Anguina (Delil. fl. aegypt. p. 110. t. 110. f. 2.) stems branched, prostrate; leaflets obovate-cuneate, crenatet; stipulas toothed; heads of flowers nearly sessile; legume linear, compressed, pilose, pilately flexuose. C. H. Native near Cairo. Flowers yellow.

Snake-podded Trigonella. Pl. prostrate.

17 T. tenue (Fisch. in hort. ger. and Bibch. fl. taur. suppl. p. 514.) stems spreading; leaflets obovate-obcordate, striated, serrulatet; stipulas lanceolate, toothed at the base, straight; flowers usually in four; floriferous peduncle awnless, about equal in length to the leaf; calycine segments subulate, length of tube; legumes usually twin, a little arched, erect, compressed, transversely and flexuose reticulatet; seeds ovate, compressed, somewhat truncate, wrinkled from dots; radicle hardly prominent. C. H. Native of Tauria, on mountains about Tiflis. This species is allied to T. cancellata. Flowers yellow.

18 T. Humicera (Spreng. neuemus. 3. p. 158.) legumes pedicellatet, linear, hooked, declinate, pubescent; fructiferous peduncles unarmet; leaflets cuneated, toothed, silky. C. H. Native of? Perhaps T. tenue, ex Spreng. l.c.

Hook-bearin' Trigonella. Pl. 3/4 foot.

19 T. Cancellata (Desf. cat. hort. par. 218. Poir. dict. suppl. 5. p. 361.) stems spreading, much branched; leaflets cuneated, serratet; stipulas subulate, small; fructiferous peduncle awnless, about equal in length to the leaf; legume arched, glabrous, compressed, reticulated with veins; seeds oblong, somewhat truncate, wrinkled from dots. C. H. Native of? Flowers yellow.

§ 2. Racemes sessile.

20 T. monocle'aca (Lin. spec. 1095.) pilose; stems prostrate; leaflets obovate-cuneate, serrulatet; stipulas linear-subulate; umbels sessile; segments of calyx subulate, length of tube; legumes usually 7, sessile, crowded, arched, divaricate, short, obliquely veinet; seeds oblong, somewhat truncate, olive-coloured, wrinkled with dots. C. H. Native of Europe. Waldst. et Kit. hung. 2. t. 142.—Breyen. cent. 80. t. 53. f. 2. Bicalcaria elliptica, Monch. meth. p. 143. Flowers yellow.

21 T. Ela'tor (Sibth. et Smith, fl. grece. t. 762. ex prod. 2. p. 108.) stem erect; stipulas lanceolate, toothed; legumes disposed in racemes, pendulous, rather falcate; peduncle elongatet. C. H. Native of Asia Minor and the Island of Cyprus. Flowers yellow.

Tall Trigonella. Pl. 1 to 2 feet.

22 T.パーティラオラ (Smith, in Rees’ cyc. vol. 36.) stems ascending; peduncle length of the flowers, which are aminated; stipulas ovate, acute, toothed; legumes disposed in racemose heads, ascending, linear-lanceolate, compressed, curved, usually containing 2 seeds. C. H. Native of Switzerland.

23 T. Pinnatifida (Cav. icon. 1. p. 26. t. 38.) stem prostrate, tetragonal; leaflets cuneate, truncate at the apex, pinnatifid-toothed; stipulas pinnatifid; umbels sessile; legumes usually 4 together, sessile, linear, arched, reticulately veinet; seeds oblong, truncate, wrinkled from dots; radicle rather prominent. C. H. Native of Spain. T. media, Delil. Ill. 732. Flowers yellow.

24 T. Polyce'ra (Lin. spec. 1093.) stems diffuse; leaflets cuneiform, dentate at the apex; stipulas lanceolate, rather toothed at the base; umbels sessile; legumes almost sessile, usually 4 together, erect or erectish, long, linear, reticulately veinet; seeds oblong, somewhat truncate, yellow, wrinkled from dots; radicle rather prominent. C. H. Native of the south of France. Flowers yellow.

25 T. Αγγλικά (Poir. dict. 8. p. 95.) stem prostrate; branches short, erect; leaflets obovate-cuneiform, denticulate; stipulas entire; umbels sessile; legumes somewhat compressed, crested, reticulated with veins. C. H. Native of Egypt. Flowers yellow.

26 T. Polya'stia (Desv. journ. bot. 1814. 1. p. 77.) stem diffuse; leaflets obovate-cordate, quite smooth, rather fleshy, obscurely toothed; legumes sessile, crowded, rather falcate, glabrous; common peduncle sessile, mucronate. C. H. Native of the Levant. Flowers yellow.

Many-flowered Trigonella. Pl. 3/4 to 1 foot.

27 T. Omnithor'ντον (Fisch. ex Horn. hafn. suppl. p. 85.) leaflets roundish, rather serrated, fleshy; peduncles spinet; legumes on very short peduncles, umbellate, reflexed, and recurved, beaked. C. H. Native of the Russian empire. Flowers yellow.

28 T. Rutlandica (Lin. spec. 1093.) stems prostrate; leaflets lanceolate, very blunt, sharply serrated; stipules nearly entire; flowers disposed in racemose heads; legume oblong, straight, a little arched; seeds unequally cordate; radicle very long. Г. H. Native of Siberia.—Gmel. fl. sib. 4. p. 24. no. 53. t. 8. Legume oblong, and terminated by a recurved mucron, and the leaflets are oblong-obovate, according to the specimens received from Siberia. Flowers yellow. This plant would be an excellent substitute for lucern, see Medicago sativa.

29 T. Lacinia (Lin. spec. 1095.) stems spreading; leaflets obovate-cuneated, half pinnate-cut; stipules dissected; flowers disposed in racemose umbels; peduncles length of leaves; teeth of calyx shorter than the tube; legume short, elliptical. Г. H. Native of Egypt. Flowers yellow.

Jagged-stippled Trigonella. Pl. spreading.

30 T. Halycalpos (Lin. spec. 1093.) stems erect or diffuse; leaflets obovate-roundish; stipules a little toothed; flowers racemose; legume flat, pendulous; seeds unequally cordate; obtuse; radicle very long. Г. H. Native of Siberia.—Gmel. sib. 4. p. 25. t. 9. Flowers yellow. Legumes white.

31 T. Hybrida (Poirr. act. toul. 3. p. 33.) stems ascending; leaflets obovate-cuneated, entire, glabrous; stipules unequally lanceolate, denticulated; flowers few, racemose; legumes pedicellate, glabrous; falcate, reticulated with veins; seeds irregularly cordate. Г. H. Native of France.—D. C. icon. pl. rar. 1. p. 29. t. 29. Flowers yellow.

32 T. Ornithopoides (D. C. fl. fr. 4. p. 550.) stems prostrate; leaflets obscure, denticulated; stipulas lanceolate, entire, rather membranous, very acute; flowers usually 2-4, disposed in a kind of umbel; legume somewhat falcate, compressed, twice the length of the calyx. Г. H. Native of France and other parts of Europe; in Britain on several heaths about London, and elsewhere. Trifàlia ornithopoides, Lin. spec. 1078. Smith. engl. bot. 1047. Falcàlia falsotrifàlia, Brot. phyt. 160. t. 68. Flowers red.

33 T. Corniculata (Lin. spec. 1094.) stem erect; leaflets obovate, dentate at the apex; stipulas lanceolate, entire; flowers racemose; legumes compressed, denticate, somewhat falcate, transversely veined; seeds unequally cordate, wrinkled from dots; radicle rather prominent. Г. H. Native of the south of France. Bucérasis grandiflora, Meech. meth. p. 143.—J. Baut. hist. 2. p. 372. f. 2.? Flowers yellow, sweet-scented.

34 T. Esculesta (Willd. enum. 709.) racemes pedunculate; common peduncle longer than the leaf; legumes linear, somewhat falcate, crowded, pedicellate. Г. H. Native of the East Indies. Medicago esculetum, Rottl. ex Willd. 1. c. The legumes of this plant are esculent.

35 T. Occulta (Delil. ill. fl. aggry. 727.) stem herbaceous, diffuse, angular at the apex; leaflets on short petioles, cuneated, serrated, rather villous; stipulas semi-ormbicular, acutely and coarsely serrated, girding the head of flowers; petals shorter than the calyx; legume ovate, rather compressed, hairy, reticately nerved, hooked from the style. О.? H. Native of sandy islands in the Nile. Flowers axillary, crowded, small, yellow. Hidden-flowered Trigonella. Pl. diffuse.

Species not sufficiently known.

36 T. Petiolaris (Viv. fl. lyb. p. 49. t. 18. f. 5.) flowers disposed in heads, pendulous; pedicels somewhat falcate; pediole double the length of the peduncle; leaflets obcordate-cuneated; stipulas oblique, ovate, acute, profoundly toothed; legume? О.? H. Native of Cyrenaica, in pastures.

Petiolar Trigonella. Pl. 1 foot.

37 T. Crassifolia (Horn. hort. hafn. 2. p. 725.) leaflets roundish, fleshy; peduncles rather spinose; legumes pedunculate, crowded, reflexed, rather falcate. Г. H. Native of Egypt. Flowers yellow.

Thick-leaved Trigonella. Pl. 1 foot.

38 T. Villosa (Thumb. prod. p. 137.) leaflets obovate, glabrous; legumes racemose, villous. Native of the Cape of Good Hope.

Vllosa Trigonella. Pl. 1 foot.

39 T. Spicata (Sibth. et Smith, fl. grac. t. 765. ex prod. 2. p. 108.) stipulas subulate, quite entire; legumes disposed in spikes, pendulous, short, pilose; peduncles elongated, rather spiny. О.? H. Native of the island of Seriphos.

Spinata Trigonella. Pl. 1/2 to 1 foot.

40 T. Armatà (Thumb. prod. 137.) branches spinescent; leaflets ovate, glabrous; legumes lateral, spiny. Г. G. Native of the Cape of Good Hope.

Armed Trigonella. Shrub.

41 T. Olara (Thumb. prod. p. 137.) leaflets ovate, toothed, glabrous; legumes umbellate, reflexed, glabrous. Г. G. Native of the Cape of Good Hope.

Glabrous Trigonella. Shrub.

42 T. Hispertà (Thumb. prod. p. 137.) leaflets oblong, obtuse, villous; legumes racemose, reflexed. Г. G. Native of the Cape of Good Hope.

Hairy Trigonella. Shrub.

43 T. Tomentosa (Thumb. prod. p. 137.) leaflets and branches tomentose; legumes pedunculate, terebrate. Г. G. Native of the Cape of Good Hope.

Tomentose Trigonella. Shrub.

44 T. Cylindracea (Desv. journ. bot. 1814. vol. 1. p. 77.) leaflets oblong, obtuse, toothed, rather pubescent, terete, acute, striated, somewhat incurved; common peduncle elongated, mucronate. О.? H. Native of the Levant.

Cylindrical-leafflet Trigonella. Pl.

Cult. None of the species of this genus are worth cultivating unless in botanical gardens. The seeds of the hardy annual kinds only require to be sown in the open border in spring. The hardy perennial kinds are easily increased by dividing the plants at the root or by seeds. Those natives of the Cape are perhaps shrubby; if this be the case, they may be propagated by young cuttings planted in sand under a glasshouse. All the species grow best in a light sandy soil.

Lin. syyst. Dinàdôphà, Decandria. Calyx campanulate, 5-toothed. Carina simple, and wings shorter than the vexillum. Legume longer than the calyx, membranous, compressed, winged, emulatin a samara.—Flowers racemose. Leaves trifoliate, terminal or middle leaflet stalked.

1 P. Cretica (Ser. ms. in D. C. prod. 2. p. 185.) stem ascending; leaflets obovate-cuneated, obsolescently-toothed; stipulas lanceolate, profoundly-toothed; teeth of calyx acute, shorter than the tube; legume wrinkled transversely, 2-seeded; seeds
Leguminosæ. LXVIII. Pócocia. LXIX. Melilotus.

5. M. melanospermum (Besser in litt. 1824.) stem firm, unequally furrowed; racemes numerous, twiggy, very long, ascending; leaflets oblong, denticulated; legumes ovate, lanceolate, black; seeds ovate, not cordate or compressed, black, rugose from dots. § H. Native of Tauria. Flowers yellow like those of M. officinalis.

6. M. officinalis (Willd. endem. p. 790.) stem erect, branched; branches spreading much; leaflets obovate-oblong, obtuse, remotely-serrate; stipulas setaceous; teeth of calyx unequal, length of tube; vexillum striated with brown; wings equal in length to the keel; legume 2-seeded, obovate, acute, and transversely wrinkled, rather pilose, at length blackish, and rather gibbous; style filiform, length of legume; seeds unequally cordate. § H. Native of Europe. In Britain in thickets and hedges, and the borders of fields. Trifólium Melilotus officinalis, a, Lin. spec. 1078. Oed. fl. dan. 934. Sturm, deutschfl. 1. fasc. 15. var. a. Trifólium officinale, Smith, fl. brit. 781. engl. bot. 1846. Flowers yellow. Fruit nearly like that of M. dentata, but the flowers are much larger. The flowers and seeds of this plant are the chief ingredients in flavouring the Gruyère cheese. This cheese no doubt owes its excellence to the mixture of herbs in the mountain pasturage, which surrounds the valley of Gruyère in Switzerland, but more particularly to the flowers and seeds of this plant, which are bruised and mixed with the curd before it is pressed. The whole plant has a peculiar scent, which becomes more fragrant in a dry state, and may have some resemblance to that of Anthosanthum. The flowers are sweet-scented; a water distilled from them possesses little odour in itself, but improves the flavour of other substances. In medicine it was esteemed emollient and digestive, and was used in fomentations and cataplasms, particularly in blister plasters, but it is now laid aside as being rather acid than emollient. Notwithstanding the strong smell of the plant, and its bitter acid taste, it does not appear to be disagreeable to any kind of cattle; and horses are said to be extremely fond of it; hence the plant is called by some Italian writers Trifólium caballinum. Ray affirms that it was formerly sown in England for the food of kine and horses; but at present it is not cultivated with us.

Var. β, angustifolia (Ser. mas. in D. C. prod. 2. p. 187.) legumes elongated, sterile ones claw-formed, pedicellate. § H. Native about Bern and Geneva.

7. M. paluster (Kit. in litt. 1815.) stems branched, erect; leaflets oblong-linear, obsoletely-toothed; stipulas linear-setaceous; teeth of calyx unequal, length of tube; vexillum longer than the wings and keel; legume 1-seeded, ovate, a little winged, rugged from lacunae, of a brownish-black colour; seeds irregularly cordate, bay-coloured. § H. Native of Hungary, growing among Arrádó phragmitis. Trifólium Melilotus paústris, Waldst. et Kt. pl. rar. hung. 3, p. 295. t. 266. Very nearly allied to M. officinalis, and perhaps distinct. Flowers yellow.

8. M. arboreus (castagne in litt. D. C. prod. 2. p. 187.) stems arborescent; leaflets obovate-oblong, sharply-toothed; stipulas setaceous, entire; flowers disposed in long racemes; teeth of calyx acute, length of tube; keel and wings shorter than the vexillum. § G. Cultivated about Constantinople, where it grows 15 feet high, and with a trunk about 3 inches in diameter. Flowers white.

9. M. altissima (Thuill. fl. par. ed. 2, p. 378 and 83.) stem A a
16 M. *Italica* (Lam. dict. 4. p. 65.) stem erect; branches ascending, thick; leaflets obovate-roundish, obsolescently-denticulated; stipulas lanceolate, acute, somewhat jagged at the base; teeth of calyx unequal, hardly the length of the tube; wings equal to the calyx, but shorter than the vexillum; legume globe, somewhat suberose, rugged from lacuna, yellowish-green, 1-seeded; seeds orbicular, compressed, rugged from dots, bay-coloured. O. H. Native of Italy. Trifolium Mellilotus Ital. Lin. spec. 1078. Melliotus roundifolius, Ten. cat. 1819. p. 57. Flowers yellow. There is a variety of this plant with entire leaves.

**Italian Milletot.** Fl. July, Aug. Fl. 1 to 2 feet. 17 M. *Gracilis* (D. C. fl. fr. 5. p. 565.) stem and branches ascending, slender; leaflets obovate, narrow, denticulated at the apex; stipulas somewhat seteaceous; teeth of calyx nearly equal, hardly shorter than the tube; wings equal in length to the calyx and vexillum; legume globose, hardly suberose, rugged from lacuna, yellowish-green, 2-seeded; seeds orbicular, compressed, rugged from dots, bay-coloured. O. H. Native of the south of France. M. Neapolitana, Tenore ex herb. Moricand. Flowers yellow.

**Slender Milletot.** Fl. July, Sept. Fl. 1 to 2 feet. 18 M. *Pallida* (Besser. in litt. 1824.) stem rather terete, lined, much branched; leaflets obovate-linear, serrulate; legume nearly globose, obsolescently reticulated, mucronate by the style, 1-seeded, of a yellowish bay-colour; seeds globose, bay-coloured, smooth. O. H. Native of Dahuria, near Nertischinsk. Flowers yellow.

**Sweet-seeded Milletot.** Fl. July, Aug. Fl. 3 to 4 ft. 

**Sect. II. Pleurotis** (from πλευραμε, pleios, transverse, and περις, a wrinkle; in reference to the transverse wrinkles on the surface of the legume). Ser. mss. in D. C. prod. 2. p. 188.) legumes wrinkled transversely and arcuately.

19 M. *Karvinskis* (Wallr. sched. crit. p. 391.) stem much branched from the base, ascending; leaflets obovate, irregularly toothed; stipulas subulate; racemes very long; teeth of calyx nearly equal, length of tube; wings equal in length to the vexillum, but exceeding the calyx; legume ovate, acute, wrinkled transversely from lacuna, usually 2-seeded, yellowish-green; seeds ovo-oblong, olive-coloured, smooth; radicle hardly prominent. O. H. Native of Germany, among corn. Flowers yellow.

**Corn-field Milletot.** Fl. July, Aug. Fl. 1 to 2 ft. 21 M. *Elegans* (Salzmann, in litt. D. C. prod. 2. p. 188.) teeth of calyx about equal, lanceolate, length of tube; legume ovate, adhering to the seeds, wrinkled irregularly and transversely, and somewhat lamose, and bay-coloured, 1-seeded; seeds subglobose, hardly retuse, rugged from dots, bay-coloured. O. H. Native of Corsica.

**Elegant Milletot.** Fl. 1 to 2 ft. 22 M. *Besseana* (Ser. mss. in D. C. prod. 2. p. 188.) stem angular, firm, branched; branches assurgent; leaflets obovate, serrulate; legume ovate, hardly compressed, very rugged, greenish; wrinkles elevated, transverse, tumid, and lamose; seeds irregularly heart-shaped, bay-coloured, rather veiny. O. H. Native of Tauria. M. imbricata, Besser in litt. (1824.) M. plicata, Stev.? Flowers yellow, like those of *M. officinalis.*
Leguminosae. LXIX. Mellilotus. LXX. Trifolium.

Sect. III. Camphorulosus (from camphoro, camphor, a cube, and root, ruthis, a wrinkle; in reference to the curved or arched wrinkles on the surface of the legumes). Ser. mss. in D. C. prod. 2. p. 189. Legumes ovate or obovate, densely and arcfually veined.

22 M. Messaneus (Desf. fl. atl. 2. p. 192.) stem erect; leaflets obovate-cuneate, denticulated; stipules broad at the base, toothed, linear at the apex; racemes few-flowered; teeth of calyx nearly equal, hardly shorter than the tube; legume lanceolate, acute, very much nerved, 1-seeded; seeds ovate, compressed, large, black, rugged from darts. H. Native of Barbary, Sicily, and Piedmont, and the Straits of Messina. Trifolium Messaneous, Lin. mant. 175. Flowers yellow.

Var. β, Libanota (Ser. mss. in D. C. prod. 2. p. 189.) fruit larger, 1-seeded; seeds ovate, wrinkled from darts; teeth of calyx narrower. H. On mount Libanon. Perhaps a proper species.

25 M. Baumei (Horn. hort. hafn. suppl. p. 84.) slender; stem erect; leaflets obovate-obovate, truncate, sharply-serrate at the apex; legume racemose, naked, wrinkled, 1-seeded. H. Native of? Flowers yellow.

26 M. Minima (Roth. nov. spec. p. 361.) stem decumbent; leaflets cuneate, deeply toothed; stipules palmately divided, rather membranous; legumes axillary, sessile, crowded, rounded, muri culate, rugged, 1-seeded. H. Native of the East Indies. Flowers small, white.

Smallest Melilot. Pl. decumbent.

27 M. Neapolitana (Tenore, prod. suppl. 1. p. 66. cat. 1819. p. 57.) stem erect; leaflets deltoid-obovate, toothed at the apex; stipulas setaceous, entire; flowers spreading; legumes 1-seeded, obovate, obtuse, naked, arcfually wrinkled. H. Native on exposed hills near Naples.

Cult. None of the species are worth cultivating except in botanical gardens. They are all easily increased by seeds, which only require to be sown in the open border in spring. A dry light soil suits them best.

LXX. TRIFOLIUM (from tres, three, and folium, a leaf; all the species of the genus have trifoliate leaves, or each leaf is composed of 3 leaflets; the Greeks called it τριφυλλον; the French trèfle; and the English trefoil or clover). Tourn. inst. 404. t. 228. Juss. gen. 355. Lam. ill. 613. D. C. prod. 2. p. 180.—Trifolium, spec. Lin.

Lin. syst. Diadéphila, Decándria. Calyx tubular (f. 32. a), permanent, glandless, 5-cleft (f. 32. a); segments subulate. Carina shorter than the wings and vexillum. Stamens diadelphous (f. 32. b). Legume small, hardly dehiscent, usually ovate, 1-2-seeded, shorter than the calyx, and covered by it, rarely oblalng, and containing 3-4 seeds, in which case it exceeds the calyx a little.—Herbs. Stipulas adnate to the petioles. Leaves usually trifoliate, rarely with 5 leaflets. Flowers disposed in dense heads or spikes, bracteate, purple, white, or cream-coloured. Petals in the greater part of the species joined together at the base. This genus includes the most valuable herbage plants adopted in European agriculture, the white, red, and yellow clover. Notwithstanding all that has been said of the superiority of lucern to clover, and of the excellence of saintfoin and various other leguminous plants, yet the red clover for mowing, and the white species for pasturage, are, and probably ever will be, found to excel all plants in these respects. The yellow clover, and the cow or meadow clover are also in cultivation but are inferior to the white and red clover.

Sect. I. Lagopus (from λαγως, λαγος, a hare, and ποιεω, pou, a foot; in reference to the soft villous heads of flowers, which have been compared to the softness of a hare's foot). Ser. mss. in D. C. prod. 2. p. 189. Flowers spike; spikes oblong, bracteate at the base. Calyx very villous, not inflated after flowering.

T. Augustifolium (Lin. spec. 1083.) stem erect; leaflets linear-lanceolate, very acute, ciliated; stipulas very long, narrow, subulate at the apex; spike solitary, terminal, between conical and oblong in shape; calyx ribbed, glabrous, and pilose; segments setaceous, spinose at the apex, hardly exceeding the monopetalous corolla, lower segment longest; seeds egg-shaped, smooth, blue-coloured. H. Native of the south of Europe and the extra-tropical parts of the south of Africa, ex Burch. cat. geogr. no. 286. Sturm, deutsch. fl. 1. fasc. 16. Savi, obs. p. 58.—Barrel. icon. 698. Flowers pale rose-coloured.

2 T. intermedium (Gussone, cat. 1821. p. 82. in a note, p. 14. but not of Lapeyr.) plant pilose; stem diffuse; leaflets lanceolate, oblong; spikes villous, between conical and oblong in shape; segments of the calyx setaceous, and nearly equal, but not spinose at the apex; corolla hardly exceeding the calyx. H. Native of Italy, on sandy hills. Corolla white. Calyx strigose, the segments terminated by fascicles of hairs. The rest of the plant appears as if it were a hybrid between T. angustifolium and T. ærense.

3 T. Purpureum (Lois. fl. gall. 484. t. 14.) stem erect; leaflets linear-lanceolate, acute, quite entire, ciliated; stipulas narrow, somewhat setaceous at the apex; spikes ovate-oblong, terminal, solitary; calyx ribbed, glabrous, and pilose; the segments setaceous, much shorter than the corolla, which is perhaps monopetalous, the lower segment longest. H. Native about Montpelier, Florence, and of the Levant. Savi, obs. p. 60. Flowers purple.

4 T. ruken (Lin. spec. 1081.) stem erect, straight; leaflets oblong; very blunt, and quite smooth, denticulated; stipulas very long and very broad, lanceolate at the apex; spikes terminal, usually twin; calyx very much striated, glandless, with the segments setaceous and very short, the lower segment longest, but hardly equal in length to the monopetalous corolla; seeds egg-shaped, smooth; radicle rather prominent. H. Native of Europe, on mountains, in meadows, and on the margins of woods. Sturm, deutsch. fl. 1. fasc. 15. Savi, obs. p. 55. Mart. fl. rust. t. 9. Jacq. aust. 4. p. 385. Flowers dark red. An elegant plant.

Var. β, furcatum (Ser. mss. in D. C. prod. 2. p. 100.) stems forked at the top, bearing 2 spikes of flowers.

Var. γ, ramosissimum (Ser. mss. in D. C. 1. c.) stem much branched, bearing many spikes. On Mount Saleva.
5 T. CERULEA scens (Bieb. fl. taur. suppl. 509.) stem erect? leaflets roundish-rhomboidal, villous, as well as the half-ovate, subulate, dentate stipulas; teeth of calyx nearly equal in length to the wings. ☉. H. Native of the desert Ankeret, between the rivers Terêek and Kuma. The plant is known from T. Icarnâta in the leaflets being lined, in the stipulas being membranous, and in the heads of flowers being shorter. Flowers bluish-purple.

6 T. Icarnâta (Lin. spec. 1083.) stem erect; leaflets roundish, obcordate, crenated, villous; stipulas broad, very short, obtuse, and spacedate at the apex: spikes terminal, solitary, on long peduncles; calyx ribbed, very pilose; the segments lanceolate-spatulate, equal, somewhat stellately disposed, equal in length with the nonpetaled corolla; seeds egg-shaped, radicle rather prominent. ☉. H. Native of the south of Europe, in subhumid meadows. Sims, bot. mag. 328. Sturm, deutsch. fl. 1. heft. 16. Mill. fig. t. 267. f. 1. Flowers crimson, red, flesh-coloured, or even white. This is an elegant plant when in flower. Mr. Miller says it will make good food for cattle, but being an annual plant will not suit with the common practice of farmers.

Var. 3, Molinériti (D. C. fl. fl. 5. p. 556.) flowers pale flesh-coloured; stipulas hardly spacedate; leaflets more or less dentilicated. ☉. H. T. Molinérite, Balb. ex Horn. Hort. hafn. p. 715.

7 T. Lagoïrus (Pourr. ex Willd. spec. 3. p. 1863.) plant very hairy; stem much branched; leaflets obovate-cuneated, dentilicated; stipulas lanceolate, very broad, short, nerved; spike terminal, oblong, solitary, sessile; calyx ribbed, very pilose; the segments saccate and equal, but shorter than the corolla. ☉. H. Native of Spain.—Poër, dict. 8. p. 10. Flowers red.

8 T. Speríacum (Sibth. and Smith, fl. genre. t. 743. ex prod. 2. p. 93.) stem erect; legume 1-seeded, disposed in spikes, erect, naked, wrinkled, acute; stipulas subulate, quite entire. ☉. H. Native of the Island of Cyprus. Flowers yellow.

Spike-flowered Trefoil. Pl. 1 foot.
9 T. Arvense (Lin. spec. 1083.) stem erect, branched, or simple; leaflets spatulate, linear, somewhat tridentate at the apex; stipulas narrow, membranous, nerved, bristle-pointed, pilose; spikes oblong, very villous, soft; calyx very pilose, the segments bristle-shaped, longer than the polypetalous corolla, and equal in length with each other; seeds egg-shaped, bicoloured; radicle not prominent. ☉. H. Native of Europe; common in fields; plentiful in Britain, in sandy barren fields. Smith, engl. bot. 944. Sturm, deutsch. fl. 1. heft. 16. Curt. fl. lond. 6. t. 50. Fl. dan. 724. Flowers pale-reddish.

Var. β. erassicaéle (Ser. mss. in D. C. prod. 2. p. 191.) heads ovate-globose, much smaller; stem very thick and very much branched; branches divaricate. ☉. H. Native of Caucasus, in fields.

Var. γ. perpusillum (Ser. l. c.) spikes somewhat globose; stems very short, procumbent. ☉. H. Ray, syn. p. 390. no. 15. t. 14. f. 2. Lobel first found this plant near Southsea Castle; Dillenius near Bracklesham, in Sussex, and Mr. Woodward, on Yarmouth Dunes, at Lowestoft, &c.

Var. δ. grælic (D. C. fl. fl. 4. p. 530.) stem and leaves smoothish; segments of the calyx villous at the apex, and coiled. ☉. H. Native of France. T. grælic, Thuil. fl. par. ed. 2. p. 283.—Barrel. Icon. 901.

Var. ε. capitâtum (Ser. l. c.) heads of flowers globose, sessile. T. arvenææ β, Savi, obs. tris. p. 19.—Barrel. Icon. t. 902.

Field Hare's-foot Trefoil. Fl. July, Aug. Brit. Pl. 1/2 to 1 ft. 10 T. Liquâsteum (Balb. in act. acad. ital. 1. p. 192. f. 2. ex Savi, obs. tris. p. 38.) stem branched, diffuse; leaflets obovate or obcordate, broad, somewhat dentilicated at the apex; stipulas broadish, lanceolate, nerved, small, ending in an acumen, which is equal in length to the limb; spikes oblong, twin, divaricate, pedunculate, pilose; teeth of calyx subulate, equal, twice the length of the tube, but exceeding the corolla; seeds egg-shaped, yellow, radicle rather prominent. ☉. H. Native of Italy, about Pisa, also in Spain and Corsica. T. arrectætâum, Brit. phyt. p. 152. t. 63. f. 1. T. aristâtum, Horn. Hort. hafn. p. 712. Link, enum. 2. p. 362. Flowers pale-red.

Var. β. parvus (Ser. mss. in D. C. prod. 2. p. 191.) stem much branched, slender; spikes small, somewhat globose. ☉. H. Native of Sweden. Perhaps only a variety of T. grælicum, ex Horn. l. c. Flowers white and pale-red.

11 T. Divaricâtum (Horn. Hort. hafn. 2. p. 715.) stem erect, divaricate, much branched; leaflets obovate, emarginate, pilose; stipulas lanceolate; spikes elongated, ovate-cylindrical; teeth of calyx subulate; corolla monopetalous. ☉. H. Native of Spain. Perhaps only a variety of T. grælicum, ex Horn. l. c. Flowers white and pale-red.

13 T. Phleoides (Pourr. ex Willd. spec. 3. p. 1877.) stem branched a little, slender; leaflets oblong, obcordate, dentilicated; stipulas rather membranous, nerved, very narrow, awl-shaped; spike pedunculate, solitary or twin, between conical and oblong, villous, bractless; flowers very dense; segments of calyx equal, diverging, subulate, dilated at the base, length of tube, but shorter than the corolla; seeds exactly egg-shaped, small, bavy-coloured; radicle hardly prominent. ☉. H. Native of Spain and Italy. Flowers pale-purple or white. Heads like those of a species of Phleum.

14 T. Lappiaceum (Lin. spec. 1082.) stem branched, diffusae; leaflets obovate, or obcordate, dentilicated; stipulas rather membranous, nerved, narrow, long, and subulate; spike sub-globose, hispid, terminal, usually solitary; segments of the calyx equal, subulate, twice or thrice longer than the tube, but equal in length to the corolla; seed egg-shaped, brown; radicle hardly prominent. ☉. H. Native of Europe. Flowers pale-red.

15? T. Echinâtum (Bieb. fl. taur. 2. p. 216.) stem declinate, branched; leaflets obovate-oblong, quite entire; stipulas subulate, pilose; heads oval, terminal, and axillary, pedunculate, leafless; segments of calyx subulate, unequal, pilose, shorter than the monopetalous corolla, when in fruit spreading much. ☉. H. Native of Caucasus. Flowers pale. Vexillum lanceolate, elongated.

16 T. Eriacéum (Bieb. fl. taur. suppl. 510.) stem erect, branched; leaflets cuneated, emarginate, almost entire, villous; stipulas lanceolate, cuspidate; segments of the calyx nearly equal, a little longer than the tube, but exceeding the corolla. ☉. H. Native of Iberia. Allied to T. divaricâtâtum. Flowers pale-red.

17 T. Malacaânthum (Link, enum. 2. p. 261.) stem flexuus,
LXX. **Trifolium.**

1. **H.** Native of?

**Soft-flowered Trefoil.** Fl. July, Aug. Clt. 1824. Pl. 1. 18 **T. Sylvaticum** (Gerard, in Lois. nat. p. 111.) stem a little branched, erect, pubescent; leaflets ovate, obtuse; stipulas dilated, upper ones inclining the spike of flowers; spike oblong, villous; calyce segments setaceous, ciliated, shorter than the corolla, one of which is longer than the rest and spreading. **H.** Native of Europe, in sterile barren places; plentiful in some parts of Britain, in chalky and dry barren fields. Smith, engl. bot. 903. Flowers white.

**Seabed Trefoil.** Fl. May, July. Britain. Pl. procumb. 25 **T. Dalmaticum** (Visini ex bot. zeit. march. 1829, p. 21.) pubescent; stems prostrate, inflamed at the apex; stipulas ovate, membranous, narrowed; leaflets stalked, serrate, obtuse, finely denticulated, floral ones almost sessile, involucrated by dilated stipulas; heads of flowers ovate-conical, axillary, and terminal, sessile and leafy at the base; calyx pubescent, having linear, straight teeth, which are at length recurved, not half the length of the gamopetalous corolla. **H.** Native of Dalmatia. Flowers white or red. Allied to *T. seainum.*

**Dalmatian Trefoil.** Pl. prostrate.

**Seeds.**

**Sect. III. Eutrichophyllum** (from eu, ou, well or good, and trichon, tripheyon, trefoil; genuine species). Ser. mss. in D. C. prod. 2. p. 192. Flowers disposed in ovate, pedunculate, or sessile, usually bracteate heads. Calyx villous, not inflated.

26 **T. marinum** (Huds. angl. ed. 1. p. 284.) stem spreading, often recurved; heads of flowers somewhat ovate-globose; stipulas oblong-ovate, obtuse, or emarginate, somewhat denticulated; stipulas narrow, pointed; spikes ovate-globose, nearly sessile; calyce segments shorter than the tube and gamopetalous corolla, stiff, unequal, at length much dilated and spreading, 3-nerved; seeds ovoid, bay-coloured, hardly gibbous at the base. **H.** Native of Europe, by the sea-side in salt marshes and meadows; plentiful in some parts of Britain, on the east and south coasts of England, from Norfolk to Somersetshire in various places. Smith, engl. bot. 220. Hook. fl. lond. t. 57. **T. irregulare**, Pour. act. toul. 3. p. 351. **T. rigi- dum**, Savi, fl. pis. 2. p. 159. t. 1. f. 1. obs. trif. p. 49. Flowers pale-red. Plant hairy.

**Post.** **Bastardium** (Ser. mss. in D. C. prod. 2. p. 192.) spikes pedunculate; calyce segments larger and finely nerveted.

**Sea-side Trefoil.** Fl. June, July. Brit. Pl. decumbent, or 1/2 foot high when growing in a tuft.

27 **T. supinum** (Savi, obs. trif. p. 46. f. 2.) stems spreading, branched; leaflets ovate, broad, ciliated; stipulas narrow, serrate, small, subulate; heads somewhat ovate, pedunculate, egg-shaped after flowering; calyce segments unequal, linear, stiff, spreading, shorter than the corolla; seeds unequally subcordate, bay-coloured; radicle prominent. **H.** Native of the south of Europe. Flowers pale-red.

28 **T. Constantinopolitanum** (Ser. mss. in D. C. prod. 2. p. 193.) stems spreading, branched; leaflets lanceolate-linear, somewhat denticulated; stipulas narrow, serrate, subulate; heads of flowers somewhat globose, terminal, and lateral, pedunculate when mature, of a conical shape; flowers crowded, at length rather loose, and apparently somewhat verticillate; calyce segments unequal, subulate, stiff, much shorter than the corolla. **H.** Frequent about Constantinople. Flowers yellow.

29 **T. Xataredi** (D. C. fl. fr. 5. p. 555.) stem erect, villous, branched; leaflets obvate-elongated, a little ciliated; stipulas narrow, serrate; heads of flowers ovate, pedunculate; calyx striated, glandular, and pilose; the segments hardly unequal and smaller than the corolla. **H.** Native of the eastern Pyrenees. Flowers pale-purple.
Var. rhamnoides (Ser. miss. in D. C. prod. 2. p. 193.) stem branched; lower segment of the calyx bi-trifiduate. 

32 T. ochroleucum (Linn. syst. nat. 3. p. 288.) pilose; stems ascending, slender; leaves distich; leaves ovate-elliptic, obuse, or retuse, finely hairy, upper ones narrowest; stipules narrow, nervet, much shorter than the petioles, pointed; heads terminal, ovate-oblong, on long stalks; calyx ribbed, smoothish; the segments linear and setaceous, unequal, stiffish, half-spreading, much shorter than the corolla, lowest segment very long. Υ. H. Native of Europe, in dry fields. Curt. fl. lond. 6. t. 49. Mart. fl. rust. 35. Jaeg. austr. t. 40. Sturm, deutsch. fl. 1. heft. 16. t. 40. Smith, engl. bot. 1224. T. roséum, Prot. ex Gussone, in litt. Flowers cream-coloured. Mr. Curtis recommends this species of trefoil to the notice of the experimental agriculturist, and thinks it may be a good substitute for the T. vénus or T. pratense in certain soils and situations, but we think it in no respect worthy of attention, as an object of culture. 

Var. rhamnoides (Ser. miss.) stem forked at the top; spikes twin, approximate. 

Var. γ. húmula (Ser. miss.) plant less villous; leaves broader, lower ones emarginate. T. ochroleucum β. D. C. fl. fr. 4. p. 528. 

Var. rhamnoides (Ser. miss.) stem much branched. 

33 T. tricolor (Bieb. fl. taur. 3. p. 212. and suppl. p. 508.) stem ascending, simple, few-leaved; leaves entire, ovate, or oblong: stipulas broadish, long, much shorter than the petiole; heads hairy, elliptic, leafy at the base, sessile; calyx ribbed, glandular, pilose; the segments setaceous and unequal, much shorter than the corolla. Υ. H. Native of Caucasus, on the Alps. An intermediate plant between T. ochroleucum and T. Pannonicum. Flowers cream-coloured. 

Hairy-headed Trefoil. Pl. ½ foot. 

24 T. canescens (Willd. spec. 3. p. 1369.) stems ascending, covered with adpressed hairs; leaves ovate, emarginate, villous; stipulas lanceolate-subulate; heads terminal, large, oblong, nearly sessile; calyx smooth; the segments lanceolate and pilose, dilated at the base, lowest one a little longer; corolla monopetalous, much longer than the segments. Υ. H. Native of Cappadochia. Sims. bot. mag. 1168. Perhaps a variety of T. Pannonicum only. Flowers cream-coloured. 

Canescens Trefoil. Fl. May, June. Cl. 1803. Pl. ½ to 1 foot, ascending. 

35 T. Pannonicum (Lin. mant. p. 276.) plant very pilose; stem simple, straight; leaves lanceolate, oblong, acute, obtuse or retuse at the apex, nearly entire, ciliated; stipulas narrow, linear, and very long at the apex, length of petiole; heads terminal, pedunculate, ovate-oblong, thick; calyx ribbed, glandular, pilose, the segments setaceous and unequal, much shorter than the corolla. Υ. H. Native of the Alps of Piedmont. Jacq. obs. 2. p. 21. t. 42. and of Lower Hungary. Flowers white, but when dry yellowish. 

Var. r. barbátum (Ser. miss. in D. C. prod. 2. p. 194.) stem forked; leaves lanceolate, acute. T. barbátum, D. C. cat. hort. monsp. 150. Native about Montpellier. 

36 T. Olympricum (Horn. moll. Hook. bot. mag. t. 2790.) stem erect, hairy; leaves leafy, lanceolate-elliptic, entire; stipulas subulate, sheathing; spikes of flowers oblong, solitary; calyx hairy, with the lower tooth equal in length to the tube of the corolla; vexillum very long. Υ. H. Native of Mount Olympus. Flowers yellowish. 

37 T. Armenia (Willd. cunn. p. 793.) stems simple, ascending; leaves linear-lanceolate, emarginate; stipulas subulate; spike dense, oblong-elliptic, solitary; lower tooth of calyx about equal in length to the tube of the monopetalous corolla. Υ. H. Native of Armenia. Perhaps only a variety of T. Pannonicum. Flowers cream-coloured. 

38 T. Squarrosum (Lin. spec. 1852.) stem branched; upper leaves opposite or alternate, rather pilose; leaves lanceolate or oval, rather retuse; stipulas narrow, smoothish, nervet, rather membraneous, ending in a long acumen each; heads ovate; calyx ribbed; the segments unequal, 3-nerved, and ciliated, the lowest segment length of corolla and deflexed; seeds oval, yellow. Υ. H. Native of Spain, and of France about Paris. D. C. fl. fr. 4. p. 531. T. dipátæum, Thuill. fl. par. cd. 2. p. 382. — Moris. hist. 2. sect. 2. t. 13. f. 1. Flowers white or cream-coloured. 

Var. r. flavicans (Ser. miss. in D. C. prod. 2. p. 194.) flowers pale-yellow. T. squarrosum, Savii, obs. p. 65. t. 3. 

39 T. L'Albidum (Rets. obs. fasc. 4. p. 36.) stem diffuse; leaves ovate-lanceolate, ending each in a short awn, and with the margins and keel ciliated; heads nearly globose, but when in fruit ovate; calyces segments subulate, unequal, adpressed, lower one 3-nerved, and about equal in length to the corolla. Υ. H. Native of? Flowers cream-coloured. Perhaps only a variety of T. ochroleucum. 

40 T. côncicum (Pers. in Savii, obs. tr. p. 41. 1810.) leaves oblongate, denticulated at the apex, mucronate; stipulas somewhat venicose, short, obtuse, and triangular at the apex; heads
ovate-conical, pedunculate; calyces very much nerved; segments half spreading, about equal in length to the corolla. O. H. Native of Europe. Flowers cream-coloured.

Kitaibel'i's Trefoil. Fl. June, Aug. Clt. 1818. Sh. ¼ foot. 42 T. Elonga'tum (Willd. spec. 3. p. 1968.) stem ascending, branched; leaflets lanceolate, emarginate, mucronate, villous; stipulas lanceolate; heads loose, elliptic, solitary; lower segment of the calyx length of wings; corolla monopetalous; vexillum very long. 2. H. Native of Galatia. The whole plant is villous. It differs from T. alpestre in the leaves being smaller, in the vexillum being longer, in the stem being branched and ascending, and in the villi. Flowers red.

Elongated-headed Trefoil. Pl. 1 foot. 43 T. Alpe'stre (Lin. spec. 1802.) stem erect, simple; leaflets lanceolate, coriaceous, ciliately-serrulatus; stipulas narrow, nerve, nearly sessile, long, and linear at the apex; heads globose; calyx striated; the segments unequal, beset with spinulous warts, the lower segment shorter than the monopetalous corolla, the rest very short and tooth-formed; seeds somewhat reniform, compressed, and yellowish. 2. H. Native of Europe, on the Alps. Savi, obs. truf. p. 54. Jacq. obs. 3. p. 14. t. 64. fl. aust. 433. Sims, bot. mag. 2779. Root creeping. Flowers purple. The plant has the leaves of T. râben and the flowers of T. pratense.

Var, ß, distâchum (Ser. miss. in D. C. prod. 2. p. 194.) heads of flowers twin, approximate. Sturm, deutschfl. fl. 1. heft. 15. 44 T. Alpe'stre (Lin. spec. 1802.) stems and petioles covered with numerous, white, soft, spreading pili. Native on Mount Pennino.

Var, ë, rubèllum (Besser, in litt.) flowers rose-coloured. Native of Lithuania.

Alp Trefoil. Fl. June, July. Clt. 1789. Pl. ½ to 1 foot. 45 T. mutu'num (Lin. faun. suec. ed. 2. p. 558.) smoothish; stem erect, flexuous, branched; leaflets oblong, coriaceous, ciliated, many-nerved, glaucous beneath; stipulas tapering, converging; heads subglobose, pedunculate, rather loose; calycine segments unequal, rather pilose, the uppermost one rather the shortest, all shorter than the monopetalous corolla; seeds irregularly cordate; radicle very prominent. 2. H. Native of Europe, in elevated pastures; plentiful in some parts of Britain. Sturm, deutschfl. fl. 1. f. 1. 15. Smith, engl. bot. 190. T. flexu-num, Jacq. fl. austr. t. 386. Mart. fl. rust. t. 13. T. alpestre, Lejeune, ex Herb. D. C. T. alpestre, Crantz. aust. 407. Pl. dan. 662. Root creeping. Flowers purple. It differs from T. pratense in the looser heads of flowers, flexuous stems, and creeping woody roots. This species goes under the names of Cow-grass, Meadow-clover, and Marl-grass. It is sometimes cultivated as an agricultural plant in England and some other parts of Europe. The best properties of the present kind of clover seem to be its power of resisting drought, and its thriving on cold teneacious soils. Yet Mr. Sinclair reports it to be preferable to T. pratense or red clover for permanent pasture on light soils. Its produce of nutritious matter, however, is said to be but half as much as that of T. pratense.

Meadow Trefoil. Fl. June, July. Britain. Pl. 1 foot. 46 T. ex'press'num (Kitt. in litt. D. C. prod. 2. p. 195.) pilose; stem erect; leaflets lanceolate; stipulas narrow, nerved, ciliated, and ascending at the apex; heads ovate, obtuse, sessile; calycine segments pilose, flexible, unequal, tetragon, shorter than the corolla. 2. H. Native of? Perhaps it is a variety of T. pratense, but the stipulas are longer, and the leaflets are narrower. Flowers purple.

Expanded Trefoil. Fl. June, July. Clt. 1820. Pl. 1 foot. 47 T. Brest'ec'tum (Schousb. in Willd. enum. p. 792.) stem branched; leaflets ovate, obtuse, oblong or denticulated; stipulas awned; heads of flowers ovate-conical, dense, solitary, sessile; corolla monopetalous; about equal in length to the caly- cine segments. Æ. Æ. H. Native of Morocco. Perhaps only a variety of T. pratense. Flowers purple.

Brest'ec'tum-flowered Trefoil. Fl. June, July. Clt. 1804. Pl. 1 to 1 ½ foot. 48 T. Pratènse (Lin. spec. 1802.) stems ascending; leaflets elliptic, more or less acute, entire; stipulas broad, nerved, glabrous, each ending in a short bristle point, inflexed; heads ovate, dense, obtuse, nearly sessile; calycine segments pilose, flexible, unequal, the lowest one longest, the rest corola gamopetalous; seeds reniform, compressed, yellowish. 2. H. Native of Europe, frequent on the Alps and in meadows; plentiful in some parts of Britain. Sturm, deutschfl. fl. 1. heft. 5. Savi, obs. truf. p. 48. Smith, engl. bot. 1776. Mart. fl. rust. t. 3. Leaflets dark-green, usually with a white subaperturate mark in the centre. Flowers purple, rarely white.

The red or broad clover is the kind most generally cultivated on land that carries white and green crops alternately, as it yields the largest crop of all the other sorts.

The soil best adapted for clover is deep sandy loam, which is favourable to its long tap roots, but it will grow in any soil, provided it be dry. Marl, lime, or chalk, is very congenial to clover.

The climate most congenial to clover is one neither very hot nor very dry and cold. Clover will be found to produce most seed in a dry soil and warm temperature, but as the production of seed is only in some situations an object of the farmer's attention, a season rather moist, provided it be warm, is always attended by the most bulky crop of clover herbage.

The culture which clover receives is ordinary farm culture, and that destined also for another crop.

The time of sowing clover-seed is generally in spring, during the corn seed time, or from February to May; but it may also be sown from August to October, and when it is sown by itself, unaccompanied by any other crop, this will be found the best season, as the young plants are less liable to be dried up, and impeded in their progress by the sun, than when sown alone in spring and remaining unshaded during the dry and hot weather of summer; but clover-seed is usually mixed with a certain portion of ryegrass seed, and sown along with or among other crops, especially with spring-sown wheat, barley, and the early varieties of oats. Unless, however, the soils on which these crops are sown are well pulverized, and have been some years under tillage, clover will not succeed in them; it being ascertained that newly broken-up pasture grounds cannot be sown down to clover and grasses till the soil is thoroughly pulverized, and the roots of the former grasses and herbage plants completely destroyed.

Some prepare clover-seed for sowing by steeping it in water or in oil, as in Switzerland, and then mixing it with powdered gyp- sum, as a preventive to the attacks of insects.

The manner of sowing clover is always broadcast. When
sown with spring corn, clover and grass seeds are usually put in after the land has been pulverized by harrowing in the corn-seed, and are themselves covered by one course more of the harrows, or if the corn is drilled, the small seeds are sown immediately before or after land-hoeing, and the land is then finished by a course of the harrow. When the land is under an autumn-sown crop of wheat or other grain, though the clovers and rye-grass are still sown in spring, the proper period must depend both upon the state of the land and the progress of the crops; and it may be often advisable to break the crust formed on the surface of tenacious soils, by using the harrow before the clover-seed is sown, as well as afterwards to cover it. Sometimes the roller only is employed at this time, and there are instances of clover and rye-grass succeeding when sown without either harrow or rolling, if the weather is moist at the time of sowing. Half an inch may be considered a proper depth to cover clover-seed in clay soils, and an inch in dry light soil, but it will grow when barely covered.

The quantity of seed sown on an acre is exceedingly various; not only as more or less white and yellow clover is sown along with grass-seeds and red clover, or when pasturage is intended, but even when they are the only kinds sown, the quantity is varied by the quality of the soils, and the different purposes of hay, soiling, or one year's pasture, to which the crop is to be applied. When pasturage is the object more seed is necessary than when the crop is to be cut green for soiling; and for hay less is necessary than to either of the former. Timely pulverized soils do not require so much seed as clays, on which clovers and rye-grass are very frequently sown among autumn or winter-sown wheat, when there is more danger of a part of it perishing from being imperfectly covered. In general 8 or 10 pounds may be taken as a minimum quantity, and from that to 14 pounds as the maximum. Rye-grass, commonly at the rate of a bushel per acre, but in many cases only half or two-thirds of a bushel, is mixed with this weight of clover, and both are sown at the same time.

When it is intended to retain the land in pasture for several years the quantity of red clover is diminished, and several kinds of more permanent herbage are added, the most common of which are white and yellow clover, and rib-wort and rye-grass. No general rule can be laid down as to the proper quantity of each to be sown; the red clover and rye-grass, however, should predominate.

In the selection of clover and rye-grass seeds particular attention should be paid to their quality and cleanliness; the purple colour of cloverseed denotes that it has been ripe and well saved; and the seeds of weeds may be detected in it by narrow inspection, if there be any; but variousarious weeds are frequently mixed up with seeds of rye-grass, which is difficult either to discover or to separate from them. Red clover from Holland or France has been found to die out in the season it has been cut or pastured, while the English seed produces plants which stand over the second, and many of them the third year (General Report of Scotland, vol. 1. p. 537); thus remaining, in the latter case, four years in the ground from the time of sowing.

The after culture of clover and rye-grass is chiefly keeping the ground clear of weeds and stones. After this the surface should be rolled once to smooth it for the scythe. This operation is best performed in the first dry weather of March. Some give a top dressing of soot, gypsum, common lime, peat or wood ashes at this time or earlier; but where the soil is in good heart, and contains calcareous matter, top-dressing cannot be considered as necessary.

The taking of the clover or clover and rye-grass crop is either for cutting green for soiling, or cutting green for feeding, or fattening live stock, by making it into hay, or by pasturing. It has been pretty uniformly found, after repeated trials upon soils of almost every description, that oats taken after clover that has been cut, either for soiling or hay, is superior to the crop taken after clover pasture by sheep. On all farms a part of this crop is cut green for the working horses, and for milch-cows, and in some instances both for growing and fattening cattle.

In feeding cattle with green clover attention must be paid to prevent swelling or hoving, which is very apt to take place when they are first put on this food, especially if it be wet with rain or dew, and the more luxuriant the clover the greater is the danger. After being accustomed to this rich food for a few days, during which it should be given rather sparingly, the danger is much diminished; but it is never safe to allow milch cows in particular to eat large quantities of wet clover.

The mode of making clover hay is to cut it close to the ground, and in as perfect and uniform a manner as is possible to accomplish. The surface in the preceding spring having been freed from stones and well rolled, the stubble after the mower ought to be as short and smooth as possible, by which means the after growth will be more vigorous and weighty. It is turned with a fork or by hand every day until it is quite dry; it is then put up in field ricks, and afterwards stacked.

The after growth or second crop of clover is vigorous or weak according to the proportion of clover plants to rye-grass, to the time when the first crop was cut, and to the moisture and warmth of the season. The first of these after cuttings may be made into hay, and sometimes the second, but in general both are consumed by soiling or pasturing, unless in some dry warm districts, as Norfolk, and parts of Suffolk and Kent, when the second growth is left to ripen its seed. In the northern counties, should it be cut for hay, which it seldom is, the best method of saving it is to mix it up with straw, which will absorb a part of its juices. It is often cut green as a part of the soil system, or where a sheep stock is kept, pastured by the old ewes or other sorts, that are to be fattened the ensuing winter on turnips.

When clover is used as a pasturage crop the live stock are either pent in by hurdles, and the hurdles shifted as the clover is eaten, or they may be tethered in the field, and the tethers removed in order to have the clover eaten regularly, as in some parts of Scotland, or the stock is introduced into the field, but in this case always earlier than in tethering and hurdles, in order to avoid the loss that would be sustained by cattle or sheep treading on tall herbage; but red clover is not generally pastured till the third year; but when white or yellow clovers are sown the herbage is sometimes not mown at all, but only pastured for three or more years; but if a little red clover is sown with them a crop of hay may be taken the second year.

The produce of clover hay without any admixture of rye-grass, on the best soils is from 2 to 3 tons per acre, and in this state in the London market it generally sells 20 per cent higher than meadow hay or clover and rye-grass mixed. The weight of hay from clover and rye-grass mixed varies according to the soil and the season from one to three tons per English acre, as it is taken from the damp ricks; but after being stacked and kept till spring the weight is found to be diminished 25 or 30 per cent. The value of clover and rye-grass hay in comparison with the straw of beans or peas, may be in the proportion of 3 to 2, and with the finest straw or corn crops in the proportion of 2 to 1. One acre of red clover will go as far in feeding horses or black cattle as 3 or 4 of natural grass. And when it is cut occasionally, and given to them fresh, it will probably go still farther, as no part of it is lost by being trodden down. With the exception of lucerne, Medicago sativa, and the herbage of rich marshes, there is no crop by which so much stock can be supported as by clover. It may be profitably employed in fattening
sheep in spring, and with this food they will soon be ready for the butcher. Afterwards a crop of hay may be got, and in two or three weeks the hay has been taken off, sheep intended to be fattened on turnips may be turned in, and kept there until the turnips are ready for them.

The nutritive products of red clover, according to Sir Humphry Davy (the quantity analysed 1000 parts) are as follows: the whole quantity of soluble or nutritive matter 39; mucilage or starch 31; saccharine matter or sugar 3; gluten 2; extract, or matter rendered insoluble during evaporation, 3.

The saving of clover-seed is attended with considerable labour and difficulty. Clover will not ripen its seeds if saved for that purpose early in the year; therefore it is necessary to take off the first crop either by feeding or with the scythe, and to depend for the seed upon those heads that are produced in the autumn. Seed clover turns out to good account in those years when the crops are not injured by the blight, which is often fatal to them, or by the rains in the autumn, which sometimes prove their destruction; for the time of harvesting this seed falling out late, when rainy weather may be expected, renders it on that account very tedious. The produce in seed may generally be from 3 to 4 or 5 bushels per acre, when perfectly clean weighing from 2 to 3 cwt. But there is great uncertainty in the produce of clover-seed from the lateness of the season at which it becomes ripe; and the fertility of the soil is considerably impaired by such a crop. Yet the high value of the seed is a great inducement to the saving of it in favourable situations (Dickson’s Practical Agriculture, vol. 2. p. 863). The growth of clover reserved for seed should be the second crop, and it should be suffered to remain until the husks become perfectly brown, when it should be cut and harvested in the usual manner, leaving it on the field till it is very dry and crisp, that the seeds may become more fully hardened; it may then be laid up dry, to be threshed out at the farmer’s convenience. Much labour and expense are necessary in separating the seeds from the husk, especially when it is effected by threshing, which seldom costs less than from 5 to 6 or 7 shillings per bushel. By the use of mills the work may be done much cheaper.

The diseases of clover are the blight or mildew, and suffocation or consumption from insects, slugs, and worms. It often happens that clover after being repeated at short intervals on the same soil either fails or does no good, whether this is owing to a disease, or a defect in some peculiar substance which enters into the food of the plant, does not appear to be clearly ascertained. A top dressing with ashes or lime is said to be unfavourable to slugs; but where vermin of this sort are very numerous the most certain remedy is a naked fallow well worked in the hottest months.

Var. a, salicium (Ser. mss. in D. C. prod. 2. p. 193.) tall; leaflets ovate or lanceolate; heads large, globose.

Var. b, gracilliscens (Ser. 1. c.) smoothish; stems filiform; heads small, few-flowered. T. pratense γ, Ser. trif. esc. no. 19.

Var. γ, pedunculatum (Ser. 1. c.) heads on long peduncles. T. pratense sativum, Sturm, deutsch. fl. 1. fasc. 15.

Var. e, multifidum (Ser. 1. c.) calyceine segments 6-7, hispid from pili. Native of Corsica.

Field Trefoil or Red Clover. Fl. May, Sept. Britain. Pl. 1 to 2 feet.

48 T. VAGINATUM (Schlech. cat. p. 51.) plant villous; stems prostrate; leaflets ovate, obtuse or retuse; stipulas broad, nerved; heads ovate, obtuse, nearly sessile; segments of calyx nearly equal; corolla gamopetalous; seed reniform. 2. H. Native of Switzerland, on mount Grimsel, and of Vallais. Flowers yellowish.

49 T. MICROphyllum (Desv. journ. bot. 2. p. 316.) smoothish; stems ascending; leaflets ovate, obtuse or retuse, dentiluated, superior ones macronulate; stipulas broadish, nerved, furnished at the apex with a broad, short, indented point; heads ovate, obtuse, sessile; calyceine segments pilose, flexilis, unequal, shorter than the gamopetalous corolla. 2. H. Native of Scandinavia, and about Paris, in dry groves. D. C. fl. fr. 5. p. 356. Flowers purple. Perhaps only a variety of T. pratense.

50 T. Noricum (Wulf. in Roem. arch. 3. p. 387.) villous: stems declinate, simple; leaflets oval-oblong; stipulas smoothish, rather narrow, somewhat lanceolate; heads of flowers subglobose, pedunculate and sessile; calyceine segments siliiform, flexilis, about equal in length, the lower one much shorter than the carina. 2. H. Native of Carinthia. Sav, obs. tr. p. 61. Sturm, deutsch. fl. 1. fasc. 16. Allied to T. pratense, but the calyces are twice the length, and thicker; and the flowers are cream-coloured.

51 T. secundatum (Visiani. ex bot. zens. March. 1829. p. 21.) plant hairy; stems ascending; leaflets ovate, obtuse, obsoletely-dentiluated at the apex, upper leaves opposite; stipulas ovate, membranous, nerved; heads of flowers ovate, terminal, girded by a 10-toothed 1-leaved involucrum; calyx compressed, nerved at the base, having lanceolate acuminate pilose teeth, the lower tooth twice the length of the others. 2 H. Native of Dalmatia. Flowers white. This plant is distinguished from all others of the genus in the form of the involucrum.

52 T. PENNSYLVA nicum (Willd. enu. p. 793.) stem much branched, flexuous; leaflets ovate-elliptic, obtuse, quite entire; stipulas nerved; heads ovoid, cylindrical, solitary, dense; lower segment of calyx shorter than the monopetalous corolla. 2. H. Native of North America. Very like T. medium or T. pratense. Flowers red.

53 T. FIMBRIATUM (Lindl. bot. reg. 1070.) stems prostrate, glabrous; leaflets oval, smooth, toothed, the teeth setaceous; heads of flowers on long peduncles; involucrum shorter than the flowers, and as, are, as the stipulas, multilobed; the segments awned; calyx turbinate, with the segments pungent, about the length of the tube of the corolla; seeds round, black. 2. H. Native of North America, in the neighbourhood of the Columbia river. Flowers purple.

54 T. Worbskòlódi (Lehm. cat. sem. hort. hamb. 1825.) heads of flowers hemispherical, solitary, terminal, girded by an orbicular, jagged, awned involucrum; wings divaricate, a little shorter than the vexillum; leaflets obovate-oblung, pectinately-dentiluated, mucronate; stipulas broad, fringed. 2 H. Native of Greenland.

Worbskòlódi’s Trefoil. Fl. reclining.

55 T. TRIDENTA'TUM (Lindl. bot. reg. no. 1070.) stems ascending, nearly simple, glabrous; leaflets linear, acute, toothed, the teeth setaceous; heads of flowers on long peduncles; involucrum fringed, awned, shorter than the flowers; upper stipulas pectinata; calyx tubular, the limb dilated and coloured, with the segments tridentate and awned, shorter than the corolla. 2. H. Native of North America, in the neighbourhood of the Columbia river. Flowers purple.

Tridentate-sppalled Trefoil. Fl. ascending.

56 T. CYATHIFERUM (Lindl. 1. c.) stems prostrate, glabrous; leaflets obovate, denticulated, obtuse; heads of flowers on long
peduncles; involucr e cup-shaped, truncate, veiny, and toothed, length of flowers; stipulas ovate, short; calyxes membranous, the segments setaceous, 3-5-parted, length of corolla. 2. H. Native with the two preceding species. Flowers purplish.

Cup-bearing Trefoil. Pl. prostrate.

67 T. involucratum (Willd. spec. 3. p. 1872) plant quite smooth; stems straight, erect; pedicels long; upper leaves oblong-linear, sharply-toothed; stipulas membranous, narrow, linear, very acute; heads pedunculate, hemispherical, girded by an orbicular, toothed involucrem; bracteas bicurate, but multifid according to Kunth; segments of the calyx setaceous, longer than the tube, and much shorter than the corolla; ovary stipitate, 5-6-ovulate. O. H. Native of Mexico, near Valladolid, at the altitude of 6000 feet. H. B. et Kunth, nov. gen. amer. 6. p. 302. Kunth, pl. legum. 186. t. 53. Flowers purplish. Stigma small, oblique, rather linear, obtusely papillose.

Involute Trefoil. Pl. 1 foot.

56 T. mucronatum (Willd. herb. ex Spreng. syst. 3. p. 298) stem ascending, 1-leaved; leaflets linear, mucronate, serrated; stipulas broad, lanceolate, cuspidate; calyxes bracteate, the stipules anned and equal, shorter than the corolla; heads of flowers roundish. 2. H. Native of New Spain. Mucronate-leafed Trefoil. Pl. ascending.

59 T. microcephalum (Parsh. fl. amer. sect. 2. p. 478) stem ascending, pubescent; leaflets obvate, emarginate, dentilicate; stipulas ovate, acuminate; heads of flowers small, few-flowered, on long peduncles; flowers sessile in the heads; leaflets of involucrum ovate, awned; calyces segments anned, length of corolla. 2. H. Native of North America, on the banks of Clark's river, and of California. Flowers pale-purple.

Small-headed Trefoil. Pl. 1 foot.

60 T. pallescens (Waldst. et Kt. pl. rar. 1. p. 35. t. 36) stems diffuse; leaflets ovate-roundish, denticulate; stipulas pilose, broad, setaceous at the apex; heads of flowers globose, rather hispid, hardly pedunculate; calyces segments setaceous, pilose, unequal, shorter than the monopetalous corolla; seeds ovate, compressed, yellow, globose. O. H. Native of Hungary, in meadows and corn-fields. This plant is nearly allied to T. pratense, but the heads are smaller, the flowers are white, and the vexillum is emarginate.

61 T. diffusum (Ehrh. beitr. 7. p. 165) plant soft, villous, and glaucous; stems diffuse; leaflets ovate-lanceolate, obtuse or retuse; stipulas narrow, ending in a linear-lanceolate acumen; heads of flowers ovate, rather hispid; calyces segments setaceous, very villous, straight, equal, shorter than the monopetalous corolla; legume circumsciss, 2-seeded; seeds bay-coloured, irregularly obcordate. O. H. Native of Hungary, in sandy places, and about Paris. Waldst. et Kt. hung. 1. p. 40. t. 50. T. ciliésum, Thun. fl. par. ed. 2. p. 380. Flowers purple. Perhaps a variety of T. hirtum.

62 T. heterophyllum (Tratt. arch. 1. p. 26. with a figure,) stems procumbent, diffuse, very straight, lower leaflets obcordate, upper ones ovate or lanceolate; stipulas ovate, awned; heads of flowers globose, solitary, dense; calyces segments nearly equal, about equal in length to the tube of the monopetalous corolla. 2. H. Native of the top of mount Etzehor. Flowers red.

Variable-leaved Trefoil. Pl. procumbent.

63 T. hirtum (All. nov. p. 20.) stem erect; leaflets obovate, cuneated, nearly entire; lower stipulas narrow, each ending in a long acumen, upper ones short, and very broad; heads of flowers nearly globose, hispid; calyces segments very long, about equal in length to the corolla, hardly unequal; seeds large, regularly ovate, very blunt. O. H. Native of the south of Europe. T. hispidum, Desf. atl. 2. p. 200. t. 209. f. 1. Flowers rose-coloured. Plant hairy.

Var. ß, pictum (Ser. mss. in D. C. prod. 2. p. 196) leaflets denticulate, spotted with red. T. pictum, Roth, cat. 2. p. 201. Savii, obs. tr. p. 27.

Var. ß, pyriforme (Ser. l. c.) stems almost simple; head solitary, terminal. Native of the Pyrenees, about Prades.

64 T. polycéphalum (Ser. mss. in D. C. prod. 2. p. 196) plant hairy, prostrate; leaflets cuneate-ovobate, entire; stipulas lanceolate, the calyces one free; heads of flowers very numerous, ovate; calyx very hairy, the segments nearly equal and flexible, shorter than the corolla; vexillum length of corolla; legume villous, 2-seeded; seeds cordate-reiniform. O. G. Native of the Cape of Good Hope. Perhaps T. lanatum of Thumb. prod. 136.

Many-headed Trefoil. Pl. prostrate.

65 T. pauciflorum (d’Urv. enum. pl. arch. p. 94) stems trailing, villous, much branched at the base; pedicels very long; leaflets cuneate, very much dilated at the apex, usually emarginate, entire; stipulas scarious, ciliated, subulate at the apex; spikes solitary or twin, few-flowered, on short peduncles; calyxes villous, the segments setaceous, and shorter than the corolla. 6. H. Native of Turkey, near Constantinople. Flowers purple.

Few-flowered Trefoil. Pl. trailing.

66 T. hemipodium (Spreng. syst. 3. p. 213) heads somewhat umbellate, 8-flowered; calyxes hairy, at length deflexed, the teeth lanceolate, shorter than the corolla; stipulas oblong-lanceolate, nerved; leaflets obovate-roundish, denticulate, nerved. O. H. Native of Quito. T. pauciflorum, Willd. herb. Humboldt’s Trefoil. Pl. prostrate.

67 T. cherleri (Lin. ammon. 4. p. 286) stem procumbent; leaflets obcordate, nearly entire; stipulas broad, ending each in a linear incurved point; heads globose, hispid, sessile; stipulas roundish; calyces segments hispid, longer than the corolla; seeds ovate, compressed. O. H. Native of the south of Europe. Savii, obs. tr. p. 23.—Barrel. icon. 829. Desf. atl. 2. p. 197. Flowers white.

Chiltern’s Trefoil. Fl. May, June. Cl. 1750. Pl. procumbent.

68 T. splendidum (Spreng. fl. atl. 2. p. 201. t. 209, exclusive of the synonyms of Barrelier,) stems diffuse; leaflets obcordate or ovate; stipulas lanceolate, acute; heads of flowers globose, hispid, sessile, involucrated; calyces segments setaceous, longer than the corolla. O. H. Native of the north of Africa, near Mascar. Flowers white. Plant villous.

69 T. rotundifolium (Smith, fl. grac. t. 747) stems simple, diffuse; leaflets nearly orbicular, toothed, hairy; calyx very hairy, longer than its teeth, which are short, lanceolate, and upright; heads of flowers globose, terminal, with lanceolate bracteas. O. H. Native of the Morea. Corolla twice the length of the calyx, elegantly variegated with pale purple and white; its petals distinct; germ hairy. The whole plant clothed with white hairs.

70 T. globosum (Linn. spec. 1081) plant very villous; stems diffuse, slender, branched; leaflets obvate-cuneiform, somewhat denticulate; stipulas lanceolate, nerved; heads of flowers globose, villous, stalked; the superior calyces destitute of a corolla, the lower ones about equal in length to the corolla; seeds egg-shaped, compressed, large, black. O. H. Native of Syria, Arabia, and Italy. Savii, obs. tr. p. 16. Flowers white.

LEGUMINOSÆ. LXX. TRIFOLIUM.

71 T. radiósum (Wahl. in isis. 1828. vol. 21. p. 271.) stems ascending, and are, as well as the leaves, villous; leaflets oblong-ovate; the interior of the head of flower abortive; teeth of calyx curved, setaceous, plumose, shorter than the corolla. O. H. Native of the Levant. Like T. globosum, but double the size.

Rug-headed Trefoil. Pl. ascending.

72 T. Oliérviánum (Ser. mss. in D. C. prod. 2. p. 297.) villous; stems diffuse; leaflets obvate-cuneate, short, broad, entire; stipulas lanceolate, each ending in a long narrow acuminate teeth sub-globose, few-flowered; calyces segments bent, filiform, piseo, ascending, equal, much shorter than the corolla. O. H. Native about Constantinople. Flowers red.

Oliver's Trefoil. Pl. diffuse.

73 T. Clypéárum (Lin. spec. 1804.) pubescent; stems diffuse; leaflets obvate, dentate, stipulas broad, nerved, ciliated; heads of flowers sub-globose; calyces segments leafy, lanceolate, nerved, unequal, spreading, much shorter than the corolla; legume 1-seeded; seeds sub-cordate? O. H. Native of the Levant.—Savi, obs. truf. p. 61. Gertn. fruct. t. 153.—Alp. exot. t. 306. Flowers pale-red. The plant is named T. Clypéárum in reference to the calyx when in fruit being spread like a buckler.

Stellate-caledyed Trefoil. Fl. Ju. July. Britain. Pl. 1/2 ft. 75 T. Leucántum (Bieb. fl. tur. 2. p. 214.) stems ascending, villous; leaflets obvate-oblong, somewhat serrated at the apex; stipulas lanceolate, subulate; heads of flowers sub-globose, pedunculate, villous; calyces segments spreading, nearly equal, shorter than the corolla; legume 1-seeded; seeds ovate or orbicular, bay-coloured. O. H. Native of Tunisia, on dry hills, and of Corsica. T. Stellátum, Pall. imed. taur. T. variabile, Gussone in litt. 1824. T. obscurum, Guss. ex lett. 1824. This plant differs from T. Stellatum in the stipulas being lanceolate-subulate and entire, not ovate and dentate, as well as in the leaflets being more oblong, and the flowers being smaller and almost white, not pale-red.

White-flowered Trefoil. Fl. June, July. Clt. 1820. Pl. 1/2 ft. 76 T. Longípedunculátum (Lois. fl. gall. ex bull. sc. Aug. 1828. p. 425.) stems ascending, smooth; leaflets oblong-elliptic, quite entire, rather pilose; stipulas narrow, linear-slaw-shaped beyond the middle; heads of flowers ovate, terminal, on long peduncles; teeth of calyx unequal, rather pilose, the lower tooth longest, about equal in length to the membranous corolla. O. H. Native of Corsica, near Bonifacio. Flowers white.

77 T. Réflexum (Walst. et Kit. pl. hung. 3. p. 299. t. 269.) stems decumbent, diffuse, numerous, pilose; leaflets oblong, somewhat dentate, stipulas subulate, heads of flowers sub-globose, pedunculate; calyces segments spreading, unequal, shorter than the corolla; vexillum elongate, legume obvate, fleshy, glabrous, brown, 1-seeded; seed brown, roundish; radicle hardly prominent. O. H. Native of Hungary, in grassy places. Perhaps distinct from T. Leucántum.

Reflexed Trefoil. Pl. decumbent.

78 T. Olongrófrólo (Ser. mss. in D. C. prod. 2. p. 197.) villous; stems erect; leaflets oblong, ciliated; stipulas lanceolate, nerved, ending each in a long acumen; heads of flowers globose; calyces segments somewhat setaceous, equal, longer than the corolla. O. H. Native of Spain and Barbary. T. squarrosum, Lam. in herb. Vahl. Flowers purple.

Oblong-versed Trefoil. Pl. 1 foot.

79 T. Oscérurum (Savi, obs. truf. p. 51. f. 1.) stems spreading; leaflets obvate or obcordate, entire, stipulas membranous, nerved, acute at the apex, ciliated; heads of flowers sub-globose; calyces segments lanceolate, acuminated, nerved, pubescent, tube of length of tube, and longer than the corolla; legume 1-seeded. O. H. Native of Italy. Perhaps only a variety of T. leucántum.

80 T. Saxátile (All. fl. ped. no. 1108. t. 59. f. 3.) stems rather erect; leaves villous; leaflets cuneate, small, and entire, but emarginate at the apex; stipulas ovate, mucronulate, nerved; heads of flowers globose, depressed, sessile, bracteate; calyces tomentose; the segments small and ascending, equal, length of corolla; seeds small, black, irregularly subcordate. O. G. H. Native of Switzerland, Piedmont, and Dauphiny, on the higher Alps. Savi, obs. truf. p. 28. T. thymifórum, Vill. dauph. 3. p. 487. T. glácelae, Reyn. mem. 1. p. 166. Flowers white.

Sect. IV. TRIFOLIÁSTRUM (from trifólium, and astrum, an affixed signification, like). Ser. mss. in D. C. prod. 2. p. 148. Flowers capitate; heads globose, sessile, or pedunculate; flowers usually deflexed at length. Calyx not inflated.

81 T. Subfórica (Lin. mant. 276.) glabrous; stems very short, procumbent; petioles long; leaflets obcordate-cuneiform, denticulate; stipulas scarios, a little nerved, each ending in a short acuminate teeth of flowers axillary, sessile, nearly globose, glabrous, approximato; flowers dense, sessile; calyces membranous, smooth; the segments lanceolate, acute, flat, and nearly equal, recurved, much longer than the corolla; legume concrenate, 2-seeded; seeds nearly globose, yellowish; radicle prominent. O. H. Native of the south of Europe. In England on the sandy sea-coast at Yarmouth and Lowestoft, and at Landguard Fort. Jacq. hort. vind. t. 60. Savi, obs. truf. p. 96. Brot. phyt. p. 188. t. 94. Smith, engl. bot. 1040. Flowers pale pink.

82 T. Conócorum (Guss. cat. 1821. p. 80. pl. tur. p. 311.) stems branched, smooth, trailing; leaves on long petioles; leaflets obcordate, entire, pubescent; heads of flowers lateral and terminal, roundish, sessile, approximate; calyx pilose; the teeth erect, equal in length to the corolla; legume 1-seeded. O. H. Native of Calabria in arid fields by the sea-side.

83 T. Glóméránum (Lin. spec. 1804.) glabrous; stems spreading; leaflets obvate, sharply toothed; stipulas scarios, nerved, each ending in a long acuminate teeth of flowers axillary, sessile, distant, globose; flowers dense, sessile; calyces segments heart-shaped, short, nerved, acuminated, reflexed, shorter than the polypetalous corolla; legume 1-seeded; seed irregularly cordate, bay-coloured. O. H. Native of the south of Europe. In England, in gravelly fields and pastures about London, Isle of Sheppey, on Kew-green and Hanwell-heath, Middlesex, on the Bath hills, near Bungay, Suffolk, at Yarmouth, &c. Smith, engl. bot. 1033. Curt. lond. 4. t. 51. Flowers rose-coloured.

84 T. Parvitufórum (Ehrbl. beitr. 7. p. 165.) stems diffuse; leaflets obvate, nerved, sharply serrate; stipulas scarios, ending each in a sharp acumen; heads of flowers axillary, pedunculate, and sessile; globose; flowers dense, sessile; calyce b 2
segments nerved, lanceolate, acute, unequal, the two superior ones longer than the corolla; legume 2-seeded; seeds somewhat coriaceous, bay-coloured.  

7. Leaflets 

87 T. grandiflorum (Hook, in Bœch, bot. p. 16.) stems creeping; leaflets obcordate, striate, denticulated, and are as well as the petioles pilose; stipulas oval, ending in a long awn; peduncles hardly pilose, ascending, 3-times longer than the petiole; calyx campanulate, pilose; the segments unequal, lanceolate, exceeding the tube; corolla 5-6-times longer than the calyx, scarious, persistent.  

88 T. répens (Lin. spec. 1050.) stems creeping, rooting, diffuse, branched at the base; leaflets obovate-roundish, rather retuse, denticulated; stipulas scarious, narrow, lanceolate, each ending in a long mucrone; heads of flowers globose, axillary, on very long peduncles; flowers pedicellate, deflexed after flowering; calyce segments unequal, tooth-formed, shorter than the corolla; legume 2-4-seeded; seeds irregularly ovoid, bay-coloured.  

2. F. Native about Concepcion, Chili. Like T. obcordatum, but probably belonging to section Lupinaster.

Great-flowered Trefoil. Pl. creeping.

92 T. umbellatum (Ser. mss. in D. C. prod. 2. p. 199.) stems prostrate, pubescent; leaves petiolate; leaflets obcordate, cuneated; stipulas lanceolate, cuspidate, foliaceous, nerved; peduncles filiform, very long; heads umbellate, few-flowered; pedicels pilose, arching; flowers ascending; calyces pilose, striated; the segments lanceolate and 3-nerved, hardly the length of the corolla; vexillum hooded.  

O. H. Native of Carolina. Flowers white.

Umbricellate-flowered Trefoil. Pl. prostrate.
ovate, acuminate, entire; heads of flowers umbellate, almost globose; flowers numerous, drooping little, and reflexed after flowering; calyces glabrous, having nearly equal segments, length of corolla; legumes 2-3-seeded; seeds almost reniform, bay-coloured. O. H. Native of Portugal. Flowers pale-purple.

Drooping-flowered Trefoil. Fl. Ju. Jul. Clt. 1820. Pl. pr. 94 T. PALLÉSCENS (Schreb. in Sturm, deutschl. fl. 1. fise. 15.) stems creeping; leaflets obovate-roundish, denticulated; stipulas scarious, lanceolate, nerved, ending each in a long acumen; leaves axillary, on long peduncles; flowers pedicellate, the pedicels deflexed when in fruit; calyce segments unequal, longer than the tube but shorter than the corolla. O. H. Native of Salzburg, on the alps. Flowers cream-coloured. Perhaps a yellowish-flowered variety of T. répens.

Pale-flowered Trefoil. Fl. Sept. Clt. 1804. Pl. crep. 3. ft. 95 T. NEGRESCENS (Viv. frag. fl. ital. p. 12. t. 13.) stems tufted, decumbent; leaflets roundish, cuneate, denticulated; stipulas membranous, broad, marked with black, ending in a narrow acumen; heads of flowers naked; peduncles longer than the leaves; calyce segments unequal, much shorter than the corolla; legume 3-4-seeded. O. H. Native about Rome, on the banks of the Tiber. Flowers yellowish.

Bluish-leaved Trefoil. Fl. June, Aug. Pl. decumbent. 96 T. CESPITOSUM (Reyn. mem. l. p. 162.) plant quite smooth; stems tufted, very short; leaflets obovate, rather retuse, denticulated; stipulas scarious, narrow, lanceolate, very acute, 1-nerved; leaves axillary, on long peduncles; flowers almost sessile, the pedicels spreading when in fruit; calyce segments nearly equal, lanceolate, spinose at the apex, shorter than the corolla; legume 3-4-seeded; seeds cordate, bay-coloured. O. H. Native of Daunphy, Switzerland, and Piedmont, in alpine meadows. T. Thalii, Vill. dauph. 3. p. 478. t. 41. The calyces are longer than in T. répens. Flowers white.

Var. β, glárcéidum (Ser. ms. in D. C. prod. 2. p. 300.) heads small, few-flowered; calyces much shorter. T. glárcéidum, Schleich, ex herb Reyn.

Tufted Trefoil. Fl. June, Aug. Clt. 1815. Pl. tufted. 97 T. BURECHILLIANUM (Ser. ms. in D. C. prod. 2. p. 300.) plant smoothish; stems short; leaflets obovate, sharply toothed; stipulas long, narrow, lanceolate, foliaceous, bluish, having numerous flocculent nerves; heads of flowers axillary, on long peduncles; flowers almost sessile; calyce segments linear, 1-nerved, foliaceous, hardly awned at the apex, longer than the tube, but shorter than the corolla; vexillum longer than the wings. O. G. Native of the Cape of Good Hope.—Burchell, cat. no. 316.

Burchell’s Trefoil. Pl. ½ foot. 98 T. AFRICANUM (Ser. ms. in D. C. prod. 2. p. 300.) plant pilose; stems short; leaflets obovate or obcordate, somewhat serrulat; stipulas long and narrow, lanceolate, foliaceous, acute, having numerous, straight, parallel nerves; heads of flowers axillary, on long peduncles; flowers sessile; calyce segments tetragonal, about equal in length to the tube, but shorter than the corolla; vexillum longer than the wings. O. H. Native of the Cape of Good Hope. Burch. cat. pl. afr. extraprop. no. 2817.

African Trefoil. Pl. ½ foot. 99 T. ROTUNDATUM (Ser. in D. C. prod. 2. p. 300.) plant pilose; stems short, tufted; leaflets roundish, somewhat obtectate, almost entire, much nerved; stipulas broad, each ending in a long mucrone, having numerous flocculent nerves; heads of flowers terminal, somewhat globose, villous, fulvous, pedunculate; flowers sessile; calyce segments tetragonal, nearly equal, length of tube, but much shorter than the corolla; vexillum longer than the wings. O. H. Native of?
pulas leafy, ending each in a long, narrow acumen; heads of flowers subglobose, axillary; flowers on short pedicles, the pedicles deflexed when in fruit; calycine segments about equal, triquetral, longer than the tube, ascending, shorter than the corolla; legume 2-seeded: seeds minute, ovate, compressed, black. 2. H. Native of Europe. T. Vailiântii, Poir. dict. 8. p. 4, exclusive of the synonyme of Michelii.—Vail. bot. par. t. 22. f. 1. Flowers pale-red or white. Plant creeping.

107 T. 158166 (Brot. phyt. p. 148. t. 61.) stems prostrate and ascending; pedicels much shorter than the peduncles; leaflets obovate, obtuse, serrated, villous, stipulous broad, nerved, subulate; heads of flowers ovate; flowers sessile; calycine segments equal, erect, small, shorter than the corolla, which is somewhat falcate; legume 2-seeded; seeds somewhat reniform, of a yellowish-green colour. O. q. H. Native of Portugal. Legume membranous, coarctate in the middle from spongy substance. Flowers pale-purple.

Neck-fruited Trefoil. Pl. ascending, 1/3 foot.

108 T. REFLEXUM (Lin. spec. 1079.) plant ploxe; stems ascending; leaflets obovate, serrulated; stipula foliaceous, obliquely-cordate, acuminate; heads of flowers globose, axillary; flowers on long pedicles, at length deflexed; calycine segments nearly equal, very narrow, 1-nerved, nearly twice the length of the tube, but shorter than the corolla. 2. ? H. Native of Virginia. Flowers purple. Heads of flowers nearly twice the size of those of T. elegans. Legumes usually 3-seeded.

109 T. CAROLINIANUM (Mich. fl. bor. amer. 2. p. 58.) plant small; leaflets roundish, obcordate, ciliated; heads pedunculate, reflexed, few-flowered; calycine segments straight, linear, shorter than the tube; corolla white, hardly exerted beyond the calyx; legume usually 3-seeded. 2. ? H. Native of Carolina.

Carolinian Trefoil. Pl. 1/2 foot.

110 T. MONTAUM (Lin. spec. 1087.) plant pubescent; stem erect, nearly simple; leaflets lanceolate-oblong, obtuse, dentilculated, thickly beset with nerves; stipula lanceolate, very acute; heads of flowers nearly globose, axillary, pedunculate, but at length oblong; flowers almost sessile, crowded, spreading, at length reflexed; calycine segments unequal, narrow, length of tube, but shorter than the carina; legume 1-seeded; seed ovate-roundish. 2. H. Native of Europe, in mountain meadows. Savi, obs. trif. 169. Sturm, deutschl. fl. 1. fasc. 15. Fl. dan. 1772. Flowers white.

Var. β, pedunculosus (Ser. ms. in D. C. prod. 2. p. 201.) heads of flowers globose, solitary, on long peduncles, thicker; calyces larger.

Var. γ, incanum (Ser. 1 c.) stem, peduncled, and lower surface of leaves clothed with hoary pili. Native of Bessarabia.

111 T. BALBISIANUM (Ser. ms. in D. C. prod. 2. p. 201.) plant villous; stems tufted, simple; leaflets elliptic, obtuse, dentilculated, much nerved; stipula lanceolate, acute; heads of flowers hemispherical, terminal, solitary; peduncles much longer than the stamens; flowers ascending, purple; calycine segments equal, spreading, narrow, much longer than the cylindrical tube, and shorter than the corolla. 2. H. Native of Provence, on Mount Lachen.

Balbis's Trefoil. Pl. 1/4 to 1 foot.

112 T. RUPÈSTRE (Tenore, ex Gussone, in herb. Dunant. D. C. prod. 2. p. 201.) stems erect, simple; leaves nearly all radical; leaflets ovate, denticulated, much nerved; stipula membranous, acuminate; peduncle striate, pilose, terminal, length of stem; flowers capitulate, depressed, at length deflexed; calyx rather coriaceous, having smooth, blackish-green angles; the teeth or segments narrow, parallel, equal, longer than the tube.

L. X. TRIFOLIUM.

113 T. PRETUTIANUM (Guss. pl. rar. 308.) clothed with soft and dense pili; stems tufted and ascending; leaflets ovate, entire, or dentilculated, finely veined towards the margins; stipula narrow, ending in a long, brittle-like acumen; heads of flowers globose, solitary, bracteated by a stipule; tube of calyx lined with pili; the segments awl-shaped and parallel, unequal, having the throat filled with white pili. 2. H. Native of the higher mountains of Abrutia, on Mounts Corno and Curtone. Stems 3 inches high. Flowers reddish.

Proteus Trefoil. Pl. 1/4 foot.

114 T. LATINUM (Seh. pl. rom. fusc. 1. pt. 7. t. 1. f. 2.) stem crenated, dichotomous; leaflets lanceolate, acuminate, nearly entire; stipula narrow, nerved, pilose, linear, acute; heads of flowers on long peduncles, oval; calycine segments between triangular and subulate, ciliated, lowest one very long, but shorter than the tube of the corolla; legume membranous; seeds somewhat turbinate. 2. H. Native near Rome. The whole plant is very soft and beset with small short pili. Flowers red or white.

Sect. V. VESICA' STRUM (from vesica, a bladder, and astrum, an alluxed signification, like; in reference to the calyces in all the species of this section being inflated after flowering). Ser. ms. in D. C. prod. 2. p. 202. Flowers disposed in dense heads; under lip of calyx remaining unchanged, but the upper one, after flowering, becomes increased and inflated, and covers the legume in a kind of arched manner. Nerves in the leaves numerous.

115 T. SUBTERRANEUM (Lin. spec. 1080.) villous; stems procumbent; leaflets obcordate, entire; stipula lanceolate, broad, acute; heads few-flowered, usually 3-4, piercing the ground when in a seeding state; the lower flowers fertile having the calyx inflated; upper flowers sterile, empty, elongated, deflexed; legume 1-seeded; seed ovate, black. O. H. Native of Europe; plentiful in Britain, in dry gravelly pastures, and on barren heaths and exposed places, as on Black-heath, Greenwich-park, Hyde-park, &c. Savi, obs. trif. 12. Smith, engl. fl. 1048. Cart. lond. 1. t. 54. Flowers white or very pale red. Involucrum central, reflexed, stiff, starry, embracing the fruit.

116 T. VESICULO'SUM (Savi, fl. pis. 2. p. 165. obs. trif. 84.) stems erect, firm, striated; leaflets lanceolate, acute, sharply serrulatus; stipula narrow, rather membranous, ending each in a long acumen; heads of flowers ovate, thick, on long peduncles; calyces scarious, inflated; the segments subulate and very acute, equal, much shorter than the corolla; legumes 2-seeded; seeds ovate, compressed, yellow. O. H. Native of the south of Europe. T. recurrens, Walds. et Kit. pl. rar. hong. 2. p. 179. t. 165. T. turgidum, Bib. l. c. suppl. Flowers redish.

117 T. AMBIGUUM (Biebl. fl. taur. 2. p. 208.) stems creeping; leaflets ovate, bluntish, serrulatus; heads dense, double the size of those of T. repens; calyx striated; the teeth nearly equal, subulate, and divericate; vexillum lanceolate; legume 1-2-seeded. 2. H. Native of Tauria and Caucasus in meadows, and on the lower Volga. The barren stems creeping and tufted, the floriferous ones erect. Flowers pale-red.

Var. β, caeruleus (Biebl. fl. taur. suppl. 507.) corollas bluish. Native of the south of Tauria.

This plant comes very near *T. sparniinum* in the want of universal involucrem to the head of the flowers.

*Trigrid*—calyxed Trefoil. Fl. Ju. July. Clt. 1818. Pl. 4 ft. 124 *T. xuviolens* (Stev. in Bieb. fl. taur. 2. p. 217.) stems procumbent, quite smooth; leaflets obovate, somewhat emarginate; heads of flowers roundish; peduncles longer than the leaves; calyx when in fruit inflated, membranous, pubescent: the segments setaceous, and nearly equal, shorter than the tube. 

*? H. Native of Iberia.* This species differs from *T. phy- stodes* in being more slender, in the leaflets being more acute at the base, in the flowers being fewer, heads smaller, peduncles longer, and especially in the teeth of the calyx being smaller.

126 *T. Bonannii* (Prel. ex Spreng. syst. 3. p. 218.) stems creeping; leaflets obovate, retuse; calyx obcordate, the lower teeth setaceous, straight, and connivent; heads of flowers roundish. 

*? H. Native of Sicily.*

Bonannii's Trefoil. Pl. creeping.

127 *T. depauperatum* (Desv. journ. bot. 1814. vol. 4. p. 69.) plant many-stemmed, decumbent; stems simple; leaflets linear, especially cuneiform, glabrous, toothed at the apex; heads pedunculate, terminal, few-flowered; involucre 1-leaved, entire, truncate; calyx glabrous; vexillum when in fruit inflated. 

*? F. Native of Peru (Dombey).* This species has the habit almost of *T. folifor[m* of Poir. dict. suppl. 5. p. 385.

*Depauperated Trefoil.* Pl. decumbent.

Sect. VI. *Lupinaster* (from *lupinus*, a lupine, and *aster*, an affixed signification, like. *Some of the species contained in this section have the habit of *Lupinus*. Ser. mss. in D. C. prod. 2. p. 283.*)

125 *L. lupinaster* (from *lupinus*, a lupine, and *aster*, an affixed signification, like. *Some of the species contained in this section have the habit of *Lupinus*. Ser. mss. in D. C. prod. 2. p. 283.*)

121 *L. tomentosum* (Linn. spec. 1806.) stems prostrate; leaflets obcordate, cuneiform, sharply-serrulate; stipulas lanceolate, acute, scarious; heads of flowers globose, on very short peduncles; bracteas small, lanceolate; flowers sessile; calyces inflatet after flowering, membranous, reticulated, ploise; the segments unequal, shorter than the corolla and reticulated; bracteas small, lanceolate; legume 2-seeded; seeds irregularly subcordate, bay-coloured. 

*? H. Native of the south of Europe.* Sturm, deutschl. fl. 1. fasc. 16. with a figure. Savi, obs. triv. 75. T. bicorne, Forsk. fl. sib. 139.—Clus. hist. 2. p. 247.—Barrel. icon. 872. Nearly allied to *T. suavionnes*, but differs in the peduncles being shorter and in the calyces being inflated. The corolla of this species is turned upside down, hence the specific name.

Var. *pilosum* (Bernard in litt.) flowers 6-8 in a whorl, beneath the head of flowers.

121 *T. tomentosum* (Linn. spec. 1806.) stems prostrate; leaflets obcordate, cuneiform, sharply-serrulate; stipulas lanceolate, acute, scarious; heads of flowers globose, on very short peduncles; bracteas small, lanceolate; flowers sessile; calyxes inflated after flowering, membranous, reticulated, ploise; the segments shorter than the corolla; legume 1-seeded; seeds irregularly cordate, green, shining. 

*? H. Native of the south of Europe.* Savi, obs. triv. 75. T. bicorne, Forsk. fl. sib. 139.—Clus. hist. 2. p. 247.—Barrel. icon. 872. Nearly allied to *T. suavionnes*, but differs in the peduncles being shorter and in the calyces being inflated. The corolla of this species is turned upside down, hence the specific name.

121 *T. tomentosum* (Linn. spec. 1806.) stems prostrate; leaflets obcordate, cuneiform, sharply-serrulate; stipulas lanceolate, acute, scarious; heads of flowers globose, on very short peduncles; bracteas small, lanceolate; flowers sessile; calyxes inflated after flowering, membranous, reticulated, ploise; the segments shorter than the corolla; legume 1-seeded; seeds irregularly cordate, green, shining. 

*? H. Native of the south of Europe.* Savi, obs. triv. 75. T. bicorne, Forsk. fl. sib. 139.—Clus. hist. 2. p. 247.—Barrel. icon. 872. Nearly allied to *T. suavionnes*, but differs in the peduncles being shorter and in the calyces being inflated. The corolla of this species is turned upside down, hence the specific name.

123 *T. turgidum* (Bieb. fl. taur. 2. p. 210.) stems erectish; leaflets obovate, obcordate, almost entire; stipulas acute; heads of flowers ovate, chaffy; calyx globose, smooth, the teeth setaceous and recurved; petals mucronate. 

*? H. Native of Caucasus between the rivers Kuba and Jegorlik.* Flowers white.

123 *T. turgidum* (Bieb. fl. taur. 2. p. 210.) stems erectish; leaflets obovate, obcordate, almost entire; stipulas acute; heads of flowers ovate, chaffy; calyx globose, smooth, the teeth setaceous and recurved; petals mucronate. 

*? H. Native of Caucasus between the rivers Kuba and Jegorlik.* Flowers white.
leaflets obovate-roundish; flowers white. T. uniflorum, Sternb. in flora. 1830. p. 599.—Buxb. cent. 3. p. 18. t. 31. f. 2.

130 T. eximium (Steph. ex Fisch. and Stev. in litt. D. C. prod. 2. p. 203.) plant glabrous; stems ascending, firm; leaflets obovate, narrowed, somewhat dentilicate; petioles very short; stipules leafy, veiny, obtuse; heads few-flowered; pedicules and pedicels short, tomentose; calyces campanulate; the segments lanceolate and very acute, equal, longer than the tube, but shorter than the corolla; legume 4-5-seeded. 2. 2. Native of Dahuria. T. grandiflorum, Fisch. Led. Vexillum large. Style elongated. Corolla purple.

Var. 2. alboflorum (Fisch. in litt.) flowers white. 2. 2. Native of the Altai mountain.

131 T. alpiflorum (Lin. spec. 1080.) plant quite smooth; stems short, thick, under ground; petioles very long; leaflets 3, lanceolate-linear, bluntish, dentilicate; stipules very long, and very narrow, linear, and acute; heads of flowers umbellate, on long peduncles; pedicels small, disposed in something like a whorl; calyx campanulate, the segments equal, very long, and setaceous, but much shorter than the corolla; legume 2-seeded. 2. 2. Native of Europe, on the higher Alps and mountains. Sturm, deutschl. fl. 1. fasc. 15. with a good figure. Savi, obs. trff. 39. —Park. tebrit. 1104. f. 4. Flowers large, purple, the vexillum flesh-coloured and streaked with purple. The roots have the taste of liquorice.

132 T. lupinaster (Lin. spec. 1079.) plant quite smooth; stems straight, branched; petioles wanting; leaflets 5, linear-lanceolate, sharply-toothed, mucronate; stipulas broad, membranous, acuminate; heads of flowers pedunculate, bractless; flowers umbellate; calyx campanulate, hardly nerved; the segments acute, longer than the tube, but shorter than the corolla; legume 6-seeded. 2. 2. Native of Siberia. Lupinaster pentaphyllus, Moench. meth. suppl. p. 50. Pentaphyllum lupinaster, Pers. ench. 2. p. 382. Pentaphyllum Ammuni, Ledebr. hort. dorp. suppl. 1825. p. 5. Mart. fl. rust. t. 16. Curt. bot. mag. 876.—Gmel. sib. 4. p. 19. t. 6. f. 1. Flowers large, purple; the wings and keel paler than the vexillum.

133 T. purpureus (Fisch. in litt.) the character of this species agrees with the last in almost every particular, except in the leaflets being very broad and bluntish. 2. 2. Native of Siberia, about Barnaoul. T. lupinaster var. 2. oblongifolium, Ser. mss. in D. C. prod. 2. p. 204. Flowers purplish, large. Purple-flowered Trefoil or Bastard Lupine. Fl. June, Aug. Clt. 1816. Pl. 1 to 1 1/2 foot.

134 T. mægæcephalum (Nutt. gen. amer. 2. p. 105.) stems simple, angular; leaflets 7, cuneate-lanceolate; petioles very long; stipulas cuneate, deeply 3-toothed; segments of the calyx segetaneous and feathery; legume 2-4-seeded. 2. 2. Native of North America, at the head waters of the river Missouri. Lupinaster macrocephalus, Pursh. fl. amer. sept. 2. p. 479. t. 28. Flowers yellowish-white with a pale-purple carina.

135 T. gussati (Tinco, pl. rar. sic. pug. 1. p. 17.) plant smoothish; stem branched; leaflets 8, oblong, obtusate, sharply-denticulated, terminal one on a long petiole, lateral ones sessile; stipulas lanceolate, bluntish, toothed, ciliated; heads of flowers rather egg-shaped; pedicules pilose; flowers on short pedicels; calyces segments unequal, narrow, the lower two ones longest, the uppermost ones very short; vexillum oblate, dilated, serrulated. 2. 2. Native of Sicily, on the Nebrodes. Schrank, in flora. 1819. p. 387. Flowers bluish-red, but they fade to a reddish-yellow colour. Bonn. t. 248.

136 T. flexuosum (Douglas, mss.) stem simple, erect, villous, forked at the apex; petioles about the length of the leaflets; leaflets 3, lanceolate, acuminate, ciliated, clothed with silky villi on the under surface as well as the stipulas; pubescent above; heads of flowers ovate-oblong, villous; calyce segments subulate, unequal, lowest one longer than the corolla. 2. 2. Native of North America. Flowers apparently purple.

Plains-headed Trefoil. Fl. 1 foot.

137 T. altissimum (Doug. mss.) stem erect, forked at the apex, glabrous; leaflets 3, lanceolate, glabrous, ciliated; petals length of the combined part of the stipulas; heads of flowers globose, glabrous; calyce segments subulate, much shorter than the monopetalous corolla. 2. 2. Native of North America. Flowers purple

Tallest Trefoil. Pl. 2 feet.

Section VII. Chorono-miium (from κρούνον, chronos, time, and ομη, sema, a standard; in reference to the permanent nature of the standard or vexillum.) Ser. mss. in D. C. prod. 2. p. 204. Flowers disposed in an ovate pedunculate head. Petals scarious, yellow, fading to a bay-colour; vexillum deflexed, and permanent.

138 T. radum (Schreb. in Sturm, deutschl. fl. 1. fasc. 16. with a good figure,) stems ascending; leaves petiolate; leaflets sessile, obcordate, dentilicate; stipulas lanceolate, acute, rather membranous; heads of flowers globose, pedunculate, rather loose; vexillum obvolate; calyx very short, campanulate, the segments unequal, the uppermost one very small; legume subglobose, 1-seeded; seeds ovoid; radicle hardly prominent. 2. 2. Native of Europe, in mountain meadows. Sav, obs. trff. 113. T. spadiceum, Vill. daph. 3. p. 491. but not of Lin. Flowers yellow.

139 T. Brunivum (Ten. prod. fl. nep. 1826. ex Schlecht. Linnean. 3. p. 103.) stems ascending, branched; leaves stalked; leaflets obcordate, cuneate, dentilicate, the terminal one hardly petiolate; heads of flowers axillary, spherical; peduncles longer than the legume segments of calyx unequal; the 2 upper ones short, the rest piliferous at the apex; vexillum large, golden, furrowed; keel copper-coloured; seeds elliptical, yellow. 2. 2. Native of Naples. Allied to T. procumbens and T. agrarium.

140 T. agrarium (Lin. spec. 1087.) stem ascending, branchd., firm; leaves almost sessile; leaflets oblong-ovate, sessile, dentilicate; stipulas leafy, lanceolate, acute, longer than the petiole; heads of flowers on long peduncles, egg-shaped; vexillum obvolate; calyx campanulate, short, the segments unequal, glabrous, and elongated, the superior one smaller; legume 1-seeded, ovoid, compressed; seeds bay-coloured, irregularly cordate; radicle prominent. 2. 2. Native of Europe, in dry pastures and woods. Sturm, deutschl. fl. 1. fasc. 16. with a good figure. Pl. dan. 554. T. stræpa, Crantz austr. 411. no. 8. Flowers yellow.

141 T. spadiceum (Lin. spec. 1087.) stem erect, almost simple, slender; leaves stalked; leaflets oblong, ovate, sessile, dentilicate; stipulas leafy, narrow, acuminate; heads of flowers ovoid, on peduncles; vexillum obvolate; calyce segments unequal; the lower ones long and pilose, the two upper ones small and glabrous; legume ovoid, compressed, 1-seeded; seeds irregularly egg-shaped, bay-coloured; radicle prominent. 2. 2. Native of Europe, in mountain meadows. Sturm, deutschl. fl.
1. fasc. 16. with a good figure. Savi, obs. trif. p. 112. Sims, bot. mag. 557. Flowers yellow; the vexillum tending to a ferruginous colour.

*V. r. ramosissum* (Ser. mss. in D. C. prod. 2. p. 203.) stem much branched; heads of flowers numerous.

142 T. *cellatum* (Clark. itin. 3. ex Spreng. neve. endt. 3. p. 159.) leaves obcordate, denticulated; stipulas ciliated, rather large; heads ovate-hemispherical, few-flowered; teeth of calyx subulate, ciliated, unequal; corolla scarious, rather large; petals denticulated. O. H. Native of Abercomber Island, formerly called Laguna. Flowers yellow.

*Cilialted-calyced Trefoil*. Pl. procumbent.

113 T. *decipiens* (Horn. hort. hafn. 2. p. 719.) stem erect; leaves oval, sessile, mucronate; heads of flowers oval; vexillum somewhat deflexed, permanent; calyx 3-toothed; teeth awl-shaped, pilo-e. O. H. Native of? Very like T. spadiceum, Horn. Flowers bay-coloured.

144 T. *spicatum* (Willid. spec. 3. p. 1852.) plant rather villous; stems prostrate; leaves hardly stalked; leaves obclavate, denticulated, on very short stalks; stipulas lanceolate, ciliated, large; heads of flowers oblong-cylindrical, bay-coloured, on long peduncles; vexillum obvate; ovate, the sepals somewhat denticulated; calyxes glabrous, the segments unequal, the 2 superior ones smallest; legume somewhat globose, on a long stipe, 1-seeded; seed oblong, shining; radicle hardly prominent. O. H. Native of the islands of Cyprus, Cypria, and Zant. Flowers bay-coloured. In Zant this is the only plant made into hay. It might perhaps be tried in the south of England in dry open parts.

145 T. *billarderi* (Spreng. syst. 3. p. 211.) stem erect, pilose; heads of flowers oblong; leaves obvate-oblong, ciliated; stipulas denticulated; upper calyxes sterile; the teeth subulate, ciliated, and unequal; vexillum orbicular, nervet, permanent, deflexed. O. H. Native of Syria. T. comonum, Labill. syst. dec. 5. p. 15. t. 19. Flowers yellow.

*La Billardier's Trefoil*. Pl. 1 foot.

146 T. *procumbens* (Lin. spec. 1088.) stems procumbent; leaves on short stalks; leaves obvate or obcordate, denticulated, terminal one on a short stalk; stipulas half ovate, ciliated, shorter than the petiole; heads of flowers axillary, oval, dense; peduncles longer than the leaves, or equal with them; calyce segments unequal, the two superior ones very short; vexillum finally deflexed; legume 1-seeded; seed kidney-shaped, yellow; radicle hardly prominent. O. H. Native of Europe, in gravelly fields and pastures; plentiful in Britain.

Smith, engl. bot. 345. T. campester, Schreb. in Sturm, deutschl. 1. fasc. 15. T. pseudo-procumbens, Gmel. fl. bad. 3. p. 240. T. agrarium, Huds. ang. 328. Curr. lond. 3. t. 45. Mart. fl. rust. 121. Mill. dict. no. 5. Flowers yellow. This plant is called *Yellow or Hop Trefoil*; the latter name is bestowed on it with much propriety, the heads being larger, and more resembling the hop than any of the rest of the species. It is common on borders of fields in dry gravelly soils. In some meadows it forms a considerable part of the crop, and makes excellent fodder; and it is now very generally used for pasture with or without the white clover. The manner of sowing the seeds and after culture of yellow clover are the same as that for *red clover*. See *Trifolium pratense*.

147 T. *parnassense* (D. Cl. fl. fr. 5. p. 562.) stems procumbent; leaves obvate or obcordate, denticulated, the terminal one usually pediollate; peduncles filiform, very long; heads of flowers somewhat umbellate, few-flowered; calyce segments unequal, the two superior ones very short, longer than the tube; legume pedicellate, 1-seeded; seeds elliptic; radicle prominent.

O. H. Native of Europe, in fields, particularly in France. T. paticens, Schreb. in Sturm, deutschl. fl. 1. fasc. 16. Flowers yellow.

*V. p. pygmaenum* (Ser. mss.) stems branched, short.

148 T. *souza* (Savi, in des. mod. Flajani, 1815.) stems diffuse; leaflets obvate, sessile, denticulated; stipulas narrow, longer than the petiole; peduncles short, firm; flowers somewhat umbellate, pedicellate; tube of calyx very short; the segments long, sectaceous, and equal; legume stipitate, 1-seeded; seed ovoid-elliptic. O. H. Native of Italy, about Rome. Sebast. pl. rom. fasc. 2. p. 14. t. 4. Flowers pale-yellow.

149 T. *flave'scens* (Tino, pug. 1. p. 15.) stems rather erect, branched, dichotomous, glabrous; the two superior leaves opposite, approximating the head of the flowers; leaflets obvate, denticulated; stipulas membranous, nervet, pilose, subulate; heads of flowers roundish; calyx nerved, pilose; the segments ciliated and unequal, longer than the tube. O. H. Native of Sicily, on the Nebrodes. Schranz, in flora. 1819. p. 386. Flowers yellow.

*Yellowish-flowered Trefoil*. Pl. ½ foot.

150 T. *floriborne* (Lin. spec. 1088.) stems prostrate; leaflets obvate or obcordate, somewhat denticulated, nearly sessile; stipulas small, ovate, length of petiole, a little fringed; peduncles filiform, long; flowers somewhat racemose, leaning all one way, on short pedicels; calyce segments unequal, 2 superior ones shorter than the tube; vexillum even; legume 1-seeded, on a short stipe; seeds oblong-ovate, bay-coloured. O. H. Native of Europe, in dry or moist grassy meadows, pastures, borders of fields, and on dry gravelly soils common; plentiful in Britain. Flowers yellow. Sturm, deutschl. fl. 1. fasc. 16. Smith, engl. bot. 1257. Cattle and sheep are so fond of this trefoil that a specimen of it can scarcely be had in any pasture to which they have access.

151 T. *miatus* (Relh. 290. Smith, engl. bot. 1556.) stems procumbent; leaflets obvate, toothed, lateral ones almost sessile, middle one stalked; stipulas half ovate, acute; peduncles straight, rigid; heads of flowers hemispherical; vexillum nearly even; calyce teeth unequal, hairy towards the points; legume 1, rarely 2-seeded. O. H. Native of Europe, in gravelly fields and pastures; plentiful in Britain. T. filiforme, Ehrh. beit. 49. T. procumbens, Huds. ang. 328. Curt. lond. fasc. 5. t. 53. T. dubium, Sibth. 231. Flowers yellow.

153 T. *vul'tile* (Lour. coch. p. 445.) stems elongated, slender, twining; leaflets roundish, quite entire, tomentose; heads many-flowered, axillary; legume 2-seeded, glabrous. O. H. Native on the eastern coast of Africa. Flowers yellow.

*Twining Trefoil*. Pl. procumbent.

† Species not so sufficiently known as to be placed in either of the above sections.

154 T. *mit'num* (Bart. fl. phil. 2. p. 74.) stems somewhat C c
procumbent, smooth; leaflets cuneate, emarginate, dentiliculated, glabrous; stipulas ovate, acuminate; peduncles filiform; capsule roundish; vexillum deflected. **O. H.** Native of New Jersey. Flowers yellow?

**Least Trefoil.** Pl. procumbent.

156 T. **stipulaceum** (Thunb. prod. p. 136.) stems herbaceous, procumbent at the base; leaflets crenate, villous.—Native of the Cape of Good Hope.

**Stipulaceous Trefoil.** Pl. procumbent.

157 T. **hirsuta** (Thunb. prod. p. 136.) stems herbaceous, diffuse; leaflets oblong, hairy.—Native of the Cape of Good Hope.

**Hairyp Trefoil.** Pl. diffuse.

158 T. **lanaeum** (Thunb. prod. p. 136.) stems herbaceous, decumbent; leaflets ovate, obtuse, pilose; heads of flowers globose, wrinkly, bracteate.—Native of the Cape of Good Hope.

**Woolly Trefoil.** Pl. decumbent.

159 T. **Cape nana** (Willd. spec. 3. p. 1364.) stems herbaceous, decumbent; leaflets ovate, obtuse, pilose; heads of flowers globose, wrinkly, involucrate.—Native of the Cape of Good Hope.

**Cape Trefoil.** Pl. procumbent.

160 T. **Vexillare** (Tenore, prod. p. 43. cat. 1819. p. 58.) stems almost simple, suffruticoso, at the base; leaflets rhomboid-ovate, scarious; spiny-serrate, veiny; spine terminal, globose, villous, pedunculate; calyce segments sessile, spreading, equal in length to the corolla.—Native of Naples, on the rocks of Maggela.

**Rock Trefoil.** Pl. 1/2 foot.

161 T. **Clandestinum** (Lag. nov. gen. p. 23.) stems prostrate; leaflets ovate-cuneate, pubescent, almost entire; heads of flowers ovate, terminal, and axillar; pedunculate; calyce segments stiff, unequal; corolla hidden. **O. H.** Native of Spain; among rubbish about Madrid.

162 T. **Cuspidatum** (Lour. coch. p. 445.) stem suffruticoso, 4 feet high; leaflets linear, entire, ovate cuspidate, flowers capitate, numerous; calyx pilose; vexillum of corolla ovate, distinct, with a purple spot; legume naked, 1-seeded. **G. H.** Native of Cochlin-china. Flowers white.

**Cuspidate-leaffletted Trefoil.** Shrub 4 feet.

163 T. **Ascendens** (Horn. hort. hafn. 2. p. 716.) stems ascending; leaflets ovate, pubescent; heads roundish, terminal, pediclicate, exstipulate; calyx compressed; the segments nearly equal, 3 times shorter than the monopetalous corolla. **2. H.** Native of Georgia.

**Ascending-stemmed Trefoil.** Pl. ascending.

164 T. **Forsskali** (D’Urv. enum. pl. afric. p. 94. no. 691.) stem erect, villous, branched above; leaflets ovate-oblong, mucronate; stipulas large, straight, ending each in a long subulate point; heads ovate, dense, many-flowered; calyx clothed with hoary villi; the segments nearly equal, and very long at length spreading, a little longer than the corolla. **O. H.** Native of the island of Melos. Leaves an inch and more long, and 4 lines broad. Flowers pale flesh-coloured.

**Beautiful Trefoil.** Pl. 1/2 to 1 foot.

165 T. **Lasiocephalum** (Link, enum. 2. p. 263.) stem erect, hairy; leaflets linear; stipulas venticosae; heads of flowers ovate; calyces hairy; the segments lanceolate-subulate, spreading much. **O. H.** Native of the Cape of Good Hope.

**Woolly-headed Trefoil.** Pl. 1/2 foot.

166 T. **Ornatum** (Clark, itin. 3. ex Spreng. neve entd. 2. p. 165.) leaflets ovate, sharply-serrulate, mucronate, glabrous; heads of flowers terminal, roundish, truncate at the base, sterile at the apex; teeth of calyx subulate, equal. **O. H.** Native of? Ornamented Trefoil. Pl.

N. B. **Trifolium Magellanicae** is O’calis eriocarpus, D. C. in annul. sc nat. 4. p. 23.

**Cult.** Many of the species of Trefoil are very showy, and very fit for ornamenting flower borders. All the species will grow in any common garden soil. The perennial kinds are easily increased by dividing the plants at the root in spring, or by seeds, which always ripen in abundance. The seeds of the annual kinds only require to be sown in the open border. Those species marked frame and greenhouse only require to be protected in winter.

**LXLI. ACROPODIUM** (ακρός, akros, the summit, and ποὸς, podos, a foot; in allusion to the legumes being stalked within the calyx.) Desv. obs. legum. ex Schlecth. Linnae. 2. p. 510.

**LXII. DORYCNION** (from ὄγροι, dory, a spear; the ancient plant was used to poison spears. The present genus has, however, nothing to do with the plant of the ancients.) Tourn. inst. 391. t. 211. f. 3. D. C. prod. 2. p. 208.—Lötus, species of Lin. and others.

**LXIII. DORYCNUM** (from ὄγροι, dory, a spear; the ancient plant was used to poison spears. The present genus has, however, nothing to do with the plant of the ancients.) Tourn. inst. 391. t. 211. f. 3. D. C. prod. 2. p. 208.—Lötus, species of Lin. and others.
erect, spreading; leaves sessile; leaflets and stipulas oblong, glaucous, and silky; heads of flowers roundish; pedicels short; legume oblong, 2-seeded, rusty; seeds globose, black, with a white hilum, separated from each other by spongy substance. 

Grecian Dorycnium. Pl. 1 to 2 feet.

4. D. hisrtum (Ser. miss. in D. C. prod. 2, p. 208.) plant clothed with hoary tomentum; stem erect, suffruticose; leaves sessile; leaflets ovate, lanceolate or obvate; stipulas lanceolate; peduncles when bearing the fruit twice the length of the leaves; bracteas lanceolate, equal in length to the calyx; heads many-flowered; pedicels much shorter than the calyx; the segments subulate, and much longer than the tube, but shorter than the corolla; legume turgid, oblong, hardly longer than the calyx; seeds somewhat reniform. H. Native of the south of Europe. Lotus hisrtus, Lin. spec. 1091. — J. Bath. hist. 2, p. 360. Flowers large, pale-red.

6. D. argenteum (Dehll. fl. aegypt. 113. t. 40.) plant silky; stems suffruticos, prostrate; leaflets, stipulas, and bracteas linear-lanceolate; heads 4-6-flowered; pedicels longer than the leaves; calyx segments lanceolate, hardly equalling the corolla in length; legumes thick, ovate, hardly longer than the calyx; seeds globose, few. H. Native of Egypt. D. argenteum Alexandrinium, Lippi, mss. in herb. Juss. Flowers yellow, painted with bay-coloured lines.

Silvery Dorycnium. Pl. prostrate.

7. D. parviflorum (Ser. miss. in D. C. prod. 2, p. 208.) plant clothed with soft hairs; stems rather prostrate; leaflets obvate; stipulas ovate; heads 4-5-flowered; bracteas simple, lanceolate; peduncles longer than the leaves; calyx segments very long, about equal in length to the corolla, which is small; legume oblong, green, rather pellucid, veined transversely, hardly longer than the calyx; seeds roundish, yellowish-green. H. Native of Corsica and the Stechades Islands. Lotus parviflorus, Desf. atl. 2, p. 206, t. 211. D. C. icon. rar. 1, p. 9, t. 30. Lotus hisrtus, D. C. fl. fr. no. 3957. exclusive of the synonymes. Flowers yellowish-green. Carina narrow, and very long.

8. D. microcarpus (Ser. miss. in D. C. prod. 2, p. 209.) plant clothed with pili; stems ascending; leaflets obvate; stipulas ovate or somewhat cordate; bracteas simple, on short peduncles; calyx deeply 5-parted, hardly equal in length to the corolla; legumes 3-4 in a head, rather turgid, glabrous, hardly longer than the calyx; drooping; seeds 9-11? roundish, reniform. H. Native of Spain. Lotus microcarpus, Broth. fl. hisp. 2, p. 119. Flowers yellow.

Small-fruited Dorycnium. Pl. ascending.

9. D. subflorum (Ser. miss. in D. C. prod. 2, p. 209.) plant hairy; stems branched, diffuse; peduncles 2-3-flowered; legumes erect, terete, and are, as well as the corollas, longer than the calyx. H. Native of Spain. Lotus subflorum, Lag.

Trio-flowered Dorycnium. Pl. diffuse.

10. D. sisymbrium (Ser. miss. in D. C. prod. 2, p. 209.) leaflets and stipulas oblong, acute, tomentose, very white; flowers capitate; legumes 2-seeded, incised in the calyx. O. H. Native of the south of Europe. Lotus sisymbrium, Desv. journ. bot. 1814. vol. 1, p. 77.

Trio-seeded Dorycnium. Fl.

11. D. herbaeum (Vill. dauph. 3, p. 417, t. 41.) stems herbaceous, erect; leaflets and stipulas ovoblate, obtuse; calyx pilose; teeth of calyx much shorter than the tube; heads of flowers on long peduncles; bracteas simple, distinct from the head of flowers; legume ovate, 3 or 4 times longer than the calyx, many-seeded. H. Native of the south of Europe. Lotus Dorycnium, Crantz, fl. austral. 402. Flowers white.

12. D. squarrosulus (Vill. dauph. 3, p. 416.) stems suffruticos; leaflets and stipulas oblong-lanceolate, acute; calyx pilose, the teeth much shorter than the tube; heads of flowers on long peduncles; bracteas simple or 3-leaved; legume globose, 1-seeded, twice the length of the calyx; seeds globose, shining, von. H. Native of the south of Europe. Lotus Dorycnium, Lin. spec. 1093. D. monspeliensi, Willld. — Lob. icon. 2, p. 51. f. 1 and 2. Flowers white, but with the keel reddish. Plant hoary.

Cult. Elegant plants of easy culture, growing best in dry soil. They are all easily increased by seeds.

LXXIII. LOTUS (from λοτος of Theophrastus, and Dioscorides, but the true λοτος is Zizyphus Lotos. Lotus was a nymph turned into a tree to avoid the pursuit of Priapus. Ovid. metam. 97, &c. But the name is perhaps of Egyptian origin.) Ser. miss. in D. C. prod. 2, p. 209. — Lotos, species of Lin. L. syn. Dindelphia, Decandria. Calyx tubular, 5-cleft. Wings equal in length to the vexillum. Carina beaked. Legume cylindrical or compressed, wingless. Style straight, crowned by a subulate stigma. — Herbs, with trifoliate leaves, and leafy stipulas. Peduncles axillary, 1-6-flowered, furnished with a floral simple or trifoliate leaf at the apex. Flowers yellow, rarely white or rose-coloured.

1 L. edulis (Lin. spec. 1090.) plant pilose; stems erect; leaflets ovate, ciliated; flowers 1-5; bracteas oval, about equal in length to the calyx; legume turgid, arched, glabrous; seeds globose, compressed, wrinkled from dots. H. Native of the south of Europe. Cav. icon. t. 157. Krokiëra oligoceratos, Monch. meth. 143. — Moris. hist. 2, p. 176, sect. 2, t. 18, f. 5. Flowers yellow. The pods of this plant are eaten in Candia when young by the poorer inhabitants, as we do French beans. Edible-podded Lotus. Fl. July, Aug. Clt. 1759. Pl. trailing.

2 L. ornithocephaloides (Lin. spec. 1091.) plant rather villous; stems diffuse; leaflets ovoblate-rhomboid, entire; stipulas ovate; flowers 3-5 in an umbel; bracteas much longer than the calyx; legume compressed, somewhat lomentaceous, glabrous, a little curved and deflexed, of a bay-colour; seeds globose, compressed, olive-coloured, smooth. H. Native of the south of c c 2

3 L. Peregrinus (Lin. spec. 1090.) plant pubescent; stems diffuse; leaflets obovate, entire; stipulas ovate; flowers 2-3 in an umbel; bracteas longer than the calyx; lateral leaflets smallest and sessile, terminal one larger and stalked; legume compressed, somewhat lomentaceous, glabrous, straight, horizontal; seeds globose, compressed, dark, smooth. O. H. Native of the south of Europe. L. oligoceras, Lam. dist. 3. p. 605. Foreign Bird's-foot Lotus. Fl. July, Aug. Clt. 1713. Pl. diffuse, 2 ft long.

5 L. Tetraphylus (Linn. fl. suppl. p. 340.) plant rather hispid; stipules prostrate; leaves with one stipula only; leaflets obcordate, cuneate, entire; flowers axillary, on long peduncles; bracteas obovate, much shorter than the calyx. O. H. Native of the Balearic Islands and of Cyrenaica, on the mountains. Lam. dist. 3. p. 605. Flowers yellow, but with the vexillum dark-purple on the outside. Leaves having two leaflets on one side, and one on the other, as well as a terminal one.

6 L. Subpinatus (Hook. in Beech. voy. p. 17. t. 8.) plant pilose; stems erect; leaves pinnate, exstipulate; leaflets 5-6, 2 or 3 of these terminal, and other 2 on one side of the petiole, all elliptic; peduncles very short, axillary, solitary, 1-flowered; legume straight, compressed, margins hairy. O. H. Native of Chili, at Concepcion. Flowers yellow. Stigma obtuse, not subulate, as in the rest of the genus. It comes nearest to L. tetraphyllus, that species being furnished with one additional leaflet at the side of the petiole, and this is furnished with 2 unilaterlal leaflets. Stamens diadephous. Lotus uriculatus, Dombey, et Lag. herb. Anthyllis Chilensis, D. C. prod. 2. p. 171. Somewhat-pinnate-leaved Bird's-foot Lotus. Pl. 4 foot.

7 L. Flexuosus (Lam. dist. 3. p. 606.) plant pilose; stems prostrate, branched, flexuous; leaflets and stipulas lanceolate, ciliate, small; flowers solitary; peduncle longer than the leaf; bracteas shorter than the calyx; calyce segments acute, length of tube, but shorter than the corolla. O. H. Native of Europe. Flowers yellow.

§ 1. Style furnished with one tooth.

8 L. glaucus (Ait. hort. kew. ed. 1. vol. 3. p. 92. ed. 2. vol. 4. p. 292.) plant glaucous, and pilose; stems prostrate; leaflets and stipulas thickish, obovate, small; flowers 3-4 in a corysm; bracteas form of the leaflets, shorter than the calyx; pedicels very short; legume somewhat lomentaceous, smoothish, shining; seeds rather globose, black, smooth. 2. F. Native of Madeira. Flowers yellow.

IX. III. Lotus.

9 L. sessilifolius (D. C. cat. hort. mssnp. p. 123.) plant glaucous; stem suffruticose; leaflets rather fleshy, linear, sessile, canescence; stipulas linear; peduncles very long, axillary; flowers corymbose, on short pedicels; legumes cylindrical, glabrous, divaricate; seeds almost globose, small, dark, smooth. 2. G. Native of Tenerife. L. dorynoides, Poir. suppl. 3. p. 507. Flowers yellow.

10 L. Anthylloides (Vent. malm. p. 92. t. 92.) shrubby; leaflets and stipulas spatulate and pilose; bracteas shorter than the calyx; peduncles long; flowers on very short pedicels, disposed in a corysm. 2. G. Native of the Cape of Good Hope. Perhaps only a variety of L. Jacobus, with yellow flowers.

11 L. atopophu'rus (D. C. cat. hort. mssnp. p. 121.) plant glaucous; stem shrubby; leaflets and stipulas obovate, smoothish; bracteas either of 1 or 3 leaflets, obovate; peduncles longer than the leaves; flowers corymbose, on very short pedicels; legumes terete, glabrous; seeds nearly globose, of a greenish-black colour. 2. G. Native of? Perhaps a variety of L. Jacobus, with a hybrid between L. anthylloides and L. Jacobus. Flowers very dark purple.

Dark-purple-flowered Bird's-foot Trefoil. Fl. April, Dec. Shrub 1 to 3 feet.

12 L. Jacobus (Lin. spec. 1091.) plant rather glaucous; stems shrubby; leaflets and stipulas linear or linear-spataulate, rather pilose and canescence, mucronate; bracteas of 1 or 3 linear leaflets; peduncles longer than the leaves; flowers corymbose, on very short pedicels; legume terete, glabrous. 2. G. Native of the Island of St. James. We have also seen this plant in the Island of Tenerife, and in several of the Cape de Verd islands, particularly in St. Jago. Curr. bot. mag. 75. Mill. fig. 165. Comm. hort. 2. p. 165. t. 83. Mœch. meth. suppl. p. 52. Corolla dark-purple, almost black, with the vexillum yellowish.

Var. br. luteus; flowers yellow. Reared in the gardens.

St. Jago Island Bird's-foot Trefoil. Fl. all the year. Clt. 1714. Shrub 1 to 3 feet.

13 L. Arenarius (Brot. fl. lus. 2. p. 120.) stems procumbent, branched, pubescent; branches and peduncles crotchless; leaflets rather acute, cuneate; stipulas ovate; heads 5-10-flowered; bracteas nearly lanceolate, smaller than the calyx; calyx somewhat bilabiata, the two superior teeth longest; legume terete, glabrous. O. H. Native of Portugal, in the sea-sand at Costa da Trafaria, beyond the Tagus. Flowers yellow.

§ 2. Styles without a tooth.

14 L. Broussonetii (Choisy, fl. terneriff. mss. D. C. prod. 2. p. 211.) stems shrubby; leaflets broad, obovate, smoothish; pedioles and branches tomentose; stipulas ovate, obute, solitary, or twin, about the size of the leaflets; corymus of flowers terminal, bracteless, on short peduncles; pedicels and calyxes tomentose; the segments length of the tube. 2. G. Native of Tenerife or Mogador. Flowers yellow.

Broussonet's Bird's-foot Trefoil. Shrub 1 to 2 feet.

15 L. Spectabilis (Choisy, fl. terneriff. mss. D. C. prod. 2. p. 211.) plant quite glabrous; stem suffruticose; leaflets obovate, rather retuse; stipulas ovate-roundish, much smaller than the leaflets; coryms many-flowered, axillary, bracteless; peduncles longer than the leaves; pedicels about the length of the calyxes; calyce segments shorter than the tube; legume
Many-leaved Bird's-foot Trefoil. Shrub 1 foot.

23 L. obtusatus (Ser. mss. in D. C. prod. 2. p. 212.) plant canescent; stems decumbent; leaflets and bracteae obovate, clothed with hoary tomentum, mucronulate, rather thickish; stipulas ovate, much shorter than the peduncles; heads few-flowered; calyce segments obtuse, much shorter than the tube and corolla; style inclosed in the calyx; legume rather terete, bay-coloured, but ending in a yellow mucron. \(2 \times \) H. Native of Egypt. Flowers yellow.

24 L. Garciix (D. C. prod. 2. p. 212.) stems pubescent, branched; leaflets nearly sessile, and are as well as the stipulas obovate-oblong and pubescent; flowers axillary, usually solitary, almost sessile; segments of the calyx oblong, villous; legume glabrous, straight, a little longer than the calyx. \(0 \times \) H. Native of Persia. Aspálatos Persicosis, Burm. fl. ind. 155, exclusive of the synonyms. Legumes black when dry. Corolla hardly longer than the calyx. Stamens diadephous.

Garciix's Bird's-foot Trefoil. Pl. prostrate.

25 L. Dioscoridis (All. pedem. no. 1131. t. 59. f. 1.) stems erect, branched; leaflets obovate, thickish, emarginate, glaucous; stipulas ovate, shorter than the petiole; peduncles axillary, much longer than the leaves, usually 2-flowered; calyce segments lanceolate, longer than the tube, but shorter than the corolla; legumes usually twin, long, torulose. \(2 \times \) H. Native of Piedmont, and about Nice. Flowers small, yellow.

26 L. Gebe1la (Vent. hort. cels. t. 57.) plant glabrous; stems decumbent, rather woody; leaflets and stipulas ovate, rather glaucous; bracteae about equal in length to the calyx; heads of long peduncles usually 3-flowered; calyce segments length of tube, but much shorter than the corolla; legume cylindrical, torulose, thick; seeds globose, bay-coloured. \(2 \times \) H. Native about Aleppo, on Mount Gebel-cher. Flowers large, at first red, but at length becoming pale rose-coloured. The pods or legumes are eaten by the inhabitants of its native country, as French beans are with us.

27 L. Arabicus (Lin. mant. 104.) stems prostrate; leaflets and stipulas obovate-cuneated, equal, hoary beneath; heads few-flowered; bracteae longer than the calyx; peduncles length of bracteae; calyce segments very narrow, longer than the tube; legume terete, very smooth, somewhat torulose; seeds somewhat kidney-shaped, variegated. \(2 \times \) F. Native of Arabia. Jacq. hort. vind. t. 155. Flowers red.

28 L. Decumbens (Poir. suppl. 3. p. 508.) plant pilose; stems slender, decumbent, branched; leaflets and stipulas lanceolate; heads on long peduncles, containing about 4 flowers each; bracteae lanceolate, about equal in length to the calyx; calyce segments acute, hardly longer than the tube; legume rather terete, glabrous, bay-coloured. \(2 \times \) H. Native of the south of France. Flowers yellow, greenish at the apex.

29 L. Pilosissimus (Poir. suppl. 3. p. 504.) plant very pilose; stems branched, rather prostrate; leaflets obovate-lanceolate; stipulas ovate, pubescent; heads on long peduncles, few-flowered; bracteae narrow-lanceolate; calyce segments narrow, acute, longer than the tube; legume nearly terete, glabrous, brown. \(2 \times \) H. Native of the south of France. L. hispidus, Pers. ench. 2. p. 354. but not of D. C. Corolla yellow, but becoming green when dried. Perhaps only a variety of L. hispidus.
LEGUMINOSE. LXXXIII. Lotus s.

Var. β, filiformis (Poir. l. c.) stem and branches filiform and very long; leaflets smaller.

30 L. hispidus (Desf. cat. hort. par. 190.) stems numerous, prostrate; leaflets hispid, oblong-lanceolate; stipulas ovate; heads few-flowered, much longer than the leaves; bracteas lanceolat, length of calyx; calyce segments longer than the tube, but shorter than the corolla; legume compressed, dotted; seeds orbicularly reniform, black. H. Native of France, as Bayonne, and of Corsica. Lois. fl. gall. 490. t. 16. D. C. fl. fr. 5. p. 573.

Flowers yellow.

31 L. unibracteatus (Viv. fl. libry. p. 48. t. 18. f. 4.) plant diffuse, clothed with rufescence hairs; leaflets and stipulas ob-ovate; flowers axillary, solitary; calyces segments lanceolate-linear, setaceous at the apex, much shorter than the corolla; wings length of carina, which terminates in a long beak; bracteas solitary; legume unknown. H. Native of Cyrenaica, on the mountains. Corolla with the vexillum and carina deep-purple, as well as the tops of the wings, the rest yellow.

One-bractcd Bird's-foot Trefoil. Pl. diffuse.

32 L. suaveolens (Pers. ench. 2. p. 334.) stem diffuse, pilose, tomentose; leaflets ovate, rather oblique; bracteas usually solitary; flowers generally 3 on the top of each peduncle; calyx hairy; legume terete. H. Native of the south of France. Flowers 3-5 in an umbel, at first pale-yellow, but at length becoming bay-coloured, smelling like those of Lupinus luteus. The plant is like L. hispidus, but larger.

33 L. angustissimus (Lin. spec. 1090.) stems branched, prostrate, tubular, and are as well as the leaves hispid; leaflets and stipulas ovate or oblong-linear, rather pilose, and glaucous; heads 1-3-flowered; peduncles hardly twice the length of the leaves; bracteas unequal or solitary; calyx loosely hairy; calyce segments fringed, longer than the tube but shorter than the corolla; legume compressed, 2-edged, very slender, and usually solitary; seeds globose, pale-green. H. Native of the south of Europe. In Britain in meadows towards the sea, on the south and western coasts of England; on the rocky beach at Hastings, Sussex; in Devonshire; in a meadow near St. Vincent's Rocks, Bristol. L. angustissimus, Gouan. hort. 384. — J. B. B. hist. 2. p. 356. f. 2. — Morris. hist. vol. 2. p. 175. sect. 2. t. 18. f. 1. Lotus diffusus, Sol. in Smith, fl. brit. 2. p. 794, engl. bot. t. 925. Flowers yellow.

34 L. ciliatus (Ten. prod. p. 44. cat. 1819, p. 58.) stems prostrate; leaflets glabrous, with the margins and calyces ciliolate; legumes solitary, cylindrical, glabrous, sessile. H. Native of Sicily, in humid fields. Flowers yellow. Perhaps only a variety of L. diffusus.

35 L. gracilis (Waltish. et Kt. hung. 254. t. 229.) stems erect, and are as well as the leaves pilose; leaflets and stipulas lanceolate; peduncles twice the length of the leaves, usually bearing about 2 flowers; bracteas equal in length to the calyx; calyce segments narrow, pilose, longer than the tube, but shorter than the corolla; legumes linear, very slender, almost terete, glabrous, 6-times longer than the calyx; seeds nearly globose. H. Native of Hungary. Flowers yellow. Perhaps only a variety of L. angustissimus.

Slender Bird's-foot Trefoil. Fl. Ju. Aug. Clt. 1812. Pl. 1/2 ft. 36 L. lanuginosus (Vent. malm. p. 22. in a note) stems prostrate, branched, and are as well as the leaves woolly; leaflets obcordate; stipulas ovate-roundish; peduncles axillary, elongated, drooping, 1-flowered. H. Native of the Levant. Flowers rose-coloured. Bracteas ovate, hardly equal in length to the calyx; calyce segments lanceolate, hardly longer than the tube, but much shorter than the corolla.

37 L. coimbrensis (Brot. fl. lus. 2. p. 118. phyt. p. 127. t. 53.) plant rather glabrous; leaves glaucous; intermediate leaflet obovate, lateral ones lanceolate; stipulas ovate; peduncles very short, 1-flowered; calyce segments narrow, length of tube, but shorter than the corolla; the tops of the leaflets and stipulas ciliolate and awned; legume cylindrical, very long, arched, glabrous; seeds very numerous, ovate, green. H. Native of the south of Europe, particularly in Portugal, about Coimbra. L. aristatus, D. C. hort. monsp. p. 122. Flowers small, white, with the keel purple.

38 L. glaberrimus (D. C. cat. hort. monsp. p. 122.) plant quite smooth, diffuse; leaflets obovate; stipulas ovate; flowers axillary, solitary, on very short pedicels; legume linear, rather compressed, a little arched. H. Native of? Flowers small, white, but with the carina purple.

39 L. trichoeraeus (Lag. nov. gen. 23.) stems decumbent; leaflets cuneate, pilose; stipulas coriaceous, twice the length of the common petiole; bracteas length of calyx; legumes very long, nearly terete, falcate, tomentose. H. Native country unknown. Flowers white, but the keel is dark purple at the apex. Perhaps a hairy-fruited variety of L. coimbrensis.

40 L. odoratus (Sims, bot. mag. 1233.) plant hairy; stems diffuse; leaflets lanceolate; stipulas ovate; bracteas usually 1-leaved, lanceolate; peduncles long, usually bearing about 5 flowers at the apex; legumes straight, somewhat torulose. H. Native of Barbary. Flowers yellow. Perhaps only a variety of L. corniculatus.

41 L. corniculatus (Lin. spec. 1092.) stems recumbent, pithy; leaflets obovate, acute, entire, glabrous, or a little hairy; stipulas ovate; leaflets of bracteas lanceolate or linear; peduncles very long, each bearing 3-4-5 or 10 flowers at the apex, in a kind of flat umbel; calyx campanulate; the segments length of tube but much shorter than the corolla; legumes spreading, nearly cylindrical; seeds reniform, blackish-green; filaments all dilated; claw of the vexillum obovate. H. Native of Europe, in open grassy pastures, heaths, and commons; plentiful in Britain. Smith, engl. bot. 2004. Curt. fl. lond. 2. t. 56. Mart. rust. t. 53. Fl. dan. t. 991. Stems like the leaves glaucous; underside of the leaves clothed with close-pressed hairs; but sometimes they are quite smooth; when this is the case it is L. arvensis of Schkuhr. handb. 2. t. 211. Flowers bright yellow, fading to an orange-colour, but becoming dark-green in drying. The vexillum is striped with red at the base in front. This plant has been recommended for cultivation under the erroneous names of Milkt-clover and Astragalus glycyphyllus by the late Dr. Anderson, in his Agricultural Essays, as very excellent for fodder as well as for hay; it has been tried as a substitute for clover on moist lands, and seems to succeed very well, but to have no particular advantage over the clover.

Var. β, pilinus (Schleich. cent. exsicc. no. 75.) stems and leaves small; flowers usually reddish on the outside. H. Native of the Alps of Switzerland.

42 L. major (Scop. carn. 2. p. 86.) Stem erect, tubular, more or less pilose, rarely smooth; leaflets obovate, fringed or hairy; peduncles long, bearing from 6-12 flowers in an umbel; calycine teeth stellate; claw of vexillum linear; shorter filaments not dilated; legumes drooping, terete.  2. H. Native of Europe, in wet bushy places, osier-holes, and in hedges and ditches. Smith, engl. bot. 2091. Lotus corniculatus γ, Smith, fl. brit. 794. L. corniculatus β, Hook. scot. 220. L. corniculatus β, major, Ser. miss. in D. C. prod. 2. p. 514. L. uliginosus, Schk. handb. 2. t. 211. Flowers larger and of a duller orange-colour than those of L. corniculatus. Whether there may be any difference in the agricultural qualities of these two plants, and whether the present might be capable of cultivation in wet meadows, no one has hitherto inquired.  

Var. β, villosus; stems and leaves villous; erect. L. villous, Thunb. fl. par. ed. 2. p. 387.

43 L. ciliatissimus (Pers. encl. 2. p. 354.) Plant glaueous and pilose; stems recurrent; leaflets ovate, flabby; root thick, fibrous.  2. H. Native of the south of Europe, in sterile places by the sea-side. Flowers yellow. L. corniculata c, cerasifolius, Pers. 1. c.

45 L. Forsterei (Sweet. hort. brit. p. 206.) Stems recurrent, nearly solid, angular, smooth, and glaueous; leaves glaueous, smooth above, but occasionally clothed beneath with short, close-pressed, bristly hairs; leaflets and stipulas similar, lanceolate, pointed, oblique, except the terminal one, which is obovatelineolate; peduncles 4 or 5-times the length of the leaves, each bearing an umbel of 3-6-flowers, accompanied by a terminal leaf; calyx having its teeth shorter than the tube; legumes spreading, cylindrical, 2-edged.  2. H. Native of Britain in fields and meadows; at Hastings, Sussex; near Bulverhithe; also in meadows near Tonbridge; in Scotland, in moors near Forfar, particularly in the Forest-moor, and at Balichno on the road to Karrymuir. The plant is said also to be native of Switzerland and the Levant, as well as on the sandy shores of Sicily. L. decumbens, Forst. tomh. 86. Smith, engl. fl. 3. p. 314, but not of Poir. Flowers bright-yellow. This plant approaches nearest to L. pedunculatus of Cav. icon. t. 164. But its stem is said to be erect, about 3 feet high, and every part of the plant is perfectly smooth.  

46 L. pedunculatus (Cav. icon. 2. p. 52. t. 160.) Plant smooth; stems erect; leaflets lanceolate, acute, terminal one stalked; stipulas ovate, somewhat cordate; peduncles very long, bearing each a capitately umbel of flowers; bracteas lanceolate, acute, longer than the calyx, which is rather campanulate; calycine segments nearly equal, acute, length of tube, but much shorter than the corolla.  2. H. Native of Spain. Flowers yellow.

47 L. palustris (Wildl. spec. 3. p. 1394.) Stems branched, erect, and are as well as the leaves hairy; leaflets obovate, acute; stipulas ovate, rather cordate, size of the leaflets; heads usually 4-flowered; legume terete, glabrous.  2. H. Native of Candia. Flowers yellow. Habit of L. corniculatus.

48 L. Ambusus (Besser. ex Spreng. syst. 3. p. 282.) Plant herbaceous, decumbent; leaflets obovate-oblong, acute, and are pilose as well as the ovate stipulas; umbels of flowers on long peduncles, somewhat bracteate; legumes torulose, obtuse, awned, spreading.  2. H. Native of Volynia. Flowers yellow.

Ambiguous Bird’s-foot Trefoil. Pl. decumbent.

† Species not sufficiently known.

49 L. intermedius (Pers. encl. 2. p. 354.) Stems erect, villous, herbaceous; leaflets obovate-lanceolate, acuminate; heads roundish, containing 6-8-flowers, axillary, on long peduncles.  2. H. Native of? Flowers purplish.

50 L. trifolium astra (Dresw. in Lam. dict. 3. p. 612.) Plant hairy; stems prostrate; leaflets ovate, obtuse; stipulas ovate, acute, small; flowers capitate; calyx bilabiata; upper lip 2-lobed; lobes acute; lower lip tridentate; bracteas seceae; corolla length of calyx; legume turbid, villous.  2. H. Native of the Levant. Perhaps a species of Dorycnium.

Trefoil-like Bird’s-foot Trefoil. Pl. prostrate.

51 L. candidus (Mill. dict. no. 7.) Stems erect, branched, hairy; leaflets tomentose; heads of flowers nearly globose, hairy.  2. H. Perhaps Dorycnium tomentosum. Flowers pale-red or white.

Cult. The hardy species of Lotus are well adapted for ornamenting rock-work or dry banks. The seeds of the annual kinds only require to be sown in the open border or on rock-work in spring. The greenhouse and frame kinds grow well in any light soil, and young cuttings of them will root if planted in a pot of sand, with a hand-glass placed over them; however, all the species are most easily increased by seeds.

LXXIV. TETRAGONOLOBUS (from tetrá̅, tetra, four, γωνία, an angle, and λοβος, a pod; in reference to the legumes, which are furnished with 4 wings or angles). Scop. carn. 2. p. 87. Mœch. meth. p. 164. D. C. prod. 2. p. 215. —Scandálida, Neck. elem. no. 1306.

Lin. syst. Diadèphila, Decadèdra. Calyx tubular, 5-cleft. Wings shorter than the vexillum. Carina beaked. Style flexuous. Stigma funnell-shaped, at length obliquely beaked. Legume cylindrical, furnished with 4 foliaceous wings, so as to give it a tetragonal appearance.—Herbs, with broad leafy stipulas, trifoliolate leaves, winged petioles, alternate leaflets, axillary, 1-2-flowered peduncles, each furnished with a bract or floral leaf at the apex.

1 T. purpuréus (Mœch. meth. p. 164.) Plant pilose; stems rather decumbent; leaflets obovate, entire; stipulas ovate; flowers solitary or twin; bracteas longer than the calyx; legume glabrous, with broad wings; seeds globose.  2. H. Native of the south of Europe. Lotus tetragonolobus, Lin. spec. 1089. D. C. fl. fr. 4. p. 555. Curt. bot. mag. 151.—J. Bahn. hist. 2. p. 258. f. 2. Flowers dark-purple.

Var. β, minor (Moricand, herb.) stem, leaves, and legumes much smaller.

2 T. biflorus (Ser. in D. C. prod. 2. p. 215.) Plant pilose, rather decumbent; leaflets ovate, somewhat mucronulate, entire; stipulas orbicular-oblong, acuminate; flowers twin or tern; bracteas ovate, shorter than the calyx; legumes pilose, with narrow wings; seeds almost globose.  2. H. Native of Barbary, and in fields about Palermo. Lotus biflorus, Dresw.

3 T. siliquosus (Roth. fl. germ. 1. p. 329.) plant pilose; stems rather decumbent; leaflets ovate, entire; stipulas ovate, bluish; flowers solitary, on long peduncles; bracteobovate-linear, shorter than the calyx; legume smooth, with very narrow wings, \( H. \) Native of Europe, in humid meadows. Lótus siliquosus, Lin. spec. 1089. Lam. ill. t. 611. f. 2. Jacq. fl. aust. 4. t. 361. Flowers yellow.

4 T. maritimus (Roth. fl. germ. 1. p. 329.) plant glabrous, smooth; stems decumbent; leaflets ovate, fleshy, sessile, the edge towards the top having a few scattered hairs, as well as the stem; stipulas ovate, acute, the same size as the leaflets; peduncles long, 1, seldom 2-flowered; bracteobovate-linear, shorter than the calyx, which is hairy at the edge; legume smooth, with narrow wings. \( H. \) Native of Europe, as Sweden, Denmark, the south of France, &c. Lótus maritimus, Lin. spec. 1089. Oed. fl. dan. t. 800. Flowers purple.

5 T. conjugatus (Ser. miss. D. C. prod. 2. p. 215.) plant pilose; stems rather decumbent; leaflets ovate, entire; stipulas ovate, small, acuminate; flowers in pairs; bracteobovate, longer than the calyx; legume glabrous, nearly terete, with very narrow wings, which are hardly curled; seeds ovate, compressed, black. \( H. \) Native about Montpelier. Lótus conjugatus, Lin. spec. 1089. Flowers purple.

LXXV. HOSACKIA (in honour of David Hosack, M. D. F. R. S. Professor of Botany, in the university of New York, a gentleman to whom the scientific men of North America owe the same gratitude as those of England do to Sir Joseph Banks). Douglas, miss. Bentham, in bot. reg. 1257.

Lin. syst. Diadephya, Decándria. Calyx campanulate, 5-cleft. Wings about equal in length to the vexillum. Keel beaked. Style filiform, crowned by a capitata stigma. Legume cylindrical or a little compressed, straight, smooth.—Herbs with impari-pinnate leaves, and with the leaflets usually alternate. Stipulas membranous, minute, or obsolete. Peduncles axillary, long. Flowers umbellate, usually yellow.

1 H. bicolor (Douglas, miss. ex. bot. reg. 1257.) plant glabrous; flowers umbellate, bracteate; leaves with 7-9 leaflets. \( H. \) Native of North America, in overflowed meadows, between Fort Vancouver and the great rapids of the Columbia river. Lótus pienią, Hook, bot. mag. 2913. Root creeping. Stems ascending. Flowers 6-10 in each umbel. Vexillum and carina yellow, but with the wings white.

2 H. decumbens (Bentham, in bot. reg. no. 1257.) plant pubescent; flowers umbellate; bracteae of 1 or 3 leaflets; leaves having 4 or 5 alternate leaflets. \( H. \) Native of North America. Flowers very minute or wanting. Calycine segments linear, equal, villous. Form of petals like those of the preceding species. Filaments all antheriforous.

3 H. persiana (Bentham, l. c.) plant pubescent; peduncles 1-flowered, bearing a 1-leaved bracteae just under the flower; calyx villous; leaves having 3+5 or 5 leaflets. \( H. \) Native of North America, on the banks of the Missouri. Lótus sericus, Pursh, fl. amer. sept. 2. p. 489. Trigonella Americana, Nutt. gen. 2. p. 120. Ser. in D. C. prod. 2. p. 185. Leaflets usually alternate. Stipulas very minute or wanting. Calycine segments about equal in length to the corolla. Flowers yellow.

4 H. fariniflora (Bentham, l. c.) plant quite smooth and glabrous; peduncles 1-flowered, furnished with a bracteae under each flower, which is usually trilobate; calyx almost glabrous; leaves having 4-6 leaflets. \( H. \) Native of North America. Root furnished with pea-formed tubercles. Leaflets alternate, obtuse. Stipulas very minute or wanting. Calyx almost glabrous, its segments short, and sparingly pilose. Corolla as in \( H. \) Persiana, but smaller.

Small-flowered Hosackia. Pl. decumbent.

6 H. repens; plant almost smooth; stems creeping, rooting; leaflets 5 pairs, ovate, slightly mucronulate; heads containing about 5 flowers; calyx striately hairy, with lanceolate teeth. \( H. \) Native of Mexico. Lótus repens, Moc. et Sesse, in herb. Lamb. Resembles H. bicolor. Flowers yellow. Pods linear, compressed. Stig mata capitata.

Creeping Hosackia. Pl. creeping.

Cult. The species of Hosackia are rather showy, and well adapted for ornamenting flower-borders and rock-work. They will grow in any common garden soil, and are easily increased by seeds, or by dividing the plants at the root.

Lin. syst. Diadephya, Decándria. Calyx cup-shaped, 5-toothed. Vexillum broad. Ovary many-seeded. Style simple. Legume few-seeded, with the valves separating from both margins, which are left on the plant even when the seeds have fallen.—A shrub, with flat branches and bluish flowers; the leaves when present ternate or pinnate.

Cult. This shrub is a great ornament to greenhouses in spring and almost all the year, being purposely clothed with beautiful blue flowers. A mixture of loam, peat, and sand suits it best, and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them.

LXXXVII. CYAMOT/SIS (from kwanos, kyamos, a beam,
and opus, resemblance; the plant resembles the bean). D. C. leg. mem. vi. prod. 2. p. 216.

Lin. syst. Monadelphia, Decadria. Calyx turbinately-tubular, 5-cleft; the lobes lanceolate-subulate and acute, the two upper ones rather remote. Petals about equal, at length separating elastically. Vexillum roundish. Wings oblong. Keel composed of 2 petals, straight and acute. Stamens 10, monadelphous. Ovary linear, terete. Style ascending. Stigma capitate. Legume compressed, 2-valved, oblong-linear, beaked, by the aminated style, having 2 nerves near the superior surface, and furnished with cellular substance between the seeds. Seeds 7-8, obovate or truncate, compressed. Endopleura tumid, appearing like albumen. Cotyledons elliptic, flat, thickish, and foliaceous. Primordial leaves simple and ovate.—An erect herb, with subulate stipules, pinnately trifoliolate leaves, ovate, exstipellate, glaucous, dentilicate leaflets, and axillary, short, racemes of small, erect, blue flowers. The hairs on the plant are fixed by their centre, as in Indigofera. The genus appears to be allied to Dölichos or Caryocarca on the one hand and to Lpinus, Psoralea or Indigofera on the other.

1 C. psoraleaeides (D. C. prod. 2. p. 216.). C. S. Native of the East Indies, from whence it has probably been sent into Arabia and the West India Islands. Psoralea tetragonolobus, Lin. manti. 104. Dölichos fakeiformis, Lher. stip. t. 78. Dölichos psoraleoides, Lam. dict. 2. p. 300. Lupinus trifolius, Cav. of. 1. t. 59.

Cult. This plant is not worth cultivating, except in botanical gardens. The seeds of it should be sown in a pot filled with loam and sand, and placed in a hot-bed, and when the plants have grown 2 or 3 inches high, they should be planted singly into separate pots, and replaced again in the hot-bed, where they will ripen their seed. Some of the plants may be planted out in the open border, in a sheltered situation.

Subtribe III. Clitóre (plants agreeing with Clitória in some characters). D. C. leg. mem. vi. prod. 2. p. 216. Legume 1-celled (f. 34. c). Stamens usually diadelphous (f. 34. d). Stems herbaceous or subterranean, usually twining. Perhaps some of the genera should have been placed in Tribe Phasaeae.

LXXVIII. PSORALEA (from ψοράλεος, psoraleas, scurvy; in reference to the scurvy appearance of the calyx, and most parts of the plants, from tubercles). Lin. gen. no. 894. Lam. ill. t. 614. D. C. prod. 2. p. 216.—Dorycnium and Rutéria, Mcnch.

Lin. syst. Diadélphus, Decadria. Sepals 5, joined together to the middle into a 5-cleft, permanent calyx, with the tube usually beset with glands; the lobes acuminate, having the lower one a little more lengthened out than the others. Stamens 10, usually diadelphous, the tenth one is sometimes connected with the others at the base. Legume length of calyx, valveless, 1-seeded, sometimes ending in a beak.—Shrubs or herbs, usually warty from glandular tubercles. Leaves variable. Stipulas adnate to the base of the petiole. Disposition of flowers variable, blue, white, or purpl.

* Flowers axillary, especially sessile, or on simple pedicels in the axils of the leaves, but never disposed in a spike or head.

1 P. odoratissima (Jacq. Hort. schmbr. 2. p. 229.) leaves impari-pinnae; leaflets usually 7-pairs, linear-lanceolate; pedicels axillary, 1-flowered, shorter than the leaves.  h. G. Native of the Cape of Good Hope. Flowers blue and white. Lobes of calyx 5 acute and 2 obtuse, upper one reflexed at the apex, lower one straight. Bracteoles 2, rather distant from the calyx. Sweet-scented Psoralea. Fl. May, Jul. fl. 1725. Sh. 4 to 6 ft.

2 P. arboréa (Sims, bot. mag. 1. 2090.) leaves impari-pinnae; leaflets 5-pairs, linear-lanceolate; pedicels axillary, 1-flowered, longer than the leaves.  h. G. Native of the Cape of Good Hope. Flowers bluish. Bracteoles 2, concrete, approximating the calyx, which is hairy. Stipulas callous, recurved.

3 P. pinnaéa (Lin. spec. 1074.) leaves impari-pinnae; leaflets 2-3-pairs, linear, and are as well as the branchlets rather puberulous; pedicels axillary, 1-flowered, much shorter than the leaves.  h. G. Native of the Cape of Good Hope. Andr. rep. 474. Rutéria pinnaá, Mcnch.—Herm. jung. 1273.

Burn, cap. 22. Flowers blue, striped.

Pinnate-leaved Psoralea. Fl. May, July. Ct. 1690. Sh. 3 to 6 feet.

4 P. levigótá (Lin. fil. suppl. 359.) leaves impari-pinnae, with about 3 pairs of lanceolate leaflets, which are smooth as well as the branchlets; stipulas reduced to acute tubercles.  h. G. Native of the Cape of Good Hope. Flowers purple, but not striped.

Smooth Psoralea. Shrub 2 to 3 feet.

5 P. verrucósa (Willd. spec. 3. p. 1343.) leaves impari-pinnae, with 1 or 2 pairs of lanceolate, glabrous, glaucous leaflets; branches warty; pedicels 1-flowered, usually 3 together, axillary.  h. G. Native of the Cape of Good Hope. P. angustifolía, Jacq. hort. schmbr. 2. p. 226. P. trifória, Thumb? Flowers blue and white. Peduncles sometimes 3-flowered.

6 P. trifória (Poir. dict. 5. p. 683.) leaves almost sessile, trifoliate; leaflets linear-spathulate, ending in a somewhat recurved mucron; branches and calyces pubescent; pedicels in threes, axillary, 1-flowered, and forming something like a spike at the tops of the branches.  h. G. Native of the Cape of Good Hope. P. trifória, Thumb. p. 135. Flowers blue.

Three-flowered Psoralea. Shrub 2 to 3 feet.

7 P. filifórmos (Poir. dict. 5. p. 682.) leaves trifoliate; leaflets filiform, upper ones simple, and are as well as the branches pubescent; pedicels axillary, 1-flowered, solitary.  h. G. Native of the Cape of Good Hope. P. decidua, Berg. pl. cap. 220. Sieb. pl. euc. cap. 37. Branches glandular, but pubescent at the apex. Very like P. tenutifólia.

Filiform-leaved Psoralea. Shrub 2 to 4 feet.

8 P. axillárís (Lin. fil. suppl. 358.) leaves trifoliate; leaflets lanceolate; pedicels filiform, axillary, 1-flowered.  h. G. Native of the Cape of Good Hope. P. lineáris, Thumb. prod. 135. This species is hardly known. The plant preserved in the Banskian herbarium under this name has the leaflets obovate, emarginate, and the flowers almost sessile. Lher. ms.

9 P. tenutifólia (Lin. spec. 1074.) upper leaves simple, the rest trifoliate; leaflets linear-lanceolate, mucronate; pedicels axillary, 1-flowered, solitary.  h. G. Native of the Cape of Good Hope. Jacq. hort. schmbr. 2. p. 225. Rutéria tenutifólia, Mcnch. Very like P. verrucósa, but the branches are smooth. Flowers blue and white, mixed.

10 P. fasciculárís (D. C. prod. 2. p. 217.) leaves trifoliate, but some of them are simple; leaflets linear, very much acuminate; pedicels axillary, 1-flowered, 6 or 8 in a fascicle, a little longer than the flowers.  h. G. Native of the D D
Cape of Good Hope. Lotus tenuifolius, Burm. cap. prod. 23.

* * * Flowers blue.

**Fascicled-flowered Psoralea.** Shrubs 3 to 4 ft.

11 P. Multicaulis (Jacq. hort. schenbr. 2. p. 55. t. 230.) leaves trifoliate, but the upper ones simple; leaflets linear-lanceolate, mucronate; pedicels axillary, very short, aggregate, and somewhat capitate. 2. G. Native of the Cape of Good Hope. Flowers with the vexillum white and the wings and keel violet.

12 P. aprilyla (Lin. mant. 450.) lower leaves trifoliate or simple; leaflets linear-lanceolate, upper ones abortive, scale-formed; pedicels axillary, short, solitary, 1-flowered. 7. G. Native of the Cape of Good Hope. Jacq. hort. schenbr. 223. Sims, bot. mag. 1757.

**Leafless Psoralea.** Fl. May. Cltt. 1790. Sh. 4 to 7 ft.

13 P. Lathyriophila (Balb. st. hort. taur. descr. p. 25, with a figure) leaves simple, ovate, or oval-oblong, ciliated; stipules joined in one, clasping the stem, bifid at the apex; stems decumbent, diffuse; flowers axillary, 1-2, almost sessile. 7. G. Native of the Cape of Good Hope. Flowers blue.

**Descemtient Psoralea.** Fl. April, May. Cltt. 1774. Pl. dec.

15 P. reifens (Lin. mant. 263.) leaves trifoliate; leaflets obovate, obtuse, shorter than the petiole; pedicels 1-flowered, disposed in something like umbels in the axis of the leaves, each furnished with 2 bracteas in the middle. 7. G. Native of the Cape of Good Hope. Calyx pubescent. Flowers blue. Stems trailing and rooting.

16 P. hirta (Lin. amoen. 6. afr. 35.) leaves trifoliate; leaflets obovate, ending in a recurved point, dotted, and pubescent beneath; branches clothed with adpressed hoary villi; flowers axillary, sessile, numerous, upper ones disposed in a spiral manner. 7. G. Native of the Cape of Good Hope. Poir. dict. 5. p. 688. Ononis strigosâ, Burm. cap. 21. but not of Thumb. Flowers blue.

**Haairy Psoralea.** Fl. May, Aug. Cltt. 1713. Sh. 2 to 3 ft.

17 P. Jacquiniana; leaves trifoliate, on short pedioles; leaflets obovate, emarginate, hairy, as well as the rest of the plant; stipules subulate; peduncles axillary and terminal, each bearing a bracteate head of flowers, those at the tops of the branches disposed in interrupted spikes. 7. G. Native of the Cape of Good Hope. P. hirta, Jacq. hort. schenbr. 2. t. 228. P. hirta, var. b, Jacquiniana, D. C. prod. 2. p. 217. Flowers white, but with the vexillum pale violet.

**Jacquin's Psoralea.** Fl. May, Jul. Cltt. 1713. Sh. 3 to 4 ft.

18 P. Aculeata (Lin. spec. 1074.) leaves trifoliate; leaflets cuneiform, ending in a recurved mucrone, glabrous; stipulas prickly-formed; flowers axillary, solitary, sessile, approximate. 7. G. Native of the Cape of Good Hope. Andr. bot. rep. 146. Sims, bot. mag. 2158. Flowers blue and white mixed.

Var. b, capitata; flowers capitata. Thunb. prod. 136. Lam. ill. t. 614. f. 5. 2.

* * * Flowers nearly sessile, and approximate in the axis of the leaves, but capitulate or siliate at the tops of the branches. 19 P. Bracteata (Lin. mant. 264.) leaves trifoliate; leaflets cuneiform, ending in a recurved mucrone, full of pellucid dots, longer than the petiole; heads of flowers terminal, bracteate. 7. G. Native of the Cape of Good Hope. Jacq. hort. schenbr. 2. t. 224. Curt. bot. mag. 446. P. cuneifolia, Broth. Ononis trifoliata, Lin. syst. nat. Trifolium tréutica, Lin. spec. 1085. Stipulas membranous, rather fleshy. Flowers violaceous, but with the keel white. Comm. hort. 2. p. 211. t. 106.

**Bracteate-headed Psoralea.** Fl. June, July. Cltt. 1791. Sh. 3 to 4 feet.

21 P. spicato (Lin. mant. 264.) leaves trifoliate; leaflets obovate-oblong, terminating in a recurved mucrone, beset with black dots beneath; spikes of flowers terminal, oblong. 7. G. Native of the Cape of Good Hope. Wildl. spec. 3. p. 1345. Andr. bot. rep. 411. Flowers blue, mixed with white? This species comes very near P. bracteata, but the leaves are without the pellucid dots which are so conspicuous in that plant.

**Spike-flowered Psoralea.** Fl. June, July. Cltt. 1774. Sh. 2 to 4 feet.

22 P. stachydius (Lin. fl. suppl.) leaves trifoliate; leaflets oblong, mucronate, villous on both surfaces as well as the stems and calyces; spike of flowers terminal, interrupted. 7. G. Native of the Cape of Good Hope. P. stâchýos, Thunb. fl. cap. 608. Leaves dotted above. Petioles 4-5 times shorter than the leaflets. Deafated spike not unlike a head of lavender. Corolla fennugueous.

23 P. striata (Thumb. l. c.) leaves trifoliate; leaflets oblong, mucronate, pubescent beneath; racemes terminal, interrupted. 7. G. Native of the Cape of Good Hope. Flowers blue.

**Striated Psoralea.** Fl. May, Ju. Cltt. 1816. Sh. 2 to 3 ft.

24 P. racemosa (Thumb. l. c.) leaves trifoliate; leaflets oblong, mucronate; racemes terminal, elongated. 7. G. Native of the Cape of Good Hope. Flowers blue.

**Racemose-flowered Psoralea.** Shrub 2 to 4 feet.

25 P. aegœtea (Thumb. l. c.) leaves trifoliate; leaflets ovate, cut, mucronate, silvery; racemes of flowers interrupted. 7. G. Native of the Cape of Good Hope. Flowers blue.

**Silvery Psoralea.** Fl. May, July. Cltt. 1816. Sh. 2 to 4 ft.

26 P. tomentosa (Thumb. fl. cap. 666. but not of Cây.) leaves trifoliate; leaflets oblong, tomentose beneath; heads of flowers terminal. 7. G. Native of the Cape of Good Hope. Flowers blue.

**Tomentose Psoralea.** Fl. May, July. Cltt. 1820. Sh. 2 to 4 ft.

27 P. Astragalifolia (Poir. dict. suppl. 4. p. 587.) leaves trifoliate, glabrous; lower leaflets elliptic-ovate, smaller, superior ones narrow, lanceolate, and longer; spike of flowers terminal, somewhat capitate. 7. G. Native of the Cape of Good Hope. Perhaps the same as P. capitata.

**Milk-etch-leaved Psoralea.** Shrub 1 to 2 feet.

28 P. capitata (Lin. fl. suppl. 339. Thunb. l. c.) leaves trifoliate and simple, linear or elliptic-linear; heads of flowers spicate, terminal. 7. G. Native of the Cape of Good Hope. Vexillum scattered over with dots, similar to those on the leaves. Flowers purple.

30 P. *cornifolia* (Lin. spec. 1075.) leaves simple, ovate, cordate, a little toothed; heads of flowers axillary, on long peduncles. G. Native of the Cape of Good Hope. This species belongs probably to the following division.

*Round-leaved Psoralea.* Shrub.

**Peduncles axillaries, bearing capitate spikes of flowers at their tops.**

30 P. *cornifolia* (Lin. spec. 1075.) leaves simple, ovate, cordate, a little toothed; heads of flowers axillary, on long peduncles. G. Native of the Cape of Good Hope. This species belongs probably to the following division.

31 P. *virga* (Nutt. gen. amer. 2. p. 104.) leaves simple, very remote, almost glabrous, linear-lanceolate, radical ones oblong-obovate; spikes of flowers ovate-oblong, on peduncles, which are shorter than the leaves; bracteas long, subulate, deciduous. H. Native of the west of Florida, between St. Mary's and Satilla river. Stem striated, twiggy, a little pubescent, as well as the leaves. Flowers blue; the vexillum finely striated.

**Twiggy Psoralea.** Pl. 2 feet.

32 P. *acaulis* (Stev. in Bieb. fl. taur. 2. p. 206.) radical leaves trifoliate, on long petioles; leaflets, ovate, obtuse, sharply toothed, the middle leaflet sessile; peduncles radical, very long. H. Native of Western Siberia. Spike of flowers oval-oblong. Flowers purplish. Peduncles pubescent. Leaves hairy, as well as the peduncles. Calyx beset with black hairs.

**Stalkless Psoralea.** Pl. 1 foot.

33 P. *arentaria* (Nutt. gen. amer. 2. p. 103.) leaves trifoli- late, rather pubescent; leaflets linear-lanceolate, obtuse, mucronulate; peduncle axillary, longer than the leaves; spikes of flowers capitately; bracteas deciduous; teeth of calyx obtuse, nearly equal in length, glandular. F. Native of North America, on the banks of the river Missouri. *Psoralea* lanceolata and P. *elliptica*, Pursh, fl. sept. amer. 2. p. 475 and 741. Root creeping. Stems dichotomously, erect. Flowers purplish-blue. The leaves are aromatic when bruised.

34 P. *sinica* (Poir. suppl. 4. p. 587.) leaves pinnately-trifo- liate; leaflets elliptic, obtuse, glabrous, whitish beneath, somewhat emarginate and mucronulate at the apex; racemes very short, axillary, glandless; segments of the calyx linear, elongated, acuminate, and rather villous. F. Native of Siberia. Flowers pale-blue.

**Siberian Psoralea.** Pl. 1 to 2 feet.

35 P. *palestina* (Gouan. ill. 51.) leaves pinnately-trifoliate; lower leaflets ovate, superior ones lanceolate; petioles pubescent, sulcate; peduncles axillary, 2-5-times longer than the leaves; spikes of flowers capitate; calyxes pubescent, at length a little inflated. F. Native of Palestine, south of Tauria, and about Constantinople, and now in the south of France. Jacq. hort. vind. 2. t. 184. D. C. fl. fr. suppl. p. 554. P. bituminosa, Pall. ined. Flowers blue. Very like the following species, but the plant is nearly scentless.

36 P. *bipinnata* (Lin. spec. 1075.) leaves pinnately-trifo- liate; leaflets ovate-lanceolate; petioles pubescent; peduncles axillary, 3-4-times longer than the leaves; spikes of flowers capitate; calyxes pubescent. F. Native of the south of Europe, in exposed places. Lam. ill. 614. f. 1. There is a variety with narrower leaflets. Besl. aest. t. 11. f. 2. *Dorycnium angustifolium,* Moench. Perhaps this last variety is sufficiently distinct from P. frutescens of Poir. dict. 5. p. 684. There is a plant described in Berg. cap. 241. which differs from this in the spikes of flowers being terminal. Flowers with the vexillum and keel purple, and the wings almost white, smelling like the paniculate *Capitatus.* The leaves when handled emit a strong scent of bitumen.

**Butternut-scented Psoralea.** Fl. April, Sept. Clt. 1570. Shrub 2 to 3 feet.

37 P. *sericea* (Poir. dict. 5. p. 687.) leaves pinnately-trifo- liate; leaflets ovate-lanceolate, silky beneath; peduncles axil- lary, 2 or 3 times longer than the leaves; heads of flowers depressed, involucrated; leaflets of the involucre almost equal in length to the calyx. F. Native of the Cape of Good Hope. P. pedunculata, Ker, bot. reg. t. 223. Stipulas narrow, acuminated. Corolla bluish-violet.

38 P. *mutisii* (H. B. et Kunth, nov. gen. amer. 6. p. 487. pl. legum. 191. t. 54.) leaves trifoliate; leaflets lanceolate-oblong, quite entire, glabrous, having the middle nerve, petioles, and branches pilose; spikes axillary, pedunculate, oblong-cylindrical, dense-flowered; calyx clothed with adpressed pil. F. Native of South America, near Santa Fe de Bogota, and about Quito. Indigofera Mexicana, Lin. fil. suppl. 335. Flowers white.

*Mutis's Psoralea.* Shrub 2 to 3 feet.

**** Peduncles axillary, bearing the flowers in loose spikes or racemes at their tops.** Poikadeniir, Ell.

39 P. *pentaphylla* (Lin. spec. 1076.) leaves with 5 leaflets, palmately disposed; leaflets unequal, oval, acute at both ends, pubescent, and glandular, and with the margins ciliate; stem and petioles villous. F. Native of Mexico. B. Juss. act. par. 1744. p. 381. t. 17. The roots are thick, and are supposed to be the *contrayera* of the Shorb.

**Free-leaved Psoralea.** Shrub.

40 P. *esculent* (Pursh. fl. sept. amer. 2. p. 475. t. 22.) plant hairy; leaves with 5 leaflets, which are disposed palmately; leaflets ovate-elliptic, glabrous above; spikes of flowers somewhat capitate, pedunculate, axillary; bracteas ovate, acuminated, each enclosing 3 flowers; corolla hardly longer than the calyx. F. Native of North America, on the elevated plains of the river Missouri. Flowers blue. Root simple, somewhat fusiform, bulbous above the middle; it is rather insipid in taste, but not disagreeable either raw or boiled, the latter is the common mode of preparation of the savages; its texture is laminated, always teneous, solid, and never farinaceous; it is also somewhat medicinal, and operates as a diuretic. It is known to the Canadian boatmen by the name of *Pomme de prairie.*

41 P. *uspida* (Pursh. fl. sept. amer. 2. p. 741.) plant villous; leaves with 5 leaflets, which are disposed in a palmate manner; leaflets ovate-obovate, mucronate; spikes axillary, dense-flowered; calyx segments as well as the bracteas ovate, cus- pidate, conspicuously dotted. F. Native of Upper Loun- sia, on the high plains of the river Missouri. P. macrophylla, Fras. cat. 1813. Root large, tuberous, branched. Flowers blue.

42 P. *esculenta* (Nutt. in. Fras. cat. 1813. gen. amer. 2. p. 102.) plant silky and canescent; leaves having 5 or 9 leaflets, disposed in a palmate manner; leaflets ovate-oblong, glabrous, and few-flowered, interrupted; bracteas acuminated, 3-flowered. F. Native of North America, on the plains of the Missouri. P. arborescens, Pursh. fl. sept. amer. 2. p. 475. Root flagellaribely-fusiform. Flowers small, azure-blue. Like P. *esculent*, but differs in being clothed with soft, white, and silky villi, but not tomentum.
43 P. lupinélla (Michx. fl. bor. amer. 2. p. 56.) plant smooth; leaves on long petioles, having 5 or 7 leaflets, which are disposed palmately; leaflets narrow, linear; racemes axillary, longer than the leaves; bracteas 1-flowered; lower segment of the calyx longer than the rest. 2. F. Native of North America, from South Carolina to Florida. Nutt. gen. amer. 2. p. 1046. Calyx plant leaves having the lower leaves have 7 leaflets, and all the upper ones 5. Flowers purplish, not remarkably small. A very singular plant, the leaflets are so narrow as to be distinguishable from the petiole, 2 or 3 inches long.

44 P. multi'tyga (Ell. sketch. 2. p. 198.) stem branched, smoothish; leaves pinnate, with 9 or 10 pairs of leaflets; leaflets oblongo-lanceolate, obtuse, pubescent; spikes oblong; bracteas small, membranous, glandless. 2. F. Native of Carolina, about Abbeville. Corolla violaceus. Ovary perhaps 1 ovulate.

Many-paired-leafed Psoralea. Pl. 1 to 2 feet.
45 P. tenue'lora (Pursh, fl. sept. amer. 2. p. 475.) plant nearly smooth, much branched; leaves trifoliate; leaflets elliptic; sepals lanceolate, free dots on both surfaces, pubescent beneath; peduncles axillary, few-flowered, longer than the leaves; calycine segments nearly equal. 2. F. Native of North America, on the plains of the Missouri, near the Arkansas village. Habit and mode of vegetation similar to Baptisia tinctoria. Bracteas 3-flowered, shorter than the pedicels. Root flagellately fusiform. Racemes slender, 2 or 3 inches long, interrupted, 9-12-flowered. Flowers very small, pale-purple.

46 P. longitudinala (Pursh, fl. sept. amer. 2. p. 741.) plant clothed with silky villi; leaves trifoliate; leaflets linear, elongated; spikes pedunculated, loose-flowered, shorter than the leaves; teeth of calyx as well as bracteae subulate. 2. F. Native of Upper Louisiana. Leaves glandless. Flowers apparently white.

Long-leaved Psoralea. Pl. 1 to 2 feet.
47 P. JAMESI (Torréy, in. ann. lyc. new york. vol. 2. p. 165.) leaves trifoliate; leaflets ovate, very obtuse, cuneate at the base, quite entire, silky on both surfaces; petioles pubescent; spikes of flowers capitate; bracteas oblongo, acuminate; calyx very hairy; the teeth subulate, and nearly equal. 2. F. Native of Canada, in the plains. Flowers blue. Stamens constantly monadophylous.

James's Psoralea. Pl. ½ foot.
48 P. latifolia (Torréy, l. c.) leaves trifoliate; leaflets broad-ovate, acuminate, smooth, but ciliate on the margins, terminal leaflet on a long petiole; spikes loose-flowered, elongated, axillary; bracteas deciduous; calyx glabrous, with acute teeth. 2. F. Native of the plains of Missouri, near St. Louis.

Broad-leaved Psoralea. Pl. 2 to 3 feet.
49 P. glandulósa (Ell. sketch. 2. p. 198.) plant pubescent and glandless; leaves pinnately trifoliate; leaflets oblongo-lanceolate, entire; racemes of flowers oblong; bracteas broad-lanceolate, ending each in a long acumen, and are pubescent as well as the calyx. 2. ? F. Native of Carolina and Florida, and common in the open forests of Ohio, Kentucky, and Tennessee. Melilotus psoraleoides, Nutt. gen. amer. 2. p. 104. ex Ell. Stem minutely striose, grooved; spike or raceme of flowers 3-4 inches long, on a peduncle, which is from 4 to 6 inches long. Flowers pale-violet, pedicellate. Legume gibbous and transversely veined. The plant appears to be a connecting link between Psoralea and Melilotus.

50 P. meii'loides (Michx. fl. bor. amer. 2. p. 58.) plant pubescent; leaves pinnately trifoliate; leaflets lanceolate, glandular beneath; peduncles racemose, length of leaves; racemes or spikes linear; bracteas acuminate, longer than the calyx. 2. F. Native of Carolina, Florida, Ohio, Kentucky, and Tennessee in open forests. Sims. bot. mag. 2063. Ker. bot. reg. 454. Bart. fl. t. 51. f. 1. P. meii'tosus, Pers. Flowers pale-purple. Legume length of calyx, gibbous, wrinkled, terminated by the style.

52 P. glan'dulósus (Lin. spec. 1073.) plant glabrous; leaves pinnately trifoliate; leaflets ovate-lanceolate, acuminate; peduncles glabrous from glands; racemes axillary, pedunculate, longer than the leaves. 2. F. Native of Chile, where it is common on the shores of the Bosphorus. Sm. fœ. Fl. pers. t. 15. 3. Arct. spec. i. p. 24. t. 11. P. lutea, Mol. chil. 135. P. Cülen. Poir. diet. 5. p. 683. Flowers bluish-purple, the wings and keel white. The plant has the smell of rue, and is considered vulnerary and purgative; the leaves are applied in the forming of a cataplasm to heal wounds, and an infusion of the roots is purgative.

53 P. pur'èscens (Balb. in Pers. ench. 2. p. 347.) leaves pinnately trifoliate; leaflets ovate-oblong, pubescent, dotted on both surfaces; branches, petioles, and peduncles hairy; bracteas and calyces villous and glandular; spike interrupted, rather shorter than the leaves. 2. G. Native of Peru. P. purèscens, Willd. enum. 788. Lindl. bot. reg. 965. Poir. diet. 5. p. 686. P. frutèscens, Poir. diet. Flowers bright blue.

54 P. macròsta'chiya (D. C. prod. 2. p. 226.) leaves pinnately trifoliate, pubescent: leaflets ovate, mucronate; peduncles scabrous from glands; peduncules axillary, 4-times longer than the leaves; spikes cylindrical, and are as well as the rachis, bracteas, and calyces very hairy. 2. F. Native of Nootka Sound, on the north-west coast of America. Bracteas pubescent, length of calyx. Spike a little branched.

Long-spiked Psoralea. Pl. 2 feet.
55 P. canes'cents (Michx. bor. amer. 2. p. 57.) leaves trifoliate, on very short petioles, pubescent; leaflets ovate, on longish petioles; peduncles axillary, 2 or 3-times the length of the leaves; spikes or racemes interrupted; calyx rather gibbous, villous; bracteas ovate, mucronate. 2. F. Native of Carolina and Georgia. Root rather fusiform, bulbous at the neck. Leaves and calyces full of pellicid dots. Flowers blue.

56 P. divarica'ta (H. B. in Willd. enum. 788.) leaves trifoliate, glabrous; leaflets lanceolate; spikes interrupted, pedunculate, axillary, longer than the leaves; stem branched, divaricate. 2. G. Native of Peru, near Guanacabamba. Allied to P. pubèscens. Calyx tormentoso, according to Link, in. P. divaricate. Stipulas ovate, adnate to the base of the petiole. Stamens monadophylous, ex Bonpland, miss. in Kunth, nov. gen. amer. 6. p. 486. Flowers yellow.

57 P. denta'ta (D. C. prod. 2. p. 221.) leaves pinnately trifoliate, glandular, and almost glabrous; leaflets ovate, pendent-toothed, cuneate at the base, and entire; racemes pinate, interrupted, pedunculated, longer than the leaves; bracteas subulate, hardly exceeding the pedicels. 2. G. Native
of Madeira, not of America. P. Americana, Lin. spec. 1075. Jacq. hort. scherv. 227.—Lob. icon. 2. t. 31. f. 1. Flowers white, but the keel is dark purple at the apex. Calyx glandular and smoothish.

Var. β, villosa; calyx glandular and villous. P. polyscy- chya. Poir. suppl. i. p. 587. if the synonyme be rightly attached. Native of Mauritania, near Alessar.

Toothed-leaved Psoralea. Fl. Jul. Aug. Cult. 1610. Sh. 1 ft. 58 P. flaca (Delil. fl. &g. p. 109. t. 37. f. 3.) branches warty from glands; leaves pinnately trilobate; leaflets oblong-lanceolate, plicate, repand-toothed; spikes axillary, longer than the leaves; racis permanent after the flowers have fallen, and becoming hard and spinose. ♂, G. Native of Upper Egypt, at the foot of the mountains between Qurnah and Medyinet-abun.

Plaited-leafletted Psoralea. Shrub 1 to 2 ft. 59 P. obtusifolia (D. C. prod. 2. p. 221.) branches and leaves clothed with adpressed canescent pubescence; leaves tri- foliate; leaflets obvate, plicate, denticulate, the middle one petiolate. ♂, G. Native of the Cape of Good Hope. Burch. cat. 1214. This plant is very much like the preceding species.

Obtuse-leaved Psoralea. Shrub.

† Species not sufficiently known.

60 P. ? xerophylloides (Lour. coeh. p. 444.) arboreous; leaves pinnate; leaflets oblong-ovate; peduncles lateral, many-flow- ered; calyx rather truncate, biglandular at the base. ♂, G. Native of Cochin-china, in woods. Flowers reddish-white.

Reddish-flowered Psoralea. Tree 10 ft. 61 P. ? senectina (Lour. coeh. p. 443.) arboreous; leaves imparipinnate; leaflets ovate, acuminate, glabrous; spikes crowded, nearly terminal; calyx scutate, glandular. ♂, G. Native of Cochin-china in woods. Flowers violaceous. Legume 1-2-seeded.

Stout-calyxed Psoralea. Tree 20 ft. 62 P. ? obovata (Mill. dict. no. 7.) leaves imparipinnate, with 3 or 4 pairs of roundish, villous leaflets; heads of flowers axillary and terminal. ♂, G. Native of Vera Cruz. Flowers yellow, mixed with red.

Humble Psoralea. Shrub 5 to 6 ft. 63 P. ? scandens (Mill. dict. no. 4.) leaves pinnate, with 3 pairs of oval obtuse leaflets; racemes sessile, axillary; stem branched, climbing. ♂, G. Native of Campanea. Flowers blue. Perhaps a species of Gálega.

Climbing Psoralea. Shrub cl.

64 P. ? poststra (Lin. amoen. 6. p. 93.) leaves glabrous, supra-decompound, digitate; lobes and lobules linear, middle one trifid; racemes axillary, pedunculate, roundish; stem decuman- tum. ♂, G. Native of the Cape of Good Hope. Flowers yellow. The plant has the habit of a species of Hermannia. The stipules are ovate and the stamens diadelphous. The legume is unknown, therefore the genus is doubtful.

Prostrate Psoralea. Shrub prostrate.

Cult. All the species of this genus are rather elegant when in bloom. The stove and greenhouse kinds grow best in a mixture of loam and peat, and young cuttings root freely, if planted in a pot of sand, with a bell-glass placed over them; those of the stove species in heat. The frame kinds, or those natives of North America, grow best in heat and sand, and are increased by seeds, or cuttings will strike root.

LXXIX. INDIGOFERA (indigo, a blue dye, stuff, which is a corruption of Indicum, Indian, and fēro, to bear; the greater part of this species of the genus produce indigo). Lin. gen. 889. Lam. ill. 626. D. C. leg. mem. vi. prod. 2. p. 221.

Lin. syst. Deiadelphía, Decandria. Calyx 5-cleft; lobes acute. Vexillum roundish, emarginate (f. 33. a.). Keel furnished with a subulate spur on both sides, at length usually bending back elastically. Stamens diadelphous. Style filiform, glabrous. Le- gume nearly terete (f. 33.c.), or flator-tetragonal, 2-valved, many-seeded, rarely few-seeded or ovate, 1-seeded at the base or sub-globose. Seeds ovate, truncate at both ends, and usually separated from each other by cellular substance.—Herbs or sub- shrubs. Stipulas small, distinct from the petiole. Peduncles axillary. Flowers discolored in racemes, purple, blue, or white. Leaves impati-pinnate, digitate, or simple. Leaflets usually stipulate at the base. The hairs on the plants usually ad- pressed and fixed by their centre.

§ 1. Simplexifolia (from simplex, simple, and folium, a leaf; in reference to the leaves of all the species contained in this division being simple). Leaves simple, sessile, or standing on a very short petiole.

Four-seeded Indigo. Pl. 1 foot.

3 I. paniculata (Pers. ench. 2. p. 7.) leaves oblong-linear, nearly naked; peduncles shorter than the leaves, the alternate ones terminal and panicled, elongated; legume terete, deflexed, 4-seeded, glabrous. ♂, G. Native of Guinea. Stem much branched; branches twiggly. Flowers red.

Panicled Indigo. Shrub 1 to 2 ft. 4 I. simplicifolia (Lam. dict. 3. p. 251.) leaves oblong- linear, almost naked; peduncles shorter than the leaves, each bearing 3 or 4 remote flowers; legume terete, tetragonal, mucronate, erect, 12-16-seeded, glabrous. ♂, G. Native of Sierra Leone. Stem erect, much branched; branches twiggly. Leaves an inch long.

Simple-leaved Indigo. Shrub 1 to 2 ft. 5 I. filifolia (Thunb. prod. 132. fl. cap. 506.) but not of Ker.) leaves and branches filiform; the stigme on the leaves, branches, and calyces are few and adpressed; racemes pedun- culate, few-flowered; legume deflexed, filiform. ♂, G. Na- tive of the Cape of Good Hope. Flowers red or purple.

Thread-leaved Indigo. Fl. July, Oct. Cult. 1812. Sh. 1 ft. 6 I. oblongifolia (Forsk. descr. 137. Vahl. symb. 1. p. 55.) leaves simple, oblong, silky; racemes axillary, 3-times longer than the leaves; calyx and vexillum villous. ♂, G. Native of Arabia Felix at Loujahan. A deection of the herb is used in Egypt against the colic.

Oblong-leaved Indigo. Shrub.

7 I. depressa (Thunb. prod. 132. fl. cap. 506.) leaves ovate, silky; branches stiff, pubescent; spikes terminal, leafy, silky. ♂, G. Native of the Cape of Good Hope. Willd. spec. 3. p. 1222. Flowers red.

Depressed Indigo. Shrub prostrate.

8 I. ovata (Thunb. prod. 132. fl. cap. 506.) leaves simple, ovate, villous; stem erect, glabrous; racemes terminal, ovate. ♂, G. Native of the Cape of Good Hope. Flowers red.

Ovate-leaved Indigo. Shrub.

9 I. myrsinifolia (Rottl. in herb. Balb.) leaves elliptic, mucronate, beset with adpressed stigme on both surfaces; stems, branches, and legumes clothed with simple villi; flowers axil- lary, solitary, almost sessile, disposed in a leafy raceme; legume
nearly terete, hardly 3-times longer than the calyx. 7. S. Native of the East Indies.

_Mysore_ Indigo. Shrub.

10 I. _echinata_ (Wild. spec. 3. p. 1222.) leaves obovate, glabrous; stem prostrate, compressed at the apex; racemes axillary, about equal in length to the leaves; legumes falcate, echinated. O. S. Native of Tranquebar. I. prostrata, Roxb. but not of Wild. Flowers purple.

_Echinatus_-leaved Indigo. Pl. prostrate.

11 I. _cordifolia_ (Roth. nov. spec. 357.) hoary and pilose; leaves simple, cordate, roundish, mucronate, almost sessile; flowers axillary, sessile. O. S. Native of the East Indies. Flowers small, purple.

_Cordata-leaved_ Indigo. Pl. prostrate.

§ 2. _Oligophylla_ (from oligos, few, and φυλλον, phyllon, a leaf; in reference to the species contained in this section having the leaves composed of very few leaflets). _D. C._ prod. 2. p. 222. Petiole elongated. Leaflets 1 or 3, terminal one stalked, the rest lateral, usually only one pair.

12 I. _Monophylla_ (D. C. prod. 2. p. 222.) leaves and branches hoary from adpressed down; petiole furnished with 2 little stipulas at the base; leaflet one, obovate, mucronate, feather-nerved; racemes much longer than the leaves; corolla clothed with rafous villi; legume spreading, straight, somewhat compressed, clothed with reflexed down. 7. G. Native of New Holland, on the eastern coast. A very distinct species: the leaves appear impari-pinnate, but are reduced to the terminal leaflet.

_One-leaved_ Indigo. Shrub 2 feet.

13 I. _Diphylla_ (Vent. choix. t. 30.) plant decumbent and pubescent; leaves petiolate, bifoliate; leaflets ovate, one of which is terminal the other lateral and smaller; racemes length of leaves; legumes arched, compressed, 2-4-seeded. O. S. Native of Africa. Flowers small, rose-coloured.

_Var. ß, lamuniosa_ (D. C. prod. 2. p. 223.) plant clothed with lanuginous stigae; stem and legumes very hispid. O. S. Native of Africa. I. glauca, Perr. in litt. but not of Lam.

14 I. _Subulata_ (Vahl. in Poir. suppl. 3. p. 150.) erect, glabrous; leaves petiolate, trifoliate; leaflets ovate-elliptic, the lateral leaflets seldom absent; racemes slender, shorter than the leaves; legume reflexed, slender, terete, acuminate, many-seeded. O. S. Native of Guinea (Thomson), Jamaica (Bertero). I. mucronata, Spreng. in herb. Balb. Stipulas subulate. Flowers pale-red.

_Subulate-stipulata_ Indigo. Pl. 1 foot.

15 I. _Clitoria_ leon; plant hairy, herbaceous, branched; leaves ternate; leaflets lancolate, obtuse; racemes elongated, axillary; legume hairy, straight. O. S. Native of Sierra Leone, in arid places. Flowers flesh-coloured.

_Clitoria-like_ Indigo. Pl. 1 foot.

16 I. _Engonis_; herbaceous, erect; stem simple; leaves ternate; leaflets elliptic, acute, hairy; racemes elongated, axillary; legume short, compressed, hairy. O. S. Native of Sierra Leone, in arid places.

_Elongated-racemed_ Indigo. Pl. 1 foot.

17 I. _Pilosa_ (Poir. suppl. 3. p. 151.) branches slender, pilose; leaves of 1 or 3 elliptic leaflets, on short petioles; pedicels axillary, 1-flowered; calyxes hairy. O. S. Native of Guinea. Flowers red.

_Pilose_ Indigo. Pl. 1 foot.

18 I. _Leschenaulti_ (D. C. prod. 2. p. 223.) branches angular, finely pubescent; leaves on long petioles, trifoliate; leaflets oval, obtuse, terminal one largest; racemes shorter than the leaves, many-flowered, sessile, only bearing fruit at the base; legumes straight, spreadingly deflexed, tetragonal, acute, 8-10-seeded. O. S. Native of Bengal. Flowers purple.

19 I. _trifolifera_ (Linn. amon. 4. p. 257.) plant ascending, rather pubescent, exstipulate; leaflets 3, oval-oblong, pilose, mucronulate; flowers axillary, almost sessile, glomerate; legume obliquely tetragonal, pendulous, scabrulous, 5-6-seeded. O. S. Native of the East Indies. Lateral leaflets opposite. Flowers red.

20 I. _aristata_ (Spreng. syst. 3. p. 273.) leaflets 3, spatulate, mucronately-awned, hoary from hairs on both surfaces; pedicels axillary, 1-flowered; calyce segments capillary and plumose. O. G. Native of the Cape of Good Hope.

_Arnedleaved_ Indigo. Pl. decumbent.

21 I. _multicaulis_ (D. C. prod. 2. p. 223.) stems numerous, slender, diffuse; stipulas subulate, small; leaflets 3, oblong-cuneated, obtuse, mucronate; flowers axillary, sessile, glomerate; legumes pendulous, compressed, acute, 5-6-seeded, scabrulous from adpressed pili, which are fixed by their centre, as well as the stems and leaves. O. G. Native of Nipaul. I. trifoliata, D. Don, prod. fl. nep. 245. The terminal leaflet of a short petiole. Legume obliquely tetragonal. D. Don. Flowers small, red.

22 I. _gracilis_ (Spreng. syst. append. p. 285.) stem diffuse, branched, smoothish; leaflets 3, elliptic, mucronate, glabrous above, but rather striose beneath; stipulas subulate; racemes few-flowered; legumes hairy, reflexed, few-seeded. 7. S. Native of the Cape of Good Hope. Flowers red or purple.

_Slender_ Indigo. Shrub diffuse.

23 I. _Timorensis_ (D. C. prod. 2. p. 223.) erectish, hoary in every part from adpressed pubescence, which is fixed by the centre; leaflets 3, obovate-oblong, glandless; racemes axillary, length of petiole; legumes spreading, tetragonal, straight, 6-8-seeded. O. S. Native of the East Indies.

_Timor_ Indigo. Pl. 1 foot.

24 I. _glandulosa_ (Willd. spec. 3. p. 1287.) erect; branches angular, rather pilose; leaflets 3, oblong-obovate, pilose beneath, and covered with glandular dots; racemes shorter than the petioles; legume muricate. O. S. Native of the East Indies. Flowers purple.

25 I. _diversifolia_ (D. C. prod. 2. p. 223.) plant diffuse, rather hairy from adpressed pubescence, which is fixed by the centre; leaflets 3 or 3, oblong, the terminal one longest, the rest solitary, alternate or opposite; peduncles 1-3-flowered, rather longer than the petioles; legumes straight, spreadingly deflexed, rather downy. 7. S. Native of Bourbon. Stem slender, a finger high, suffruticosum at the base.

_Diverse-leaved_ Indigo. Pl. diffuse.

26 I. _bracteolata_ (D. C. prod. 2. p. 223.) stem herbaceous, erect, much branched; branches terete, rather hairy, at length glabrous; cauline leaves few, impari-pinnate, having 3 or 5 leaflets, those on the branches bracteae-formed, oval, sessile, simple, all covered with adpressed bristles; legume oval-oblong, acute, compressed, 1-2-seeded. O. S. Native of Senegal. Crotalária bracteolata, Perr. in litt. Perhaps the axillary branches are elongated peduncles, furnished with leaf-like bracts, and bearing solitary flowers in the axils of these bracts.

_Bracteolate_ Indigo. Pl. 1 foot.

27 I. _biflora_ (Roth. nov. spec. 358.) shrubby, erect, clothed with rufescent down; leaflets 1-3, elliptic, acuminate, 3-nerved, scabrulous; peduncles axillary, 2-flowered, equal in length to the petioles; legume ovate, 2-seeded, mucronate, glabrous. 7. S. Native of the East Indies. Flowers dark-purple.

_Two-flowered_ Indigo. Shrub 1 to 2 feet.
28 I. peregrina (D. C. prod. 2. p. 224.) stem terete, filiform, glabrous, suffruticos; leaflets 3, about equal in size and shape, oblong-linear, acute, pubescent above, dotted and strigose beneath; flowers 2, axillary, nearly sessile; legume reflexed, tetragonals, straight, 5-6-seeded. G. Native of the East Indies. Lotus peregrinus, Burm. fl. ind. 175; but not of Lin. Trifolium peregrinum, òbre råbro, Kleinb. in herb. Burm. Flowers red.

Foreign Indigo. Pl. procumbent.
29 I. ENEUMA (Jacq. hort. scheunbr. 2. t. 233.) suffruticos; erect, glabrous; leaflets 3, obcordate or obovate; racemes pedunculate, few-flowered, hardly twice the length of the leaves; legume terete, acute, pendulous. G. Native of the Cape of Good Hope. Lodd. bot. cap. 500. Flowers red, streaked with white in the middle. "Blufl. cap. 597.

30 I. AAMEGA (Alt. hort. kew. 3. p. 68.) plant suffruticos, erect; leaflets 3, oval, rather pilose, mucronate, pale beneath; spike pedunculate, many-flowered; 4-times the length of the leaves; calyxes loose; legume terete, acute, pendulous. G. Native of the Cape of Good Hope. Jacob, hort. scheunbr. 2. t. 234. Ker. bot. reg. 300. I. heterophylla, Thunb. fl. cap. 597. Flowers deep red.

31 I. RODA (Willd. enum. 780.) plant shrubby, erect; branches angular, pendulous; leaflets 3, obovate orbicular, retuse, covered beneath with strigose pili. G. Native of the East Indies. Flowers and fruit unknown.

32 I. MUTISI (Spreng. syst. 3. p. 274.) branches clothed with pilose pubescence; leaflets 3, and are as well the stipula ovate and glabrous; spikes of flowers panicked. G. Native of New Granada. I. Mexico, Lin. ill.

Mutis's Indigo. Shrub.
33 I. VIRGA (D. C. prod. 2. p. 224.) plant suffruticos, erect, slender; branches terete; leaflets 3, obcordate, mucronate by an awn, somewhat coriaceous, glabrous above and pubescent beneath; racemes somewhat spicate, shorter than the leaves; calyces villous. G. Native of the East Indies. Flowers purplish.

Var. 8, pareifolia (D. C. prod. 2. p. 224.) leaflets obovate, smaller. G. Native of China.

34 I. COMPLANATA (Reichb. ex Spreng. syst. append. p. 284.) branches flat, 2-edged; leaflets 3, lanceolate-linear, acute, silvery beneath, very short, adpressed strigose; racemes many-flowered, terminal; calyx white. G. Native of the Cape of Good Hope. Flowers red.

Flat-stemmed Indigo. Shrub 1 foot.
35 I. CANESCENS (Lam. dict. 3. p. 251.) the whole plant clothed with adpressed canescent down; branches angular; leaflets 3, ovate, obtuse, terminal one largest; racemes axillary, sessile, shorter than the leaves; legume straight, linear, tetragonal, white, spreadingly reflexed. G. Native of the East Indies. Flowers red.

Canescent Indigo. Shrub 1 foot.
36 I. NIVEA (Willd. herb. ex Spreng. syst. 3. p. 273.) erect, and clothed with silky white down; leaflets 3, obovate, obtuse; racemes shorter than the leaves. G. Native of the Cape of Good Hope. Flowers red.

White-leaved Indigo. Shrub 1 to 2 feet.
37 I. PAUCHFOLIA (Delil. fl. aegypt. 107. t. 37. f. 22.) plant shrubby, erect, clothed with white adpressed down; branches terete; leaflets 1 to 4, oblong, mucronulate, lower ones smallest, usually alternate; racemes somewhat spicate, longer than the leaves; legumes somewhat filiform, torulose. G. Native of Egypt, in Elephant Island, and of the East Indies. Flowers probably red. Very like the following species.

Few-leaved Indigo. Shrub 1 to 2 feet.

§ 3. Multijuga (from multus, many, and jugum, a yoke or pair; in reference to the leaves being composed of many yokes or pairs of leaflets). Leaves impari-pinnate, having usually many pairs of leaflets, rarely 2 pairs only.

* Ptiloles elongated. Stems shrubby.

38 I. AROBNTA (Lin. mant. 27. but not of Burm.) shrubby; branches terete, white from silky adpressed down; leaves with 1-2 pairs of obovate leaflets, which are clothed with silky pubescence; racemes shorter than the leaves; legumes pendulous, somewhat compressed, torulose, canescent, 2-4-seeded. G. Native of Egypt, Arabia, and the East Indies. "Lher. strup. t. 29. I. articulata, Gouan. ill. 49. I. glauces, Lam. dict. 3. p. 246. I. tinctoria, Forsk. descr. 183. This plant is gathered in Barbary and Egypt for indigo. According to Desfontaines it is cultivated extensively in the kingdom of Tunis for dyeing; but he says it is not indigenous there. The Arabs call it Habail. Flowers with the vexillum and keel yellow and wings red.

39 I. TINCTORIA (Lin. spec. 1001.) stem suffruticos, erect; leaves pinnate, with 4-7 pairs of obovate leaflets, which are pubescent beneath; racemes axillary, shorter than the leaves; legumes terete, torulose, arched, 8-10-seeded. G. Native of both Indies and tropical Africa, where it is cultivated to a great extent.—Sloan. jan. 2. t. 179. f. 2.—Rheed. mal. 1. t. 54. Rumph. amb. 5. t. 8. I. sumatrana, Grrntn. fruct. 2. p. 317. t. 148. Lam. ill. t. 626. f. 1. Perhaps I. curvata of Roxb. hort. beng. p. 55. is sufficiently distinct from this plant. I. indica, Lam. dict. 3. p. 245. Flowers with a pale vexillum and red keel and wings. Indigo is one of the most profitable articles of culture in Hindostan, because an immense extent of land is required to produce but a moderate bulk of the dye; because labour and land there is cheaper than anywhere else, and because the raising of the plant and its manufacture may be carried on even without the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, perfectly free from weeds, and dry if naturally moist. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise if the seed is deposited in a dry soil or in the dry season, it heats, corrupts, and is lost. The crop, being kept clear of weeds, is fit for cutting in 2 or 3 months, and it may be repeated in the rainy season every six weeks. The plants must not be allowed to come into flower, as the leaves at that time become dry and hard, and the indigo produced is of less value, nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. Being cut, the herb is first steeped in a vat till it has become macerated, and parted with its colouring matter, then the liquor is let off into another vat, in which it undergoes the peculiar process of beating, to cause the fecula to separate from the water. This fecula is then let off into a third vat, where it remains some time, and is then strained through cloth bags, and evaporated in shallow wooden boxes placed in the shade. Before it is perfectly dry it is cut into small pieces of an inch square; it is then packed in barrels or stowed in sacks for sale. Indigo was not extensively cultivated in India before the British settlements were formed there; its profits were at first so considerable, that, as in similar cases, its culture was carried too far, and the market glutted with the commodity. The indigo is one of the most precarious of oriental crops, being liable to be destroyed by hail-storms,
which do comparatively little injury to the sugar-cane and other plants.

Indigo has long been cultivated in Spain, but has been long on the decline in that country, owing to the more favorable circumstances of the East and West Indies. It was tried in the south of France and Italy during the time of Bonaparte, and found not worth following for the same reason.

The indigo commonly cultivated in the West Indies is the \textit{I. A. nil}, and sometimes \textit{I. tinctoria} and \textit{I. Guatimala}, though there are various species and varieties which afford a similar dye. \textit{Indigo} thrives best in free rich soil and a warm situation, frequently refreshed with moisture. Having first chosen a piece of ground and cleared it, hoed it into little trenches, not above two inches or two inches and a half in depth, and not more than 15 or 15 inches asunder. In the bottom of these at any season of the year, strew the seeds pretty thick, and immediately cover them. As the plants shoot they should be frequently weeded, and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate \textit{indigo} in great quantities, only strew the seed pretty thick in little shallow pits, hoed up irregularly, but generally within 4-5 or 6 inches of each other, and covered as before. Plants raised in this manner are observed to answer as well or rather better than the others, but they require more care in the weeding. The plants grow to full perfection in 2 or 3 months, and are observed to answer when cut in full blossom. They are cut with reaping hooks, a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper. Seventeen negroes are sufficient to manage twenty acres of \textit{indigo}; and one acre of rich land, well planted, will, with good seasons and proper management, yield 500 pounds of \textit{indigo} in twelve months, for the plant after being cut sends out stolons or new growths, and gives 4 or 5 crops a-year, but must be replanted or resown afterwards. (P. Browne.)

According to Loureiro \textit{indigo} is spontaneous in China and Cochin-China, and is cultivated all over those vast empires. The ancients were acquainted with the dye which we call \textit{indigo} under the name of \textit{indicum}. Pliny knew that it was a preparation of vegetable substance, though he was not acquainted with the plant nor the process of making the dye. Even at the close of the sixteenth century it was not known in England what plant produced \textit{indigo}. For in the Remembrancer for Master T. by Richard Barkly in 1582, he was instructed to know if \textit{Anil}, that coloureth blew, be a natural commodity of those parts (Turkey) and if it be compounded of an herb, to send the seed or root, with the order of sowing, \\&c. that it may become a natural commodity in the realm as woad is, that the high price of foreign woad might be brought down."

\textit{Dyer's Indigo}. Fl. July, Aug. Ct. 1731. Shrub 2 to 3 ft. 40 \textit{I. Guatimala} (Lam. hort. jan. 1. p. 429.) plant shrubby, erect; leaves pinnate, with 4 or 5 pairs of lanceolate leaflets, which are hoary beneath; racemes axillary, shorter than the leaves; legumes recurved, declining, gibbous at the summit, many-seeded. \textit{h. S.} Native of South America, at Guatimala. \textit{I. tinctoria} \textit{b}, brachycarpa, D. C. prod. 2. p. 234. Flowers red.

Dr. Patrick Browne says this plant seldom exceeds 3 or 4 feet high, throwing out many suberect branches as it rises. It is said to be much hardier than \textit{I. tinctoria} or \textit{I. Anil}, and affords a finer pulp, but it does not yield so great a quantity, and is only cultivated where the seasons are not so certain, or in mixed fields. The former yielding more of the dye than either of the others is generally preferred, though liable to many more mischieves.

\textit{Guatimala Indigo}. Fl. July, Aug. Ct. 1731. Sh. 3 to 6 ft. 41 \textit{I. Anil} (Lam. mnt. 272.) plant shrubby, erect; leaves pinnate, having 3-7 pairs of oval or oblong leaflets, hardly pubescent beneath; racemes axillary, shorter than the leaves; legumes compressed, not torulose, deflexed, arched, with the sutures on both sides rather prominent. \textit{h. S.} Native of South America, spontaneous, but cultivated for indigo in both Indies. See \textit{I. tinctoria} for culture and uses. Dr. Miller says this plant grows to the height of 5 or 6 feet (if this be his \textit{I. suffruticosa}), and that being a much larger plant than \textit{I. tinctoria}, it will afford a greater quality of \textit{indigo} from the same compass of ground, than any of the other species, especially if cut before the stems grow woody; it will also grow on poorer land. It is very common in Jamaica, growing wild in all the savannahs, where doubtless it had been cultivated in former times. It is harder than any of the other sorts, and grows very luxuriantly, even in the driest lands; but it does not yield so much pulp, according to P. Browne; the dye, however, that is extracted from it is generally the best, of a fine copperish cast, and of a fine grain. The plant is called \textit{Abil-nil} or \textit{Nilé} by the Arabs, and \texti{Nil} by the Bengalies.

\textit{Var. a}, oligophylla (D. C. prod. 2. p. 225.) leaves having 3-4 pairs of leaflets; legumes arched. \textit{h. S.} Sloan. jum. t. 176. f. 3. Lam. ill. t. 629. f. 2. Native of South America, and the West Indies.

\textit{V. b}, polyphylla (D. C. l. c.) leaves having 5-7 pairs of leaflets; legumes arched. \textit{h. S.} I. Corneziel, Moc. et Sesse, fl. mex. icon. ined. Native of South America, and the West Indies.

\textit{Var. c}, orthocarpa (D. C. l. c.) leaves having 5-7 pairs of leaflets; legume deflexed, straight. \textit{h. S.} Runn. amb. 5. t. 80.? East Indies and Madagascar. Perhaps a proper species. \textit{Anil} or West Indian Indigo. Fl. July, Aug. Ct. 1731. Shrub 2 to 4 feet.

42 \textit{I. Thibaudiana} (D. C. prod. 2. p. 225.) stem suffruti- cose, erect; leaves pinnate, having 10 or 11 pairs of elliptic, retuse, mucronate leaflets, which are pubescent on both surfaces; racemes length of leaves; legume pulvinate, straight, linear, compressed, tapering into an acumen at the apex, 8-10-seeded. \textit{h. S.} Native of Mexico. Legumes disposed in a raceme, which is 30 or 40 inches long. Flowers dark purple.

\textit{Thibaud's Indigo}. Shrub 5 to 6 feet.

43 \textit{I. Leptostachya} (D. C. prod. 2. p. 225.) stem suffruti- cose, erect; leaves pinnate, with 5-10 pairs of leaflets; leaflets elliptic-obovate, retuse, mucronate, rather pubescent on both surfaces; racemes axillary, slender, length of leaves; flowers distinct, erect; legume reflexed, straight. \textit{h. S.} Native of the East Indies. Flowers red, about 20 in a spike.

44 \textit{I. uncina}a; shrubby, erectish, branched, stiff; leaves pinnate, with 5 pairs of lanceolate, mucronate pubescent leaflets; racemes short, spicate, axillary, sessile; legumes arched, crowded. \textit{h. S.} Native of Sierra Leone, in waste places.

\textit{Hooked-podded Indigo}. Shrub 2 feet.

45 \textit{I. atropurpurea} (Hamilt. in Horn. hort. hafn. add. 152.) shrubby, erect; leaves pinnate, with 5-7 or 10 pairs of oval, retuse, mucronate leaflets, having their margins rather undulated, younger ones covered with adpressed pubescence, adult ones nearly glabrous; racemes axillary, slender, lower ones length of leaves; calyx silky; legume straight, compressed, mucronate, pulvinate, 8-10-seeded. \textit{h. G.} Native of Nipaul, at Narain-hetty. D. Don, prod. fl. nep. 244. Flowers showy, dark-purple. Stipulae obsolete.

46 \textit{I. Dousa} (D. Don, prod. fl. nep. 244.) shrubby; leaves pinnate, having 10-16 pairs of oval use, mucronate leaflets, which are clothed with rufescent pili on both surfaces, as well as the branches; spikes axillary, shorter than the leaves; bracteas and stipulas linear and hispid; teeth of calyx ovate,
LXXIX. Indigofera.

209

Acute. \( \gamma \). G. Native of Upper Nipal, at Snembo, where it is called *Dosi-sra* by the Nawaiis. Flowers purple.

*Dosi-sra* Indigo. Shrub 2 to 4 feet.

47 I. **galeoides** (D.C. prod. 2. p. 225.) stem erect; leaves pinnate, having 8 or 9 pairs of elliptic, mucronate leaflets, which are beset with minute pubescence on both surfaces; racemes axillary, one half shorter than the leaves; legumes erect, straight, linear, acuminate, compressed, rather callous at the sutures on both sides. 10-12-seeded. \( \gamma \). S. Native of Ceylon. Legume 2 inches long and hardly a line broad.

*Galega*-like Indigo. Shrub 3 to 4 feet.

48 I. **cassioïdes** (Rott. ex herb. Balb. D.C. prod. 2. p. 225.) stem suffrutescent, erect; leaves pinnate, having 4 or 5 pairs of elliptic-obovate, retuse, mucronulate leaflets, which are rather pubescent on both surfaces; racemes length of leaves; legumes spreading, rather compressed, glabrous, 10-seeded, with the suture thick and prominent on both sides. \( \gamma \). S. Native of India, on the Nellignory mountains, where it is called *Maniligiuda*. The leaves are nearly like those of a species of *Colutea*. Legume slight, an inch long.

*Cassia*-like Indigo. Shrub 3 to 4 feet.

49 I. **cylixerica** (D.C. prod. 2. p. 225.) stem suffrutescent; leaves pinnate, having 4 or 5 pairs of obovate-obtuse, obtuse, or emarginate, glabrous leaflets; racemes longer than the leaves; legumes spreading, straight, cylindrical, 8-10-seeded, glabrous, with the sutures not prominent. \( \gamma \). G. Native of the Cape of Good Hope. Leaves very like those of *Colutea*. The legume almost like that of *Calophyæa*, about an inch long, and about 2 or 3 lines in diameter.

*Cylindrical*-poddled Indigo. Shrub 1 to 2 feet.

50 I. **Iucina** (Delam. herb. amat. t. 227.) stem shrubby, erect, and as well as the leaves smooth; petioles elongated, filiform, in the young plants the leaves are furnished with 3 or 4 pairs of obovate-oblong leaflets, but at length almost all nearly leafless; racemes erect, shorter than the petioles; legumes reflexed. \( \gamma \). G. Native of the Cape of Good Hope. I. aphylla, Link. enum. 2. p. 281. I. filifolia, Ker. bot. reg. 104. Lebekcia contaminata, Ait. hort. kew. ed. 2. vol. 4. p. 261. but not of Thorn. Spâritium contaminatun, Ait. hort. kew. ed. 1. vol. 5. p. 16. but not of Lin. Flowers purple.

I. **aestifolia** (Willd. spec. 3. p. 1235.) shrubby; branches terete, rather pubescent; leaves pinnate, having 5-7 pairs of elliptic-obtuse, glabrous leaflets; racemes rather shorter than the leaves; legumes spreading, terete, straight, glabrous, 8-10-seeded. \( \gamma \). G. Native of New Holland. Lod. bot. cab. 149. Ker. bot. reg. 365. Flowers rose-coloured.

52 I. **sylvilla** (Sieb. pl. exsic. nov. holl. no. 379.) erect, shrubby; stem and branches acutely angled; leaves with 4-7 pairs of leaflets; leaflets nearly equal, elliptic, quite smooth, for the most part emarginate; racemes shorter than the leaves, or about the same length. \( \gamma \). G. Native of New Holland. Hook, in bot. mag. 3000. I. angulata, Lindl. bot. reg. 2578. I. speciosa, Fraser, nss. Flowers rose-coloured, inclining to purple. A very showy plant.

53 I. **xuda** (G. Don, in Loud. hort. brit. p. 301.) plant almost leafless; branches terete, mucronate; racemes axillary; corolla, calyx, and pedicels purple. \( \gamma \). G. Native of the Cape of Good Hope. Racemes long, in the axils of the branches. Lebekcia nuda, Sims, bot. mag. t. 2214. Flowers purple.

54 I. **macrostëcha** (Vent, malm. t. 44.) shrubby; branches terete, clothed with adpressed pubescence; leaves pinnate, having 8 or 10 pairs of oval-oblong, obtuse, mucronate, pubescent

...
the under; racemes many-flowered, nearly sessile, shorter than the leaves; legumes reflexed, nearly terete, rather falcate, 4-6-seeded.  pH. S. Native on the shores of Peru, near Truxillo. Flowers rose-coloured.

Truxillo Indigo. Shrub 6 ft. 

1. *Lepiseceoides* (H. et Kunth, l. c.) shrubby; leaves pinnate; leaflets 3 pairs, lanceolate-oblong, rounded at the apex and mucronate, acute at the base, beset with stipules on both surfaces as well as the branches, glaucous beneath; racemes many-flowered, on short peduncles, exceeding the leaves; legumes reflexed, rather compressed, straight, usually 8-seeded.  pH. C. Native of Mexico, on Mount Jorullo. Flowers red.

Lespedeza-like Indigo. Shrub 1 to 3 ft. 

65. *Arborescens* (Zucc. obs. 1. no. 84.) shrubs; leaves crowded; leaflets glabrous beneath, with short brown stipules, large and somewhat falcate.

66. *Secundiflora* (Poir. suppl. 3. p. 148.) shrubby; branches terete, scabrous from adpressed bristles; leaves pinnate, with 4 to 8 pairs of oblong, mucronate leaflets, which are also beset with adpressed bristles beneath; racemes almost terminal, twice the length of the leaves; legumes spreading, terete, linear, glabrous.  pH. S. Native of?

Arborescens Indigo. Shrub.

67. *I. secundiflora*; leaves with usually 4 pairs of oblong-spatalate leaflets, which are clothed with white silky pubescence beneath; peduncles axillary, usually 1-flowered; legumes linear, straight.  pH. S. Native of Guadaloupe. Flowers red.

Bertero's Indigo. Shrub decumbent.

68. *I. mucronata* (Sprague in herb. Balb. D. C. prod. 2. p. 227.) stem terete, suffrutescent at the base; petals and leaves clothed with adpressed striga on both surfaces; leaves pinnate, with 2 to 3 pairs of mucronate, ovate leaflets, which are pale beneath; racemes pedunculate, longer than the leaves; legumes reflexed, straight, a little tetragonal, mucronate, clothed with stipigose pubescence, many-seeded.  pH. S. Native of Jamaica.

Mucronate-leafted Indigo. Shrub 2 to 3 ft. 

**Petioles elongated. Stem herbaceous.**

69. *Inquisans* (Willd. spec. 3. p. 1236.) stem herbaceous, erect, and as well the terete branches hispid from clammy pili; leaflets 4-5 pairs, elliptic-oblong, clothed with adpressed white pili beneath; racemes shorter than the leaves; legumes spreading, straight, terete, rather pilose, 8-10-seeded.  pH. S. Native of St. Domingo. Flowers red. This plant is cultivated for Indigo in St. Domingo.

Dyinge Indigo. Pl. 1 foot.

70. *I. lateritia* (Willd. spec. 3. p. 1233.) stem herbaceous, erect, pilose, clammy; leaves with 1 to 2 pairs of obovate, villous leaflets; racemes usually about equal in length to the leaves; legumes tetragonal, hairy, straight, 4-5-seeded.  pH. S. Native of Guinea, particularly in the island of St. Thomas. I. hispana, Jacq. Icon. rar. t. 359. coll. 2. p. 359, but not of Lin. Flowers red.

71. *I. viscosa* (Lam. dict. 3. p. 247.) stem herbaceous, erect, and as well the terete branches, rather hispid from clammy pili; leaves with 6 pairs of oblong-elliptic leaflets, which are clothed with adpressed bristles beneath; racemes shorter than the leaves; legumes spreading, straight, somewhat compressed, rather pilose, 8-10-seeded.  pH. S. Native of the East Indies. I. gravoensis, Wendl. sect. ban. t. 12. Flowers red. This species is very like I. lateritia.

Far. b; stem rather diffuse.  pH. S. Native of the island of Timor.

72. *I. glutinosa* (Perr. in litt. but not of Vahl. D. C. prod. 2. p. 227.) stem almost herbaceous, much branched; branches terete, beset with glutinous hairs; leaves with 3 pairs of elliptic-ovate leaflets, which are clothed with adpressed bristles beneath; racemes a little longer than the leaves; flowers distal; legumes straight, nearly terete, erect, clothed with clammy hairs, 8-10-seeded.  pH. S. Native of Guinea, particularly in Senegal. Flowers red.

Glutinum-hairied Indigo. Pl. 1 foot.

73. *I. dendroides* (Jacq. icon. rar. 3. t. 571. coll. 2. p. 357.) stem herbaceous, erect, with 12-16 pairs of elliptic leaflets, which are scabrous on the upper surface, and clothed with whiteomentum on the under; racemes length of leaves; legumes pendulous, straight.  pH. G. Native of Nipafl. Habit almost of a species of *Dalea*. Racemes and branches clothed with rufous villi. Stamens diadelphous. Ovary linear, compressed, almost tetragonal, acuminate by the style.

Many-leafted Indigo. Pl. 1 foot. 

75. *I. heterotricha* (D. C. prod. 2. p. 227.) stem almost herbaceous, terete; branches and peduncles hispid from long, stiff, bristy hairs, which are hooked at their apexes; leaves with 4-6 pairs of elliptic or ovate, mucronate leaflets, which are beset with adpressed striga beneath; racemes much longer than the leaves, pedunculate; legumes reflexed, terete, mucronate, bearing adpressed striga and bristy hairs.  pH. G. Native of the Cape of Good Hope. Barch. cat. geogr. no. 2635. Flowers red? A very distinct species.

Variable-haired Indigo. Pl. 1 to 2 feet.

76. *I. domingensis* (Sprague in herb. Balb. D. C. prod. 1. c.) stems somewhat herbaceous; branches rather villous; and rather compressed at the apex; leaves with 4 pairs of obovate leaflets, which are doted beneath and covered with adpressed pubescence on both surfaces; racemes longer than the leaves, crowded with flowers; legumes pendulous, terete, rather torulose, and rather villous, 3-4-seeded.  pH. S. Native of St. Domingo. Aligned to the following and *I. concinna* phylla. Flowers rose-coloured.

St. Domingo Indigo. Pl. 1 foot. 

77. *I. oligosperma* (D. C. prod. 2. p. 228.) stem herbaceous, erect; branches angular at the apex and pubescent; leaves with 4-5 pairs of elliptic-oblong, mucronate leaflets, which are covered with adpressed bristy hairs on both surfaces; racemes length of leaves; legumes terete, villous, and bristy, 2-3-seeded, spreadingly-reflexed.  pH. S. Native of Senegal. It differs from *I. disperta* in the leaves not being glabrous, in the legumes being more slender and not torulose, and in being much more villous. Flowers red.

Few-seeded Indigo. Pl. 1 foot. 

78. *I. disperta* (Lin. syst. nat. 3. p. 292.) stem herbaceous? branches terete; leaves with 4-6 pairs of elliptic-oblong, glabrous leaflets; racemes slender, longer than the leaves; legumes terete, rather torulose, mucronate, 2-seeded, scabrous
I. INDIGOBERA. 211

LEGUMINOSÆ. LXXIX. Indigobera.

(ex desr.) glabrous (ex icón.). o. i. S. Native of the Indies.

—Trew. chret. t. 55. Flowers rose-coloured.

Two-seeded Indigo. Pl. 1 foot.

79 A. fusca; stem erect, beset with long brown hairs; leaves with 2 or 3 pairs of cuneated, mucronate, pilose leaflets; stipules filiform, also pilose; spikes or racemes of flowers axillary or lateral; calyx and legume clothed with fuscous hairs. o. S. Native of Guinea, among grass. Flowers small, flesh-coloured.

80 A. hirsuta (Lin. spec. 1602, but not of Jacq.) stem subfusco-tomentose, erect; branches terete, and as well as the petioles and peduncles hairy; leaves with 3-5 pairs of obovate-oblong, obtuse leaflets, which are villous on both surfaces; racemes longer than the leaves; legumes tetragonal, 6-seeded, pendulous, hairy. h. S. Native of the East Indies and Guinea. Lam. ill. t. 625. F. 3. I. Indica, Mill. dict. no. 4. but not of Lam.—Burm. zeyl. 37. t. 15. Rheed. mal. 1. t. 55. Flowers purple or red.

81 A. astragalina (D. C. prod. 2. p. 228.) stem herbaceous, erect, rough from simple hairs; leaves having 4 pairs of obovate, very obtuse leaflets, which are villous on both surfaces and white beneath; racemes shorter than the leaves; legumes tetragonal, pendulous, very hairy, 2-seeded. o. S. Native of Senegal. Astragalus, Pers. in litt. 1823. This species is very nearly allied to the preceding, but the ears on the upper surface of the leaves are adpressed and scarcely or not bifurcate. Flowers red.

Milk-vetch-like Indigo. Pl. 1 foot.

82 A. senegalensis (Lam. dict. 3. p. 248.) stem herbaceous, decumbent; branches slender, angular; leaves with 1-3 pairs of leaflets; leaflets oblong, beset with adpressed bristly hairs on both surfaces; racemes longer than the leaves; legumes pendulous, much compressed, puberulous, oblong, mucronate, 3-4-seeded. o. S. Native of Senegal. I. tetrasperma, Vahl. ex herb. Juss. Habit of a species of Eremum. This is a very distinct species. Flowers red.

Senegal Indigo. Pl. procumbent.

83 A. farinula (Guillaud, voy. mer. part. bot. t. 5. fl. 1.) branches diffuse; leaves pinnate, with 2 or 3 pairs of obovate, grey leaflets; stipulas awl-shaped; spike of flowers about equal in length to the leaves. o. F. Native of Nubia. Flowers red.

Least Indigo. Pl. diffuse.

84 A. linearis (D. C. prod. 2. p. 228.) stems herbaceous, rather diffuse; branches slender, angular; leaves having 1 or 2 pairs of linear leaflets, which are beset with adpressed bristly hairs on both surfaces; racemes rather longer than the leaves; legumes pendulous, linear, mucronate, straight, much compressed, scabrous, and puberulous, 10-12-seeded. o. S. Native of Senegal. Flowers red.

Linear-racemose Indigo. Pl. diffuse.

85 A. hendecaphylla (Jacq. icon. rar. t. 570. coll. 2. p. 358.) stem herbaceous, prostrate; branches terete and are as well as the leaves slightly covered with cincereous pubescence on both surfaces; leaves with 4-5 pairs of obovate, oblong, cuneated, obtuse leaflets; racemes shorter than the leaves; legumes reflexed, terete, but slightly tetragonal, straight, villous, 8-10-seeded. o. S. Native of Guinea, particularly of Senegal and the island of St. Thomas. Ker. bot. reg. 789. Bean.

fl. d’ow. t. 84. Flowers rose-coloured. The plants of this species which are cultivated in the gardens are almost smooth, except the under surface of the leaves.

86 A. Perrotteii (D. C. prod. 2. p. 228.) stems herbaceous, prostrate, young ones compressed, and clothed with villous pubescence; leaves with 3 or 4 pairs of obovate-oblong leaflets, clothed on both surfaces with cincereous pubescence, besides being dotted beneath; racemes crowded with flowers, shorter than the leaves; legumes oblong, terete, straight, pubescent, 3-4-seeded. o. S. Native of Senegal. I. prostrata, Perr. in litt. but not of Willd. Very like I. eucaphylla, but the petioles are longer, the stipulas linear-subulate, and the legume 3-4-seeded. Flowers red.

Perrottei’s Indigo. Pl. prostrate.

87 A. sessiliflora (D. C. prod. 2. p. 228.) stem herbaceous, erect, much branched; branches terete, and as well as the leaves clothed with adpressed silky pubescence; leaflets 3 or 4 pairs, obovate; spikes crowded with flowers, sessile in the axils of the leaves, and shorter than them; legume terete, pubescent, straight, 4-6-seeded. o. S. Native of Senegal. Root simple, cylindrical, rather fusiform. Flowers red.

Sessile-flowered Indigo. Pl. 1 foot.

88 A. acides (Vahl. in Poir. suppl. 3. p. 147.) stems herbaceous, compressed, 2-edged peltate; leaflets 9 or 11, alternate, obovate-oblong, obtuse, smoothish; racemes longer than the leaves; legumes pendulous, linear, compressed, acute, puberulous, 8-10-seeded. o. S. Native of Guinea. Flowers rose-coloured.

Two-edged-stemmed Indigo. Pl. prostrate.

89 A. alterans (D. C. prod. 2. p. 228.) branches filiform, and are as well as the leaves clothed with adpressed, briskly hairy; leaflets 7-11, alternate, obovate, or oblong, a little mucronulate; racemes longer than the leaves; calyces lobes ending each in a setaceous acumens, about equal in length to the corolla; legumes reflexed. h. ? G. Native of the Cape of Good Hope. Bureh. cat. no. 2079. Flowers reddish. Perhaps the same as I. punctata, Thumb. prod. 135. fl. cap. 599. but there are nothing like dots on the present plant to be seen.

Alternating-racemose Indigo. Pl. 1 foot.

90 A. Carolina (Walt. earl 187.) stem herbaceous, erect; branches terete; leaves with 6 or 7 pairs of oval-oblong leaflets, which are slightly covered with adpressed pubescence; racemes slender, longer than the leaves; legumes pendulous, usually 2-seeded, reticulately veined. T. G. Native of North America, from Carolina to Florida. Mich. fl. bor. amer. 2. p. 68. Flowers blue.

Carolinian Indigo. Pl. 1 foot.

91 A. lagascan (D. C. prod. 2. p. 229.) stems herbaceous, erect; branches terete, beset with adpressed briskly hairy, cincereous at the apex; stipulas linear, acuminate, rufous, and scarios; leaves with 5 pairs of obovate or oblong, mucronate leaflets, young ones clothed on both surfaces with adpressed bristly hairs, the adult ones only on the under surface; racemes pedunculate, longer than the leaves; legumes reflexed. Native of Peru, at Chenchin. Flowers red.

Lagarca’s Indigo. Pl. 1 foot.

92 A. plumosa (Spreng. syst. 3. p. 278.) plant decumbent and villous; leaflets usually about 8 pairs, spatulate, emarginate; racemes few-flowered, on long peduncles; calyces segments at length elongated, very villous and plumose. o. S. Native of? Featherly-calyx’d Indigo. Pl. decumbent.

93 A.aspera (Perr. in litt. D. C. prod. 2. p. 229.) stem herbaceous, erect, branched; branches terete; leaves and peduncles covered with adpressed stiguge; leaves with 1 or 2 pairs of linear, acute leaflets; racemes slender, longer than the leaves; legumes
reflexed. O. S. Native of Senegal, on plains near Richard-Tole. Flowers red. Habit nearly like that of *I. pse loreoides*, but differs in the leaves being pinnate.

**Rough Indigo.** Pl. 1 foot.

94. *I. jamaicensis* (Spreng. syst. 3. p. 277.) herbaceous; leaves with 3 pairs of oblong, mucronate leaflets, and are as well the erect angular branches beset with adpressed bristly hairs; racemes straight, exceeding the leaves; legumes reflexed, almost terete. O. S. Native of Jamaica. Flowers red.

**Jamaica Indigo.** Pl. 1 foot.

95. *I. speciata* (Forsk. descr. 13. Vahl. symb. 1. p. 56.) stem herbaceous, decumbent, villous; leaves with 4 pairs of obvolute villous leaflets, outer ones largest; stipulas lanceolate-subulate, dry; spikes longer than the leaves; legume terete, pubescent, pendulous.—Native of Arabia Felix. Flowers red. Allied to *I. hirsuta*.

**Spicate-flowered Indigo.** Pl. decumbent.

96. *I. scabra* (Roth, nov. spec. 359.) the whole plant is scabrous from adpressed stipiges: stem erect, tetragonal; leaves with 4 pairs of ovariate villous leaflets; racemes elongated, loose, exceeding the leaves; legume pendulous, a little arched, stipigose, and somewhat tetragonal. O.? S. Native of the East Indies.

**Scabrous Indigo.** Pl. 1 foot.

97. *I. microcarpa* (Desv. journ. bot. 1814. 1. p. 79.) stem; leaves with 4 pairs of leaflets, covered with white hairs; racemes shorter than the leaves; legume very short, white, 2-seeded. Native of Brazil.

**Small-fruited Indigo.** Pl. ?

98. *I. fragrans* (Retz, obs. 4. p. 29.) stems terete, rather pilose; leaves with 1 or 2 pairs of leaflets; leaflets ovate, terminal one obvolute and larger; racemes longer than the terminal leaf, 3-5-flowered; legume linear, tetragonal. O. S. Native of the East Indies.—Plk. phys. t. 166. f. 1. Flowers red.

**Fragrant Indigo.** Pl. June, July. Clt. 1816. Pl. 1 foot.

99. *I. pusilla* (Lam. dict. 2. p. 248.) stems terete, beset with a few adpressed stipiges; leaflets 3 or 4, alternate, oval, clothed beneath with white hairs, terminal one oblong and longer; racemes a little longer than the leaves, few-flowered; legume deflexed, linear, rather terete, 4-6-seeded, hardly puberulous. O.? S. Native of Madagascar and the Island of Bourbon. I. tenella, Vahl. mss. Flowers red.

**Small Indigo.** Pl. prostrate?

100. *I. glabra* (Linn. spec. 1052.) stem herbaceous, smoothish; leaves with 1 or 2 pairs of obvolute leaflets, which are smooth above and pubescent beneath; racemes few-flowered, length of leaves; legumes horizontal, glabrous, terete, acute. O. H. Native of the East Indies.—Plk. aln. t. 166. f. 1. Branches with a few long hairs. *Stipulas secatceae*. Flowers red.

102. *I. pentaphylla* (Linn. syst. veg. 56.) stems herbaceous, depressed; leaves with 2 pairs of oval leaflets; peduncles 2-flowered. O. S. Native of? Very like the preceding species. Flowers red.

**Five-leafletted Indigo.** Pl. prostrate.

103. *I. semirafa* (Forsk. descr. 137. Vahl. symb. 1. p. 56.) stem suffruticose, prostrate; branches terete, clothed with hoary villi; leaves with 2 pairs of obcordate, mucronate leaflets; racemes longer than the leaves; legumes pendulous, oblong, torulose, 2-seeded. O. S. Native of Arabia and eastern Asia. Mart. acad. mon. 6. p. 189. The whole plant is very villous. Flowers red. Perhaps only a variety of *I. enneaphylla*.

**Half-three-paired-leafletted Indigo.** Shrub prostrate.

**Four Indigo.** Shrub 1 foot.

105. *I. miniata* (Ort. dec. 28.) stems herbaceous, procumbent, and are as well as the leaves clothed with adpressed silky pubescence; leaves with 2-3 pairs of oblong-linear leaflets; racemes pedunculate, longer than the leaves; legumes linear, tetragonal, 4-seeded. O.? S. Native of Cuba. Flowers vermilion-coloured.

**Vernilion-flowered Indigo.** Pl. procerum.

**Cytisus-like Indigo.** Pl. July, Aug. Clt. 1774. Sh. 3 to 5 ft.

107. *I. loroides* (Lam. dict. 3. p. 247.) stem shrubby, erect; branches terete, clothed with hoary pubescence; leaves with 2 pairs of lanceolate, velvety leaflets; racemes longer than the leaves; calyx short; legume linear, a little arched, velvety, rather torulose. G. Native of the Cape of Good Hope. Comm. hort. 2. t. 84. Flowers red. Very like the preceding species.

**Blackish Indigo.** Pl. 1 foot.

109. *I. capellaria* (Thunb. prod. 133. fl. cap. 599.) stem suffruticose; branches slender, terete, glabrous; leaves with 2 or 3 pairs of filiform, acute, glabrons, approximate leaflets; racemes pedunculate, much longer than the leaves. G.
Native of the Cape of Good Hope. J. tenellifolia, Lam. dict. 3. p. 249. Flowers red.

**Cephalary-leaved Indigo.** Shrub ½ foot.

110 I. PERRINIFLORA (Spreng. neuc. entd. 2. p. 161.) branches terete, beset with adpressed pili; leaves with usually 4 pairs of linear, obtuse, mucronate leaflets, which are lined above, and silky beneath; racemes few-flowered; legumes linear, clothed with rusty villi. C. S. Native of South America.

**Petit’s Indigo.** Pl. 1 foot?

111 I. angustifolia (Lin. mant. 272.) stem shrubby; branches terete, hoary; leaves with 2-3-4 or 5 pairs of approximate, linear, obtuse leaflets, which are canescent on the under surface, and somewhat revolute at the margins; racemes 3 times longer than the leaves; calyxes canescent. G. Native of the Cape of Good Hope. Thurb. fl. cap. 599. Sims. bot. mag. 465. Polygala pimpinella, Burm. cap. 20. Corolla purplish.

112 I. HEMBOLULTA (Spreng. syst. 3. p. 276.) shrubby, erect, smoothish; leaves with 2 pairs of spatulate, mucronate leaflets, which are rather silky beneath; racemes exceeding the leaves; legumes pendulous, nearly terete. G. Native of Mexico. I. mucronata, Wildl. herb. Flowers red.

**Hmboldt’s Indigo.** Shrub 2 to 3 feet.

113 I. ORNITHOPTERIDES (Schlecht. and Cham. in Linnnea. 5. p. 577.) leaves with 2 pairs of leaflets; pili strisge, cinereous; stems diffuse, prostrate; racemes on long peduncles, few-flowered, exceeding the leaves; calyces segments subulate-acuminated, equal in length to the corolla; legume deflexed, 8-seeded, straight. C. S. Native of Mexico. Habit of I. enneaphylla. Stipulae subulate. Flowers red.

**Ornithopus-like Indigo.** Pl. prostrate.

§ 5. Digiitato (from digitatus, fingered, in reference to the leaflets all rising from a common centre, as the fingers of the hand). Leaflets 3 or 5, rising from the same dot or centre, either from the top of petals, or directly from the branches.

114 I. sulcatA (D. C. prod. 2. p. 231.) branches angular and furrowed, rather canescent; petioles wanting; leaflets 3-5, linear, mucronate, stiff, with somewhat revolute margins, clothed with hoary villi beneath; flowers axillary, on short pedicels, in fascicles. G. Native of the Cape of Good Hope. Flowers red.

**Furrowed-stemmed Indigo.** Sh. 1 to 2 feet.

115 I. ASPALATHOIDES (Vahl. in herb. Juss. D. C. prod. 2. p. 231.) branches terete, hoary from adpressed down, which is fixed by the centre; petals wanting; leaflets 3-5, linear, very slender, somewhat complicated, beset with adpressed hairs; pedicels axillary, solitary, 1-flowered; legumes straight, terete, 4-6-seeded, much puberulent. G. Native of Ceylon and Malabar. Aspalathus indica, Lin. spec. 1001.—Bur. fl. ind. 155.—Fl. Pl. hyg. t. 201. f. 1.—Rheed. mal. 9. t. 3. Flowers red. Habit of Aspalathus, but the staminodes are dudelphous, and the down and the legumes are that of Indigofera.

116 I. FILIFORMIS (Thurb. fl. cap. 598.) branches terete, young ones rather hairy; petals almost wanting; leaflets 5, oblong, cuneate, mucronate, strigose above, but white beneath, with the margins revolute; racemes pedunculate, much longer than the leaves; legumes straight, terete, spreading, glabrous, 8-10-seeded. G. Native of the Cape of Good Hope. I. cándicans, Sieb. pl. exsic. cap. no. 55. Very like the following species, but differs in the flowers being loosely racemose, not capitate. Thumberg says his plant has terminal racemes of flowers; in ours they are axillary.

**Fork-tail-like Indigo.** Shrub.

118 I. CORIÆCÆA (Ait. hort. kew. 3. p. 68.) branches terete, hairy; petals very short; leaflets 5, obovate, cuneated, somewhat emarginate and mucronate, beset with adpressed striae above, but hoary beneath; peduncles 3 times longer than the leaves; flowers disposed in dense heads; legumes linear, straight, terete, glabrous. G. Native of the Cape of Good Hope. Lotus Mauritaniææ, Lin. spec. 1091. I. Mauritaniææ, Thurb. fl. cap. 598. Lotus fruticosus, Berg. cap. 238. Lotus racemosus, Poir. suppl. 3. p. 568. Indigofera, Sieb. pl. exsic. cap. no. 54. This plant has very much the habit of Dorjanium. Flowers red or purple.

**Coriaceous Indigo.** Fl. July, Aug. Clt. 1774. Sh. 2 to 3 ft.

119 I. SARMENTOSA (Lin. fil. suppl. 324. Thurb. fl. cap. 596.) stem very short, much branched; branches filiform; leaves and calyces clothed with adpressed striae pubescence; petals very short; leaflets ovate, small, mucronate; pedicels axillary, usually 2-flowered, much longer than the leaves; legumes cylindric, glabrous. G. Native of the Cape of Good Hope. Ononis filiformis, Lin. mant. 266. Lotus estipitatus, Berg. cap. 237. Flowers red.

Var. ß, microphylla (Lam. dict. 3. p. 250.) leaves with 3-5 leaflets.

**Sarmentose Indigo.** Fl. June, July. Clt. 1780. Pl. straggling.

120 I. DIGITATA (Thurb. fl. cap. 598.) branches slender, angular at the apex, and are, as well as the leaves and calyces, somewhat canescant from adpressed striae; leaves stalked, punitally 5-6-foliate; leaflets lanceolate-linear, acute, complicated; pedicels much longer than the leaves, bearing at the top of each a dense ovate-oblance spike of flowers. G. Native of the Cape of Good Hope. Flowers red.

**Digitate-leaved Indigo.** Shrub 1 to 2 feet.

121 I. BURCHELLEI (D. C. prod. 2. p. 231.) branches slender, angular at the apex, and are, as well as the petals and leaves, hoary from adpressed striae; leaves stalked, 4-5-foliate; leaflets obcordate, mucronate, hoary beneath, and rather stipose above. G. Native of the Cape of Good Hope. Burch. cat. no. 2918. Flowers red.

**Burchell’s Indigo.** Shrub 1 to 2 feet.

122 I. sessilifolia (D. C. prod. 2. p. 231.) branches terete, young ones canescent, at length becoming spinose; petals wanting; leaflets 3, obovate-cuneated, retuse, somewhat emarginate, pubescent beneath; spikes pedunculate, longer than the leaves; legumes compressed, rather arched, glabrous, 4-seeded. G. Native of the Cape of Good Hope. This species is nearly allied to I. tenuifolia, but differs in the leaves being all sessile, and in the legume being compressed, not terete. Flowers red.

**Sessile-leaved Indigo.** Shrub 1 to 2 feet.

123 I. SPINOSA (Forsk. descr. 137. Vahl. symb. 1. p. 55.) branches grey; leaves on short petioles, trilobate; leaflets obivate, hoary; stipulas aroere; peduncles spinose, 2-3-flowered, twice the length of the leaves; legume terete, but somewhat tetragonal, scabrous. G. Native of Arabia Felix, and the East Indies. This plant has the habit of a species of Althagi. Flowers red.

**Spiny Indigo.** Fl. May, July. Clt. 1826. Shrub 1 to 2 ft.

124 I. CANIDICANS (Ait. hort. kew. 3. p. 67.) branches slender, angular, clothed with adpressed silky canescent down; leaves stalked, trifoliate; leaflets lanceolate-linear, silky beneath; stipules small; spikes pedunculate, few-flowered, much longer than...
the leaves; legumes cylindrical, straight. \( \gamma \). G. Native of the Cape of Good Hope. Flowers red. Curt. bot. mag. 198.

White-leaved Indigo. Fl. May, June. Clt. 1774. Sh. 1 to 2 ft. 125 I. FZORALECLES (Lin. syst. nat. 465.) branches angular, hairy, pubescent; leaves petiolate, trifoliate; leaflets lanceolate, clothed with adpressed pubescence beneath; stipulas linear-subulate, elongated; racemes pedunculate, much longer than the leaves; legumes pendulous. \( \gamma \). G. Native of the Cape of Good Hope. Lam. ill. t. 626. f. 4. Sims, bot. mag. 476. Cyttisus psoraloides, Lin. spec. 1043. Burn. cap. prod. p. 22. I. racemosa, Lin. spec. 1062.—Plak. phyt. t. 320. f. 3. \( \gamma \). \( \gamma \). but the racemes in the figure are shorter than the leaves. Flowers red.

Psoralea-like Indigo. Fl. Ju. Sept. Clt. 1758. Shrub 2 feet. 126 I. CINE\'REA (Willd. spec. p. 1225.) branches rather angular, clothed with greyish silky pubescence; leaves petiolate, trifoliate; leaflets oblong-lanceolate, pubescent beneath; flowers axillary, sessile; legumes spreadingly deflexed, puberulous, rather tetragonal, 4-6-seeded. \( \gamma \). \( \gamma \). S. Native of the East Indies. Flowers small, red.

Grey Indigo. 137 I. MOLCECA\'NA (D.C. prod. p. 232.) branches slender, terete, puberulous; leaves petiolate, trifoliate; leaflets oblong-lanceolate, pubescent beneath; flowers axillary, sessile; legumes spreadingly deflexed, puberulous, rather tetragonal, 4-6-seeded. \( \gamma \). \( \gamma \). S. Native of the Moluccas. The middle leaflet is on a short petiole. The flowers are probably red.

Molucco Indigo. Shrub.

128 I. STIPULARIS (Link. enum. p. 250.) stem beset with short stigmas; leaves trifoliolate; leaflets ovate, with a few adpressed hairs; stipules ovate, acute; racemes longer than the leaves. \( \gamma \). G. Native of the Cape of Good Hope. Perhaps belonging to a different section. Flowers red.

Stipular Indigo. Fl. May, July. Clt. 1824. Sh. 1 to 2 feet. 129 I. INC\'A\'NA (Thumb. prod. 132. fl. cap. 596.) stems decumbent, very much branched, suffrutescent at the base; branches clothed with silky pubescence; leaves petiolate, trifoliate; leaflets ovate, acute, silky; legume reflexed, silky. \( \gamma \). G. Native of the Cape of Good Hope. Flowers red.

130 I. ARC\'AUTA (Willd. spec. p. 1228.) branches angular, clothed with hoary pubescence; leaves petiolate, trifoliate; leaflets elliptic, obtuse, mucronate, canescent beneath; racemes about equal in length to the petioles; legume arched, reflexed, tetragonal, canescent. \( \gamma \). \( \gamma \). S. Native of the East Indies. Flowers red.

Arched-podded Indigo. Pl.

131 I. TRI\'TA (Lin. fl. suppl. 535.) stem erect; branched at the base; leaves petiolate, trifoliate; leaflets ovate-lanceolate, acute; racemes shorter than the leaves. \( \gamma \). \( \delta \). \( \gamma \). S. Native of the East Indies. Flowers red.

Wora Indigo. Fl. June, July. Clt. 1802. Pl. 1 foot. 132 I. HEDYSAR\'IDES (Lam. diet. 3. p. 250.) stem erect, branched at the base; leaves petiolate, trifoliate; leaflets ovate, obtuse; legume arched. \( \gamma \). G. Native of the East Indies, ex Rhed. mal. 9. t. 36. and perhaps of China if I. coecinea, Lour. coeh. p. 457. be the same. Flowers deep red.

Hedysarum-like Indigo. Fl. June, Aug. Clt. 1822. Pl. 1 ft. 133 I. ER\'E\'TA (Thmb. prod. 133. fl. cap. 597.) stem herbaceous, nearly erect; leaves petiolate, trifoliate; leaflets obovate, acute, glabrous above, and clothed with fine pubescence beneath; legume cylindrical, acute, reflexed, pubescent.—Native of the Cape of Good Hope. Flowers red.

Erect Indigo. Pl. 1 foot. 134 I. PROCR\'EMENS (Lin. mant. 271.) stems flexuous, decumbent, compressed, smooth; leaves petiolate, trifoliate; leaflets obovate, smooth above, but clothed with adpressed pubescence beneath; racemes much longer than the leaves. \( \gamma \). G. Native of the Cape of Good Hope. Thumb. fl. cap. 597. Flowers blood-coloured, large for the size of the plant.

Prostrate Indigo. Pl. prostrate.

† Species not sufficiently known.

136 I. ROTUNDIF\'OLIA (Lour. coeh. p. 458.) stem twining, herbaceous, pilose; leaves trifoliolate; leaflets roundish, tomentose on both surfaces; racemes axillary, short, legumes oblong, flat, acuminate, glabrous, 2-seeded. \( \gamma \). \( \gamma \). G. Native of China, near Canton. Flowers yellow.

Round-leafletted Indigo. Pl. twining.

137 I. BUFA\'LVA (Lour. coeh. p. 458.) stems suffrutescent, climbing, glabrous; leaves trifoliolate; leaflets ovate, glabrous; racemes axillary and terminal, on long peduncles; legumes straight, rather compressed, villous. \( \gamma \). \( \gamma \). G. Native of Cochin-china, among bushes. Flowers between white and purple.

Ox Indigo. Shrub cl.

138 I. STRIGOSA (Sprigg. neue ent. 3. p. 54.) shrubby; stems filiform; leaves abruptly-pinmate; leaflets 5-7, linear, acute, strigose; stipulas cupululate; racemes terminal? flaccid. \( \gamma \). G. Native of the Cape of Good Hope. Allied to I. filiformis.

Strigose Indigo. Shrub 1 foot.

139 I. OXYCE\'REA (Desv. journ. bot. 1814. vol. 1. p. 79.) stem angular, pentagonal, pilose; leaflets oblong-ovate, mucronate, pilose; spikes of flowers on long peduncles; legumes terete, a little incurved, acute. \( \gamma \). \( \gamma \). S. Native of the Andilies. Perhaps the leaves are pinmate or digitate.

Sharp-fruitied Indigo. Shrub.

140 I. DIFF\'SA (Desv. 1. c.) branches diffuse; leaflets obovate, somewhat emarginate, pilose; spikes of flowers very short; legumes divate, rather pilose. \( \gamma \). \( \gamma \). S. Native of the African islands.

Diffuse Indigo. Shrub.

Cott. The whole of the species of this genus are rather elegant delicate plants, and all the green-house shrubby kinds are worthy of general cultivation: these grow best in a mixture of sandy loam and peat, and they are easily propagated by young cuttings planted in sand with a bell-glass placed over them. The stove kinds require to be grown in the same kind of soil as the green-house kinds, and to be propagated in the same manner. The seeds of the annual species require to be sown in a hot-bed in spring, and when the plants have grown a sufficient height they may be planted singly in separate pots, and placed again in the hot-bed, and some may be planted out in the open ground in a sheltered situation.

LXXV. OUSTROPIS (from oug, ous, an ear, and tropis, tropis, a keel; in reference to the keel of the flower being furnished with an auricle on each side).

LIN. SYST. Diadelph\'ia, Dec\'adricula. Calyx hairy, tubular, 5-cleft; the segments subulate and acute, upper ones shortest. Vexillum broad, not emarginate, about equal in length to the wings, but longer than the keel. Keel furnished with an auricle on each side. Stamens diadelphous. Ovary pubescent, linear. Style glabrous. Stigma capitate and glandular. Legume short, cylindrical, and rather compressed, ending in the straight acute style, 3-seeded, the seeds lodged in as many cells.—A graceful small plant, with decumbent slender stems, which are slightly hairy; and small, trifoliolate, rather hairy leaves, small subulate
stipulas; umbels of small rose-coloured flowers, on long axillary peduncles.

1 O. microphyllus. 2 G. Native of the Cape of Good Hope. Lotus microphyllus, Hook, bot. mag. 2808.

Cult. The seeds of this plant should be sown thinly in a pot of light mould, and placed in the greenhouse, where the plants will rise, flower and seed, the same season.

LXXXI. CLITORIA (from Clitoria, an anatomical term, a resemblance to the subject of which has been fancied to exist in the flower). Lin. gen. no. 869. Lam. ill. 609. Guert. fract. 2. p. 149. D.C. legum. mem. vi. prod. 2. p. 235.—Ternatea, Tourn. act. acad. par. 1706, t. 1.—Clitoris, Petr. in Rai. hist. 3. p. p.p.

Lin. syst. Diadephon, Decandria. Calyx furnished with 2 large bractlets at the base, 5-cleft (f. 34. a.). Vexillum large (f. 34. b.). Stamens diadephous (f. 34. d.), inserted along with the petals above the base of the calyx. Style rather dilated at the apex. Legume linear, compressed (f. 34. c.), straight, 2-valved, acuminated by the base of the style, 1-celled, many-seeded. Seeds usually separated by cellular substance.—Climbing herbs, with impari-pinnate leaves, having 2 to 4 pairs of leaflets, but usually the leaves are pinnately-trifoliate; the leaflets usually stipulate. Flowers axillary, pedicellate, large, white, blue or purple, usually resupinate.

1 C. heterophylla (Lin. dict. 2. p. 51.) stems twining, slender, glabrous; leaves with 2 to 4 pairs of rounded, ovate, or linear leaflets; stipules none; pedicels solitary, 1-flowered; bracteoles small, acute. Ζ. S. Native of the East Indies. Mauritius, Arabia, Cuba, and usually cultivated in gardens in almost all parts of the world. Sims, bot. mag. 1542.—Rumph. amb. 5. t. 31.—Rheed. mal. 8. t. 38. C. spectabilis, Sal. prod. 336. Lathyrus spectabilis, Forsk. descr. 135. Ternatea vulgaris, H. B. et Kunth. nov. gen. amer. 6. p. 415. Plumule inconspicuous according to Gurt. There are varieties of this plant with blue and white flowers, and also variegated with those colours.

Var. β, bracteata (Poir. suppl. 2. p. 301.) leaflets rather scabrous; legumes pubescent. Ζ. S. Native of? Flowers whitish-purple.

Sect. II. Euctroria (from eu, well or good, and clitoria; in reference to this section containing the true species of the genus). D. C. legum. mem. vi. prod. 2. p. 234. Calyx tubular. Vexillum spurious. Leaves pinnately-trifoliate, that is, with only one pair of leaflets and an odd one.

3 C. Maria'sa (Lin. spec. 1026.) stems twining, glabrous; leaflets ovate-lanceolate; pedicels solitary, 1-3-flowered; bracteoles lanceolate, and are, as well as the calyxes, smooth; teeth of calyx nearly equal. Ζ. F. Native of North America, from Virginia to Carolins, in hedges by the sides of rivulets. Michx. fl. bor. amer. 2. p. 62. Flowers pale-blue, and flesh-coloured. Legume turbosae. Seeds glutinous according to Michx.

4 C. Mexicana (Link. enum. 2. p. 234.) stems twining; leaflets mucronate, glaesuscent and pilose beneath; pedicels 1-flowered; calyx cylinrical, much longer than the linear bracteoles; legume straight, hairy. Ζ. S. Native of Mexico. Flowers of an obscure purple colour. The plant is said to be nearly allied to the preceding species.

5 C. angustifolia (H. B. et Kunth, nov. gen. amer. 6. p. 417.) stems twining, smooth; leaflets oblong, obtuse, and rather mucronate, rather scabrous above and glabrous beneath; pedicels usually solitary, 1-flowered; calyx smoothish, having the superior teeth very short. Ζ. S. Native of South America, near Angustura. Flowers rose-coloured.

Narrow-leaved Clitoria. Pl. tw.

6 C. formosa (H. B. et Kunth, nov. gen. amer. 6. p. 417.) stems twining, smooth; leaflets oblong, obtuse, ending in a short mucron each; glabrous; pedicels 1-4-1gether, 1-flowered; calyx urceolate, glabrous, having the inferior teeth very short. Ζ. S. Native on the banks of the river Orinoco. Flowers violet-coloured. Legume compressed, sessile, glabrous.

7 C. racemosa; stems twining, pilose; leaves pinnately-trifoliate; leaflets ovate, entire, pilose; racemes axillary, spike-formed; legume curved. Ζ. S. Native of the island of St. Thomas, in the Gulf of Guinea. Flowers large, blue. Vexillum spurious.

Racemoso-Flowered Clitoria. Pl. tw.

8 C. A'lea; plant glabrous, twining; leaves pinnately-trifoliate; leaflets oblique, entire, glabrous; peduncles 2-3-flowered. Ζ. S. Native of the island of St. Thomas, in the Gulf of Guinea. Flowers white. Vexillum spurious.

White-Flowered Clitoria. Pl. tw.

9 C. potelis (D. C. prod. 2. p. 234.) stems erect, rather velvety; leaflets elliptic, glabrous above, but clothed with silky velvety pubescence beneath, as well as the peduncles, and calyxes; racemes longer than the leaves, rather panicled, spicate, many-flowered; calycines lobes acuminate, nearly equal. Ζ. S. Native of French Guiana. Flowers large, red, and beautiful, disposed along the peduncles, sessile, and furnished with a bractea and 2 bracteoles each, appearing at first sight to be furnished with 3 bracteoles each; legume compressed, linear, glabrous, each standing on a stipel, which is equal in length to the calyx, 4 or 5 inches long, and 6 lines broad.

Poiteua's Clitoria. Pl. 2 feet.

Sect. III. Centrose'ma (from κεντρον, centron, a spur, and ομο, scma, a standard or vexillum; in reference to the vexillum being furnished with a spur behind). D. C. legum. mem. vi. prod. 2. p. 234. Calyx campanulate, cleft into 5 beyond the middle. Vexillum furnished with a spur behind. Bracteoles striated lengthwise. Leaves pinnately-trifoliate, having one pair of leaflets, and an odd one.

10 C. Virginia'nae (Lin. spec. ed. 1. p. 753.) stems climbing, and are, as well as the leaves, glabrous or puberulous; peduncles 1-4-flowered; bracteoles lanceolate, about the length of the calyx; legumes linear, compressed. Ζ. F. Native of Virginia, Carolina, Jamaica, St. Domingo, and Porto-Rico, growing in hedges. Flowers very large, purplish or blue. Lindlc. bot.
reg. 1047. C. calcarigera, Sal. par. t. 51. Perhaps there are numerous species confounded under this name.

Var. a. augustifolia (D. C. pro. 2. p. 234.) leaflets linear.

Var. b. elliptica (D. C. l. c.) leaflets ovate-oblong or elliptic.

—Dill. Hort. eht. t. 76.

Var. γ, ovata (D. C. l. c.) leaflets ovate. — Plut. alm. t. 90.

† Species not sufficiently known.

17 C. vicidoles (Nees et Mart. nov. act. bonn. 12. p. 28.) branches angular; leaves pinnate, having 10 or 11 pairs of oblong-elliptic pubescent leaflets; racemes axillary, pedunculate; calyx 4-toothed; flowers resupinate.  " S. Native of Brazil.
6 N. ellipiticum (Desv. l.c.) stems twining, rather herbaceous, pilose; leaves on longish petioles, trifoliolate; leaflets elliptic, membranous, rather puberulous above, but glaucous beneath, and puberulous on the nerves; peduncles few-flowered, axillary, solitary; legume mucronate, resinoid inside. P. S. Native of St. Domingo. Crotalaria ellipiticum, Poir. Clitoria tetra-gona, Poir. Clitoria rubiginosa, Pers. ench. no. 9.

Elliptic-leafletted Neurocarpum. Pl. tw.

Falcate-podded Neurocarpum. Pl. tw.

9 N.? *macrophylum* (H. B. et Kunth, l. c.) arboreous; leaves trifoliolate; leaflets roundish-elliptic, acuminate, rounded at the base, membranous, hairy above, and clothed with fine pubescence beneath; peduncles bífid, racemose. P. S. Native of New Granada, near Turbaco. Flowers red. Legume hairy. Perhaps this shrub ought to be removed from the genus.

Large-leaved Neurocarpum. Shrub 10 feet.

Clt. *The climbing and twining species of this genus should be treated in the same manner as the species of Clitória, see p. 216. The upright kinds like other common stove shrubs.*

LIN. SYST. Tetradnária, Monogénia. Calyx tubular, permanent, somewhat bilabiata, having 5 acute teeth, the lower tooth longest. Corolla wanting. Stamens 4, 2 bearing anthers, and 2 sterile; filaments all distinct, one-half shorter than the ovary. Anthers somewhat ciliated. Legume stipitate, orpetalated at the base by the calyx, with the stipe also sheathed, compressed, somewhat tetraquous; the valves furnished with a longitudinal nerve in the centre of each. Calyx, and especially the fruit, very like that of *Neurocarpum*. The want of petals, and the few distinct stamens, are the characters by which this genus can be known.

1 M. physaloïdes (Schultes, l. c.) P. S. Native near Rio Janeiro, in fields, where it is called *coza phonos* and *timbo*. Martía physaloïdes, Leand. 1. c. Stems frutescent, twining, villous. Leaves pinnatim trifoliolate; leaflets ovate-oblong, mucronate, glabrous above, but pubescent beneath. Peduncles 2-flowered. This plant is supposed to be deleterious to cattle and sheep in Brazil.

Physaloïdes-like Martiusia. Shrub tw.

Cult. See *Clitória* for culture and propagation, p. 216.

LIN. SYST. Diadélphía, Decándria. Calyx tubular, bibracteolate at the base, somewhat bilabiata; upper lip entire or bifid, lower one 3-parted. Vexillum roundish. Stamens diadelpous, inserted with the petals in the base of the calyx. Ovary stipitate, linear, very hispid, girdled at the base by an orbicular disk. Style glabrous, obtuse. Stems procumbent or twining, beset with retrograde hairs. Leaves pinnately trifoliolate, rarely unifoliolate. Flowers axillary, twin, pedunculate, violaceous or purple. Perhaps sufficiently distinct from *Clitória* and *Galactía*.

* Leaves simple.

1 C. procumbens (Kunth, mim. 205. t. 57.) procumbent; leaflet oblong or oblong-lanceolate, obtuse, smooth, but striate beneath, as well as the calyces. P. S. Native of South America, near Popayan.

Procumbent Cologania. Pl. procumbent.

** Leaves trifoliolate.

2 C. ovalifoíia (H. B. et Kunth, nov. gen. amer. 6. p. 412.) twining; leaflets ovate-elliptic, obtuse, mucronate, rounded at the base, strigulose on both surfaces, rather glaucous beneath; calyces pilose. P. S. Native of South America, on the banks of the river Amazon near Tomepends, in the province of Bracemora.

Oval-leafletted Cologania. Pl. tw.

3 C. pulchélla (H. B. et Kunth, nov. gen. amer. 6. p. 413.) twining; leaflets elliptic-oblong, obtuse, rounded at the base, and somewhat cordate, rather striose on both surfaces, glaucous beneath; calyx pilose. P. S. Native of New Spain, near Paezcuaro.

Near Cologania. Pl. tw.

4 C. intermé dia (H. B. et Kunth, nov. gen. amer. 6. p. 414.) twining; leaflets oblong or linear-oblong, glabrous above, paler beneath, and striose, as well as the calyces. P. S. Native of Mexico, in shady woods near Real del Monte.

Intermediate Cologania. Pl. tw.

5 C. angustifólia (Kunth, mim. p. 209. t. 58.) twining; leaflets linear, obtuse, rather striose on both surfaces; calyx covered with hispid pili. P. S. Native of Mexico, in temperate parts of hills and mountains.

6 C. Broussoñetí (D. C. prod. 2. p. 237.) twining; leaflets ovate-oblong, mucronate, rather striose on both surfaces, paler beneath; flowers twin, on short pedicelles; calyx villous, rather 5-cleft, the 2 superior lobes hardly connected, lower one elongated. P. S. Native of? Clitória Broussoñetti, Balb. cat. taur. 1815. p. 26. Allied to C. ovalifoíia, but is perhaps specifically distinct from all in the 2 superior lobes of the calyx being hardly connected.

Cult. For culture and propagation see Clitória, p. 216.

LIN. SYST. Diadélphía, Decándria. Calyx bibracteate, 4-cleft; the segments acute, and nearly equal. Corolla papilionaceous, having 5 oblong distinct petals; the vexillum broader than the rest, and incumbent. Stamens diadelpous. Style glabrous, crowned by an obtuse stigma. Legume terete or compressed, many-seeded, 2-valved, 1-celled, elongated—Climbing subshrubs or herbs, with impapi-pinnate or pinnate/trifoliolate leaves, with the leaflets stipellate. Racemes of flowers axillary, P. S. P.
S. Native of Jamaica and Cayenne.—Sloane, jan. 1. t. 114. f. 4.—P. Browne, jan. 298. t. 32. f. 2. Clitória Gałatica, Lin. spec. 1026. Flowers red. Shrub yielding a milky juice, and the legume is terete according to Sloane.

2 G. sericola (Pers. ench. 2. p. 302.) stem twining, pubescent; leaflets ovate, rather retuse, hoary and silky on both surfaces; racemes sub-spicate, axillary, shorter than the leaves; corolla a little longer than the calyx. \( \text{C. C. S. Native of the Island of Bourbon.} \)

Clitória Pływne, Comm. Juss. Legume glabrous, compressed, 4-5-seeded.

14 Var. \( \beta \). phrnyoides (D. C. prod. 2. p. 237.) leaves silky and rather hairy; pedicels axillary, and usually 1-flowered. \( \text{C. C. S. Native of the Mauritius.} \) Superior lobes of calyx a little broader than the rest. Perhaps a proper species.

3 G. Cubaensis (H. B. et Kunth, nov. gen. amer. 6. p. 429.) stem twining, beset with retrograde pubescence; leaflets elliptic, rounded at both ends, membranous, puberulous above, but clothed with soft canescent pubescence beneath; calyxes and legumes silky. \( \text{C. C. S. Native of Cuba near the Havana.} \)

Flowers purple.

Crow-scaled Galactia. Pl. tw.

4 G. Nitida (Nutt. gen. amer. 2. p. 116.) stem twining, clothed with dense and soft pilis; leaflets oval, obtuse, and pilose, paler beneath; racemes pedunculate, longer than the leaves; flowers nearly sessile; legume villous. \( \text{C. C. S. Native of Carolina and Georgia.} \) Flowers reddish.

Flowers Galactia. Pl. tw.

5 G. Morii (Michx. fl. bor. amer. 2. p. 61.) stem twining, clothed with soft villi; leaflets ovate-oblong, obtuse, glaucous beneath, and nearly glabrous, smooth above; racemes pedunculate, a little longer than the leaves; flowers pedicellate; calyxes acuminate; legumes compressed, pubescent. \( \text{C. C. F. Native of Carolina and Georgia.} \) Pursh. fl. sept. amer. 2. p. 458. Hedysarum vulgare, Lin. spec. 1057.—Dill. hort. elth. I. f. 170. Flowers purple, and variegated with yellow and white.

6 G. Glandéla (Michx. fl. bor. amer. 2. p. 62.) stem prostrate and naked, twining, smoothish; leaflets elliptic-oblong, obtuse, emarginate at both ends; racemes axillary, simple, short, few-flowered; flowers pedicellate; calyxes and legumes glabrous. \( \text{C. C. F. Native of North America, from New Jersey to Carolina, in pine barrens and sandy places.} \) Erythrum vulgare, Wurt. cart. 187. Dólóchus regularis, Lin. spec. 1022. Flowers purple, red and white mixed.

7 G. Purshii (Desv. obs. leg. in Schlecht. Linnaea. 2. p. 510.) stem prostrate and somewhat twining, smoothish; leaflets elliptic-oblong, obtuse, emarginate at both ends; racemes axillary, simple, short, few-flowered; calyx glabrous; legumes villous. \( \text{C. C. F. Native of North America, from New Jersey to Carolina.} \) G. glabélla, Pursh. fl. sept. amer. 2. p. 487. but not of Michx. Flowers purple, red, and white mixed. Roots fusiform.

8 G. Radi ã ía (D. C. prod. 2. p. 238.) stem weak, twining, smoothish; leaflets oblong-linear, obtuse, glabrous; flowers axillary, pedicellate, twine; legume pubescent. \( \text{C. C. S. Native of Mexico.} \) Clitória Mariana, Moc. et Sasse, fl. mex. icon. ind. but not of Lin. Flowers of a violet-purplish color. Root woody, thick. Teeth of calyx 4, acute.

Thick-rooted Galactia. Pl. tw.

9 G. Tuberosa (D. C. prod. 2. p. 238.) stem twining, villous; leaflets ovate; flowers axillary, twine, almost sessile, and with the upper abortive leaves mixed among the flowers so as to give them the appearance of an interrupted spike of flowers; root tuberous, oblong. \( \text{C. C. S. Native of Mexico.} \) Very like the preceding species. Flowers purple.

Tuberosous-rooted Galactia. Pl. tw.

10 G. Dubia (D. C. prod. 2. p. 238.) stem twining, terete, beset with strigose pilis, as well as the under side of the leaves and petals; leaflets elliptic, obtuse, somewhat emarginate, glabrous above; racemes axillary, about equal in length to the leaves; legumes linear, rather falcate, acute, clothed with adpressed hairs. \( \text{C. C. S. Native of Guadaloupe.} \) Galéaga dubia, Balb, herb. Calyx when young strigose, but at length becoming smooth, having the lobes acuminate. Corolla copper-coloured in a dried state.

Doubtful Galactia. Shrub tw.

11 G. Jesseana (Kunth, mim. t. 55. nov. gen. amer. 6. p. 427.) stem creeping, succulent, clothed with silky tomentum; leaflets elliptic, rounded at both ends, rather coriaceous, silky-canescent above, but clothed with silky white tomentum beneath as well as the legumes; calyx clothed with silvery silky pubescence. \( \text{C. C. S. Native of South America, on the banks of the river Orinoco, near Atures.} \) Flowers rose-coloured.

Jesse's Galactia. Shrub creeping.

12 G. Berteriana (D. C. prod. 2. p. 238.) stem twining, clothed with retrorsile pilis; pedicels and leaves clothed with villous pubescence beneath; leaflets ovate, acute, glabrous above; racemes spicate, longer than the leaves; calyxes glabrous, cleft into 4 beyond the middle; legume compressed, hooked at end, in consequence of the bent style, hairy in the middle of the valves, but glabrous on the margins. \( \text{C. C. S. Native of Porto Rigo.} \) Flowers purple.

Bertero's Galactia. Shrub twining.

13 G. Augustifolia (Kunth, mim. t. 56. nov. gen. amer. 6. p. 428.) stem erect, clothed with silky pubescence; leaflets linear-oblong, rounded at both ends, with the margins undulately-repand, coriaceous, clothed above with silky pubescence, and with silky silvery tomentum; calyxes silky. \( \text{C. C. S. Native of New Andalusia, on the declivities of Mount Tumiquiri.} \) Flowers purple.

Narrow-leaved Galactia. Pl. 1 to 2 feet.

14 G. Glaucescens (H. B. et Kunth, l. c.) stem erect; smoothish; leaflets elliptic-oblong, obtuse at both ends, coriaceous, glabrous, shining above, but glaucescent beneath; calyxes and legumes clothed with silky pubescence. \( \text{C. C. S. Native of South America, in the province of Quito, at the river Cuella.} \) Flowers violaceous.

Glaucescent Galactia. Shrub.

15 G. Coriacea (Nees et Mart. nov. act. bonn. 12. p. 30.) subrubry, glabrous; leaflets ovate, cuspidate, glabrous, and reticulately veined beneath; racemes erect; pedicels tern; flowers pendulous. \( \text{C. C. S. Native of Brazil.} \) Calyx cylindrical, 4-cleft. Flowers of a beautiful red colour.

Coriaceous-leaved Galactia. Shrub 2 feet.

16 G. Martinii (D. C. prod. 2. p. 238.) stem prostrate, but twining at the apex; leaflets coriaceous-lanceolate, clothed beneath with yellowish silky pubescence, at length glabrous; racemes axillary; calyxes clothed with rufous villi. \( \text{C. C. S. Native of Brazil, in fields.} \) Clitória augustifolia, Nees. et Mart. nov. act. bonn. 12. p. 29. Calyx 4-cleft, in which particular it agrees with the rest of the species of this genus. Flowers bluish-purple.

Martinus's Galactia. Pl. tw.

17 G.? Neechei (D. C. prod. 2. p. 238.) stem twining, tomentose; leaflets oblong, obtuse, tomentose beneath; flowers somewhat capitate; bracteas lanceolate; segments of calyx acuminate, villous. \( \text{C. C. S. Native of Brazil, in fields.} \) Clitória rubiginosa, Nees et Mart. l. c. p. 29. but not of Pers. Corolla pale-blue. Calyx 4-cleft.
LEGUMINOSÆ. LXXXVI. ODONIA. LXXXVII. STEGANTROPIS. LXXXVIII. VILMORINIA. LXXXIX. DIPLONYX, &c. 219

Nees's Galactia. Pl. tw.
16 G. ? ELLIOTTII (Nutt. gen. amer. 2. p. 117.) stems twining; leaves pinnate, with 3 pairs of oblong-elliptic, coriaceous, mucronulate, glabrous, shining leaves, which are emarginate at both ends; racemes pedunculate, few-flowered, shorter than the leaves. 2. ?. Native of South Carolina. Flowers pale-red. Lower segments of the calyx elongated. Ell. sketch. 2. p. 240. Flowers pale-red.
Elliot’s Galactia. Pl. tw.
Cult. These plants should be cultivated and propagated in the same manner as that recommended for Cithoria, p. 216, but those species natives of North America do not require any heat.

LXXXVI. ODONIA (from odon, odontes, odontus, a tooth; in reference to the wings being furnished with one tooth each on the upper side). Bcrlol. luenb. 1829. p. 35. D. C. prod. 2. p. 239.
LIN. SYST. Didiaphéla, Decândria. Calyx bracteless, 4-parted, shorter than the corolla, the segments undivided and nearly equal. Vexillum eecently spreading. Wings having each a single tooth on the upper side. Carina bipartite below, deflexed, remote from the vexillum. Stamens diadelphous. Style hooked at length. Legume compressed, 1-celled, usually 8-seeded.—A twining, sericeous herb, with pinnately trifoliate leaves and axillary racemes of flowers, which are shorter than the leaves. This genus comes very near Galactia.
Tomentose Odontia. Pl. tw.
Cult. See Cithoria, p. 216. for culture and propagation.

LXXXVII. STEGANTROPIS (from stegon, steganos, covered, and tropis, tropis, a keel; in allusion to the keel being covered by the vexillum). Lehm. hort. sem. hamb. et nov. act. bonn. vol. 14. p. 820.
LIN. SYST. Didiaphéla, Decândria. Calyx 5-toothed, bifracteate, permanent. Vexillum eecently spreading, bicallos at the base, and spurred behind, inclosing the wings and keel, which are membranous. Style membranous, dilated, and bearded at the apex. Legume linear, many-seeded.—A twining herb, with pinnately ternate leaves and 2-flowered peduncles.

LXXXVIII. VILMORINIA (in honour of M. Vilmorin, Member of the Agricultural Society of Paris). D. C. prod. 2. p. 239.
LIN. SYST. Didiaphéla, Decândria. Calyx bracteless, cylindricall, obtusely 4-toothed, somewhat bilabiate. Corolla papilionaceous; petals oblong, with the wings shorter than the carina. Stamens diadelphous. Style glabrous, subulate, acute. Legume pedicellate, lanceolate, attenuated at the base, compressed, ending in a filiform point. Seeds 12-16.—An upright shrub, with impari-pinnate leaves. Stipulas broadish at the base, ending in a long subulate point. Racemes axillary. Flowers dark-red.
1 V. MULTIFLÖRA (D. C. prod. 2. p. 239.) stem erect, glabrous; leaves pinnate, with 5 or 6 pairs of ovate leaflets, which are pubescent on the under surface, racemes shorter than the leaves. Π. ? S. Native of the West Indies, particularly in St. Domingo. Cithoria multiflora, Swartz, fl. ind. occid. 3. p. 1253.

LXXXIX. DIPLONYX (from ἰκτέλος, diplos, double, and orνς, οὖς, a claw; in reference to the wings, which are furnished with two claws each.). Rafin. ex Spreng. syst. 3. p. 154.
LIN. SYST. Didiaphéla, Decândria. Calyx urceolate, bilabiate, upper lip bifid, lower one trifid. Vexillum bent, with the claw glandular. Wings biunguiculate. Legume terete, 1-celled, many-seeded.—A twining shrub, with impari-pinnate leaves, having 6 pairs of leaflets; leaflets hastate, tomentose beneath. Flowers violaceous, disposed in racemes.
1 D. ELEGANS (Rafin. ex Spreng. syst. 3. p. 277.). Π. ? S. Native of Louisiana.
Elegant Diplonyx. Shrub tw.
Cult. See Cithoria for culture and propagation, p. 216.

LIN. SYST. Didiaphéla, Decândria. Calyx tubular, 5-cleft, bifracteate at the base; segments acuminate, equal. Corolla elongated; petals 5, on long stipes; wings shorter than the carina, and the carina shorter than the vexillum. Stamens diadelphous. Style filiform, bearded lengthwise at the apex. Stigma obtuse. Legume, judging from the ovary, linear, villous, 1-celled, many-seeded.—A shrub, with impari-pinnate leaves, having many pairs of stipellate leaflets. Racemes axillary, few-flowered, shorter than the leaves. Flowers of a scarlet-purplish colour. Stipulas and bracteae acuminate.
1 B. POLYPHYLLA (D. C. l. c. t. 39.). Π. ? S. Native of Porto-Rico. Cithoria polypylla, Poir. suppl. 2. p. 302. Flowers 2 inches long. Leaves having 9 to 11 pairs of elliptic-oblong, mucronate leaflets; the young ones canescent beneath, the adult ones pubescent.
Cult. See Cithoria, p. 216. for culture and propagation.

LIN. SYST. Didiaphéla, Decândria. Calyx campanulate, 5-toothed, gibbous at the base, the lowest tooth longest and carinated. Vexillum orbicular. Stamens diadelphous. Style villous in front. Legume linear, compressed, hooked at the apex, 1-celled, many-seeded.—A tomentose shrub, with impari-pinnate leaves, and terminal racemes of white flowers.
1 K. SERICEA (Reinw. ex Spreng. syst. 3. p. 245.). Π. ? S. Native of Java.
Silky Kieseria. Shrub.
Cult. For culture and propagation see Cithoria, p. 216.

XCII. GRONA (from ἰκτέλος, grone, a cavern; in reference to the keel, which is hollowed beneath). Lour. coch. 4. p. 459. D. C. prod. 2. p. 239.
LIN. SYST. Didiaphéla, Decândria. Calyx permanent, 4-cleft; the lobes nearly equal, superior one omarginate. Corolla papilionaceous. Vexillum obcordate. Wings obtuse. Keel bent, concave below, joined with the wings as far as the middle. Stamens diadelphous, 9 joined together, and 1 free. Style filiform, crowned by a simple stigma. Legume straight, linear, compressed, many-seeded. Seeds kidney-shaped.—A suffrutescent, creeping, prostrate plant, with simple, ovate, entire leaves, and subulate stipulas. Flowers purple, disposed in spikes, each branch containing 2 flowers. Nearly allied to Galactea.
1 G. REXXS (Lour. l. c.). Π. ? S. Native of Cochlin-china, on hills.

F F 2
Creeping Grona. Pl. creeping.

Cult. A mixture of loam and sand will suit this genus, and cuttings will root freely in sand, under a bell-glass.

XCVII. GLYCINE. (from γλυκής, glycys, sweet; the leaves and roots of one or two of the species are sweet). D. C. legum. mem. vi. prod. 2. p. 241. Glycine species of authors.

LIN. Syst. Didadelphus, Decandria. Calyx 5-cleft, somewhat bilabiate; upper lip entire or hardly bidentate, lower one tridid. Corolla papilionaceous. Keel straight, obtrorse. Vexillum obovate. Stamens monadelphous. Legume compressed, attenuated into a stipe at the base, and apiculate by the style, 2-valved, continuous, many-seeded.—Climbing Indian shrubs, with deciduous stipulas, distinct from the petiole. Leaves trifolate; leaflets large, ovate, acute, reticulately nerved, stipellate at the base. Racemes compound, branched. Flowers pedicellate, twin, or tern, yellowish. Fruit not sufficiently known. A very distinct genus from Hedysarum.

1 P. tuberosa (D. C. L. c.) leaves pubescent on the upper surface, but clothed with silky villi on the under as well as the calyces and pedicels. 2. S. Native of the East Indies. Racemes of flowers nearly 2 feet long. Hedysarum tuberosum, Roxb. in Wild. spec. 3. p. 1197.

Tuberous-rooted Pueraria. Shrub cl.

2 P. Wallichii (D. C. legum. mem. vi. t. 43.) leaves glabrous on the upper surface, but pubescent on the under as well as the calyces and pedicels. 4. G. Native of Nipal. Racemes 3 or 4 inches long.

Wallich's Pueraria. Shrub cl.

Cult. For culture and propagation see Clitoria, p. 216.

LIN. Syst. Didadelphus, Decandria. Calyx cylindrical, obliquely truncate, toothless, bifracteolate at the base. Corolla papilionaceous, the claws of the petals about equal in length to the calyx. Carina obtuse. Stamens diadelphous, permanent. Style dilated in the middle. Stigma terminal. Legume attenuated at the base, 2-valved, compressed, few-seeded, torulose.—Climbing herbs, which are perhaps suffruticosae at the base. Leaves pinnately trifoliate; leaflets ovate. Racemes axillary, usually shorter than the leaves. Legume velvety, from crowded short down. Bracteoles 2, small, subulate, under the calyx.

1 D. villiflora (D. C. L. c. t. 44. prod. 2. p. 241.) branches, petioles, peduncles, and young leaves, hairy; leaflets ovate-lanceolate, adult ones almost glabrous; legume 3-times longer than the calyx. 4. G. Native of Nipal. Flowers pale in a dried state, 5 lines long.

2 D. pubescentes (D. C. L. c. t. 45. prod. 2. p. 241.) branches, petioles, peduncles, and leaves pubescent; leaflets ovate; legume 4-times longer than the calyx. 4. G. Native of Nipal. Flowers yellow. Lindl. bot. reg. 962.

Cult. For culture and propagation see Clitoria, p. 216.

LIN. Syst. Monadelphus, Decandria. Calyx campanulate, bluntly bilabiate, upper lip entire or rarely bidentate, lower one tridid. Corolla papilionaceous. Keel straight, obtuse. Vexillum obovate. Stamens monadelphous. Legume compressed, attenuated into a stipe at the base, and apiculate by the style, 2-valved, continuous, many-seeded.—Climbing Indian shrubs, with deciduous stipulas, distinct from the petiole. Leaves trifolate; leaflets large, ovate, acute, reticulately nerved, stipellate at the base. Racemes compound, branched. Flowers pedicellate, twin, or tern, yellowish. Fruit not sufficiently known. A very distinct genus from Hedysarum.

1 P. tuberosa (D. C. L. c.) leaves pubescent on the upper surface, but clothed with silky villi on the under as well as the calyces and pedicels. 4. S. Native of the East Indies. Racemes of flowers nearly 2 feet long. Hedysarum tuberosum, Roxb. in Wild. spec. 3. p. 1197.

Tuberous-rooted Pueraria. Shrub cl.

2 P. Wallichii (D. C. legum. mem. vi. t. 43.) leaves glabrous on the upper surface, but pubescent on the under as well as the calyces and pedicels. 4. G. Native of Nipal. Racemes 3 or 4 inches long.

Wallich's Pueraria. Shrub cl.

Cult. For culture and propagation see Clitoria, p. 216.
LEGUMINOSÆ

XCVII. Glycine.

221

Glycine. Shrub tw.

11 G. senica (Willd. spec. 3. p. 1059.) stems twining; leaflets ovate, retuse, silky beneath; racemes longer than the leaves; legumes, when not mature, linear, acuminate, clothed with white silky pubescence. \( \vee \). C. S. Native of Guinea. Flowers of Cítória, reddish, but the vexillum is narrow, oblong-ovate, and reflexed.

Glycine. Shrub tw.

12 G. guineensis; plant twining and villous; leaves pinately trifoliolate; leaflets ovate-lanceolate, clothed with silky villi beneath; peduncles 3-4-flowered; legume compressed. \( \vee \). C. S. Native of the Island of St. Thomas, in the Gulf of Guinea. Flowers small.

Guinea Glycine. Pl. tw.

13 G. victoria (Lindl. bot. reg. 1418.) stems twining, pilose; leaflets ovale, mucronate, pubescent; racemes axillary, many-flowered, erect, shorter than the leaves; vexillum 2-lobed. \( \vee \). C. S. Native of Mexico. Flowers violaceous.

† Species not sufficiently known.

14 G. angulata (Desv. journ. bot. 1814. vol. 1. p. 78.) stem angular; the angles hairy; leaflets ovate-oblong, obtuse, silky beneath; legumes linear, compressed, hairy. Native of North America.

Angular-stemmed Glycine. Pl. ?

15 G. emarginata (Desv. l. c.) stems twining, woody; branches pubescent; leaflets quite smooth, emarginate at the apex; flowers racemose. \( \vee \). C. S. Native of the Antilles.

Emarginate-leafletted Glycine. Shrub tw.

16 G. leucosperma (Desv. l. c.) stem twining, herbaceous, pubescent; leaflets elliptic, coriaceous, quite smooth; legume pilose. \( \vee \). C. S. Native of St. Domingo.

White-seeded Glycine. Shrub tw.

17 G. lancifolia (Lag. nov. gen. et spec. p. 24.) stems twining; leaflets narrow, lanceolate, glabrous, lateral ones oblique; peduncles axillary, solitary, racemously 4-flowered. \( \vee \). C. G. Native of the Canary Islands.

18 G. erecta (Thunb. l. c.) stem erect, hairy; leaflets oblong, villous, having rather revolute margins; flowers usually 4 in an umbel. \( \vee \). G. Native of the Cape of Good Hope. Flowers rufescence.

Erect Glycine. Shrub 2 to 3 feet.

19 G. heterophylla (Thunb. l. c.) stems decumbent and twining a little, glabrous; leaflets oblong and linear, glabrous; with somewhat revolute margins; flowers umbellate. \( \vee \). C. G. Native of the Cape of Good Hope. Flowers yellow.

20 G. argentea (Thunb. l. c.) stems twining, clothed with silky tomentum; leaflets ovate, somewhat mucronate, clothed with white tomentum beneath; peduncles axillary, 4-5-flowered; flowers umbellate. \( \vee \). C. G. Native of the Cape of Good Hope. Flowers yellowish.

Silver Glycine. Pl. tw.

21 G. monniera (D. C. prod. 2. p. 242.) stems diffuse, terete, glabrous; branches twining a little, clothed with adpressed pubescence; leaflets obovate or oval, rather acute, glabrous above, but clothed with adpressed pubescence beneath; peduncles longer than the leaves; flowers racemose, at length reflexed. \( \vee \). C. G. Native of the Cape of Good Hope. Monniera trifoliolata, Burm. cap. prod. p. 20. exclusive of the synonyms.

Monnier's Glycine. Shrub cl.
22 G. secunda (Thunb. prod. 131. fl. cap. 591.) stems decumbent, filiform, angular, pubescent; leaflets roundish, glabrous above; racemes pedunculate, axillary, many-flowered; flowers second; legumes hairy. \( G. \) G. Native of the Cape of Good Hope, in grassy places. Flowers yellow.

Sonora-flowered Glycine. \( G. \) Jul. Aug. Clt. 1825. Pl. dec. 23 G. jayacitica (Lin. spec. 1024.) stem twining, beset with retrograde villi as well as the petioles; peduncles length of leaves; flowers disposed in dense spikes, nodding; bracteas lanceolate, minute. Native of the East Indies and Japan. Thunb. in Lin. trans. vol. 2. p. 340. Flowers violaceous. The plant under this name in the herbarium of Retzius has 3-lobed repand leaflets, the middle lobe acute, the lateral ones short and very blunt; the peduncles are also longer than the leaves, and the flowers are disposed in rather loose spikes, also the calyx is acutely 5-toothed. It is, however, only the same species.

*Jasca* Glycine. Pl. tw.

24 G. villosa (Thunb. fl. jap. 283.) stems twining, tomentose; leaflets 3-roundish, acute, tomentose; racemes pedunculate, axillary, 2-5-flowered; legume tomentose. \( G. \) G. Native of Japan. Flowers purplish?

**XC VIII. CHETO'CALYX** (from χατα, a chaste, and καλυς, calyx; in reference to the calyx being covered with spiny bristles). D. C. Leg. mem. vii. prod. 2. p. 243.

Lin. Syst. *Diaspeli'phus, Decándria*. Calyx beset with glands and spiny bristles, bilabiate; segments subulate, those of the superior lip recurved, of the lower lip adpressed. Veinulum roundish, emarginate; keel conforming to the wings. Stamens diadelphous; filaments connected at the base. Ovary linear, many-seeded. Style compressed, filiform, villous. Legume unknown.-Frutescent twining plants, with impari-pinnate leaves, having 2 pairs of oval, mucronate, exstipellate leaflets. Stipulas lanceolate-linear, sparingly deflexed. Pedicels filiform, 1-flowered, raising in numbers from the axils of the leaves. Flowers yellow. This genus has the habit of *Tephrosia*, but is perhaps more nearly allied to *Glycine*.

2 C. pubescens (D. C. prod. 2. p. 245.) leaflets ovate, mucronate, clothed with velvety pubescence on both surfaces, as well as branches. \( G. \) S. Native of St. Domingo. Glycine pubescens, Bertero, in herb. Balb. The stamens which were examined in one young flower were seen to be almost distinct.

Subtribe IV. *Gal'ceae* (plants agreeing in some important characters with *Gleditsia*). Bronn. l. c. exclusive of some genera, D. C. prod. 2. p. 243. Legume 1-celled (fl. 36. c. f. 37. c.). Stamens diadelphous, rarely monadelphous. Stems herbaceous, shrubby, or arborescent. Leaves alternate or opposite, lower ones simple, the rest impari-pinnate.

**XC IX. PETA'LOSTE'MUM** (from πεταλον, petalon, a petal, and στεμον, stemon, a stamen; in reference to the stamens being joined to the petals at the base). Michx. fl. bor. amer. 2. p. 48. D. C. prod. 2. p. 248.

Lin. Syst. *Monadel'phus, Pentándria*. Calyx 5-cleft or 5-toothed. Petals 5, unguicate, like each other in shape. Stamens 5, joined together into a tube. Veinulum com-quitulate, free. Legume covered by the calyx, 1-seeded, indehiscent.—Perennial North American herbs, beset with glandular dots, with impari-pinnate leaves, and with the flowers disposed in dense, pedunculate spikes, which are either opposite the leaves, or terminal from the upper branches becoming abortive.

**Sect. I. Petaloste's'mon** (see genus for derivation). D. C. prod. 2. p. 248.—Dálea, with petandrous flowers, Vent. Calyx 5-toothed; teeth short, not plumose. Petals on long claws, with roundish limbs. Spikes of flowers cylindrical; bracteas subulate.

1 P. can'didum (Michx. fl. bor. amer. 2. p. 48. t. 37. f. 1.) spike cylindrical, on a long peduncle; bracteas longer than the flowers; leaves glabrous, with 3 pairs of lanceolate leaflets. \( V. \) F. Native of Tennessee, in the Illinois region, and on the banks of the Missouri. Dálea candida, Willd. spec. 3. p. 1337. Psoralea candida, Poir. suppl. Flowers white.

2 P. ca'rensum (Michx. l. c. t. 37. f. 2.) spikes cylindrical, pedunculate; bracteas subulate, length of calyx; bracteoles sessile, permanent; calyxes glabrous; leaflets lanceolate. \( V. \) F. Native of Georgia and Florida, in pine forests. Flowers pale flesh-coloured.

3 P. viola'ceum (Michx. l. c. t. 37. f. 3.) spike cylindrical, on a short peduncle; bracteas about equal in length to the calyx; bracteoles spatulate, deciduous; calyxes silky; leaves having 2 pairs of linear leaflets. \( V. \) F. Native of Tennessee, in the Illinois country, and in the prairies of the Missouri. Dálea violacea, Willd. spec. 3. p. 1337. Dálea purpurea, Vent. hort. ed. c. t. 40. Psoralea violacea, Poir. suppl. Sims, bot. mag. 1707. Flowers pale-purple.

4 P. macrobe's contemplating' (Torrey, in ann. lyc. 2. p. 176.) spike cylindrical, compact, very long; bracteoles lanceolate; calyxes clothed with silky villi; leaves generally with 3 pairs of lanceolate-oblong glabrous leaflets. \( V. \) F. Native of North America, about the forks of the Platte. Flowers small, white.

*Long-spired* Petalostemum. Pl. 2 feet.

5 P. bor'ereum (Nutt. in Sill. Amer. journ. 5. p. 1822. p. 298.) plant glabrous; leaflets linear; bracteas subulate, very short, permanent; calyx striated, glabrous. \( V. \) F. Native of Eastern Florida. Very like *P. violacea*, but differs in the calyxes being perfectly glabrous, and in the petals being rose-coloured.

*Rose-coloured-flowered* Petalostemum. Pl. 1 foot.

6 P. vil'losum (Nutt. gen. amer. 2. p. 85.) plant villous, decumbent; spike cylindrical, nearly sessile; bracteas shorter than the woolly calyx; leaves having 7 pairs of linear-oblong leaflets. \( V. \) F. Native in sandy places near the river Missouri about Fort Mandan, at the Knife river. Root fusiform. Petals pale-red.

*Villosus* Petalostemum. Pl. decumbent.

**Sect. II. Ku'mine's'ta'ra** (in honour of Adam Kuhn, a pupil of Linnaeus. There is, however, a genus *Kühnia*, named by Linnaeus in compliment to him; the different termination of the word is to distinguish it from that genus). Lam. dict. 3. p. 870. Vent. mem. soc. hist. nat. par. p. 113. D. C. prod. 2. p. 244.—*Cyli'podon, Rafin. in journ. phys. ang. 1819. p. 97. Calyx almost 5-parted; segments plumose. Petals linear, attenuated at the base. Flowers cipitate. Bracteae scarious, roundish, forming as it were an involucrum to the head of the flowers. Perhaps a proper genus.
7 P. corymbosum (Michx. ex Poir. in herb. Juss. D. C. prod. 2. p. 244.) flowers disposed in panicled corymb; leaves having 2-3 pairs of linear, awnless, glabrous leaflets; segments of the calyx very villous. 2. F. Native of Carolina and Georgia, in pine barrens. Kildium affinis, Walt. car. 103, Kuhnista Carolinae, Lam. dict. I. C. Dalea Kuhnista, Willd. spec. 3. p. 1537. Cylipogon virgatum, Rafin. I. c. Petals white, anthers yellow. Stamens 8, connected together at the base in this, as well as the following species, according to Rafin. I. c.

Capitate-flowered Dalea. Pl. 1 foot.

Cult. The species of this genus are very difficult to preserve in gardens. They should be grown in pots in a mixture of loam, leaf mould, and sand; and they are increased by seeds, or by dividing the plants at the roots.

C. Dalea (in honour of Thomas Dale, an English botanist of the last century.) Lin. hort. cl. 303. Michx. fl. bor. amer. 2. p. 56. D. C. prod. 244.—Parosella, Cav. elench. hort. madr.—Dalea, with decandrous flowers, Vent. Willd. Lin. syst. Monadelphia, Decadria. Calyx 5-cleft (f. 36. 6.) or 5-toothed, sometimes beset with glands. Wings and carina adhering to the tube of the stamens. Vexillum short, free (f. 36. 6.). Stamens 10, monadelphous. Legume ovate, 1-seeded (f. 36. 6.), shorter than the calyx.—American herbs, which are sometimes suffruticose at the base, beset with glandular dots in every part. Stipules adhering to the petioles at the base. Leaves impari-pinnate, having the terminal leaflet sessile. Flowers disposed in pedunculate spikes, which are opposite the leaves.

2 D. aurea (Nutt. in Fras. cat. 1813. gen. amer. 2. p. 101.) plant clothed with silky villi; stem erect; leaves having 4 pairs of obovate leaflets, which are pilose beneath; spikes of flowers dense, cylindrical; bracteas rhomboid-ovate, about equal in length to the calyx; calyx densely clothed with wool; the teeth subulate. 2. F. Native of Upper Louisiana, near White River, on the Mississippi. Pursh, fl. sept. amer. 2. p. 741. Psoralea aturia, Poir. suppl. Flowers golden-yellow.

somewhat glandular; spikes of flowers opposite the leaves, cylin-
drical, pedunculate; calyx glabrous at the base, and with a
airy limb. Θ. S. Native of South America, near Quito, and
on the mountains about Popayan. Flowers rose-coloured.

_Astromalais_ D. _punctata_ (Kunth, min. 169. t. 49. nov. gen. amer.
6. p. 483.) plant erect or procumbent, many-stemmed; leaves
with 20-30 pairs of linear, acutish, emarginately-coneave,
glabrous, glandless leaflets; spikes of flowers oblong-oblong,
long peduncles; peduncles subulate; calyx glabrous and hairy.
Θ. G. Native of Mexico near Villahondo. Flowers vio-
laeous, but yellow at the claws.

_Punctata_ D. _punctata_. Pl. procumbent.

19 D. _mutabilis_ (Willd. spec. 3 p. 1339-.) erect, branched,
glabrous; leaves with 5-10 pairs of obovate or obcordate
leaflets; spikes of flowers cylindrical, at length much elongated,
pedunculate; peduncles hispid just under the spike; calyx gla-
brous, striated with 10 black nerves; bracteas ovate, terminated
by a bristle, shorter than the calyx. Θ. S. Native of Mexico
and of the island of Cuba. Sims, bot. mag. 2486. D. bicolor,
Wildl. hort. berl. t. 89. ex Sims. D. obvato-tubulata, C. sp. no.
1339.rob. Moc. Mexico, 1339.) calyx spikes Native
native, stems 49. spikes Native

18 D. _lutea_ (Willd. spec. 3 p. 1341.) plant decumbent, many-
buds; leaves with 6 or 8 pairs of obovate, slightly emar-
ginated leaflets, but the terminal one is longest; spikes of flowers
ovate at first, but at length becoming cylindrical, pedunculate,
villous; bracteas ovate, acute, shorter than the calyx. Θ. G.
Native of Mexico. D. ovalifolia, Ort. dec. p. 30. t. 3. Psorállea
Ω. Cav. spec. 3 t. 325. D. lutea, Moc. et Sesse, fl. mex. icon.

Yellow-flowered D. _punctata_. Pl. procumbent.

19 D. _mutabilis_ (Willd. spec. 3 p. 1339-.) erect, branched,
LEGUMINOS.E. C. DALEA.

SILVERY DALEA. Shrub 2 feet.

36. **D. verrucosa**; shrubby, pubescent, with warty upright branches; leaflets 5 or 9, obovate, retuse, glandular beneath; spikes of flowers elongated, loose; calyx downy, with lanate pointed teeth.  ﾂ. Native of South America. Spikes loose, 3 inches long. Flowers pale-purple. (v. s. herb. Lamb.)

WARTED-BRANCHED DALEA. Shrub 1 foot.

37. **D. prostrata** (Off. dec. t. 69.) stems prostrate, clothed with canescent hairs, thickest towards the apex; leaves with 1 or 2 pairs of lanceolate leaflets, glabrous above, and pubescent beneath; spikes of flowers ovoid, on short peduncles, recurved; bracteas lanceolate, length of the calyx, which is very villous. ﾂ? G. Native of Mexico. Flowers yellow.

PROSTRATE DALEA. Pl. prostrate.

38. **D. proculmens** (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 246.) stems prostrate, pubescent, thickest at the base; leaves with 8 or 9 pairs of oval obtuse leaflets; spikes of flowers cylindrical, ascending, pubesculent; flowers drooping a little; vexillum very short. O. G. Native of Mexico, at Chilapa. Flowers white, but with yellowish calyx, pubescent.

PROCOUMBENT DALEA. Pl. procombent.

39. **D. mucroxa** (D. C. prod. 2. p. 246.) plant erect, branched; axillary branches bearing a spike of flowers, and one leaf in the middle of each; leaves with 5 or 6 pairs of elliptic-oblong mucronate leaflets, which are acute at both ends; spikes of flowers dense, ovate; calyx quite smooth, with short teeth; bracteas subulate, rather longer than the calyx.  ﾂ. Native of Mexico. Flowers small, white.

MUCRONATE-LEAFLETED DALEA. Pl. 1 foot.

40. **D. thouinii** (Schrank, hort. mon. t. 9.) plant erectish, glabrous; leaves with 3–5 pairs of obovate emarginate leaflets; spikes of flowers ovate, on short peduncles; bracteae ovate, acuminate, rather pilose, shorter than the calyx, which is rather hairy.  O. G. Native of South America. The spikes of flowers according to the figure are sessile, but according to the description pedunculate. Perhaps the same as Petalotelmum simplex, Moc. et Sesse, fl. mex. icon. ined. Perhaps a variety of D. alapevroides only.

41. **D. Phyutaoxides** (Wildl. spec. 3. p. 1338.) plant erect, shrubby, smooth; leaves with 7 or 8 pairs of obovate, somewhat mucronate leaflets, which are dotted beneath; spikes of flowers capitate, on short peduncles; bracteae lanceolate-subulate, ciliatæ, shorter than the calyx; calycine lobes subulate, long, and very villous.  ﾂ. Native of Caraccas. Psoralea phytoxides, Jacq. icon. rar. 3. p. 563. Psoralea emphysoides, Jacq. coll. 4. p. 144. Flowers at first white, but at length becoming violaceous.

IMPOSTUME-LIKE DALEA. Fl. July, Aug. Shrub 2 to 3 feet.

42. **D. Domínguezensis** (D. C. prod. 2. p. 246.) erect, clothed with velvety pubescence; leaves with 6 or 7 pairs of obovate, obtuse, or emarginate leaflets, which are dotted beneath; spikes of flowers capitate, on short peduncles; bracteae ovate, acute, shorter than the calyx, which is villous; calycine lobes subulate.  ﾂ. S. Native of St. Domingo. D. encaephylla, Bert. in herb. Bolb. This species comes very near D. phytabusides, but differs in the whole plant being clothed with velvety pubescence, not glabrous.

ST. DOMINGO DALEA. Shrub 1 to 2 feet.

43. **D. Ayavacaensis** (H. B. et Kunth, nov. gen. amer. 6. p. 486.) plant shrubby; branches villously-tomentose, and glandular; leaves with 7 or 8 pairs of oblong, somewhat mucronate leaflets, which are glabrous above, and pubescent beneath; spikes of flowers terminal, and opposite the leaves, oblong-cylindrical, pubesculent; calyx ornamented with rows of glands, with a hairy limb.  ﾂ. S. Native of Peru, near Ayavaca. Flowers violaceous.
Leguminosæ. C. Dalea. Glorysthiza.

Agavea Dalea. Shrub 3 to 6 feet.

D. ENSEPHYLLA (Wild. spec. 3. p. 1888.) plant erect, glabrous, leaves with 4 pairs of oblong obtuse leaflets, which are about equal in length to the peduncles, which are about equal in length to the peduncles, lobes of calyx spinaeaceous. f. S. Native of Cartagena, in bushy places. Psoralea encephylia, Link, spec. 1076. P. Cartaghenensis, Jacq. spec. 206. exclusive of the synonyme of Pluck. P. encephylia and P. Cartaghenensis, Poir. dict. 5. p. 550. Perhaps Jacquin’s plant and that of Linneus are distinct species. Flowers small, reddish.

D. onobrychus (D. C. prod. 2. p. 247.) plant erect, glabrous; leaves with 4-6 pairs of elliptic, somewhat mucronate leaflets, which are covered with dots beneath; peduncles opposite the leaves, and 4-times longer than them; spikes of flowers ovato-cylindrical, dense, villous; bracteas ovate, concave, ending in a bristle-like mucrone, rather longer than the calyx, which is villous. f. S. Native of Peru. Flowers violaceous. Branches villous. Stipites setaceous. Peduncles rather scabrous from a few tubercles.

Saintfain-like Dalea. Pl. 1 to 2 feet.

D. MUTUSI (Kunth, mim. 161. t. 47. nov. gen. amer. 6. p. 485.) plant erect, pubescent; leaves with 4-6 pairs of elliptic leaflets, which are beset with glandular dots and villi beneath, as well as the branchlets; spikes of flowers cylindrical, pedunculate, dense; bracteas ovate, ending in a long bristle point, longer than the flowers. f. S. Native of South America, at Santa Fe de Bogota. Galega carcula, Link, fil. suppl. 335. Tephrosia carcula, Pers. ench. 2. p. 329. Flowers blue.

Mutis’s Dalea. Shrub 2 to 3 feet.

D. CYLINDRICA (Hook. bot. mi-c. 1. p. 213.) plant procumbent, smoothish; leaves with 6 pairs of obovate, somewhat mucronate leaflets, which are dotted beneath; peduncles opposite the leaves, and 3 times longer them; spikes cylindrical, dense; bracteas ovate, concave, mucronate; calyx full of black dots, smooth, longer than the bracteas; segments broad-awl-shaped, ciliate. f. S. Native of Peru, in the valley of Canta. Flowers blue.

Cylindrical-spiked Dalea. Shrub.

D. exilis (D. C. prod. 2. p. 247.) plant erect, glabrous; leaves with 5-7 pairs of oblong acute leaflets, small, beset by dots beneath; spikes of flowers pedunculate, nearly globose, dense; bracteas ovate, glabrous, obtuse, mucronate, or acuminate, length of the calyx, which is villous. f. ? f. ? S. Native of Peru. Flowers violaceous. Bracteas differing in shape even in the same head of flowers. Leaflets a line and a half long.

Lean Dalea. Pl. 1 to 2 feet.

D. merophylla (H. B. et Kunth, nov. gen. amer. 6. p. 482.) plant shrubby, procumbent; leaves with 9 or 10 pairs of glabrous, obtuse, thickish leaflets, beset with glandular dots beneath; spikes of flowers oblong-cylindrical; bracteas ending in a subulate aecumen, beset with dots above, but silky beneath, length of calyx, which is clothed with glands and silky hairs. f. S. Native of Peru, on the mountains. Flowers yellow and red on the same plant according to Bonpland.

Small-leaved Dalea. Shrub procumbent.

D. oyalifolia; herbaceous, spreading, smooth; leaflets 5, elliptic, glandular beneath; stipules minute; spike long and slender, few flowered; calyx hairy, ribbed, with long-pointed recurved teeth. f. S. Native of Mexico. Plant much branched, spreading. Leaflets nearly an inch long. Spikes often a span long. Flowers white, stained with purple. (v. s. herb. Lamb.)

Oval-leaffleted Dalea. Pl. 2 feet.

D. coroinilla; herbaceous, upright, slightly villous; leaflets 7-9, obovate, mucronulate, glandular beneath; stipules long, setaceous; spikes of flowers oblong; calyx truncate, fringed with obsolete teeth. f. S. Native of Mexico. Flowers pale-purple. (v. s. herb. Lamb.)

Coronilla-like Dalea. Pl. 1 foot.

D. fruticosa; shrubby, minutely pubescent; leaves with many-pairs of oblong leaflets, which are rounded at both ends, minutely mucronulate, coriaceous and veiny; stipules prominent; spikes of flowers loose, with short blunt teeth. f. S. Native of Mexico. Spikes about 2 inches long, thinly flowered, somewhat corymbose. Flowers small, yellow? (v. s. herb. Lamb.)

Shrubby Dalea. Shrub.

Cult. All the species of this genus grow best in a mixture of loam and peat, and the shrubby and perennial kinds are easily increased by young cuttings planted in sand, with a hand-glass placed over them; those of the stover species in heat. The seeds of annual kinds should be sown in pots, which should be placed in a hot-bed, and the plants separated and planted into other pots singly when they have grown a sufficient size for that purpose, and some of them may be planted out into the open border in a warm sheltered situation, where they will probably ripen their seeds. None of the species are worth cultivating except in botanical gardens.

Lin. syst. Diadphila, Decandria. Calyx naked, tubular, 5-cren, bilabiate; lobes, especially the 2 superior ones, joined together much farther than the others. Vexillum ovate-lanceolate, straight. Keel 2-edged or of 2 petals, straight, acute. Stamens diadphils. Style filiform. Legume ovate or oblong, compressed, 1-celled, 1-4-seeded.—Perennial herbs, with long, perpendicular, sweet roots, impari-pinnate leaves, axillary racemes of blue, violaceous, or white flowers. This is the genus to which the various kinds of liquorice belong.

1 G. glabra (Lin. spec. 1046.) leaflets ovate, rather retuse, and somewhat crennate beneath, as well as the branches; stipulas wanting; spikes or racemes of flowers pedunculate, shorter than the leaves; flowers distant; legumes glabrous, 3-4-seeded. f. H. Native of the south of Europe, from Spain to Tauria, also of China, and cultivated in France, Italy, Germany, and England for the sake of its roots. Lami. ill. t. 623. f. 2. Wood. med. bot. 458. t. 167. G. levis, Pall. ill. ined. gall. append. no. 364. Liquiritia officinalis, Meech. l. c. Roots long, perpendicular. Stem only terete at the apex. Leaves usually with 5 pairs of leaflets. Flowers pale-blue. The name liquorice, according to Du Theis, is said to be a corruption of the French word Reglisse, which is itself a corruption of Glycyrhiza. It is more probable that the name liquorice has been given on account of the quantity of liquor the roots contain. Liquorice is much cultivated in Spain, and since Elizabeth’s time has been grown in different parts of England. The soil most congenial to the growth of liquorice is a deep sandy loam, trenched by the spade or plough, or with the aid of both, to 2 or 3 feet in depth, and manured if necessary. The plants are procured from old plantations, and consist of the side shoots which have eyes or buds. These may be taken off either in autumn, when a crop of liquorice is taken up for use, and laid in earth till spring, or taken from a growing plantation as wanted for planting. The planting season may be either October, or February, or March. In general the latter is preferred. The plants are dibbled in the rows 3 feet apart, and from 18 inches to 2 feet in the row, according to the richness or poverty of the soil. The after culture
LEGUMINOSE. Cl. GLYCYRHIZA. Cl. GALEGA.

consists of horse-hoeing, and deep-stirring in weeding, and in cutting down and carrying away the bauml every autumn, after it is completely withered. As the plants do not rise above a foot the first season after planting, a crop of onions is sometimes taken in the intervals. The plants must be three summers' growth, at the end of which the roots may be taken up by trenching over the ground. The roots are then either sold immediately to the brewers' druggists or to common druggists, or preserved like carrots or potatoes in sand, till wanted for use.

The roots of liquorice are externally brown, and internally yellow. Their taste is very sweet, combined with a slight degree of bitter when long kept in the mouth. The powder of liquorice usually sold is often mingled with flour, and perhaps also with substances not so wholesome. The best sort is of a brownish-yellow colour, the fine pale-yellow being generally sophisticated, and it is of a very rich sweet taste, much more agreeable than that of the fresh root.

Robiquet obtained from liquorice-root, 1. Amylaceous fecula. 2. A saccharine substance, having little resemblance to sugar. 3. A new crystalline substance. 4. A resinous oil, which is the cause of its acrimony in the decoctions. 5. Phosphatd and malleate of lime and magnesia. 6. Woody fibre.

The sweetness of liquorice-root depends upon a peculiar principle discovered by Robiquet, and called by him glycyrrhiza and glycyon. He prepared it by subjecting a strong cold infusion of the root to ebullition, which separated a coagulable matter. It was then filtered, and acetate acid added, which gradually threw down an abundant, transparent, gelatinous magma, which being washed with a little cold water to separate any adhering acid, he considered as pure glycyon. Its taste is peculiar, and intensely sweet, and its smell is not perceptible unless thrown upon hot coal, when it is resinos.

The predominant constituents of liquorice being saccharine and mucilaginous matter, its only action is that of a mild demulcent, and as such it is frequently used in catarrh, and in some stomach complaints, which seem to arise from a deficiency of the natural mucus, which should defend the stomach against the acrimony of the food and the fluids secreted into it. On account of its bulk it is rarely exhibited in substance, but more frequently in infusion or decoction.

The extract of liquorice is never prepared by the apothecary, but is commonly imported from other countries. It is imported in cylindrical rolls, covered with hay leaves. It should be perfectly black, brittle when cold, and break with a smooth and glassy fracture, have a sweet taste without empyreuma, and be almost entirely soluble in water. It is prepared from the fresh roots by expression, decoction, and inspissation. The best foreign extract of liquorice is prepared in Catalonia. The refined liquorice sold in the shops in small cylindrical pieces not thicker than a goose quill, is a composition with mucilage of glue. The extract possesses the same properties with the root, and is used for the formation of several kinds of troches.

2 G. DAYLDELIUM (Walsh. et Kit. fum. 1. p. 20. t. 21.) leaflets oblong-lanceolate, clothed beneath with clammy pubescence, acute or emarginate; stipulas marcescent; spike of flowers pedunculate, shorter than the leaves; flowers distant; legumes 5-4-seeded, usually echinated with glands. 2. H. Native of Hungary and of Caucasus, on the banks of the river Don. Stems angular at the apex. G. hiscuta, Pall. illin. append. no. 363, ex Bieb. fl. taur. suppl. 1431. Flowers blue.

Var. B. legumes smoothish. 2. H. Native of Russia, on the banks of the Don. G. glabra, Pall. illin.

3 G. LIPIDOT (Nutt. gen. andr. 2. p. 106.) leaflets oblong-lanceolate, acute, sepamlose, under surface covered with glandular dots; stipulas linear-subulate; spikes of flowers pedunculate, shorter than the leaves, dense; legumes oblong, echinated, trilobed, bracteate, rooting, abundant around St. Louis, and on the alluvial banks of the Missouri to the mountains, and is in all probability the liquorice mentioned by Sir A. Mackenzie as indigenous to the coasts of the North Pacific Ocean. Sims, bot. mag. 2150. Liquiritia lepidota, Nutt. in Fras. cat. 1813. Root flagelliform, creeping, possessing the taste of the common liquorice in a considerable degree.

4 G. FUCIGNA (Desf. atl. 2. p. 176. t. 199.) leaflets oblong, mucronate, rather lipped, the odd one on a short petiole; stipulas subulate; spikes of flowers dense, pedunculate, about equal in length to the leaves; legumes oval, mucronate, 2-seeded, echinated by bristles. 2. H. Native of Algiers and of Barbary, near Mayane. Leaflets 9-11. Root creeping. Flowers pale-yellow. The whole plant has a fetid scent when bruised.

5 Composum (Lin. fil. suppl. 339.) stems diffuse; leaflets ovate, retuse, or emarginate, usually mucronate, rather sebrous beneath, as well as the petioles and stems; stipulas lanceolate; legumes rather terete, torulose, 3-8-seeded, glabrous. 2. H. Native of Siberia, on hills between the rivers Volga and Jaick, in the desert of Tartary, at the river Karaman, on the Ural mountains, and at Lake Iierskoi. G. aspera and G. hispida, Pall. illin. ed. gall. no. 365 and 366. t. 80 and t. 81. f. 1 and 2. Racemes axillary. Flowers pale-violet.

7 G. ECHINATA (Lin. spec. 1046.) leaflets oval-lanceolate, mucronate, glabrous; stipulas oblong-lanceolate; spikes of flowers capitate, on very short peduncles; legumes oval, mucronate, 2-seeded, echinated by bristles. 2. H. Native of Apulia, on mount Gardano, and in the northern provinces of China, and of Tartary. Jaaq. bord. vint. t. 95. Sims, bot. mag. 252. Schkuhr, handb. 225. Racemes not half so long as the leaves. Flowers purple. The whole plant is glutinous to the touch. Roots horizontal, in taste like the common liquorice.

9 G. UNDULATA (Ruiz et Pav. miss. in herb. Lamb.) leaves large, with 6 pairs of elliptic-oblong, undulated, acuminate, glabrous leaflets; panicles large, shorter than the leaves, spreading, composed of numerous racemes; racemes of flowers and calyces pubescent; bractea lanceolate, 1-flowered. 2. H. Native of Peru. Flowers purple.

Waved-leaved Liquorice. Shrub.

Cult. A deep light soil suits all the species of Liquorice, and they are easily increased by taking slips from the roots with eyes, and planting them in spring.

Cl. II. GALEGA (from yaqa, gale, milk; supposed to increase the milk in animals eating of the herb). Tourn. inst. t. 232. Lam. ill. t. 625. Pers. ench. 2. p. 328.—Galaga species of Lin. and others.

LIN. SYST. Monadelphica, Decanandra. Calyx with 5 subulate, 
5 g 2
equal teeth. Vexillum ovobrace-oblong. Keel obtuse. Stamens monadelphous, having the tenth one concrete, with the others one-half of its length. Style filiform, glabrous, crowned by a terminal dot-formed stigma. Legume rather terete, turbinate, obliquely-strioted. Seeds cylindrical.—Smooth, erect, perennial herbs, with impari-pinnate leaves, ovate or lanceolate, somewhat sagittate stipules, and axillary, simple, many-flowered racemes. Flowers blue and white.

1 G. officinalis (Lam. spec. 1063.) leaves lanceolate, mucronate, glabrous; stipulas broad-lanceolate; racemes longer than the leaves. \( \frac{1}{4} \) H. Native of the south of Europe, in gravelly soils; also of Tauria and Barbary. Mill. fig. t. 137. G. vulgāris, Blackw. icon. t. 92.—Moris, hist. 2. p. 91. sect. 2. t. 7. f. 9. Flowers blue. Goat’s-rue was formerly accounted cordial and sudorific; but is now out of use in reptil. Mr. Boyle celebrated its virtues in pestilential and malignant fevers.

Var. \( \beta \), albiöflora; Flowers white.

Var. \( \gamma \), Africana (Mill. dict. no. 2.) leaves broader and blunter; racemes longer.

2 G. Pallasciensis (Pers. ench. 2. p. 328.) leaves usually with 5 pairs of ovate-oblong, rather retuse, mucronate, glaucous leaves; stem angular, flexuous; stipulas narrow-lanceolate, sagittate; bracteas linear-subulate, longer than the pedicel. \( \frac{1}{4} \) H. Native of Persia. Sweet, fl. gard. 244. Flowers white.

3 G. mtrœs (Sweet, fl. gard. t. 150.) stem angularly striated, rather flexuous; leaves usually with 5-8 pairs of oblong, silky, pubescent leaves, which are mucronulate and 2-lobed at the apex; stipulas ovate-lanceolate, acute, acutely-serrate, sagittate; flowers crowded; bracteas subulate; twice the length of the pedicels. \( \frac{1}{4} \) H. Native country unknown. Flowers bluish lilac.

4 G. orientalis (Lam. dict. 2. p. 596.) leaves ovate, acuminate, smooth; stipulas broad-ovate; racemes longer than the leaves; legumes pendulous; roots creeping. \( \frac{1}{4} \) H. Native of Caucasus, and on all the oriental mountains. Sims, bot. mag. 2192. Ker. bot. reg. 326. G. montana, Schultes, obs. 154. Flowers blue. The creeping roots and simple flexuous stems are sufficient to distinguish this species from all the others.

Cult. All the species of this genus are very elegant, and well adapted for ornamenting flower borders. They are all easily increased by dividing the plants at the root in spring, or by seeds.

CIII. CALLOTROPIS (from κάλλος, kallos, beauty, and τρόπος, trope, a keel; in reference to the keel being beautifully variegated). Galéga species, Hooker.

Lin. syst. Diadelphia, Decandria. Calyx with 5 equal filiform teeth. Vexillum erect, ovate. Wings shorter than the keel. Keel incurved. Style incurved, tipped by a hairy stigma. Stamens diadelphous, joined ones incurved, the free one straight. Legume stipitate, compressed, rather terete, tapering to both ends, many-seeded.—A herb, clothed with pubescent pili, with impari-pinnate leaves, having 6-7 pairs of oblong-cuneated, pubescent, retuse, mucronulate leaves, axillary racemes of drooping flowers, and lanceolate-subulate semiglumaceous stipulas.

1 C. tricolor. 2. G. Native of New Holland, on the north coast. Galéga tricolor, Hook. exot. fl. t. 185. Flowers pale blue, with the base of the wings and vexillum white, the latter tipped with yellow.

Cult. An elegant plant when in flower. For its culture and propagation see Galéga. It requires to be protected in winter.

CIV. TEPHROSI A (from τρήφω, tephros, ashl-coloured; in allusion to the colour of the foliage of some of the species, as those of T. cinerea, &c.) Pers. ench. 2. p. 328. Kuntl. nov. gen. amer. 6. p. 458.—Cræcca, Lin. fl. zeyl. 139. amen. 5. p. 18.—Nedchamia, Scop. but not of B. Brown, nor Cass.

Lin. syst. Monadelphus or Diadelphia, Decandria. Calyx bracteate, nearly equal, 5-toothed (f. 37 a.). Vexillum large (f. 37 b.), roundish, silky or pubescent on the outside, spreading-reflexed. Wings adhering to the keel, which is obtuse. Stamens variously connected, monadelphous or diadelphous. Style filiform. Stigma terminal. Legume usually sessile, compressed, linear (f. 37 c.), many-seeded, with the valves flat. Seeds compressed.—Shrubs or herbs, with usually impari-pinnate leaves, lanceolate or subulate stipulas, which are distinct from the petiole, not sagittate. In the true Tephrosias the leaves are impari-pinnate; in the spurious ones trifoliate or palmate. Racemes axillary, rarely opposite the leaves. Flowers white or purplish. This genus will hereafter probably be divided into several genera, when the characters are better known.

1 T. suberosa (D. C. prod. 2. p. 249.) leaves with 7-10 pairs of elliptic-oblong mucronulate leaves, which are glabrous above, and clothed with adpressed pubescence beneath; carina straight; style glabrous; legume canescent, irregularly coriaceous between the seeds. \( \frac{1}{4} \) S. Native of Bengal. Robinia suberosa, Roxb. l. c. Flowers rose-coloured. Vexillum hardly pubescent.

Corky-barked Tephrosia. Fl. Ju. Aug. Clt. 1818. Sh. 2 to 4 ft. 2 T. Chineńska (Lindl. hort. trans. 7. p. 38.) shrubby; leaves with 9-10 pairs of oblong, obtuse, pubescent leaves; racemes axillary, horizontal, compressed, many-flowered; calyx bracteolate; corolla pubescent; style glabrous; stigmas capitulate. \( \frac{1}{4} \) G. Native of China. Stamens diadelphous. Flowers bright rose-coloured. Like T. suberosa.

China Tephrosia. Fl. June, Clt. 1822. Shrub 2 to 3 feet. 3 T. fruticosa (D. C. prod. 2. p. 249.) leaves with 4 or 5 pairs of ovate-oblong, acute, glabrous leaves, but are rather villous on the nerves beneath; petals and style glabrous; legume broadly oblong, compressed, velvety, drawn out downwards into a short acumen. \( \frac{1}{4} \) & \( \frac{1}{2} \) S. Native of the East Indies. Robinia fruticosa, Roxb. l. c. Racemes panicked, short. Flowers small, red. Legume rusty.

Shrubby Tephrosia. Fl. June, Aug. Clt. 1816. Shrub cl. 4 T. soyononotis (D. C. in ann. sci. nat. 4. p. 99.) leaves with 3-5 pairs of elliptic-oblong, glabrous, acuminate leaves; petals and style glabrous. \( \frac{1}{4} \) G. Native of Nipaul. Flowers apparently white in a dry state, small.

Sophora-like Tephrosia. Shrub 2 to 4 feet. 5 T. brachystachya (D. C. l. c.) leaves with 7-8 pairs of elliptic, obtuse leaves, the young ones clothed with adpressed silky pubescence on both surfaces, adult ones glabrous on the upper surface, but pubescent beneath; racemes panicked, shorter than the leafless part of the petiole; petals and style glabrous. \( \frac{1}{4} \) G. Native of Nipaul. Flowers probably red.

Short-spiked Tephrosia. Shrub. 6 T. sericea (D. C. prod. 2. p. 249.) leaves with 6 pairs of oblong-lanceolate obtuse leaves, which are glabrous above, but clothed with silkyomentum beneath; racemes nearly terminal. \( \frac{1}{4} \) S. Native of Tranquebar. Cytisus sericeus, Willd. nov.
Slender Tephrosia. Pl. 1 foot.

12 T. pauciflora (Nutt. gen. amer. l. c.) plant herbaceous and erect, simple, velvety, and pilose; leaves with 6-9 pairs of remote, cuneate-oval, very obtuse leaflets, which are villous on both surfaces; peduncles length of leaves, usually 3-flowered. ụ. F. Native of Georgia and Florida. Flowers purple. The leaves are far apart upon the stem.

Few-leaved Tephrosia. Pl. 2 feet.

13 T. prostrata (Nutt. l. c.) plant herbaceous, prostrate, pubescent; leaves with only 1 or 2 pairs of cuneate-ovate, coriaceous leaflets, which are glabrous above, but clothed with silky villi beneath, the lower ones approximating the stem; peduncles 3-flowered, longer than the leaves; legume linear, almost straight. ụ. F. Native of Georgia. Common about Savannah, in dry and sandy woods. Galéga villosa, Michx. fl. bor. amer. 2. p. 67. T. chrysophylla, Pursh, fl. amer. sept. 2. p. 489. Flowers purple.

Prostrate Tephrosia. Pl. prostrate.

14 T. hispida (D. C. prod. 2. p. 250.) plant herbaceous, erect, dichotomous; stem and petioles heath with stiff ferruginous hairs; leaves with 5 pairs of cuneate-ovate leaflets, which are villous on both surfaces; peduncles 7-10-flowered, much longer than the leaves; flowers spicate, lower ones distant; legume linear, straight, rather hispid. ụ. F. Native of Carolina. Flowers purplish.

bisNpid Tephrosia. Pl. 1 to 2 feet.

CIV. TEPHROSIA.

Slender Tephrosia. Pl. 1 foot.

12 T. pauciflora (Nutt. gen. amer. l. c.) plant herbaceous and erect, simple, velvety, and pilose; leaves with 6-9 pairs of remote, cuneate-oval, very obtuse leaflets, which are villous on both surfaces; peduncles length of leaves, usually 3-flowered. ụ. F. Native of Georgia and Florida. Flowers purple. The leaves are far apart upon the stem.

Few-leaved Tephrosia. Pl. 2 feet.

13 T. prostrata (Nutt. l. c.) plant herbaceous, prostrate, pubescent; leaves with only 1 or 2 pairs of cuneate-ovate, coriaceous leaflets, which are glabrous above, but clothed with silky villi beneath, the lower ones approximating the stem; peduncles 3-flowered, longer than the leaves; legume linear, almost straight. ụ. F. Native of Georgia. Common about Savannah, in dry and sandy woods. Galéga villosa, Michx. fl. bor. amer. 2. p. 67. T. chrysophylla, Pursh, fl. amer. sept. 2. p. 489. Flowers purple.

Prostrate Tephrosia. Pl. prostrate.

14 T. hispida (D. C. prod. 2. p. 250.) plant herbaceous, erect, dichotomous; stem and petioles heath with stiff ferruginous hairs; leaves with 5 pairs of cuneate-ovate leaflets, which are villous on both surfaces; peduncles 7-10-flowered, much longer than the leaves; flowers spicate, lower ones distant; legume linear, straight, rather hispid. ụ. F. Native of Carolina. Flowers purplish.

bisNpid Tephrosia. Pl. 1 to 2 feet.

CIV. TEPHROSIA.

Slender Tephrosia. Pl. 1 foot.

12 T. pauciflora (Nutt. gen. amer. l. c.) plant herbaceous and erect, simple, velvety, and pilose; leaves with 6-9 pairs of remote, cuneate-oval, very obtuse leaflets, which are villous on both surfaces; peduncles length of leaves, usually 3-flowered. ụ. F. Native of Georgia and Florida. Flowers purple. The leaves are far apart upon the stem.
pairs of lanceolate-linear, acute, pilosely-pubescent leaflets; pedicels axillary, elongated, 1-2-flowered, 1-leaved at the apex; legume terete, puberulous. ½. G. Native of Mexico, near Guanaxito. Habit nearly of T. stricta.

Var. β, leiocarpa (D. C. prod. 2. p. 255.) Young legumes glabrous; leaves with 4 pairs of lanceolate short leaflets.

Orobas-like Tephrosia. Shrub 2 to 3 feet.

20 T. EMARGINATA (H. B. et Knuth, nov. gen. amer. 6. p. 461.) arborescent; branches tomentose; leaves with 14 pairs of linear-oblong leaflets, which are deeply emarginate at the apex, clothed with adpressed pubescence above, and silvery silky down beneath; racemes terminal; flowers in fascicles; legumes straightish, clothed with silky tomentum as well as the calyces. ½. S. Native of South America, in the missions of Orinoco. Stamens diadelphous. The root of this species is used to intoxicate fish, as T. toxicaria, which see, no. 8.

Emarginate-leafletted Tephrosia. Shrub 2 to 4 feet.

21 T. GRANDIFLORA (Pers. ench. 2. p. 329.) shrubby, erect, glabrous; leaves with 7-9 pairs of oblong, mucronate leaflets, which are pubescent beneath; stipulas ovate, acuminate; racemes opposite the leaves, and somewhat terminal, straight, bearing 4 flowers at the apex; bracteae ovate, concave, large, deciduous. ½. G. Native of the Cape of Good Hope. Galéga grandiflora, Vahl. symb. 2. p. 84. Ker. bot. reg. 769. Lher. str. 2. t. 44. Galéga rosea, Lam. dict. 2. p. 599. Flowers rose-coloured, larger than those of any other species in the genus.

Great-flowered Tephrosia. Fl. May, Sept. Clt. 1774. Sh. 2 to 3 feet.

22 T. Coccinea (Wall. pl. asiatic rar. vol. 1. t. 60.) sulphurose, erect; branches terete, flexuous, and are as well as under surface of the leaves clothed with white and adpressed wool; leaves sessile, with 3-4 pairs of cuneiform-obovate, retuse leaflets; racemes axillary, on long peduncles; teeth of calyx lanceolate, acuminate; stamens diadelphous; style villous beneath; legume linear, pendulous. ½. S. Native of the East Indies, on the left bank of the Irawaui, near Yennanheun. Flowers scarlet.

Scarlet-flowered Tephrosia. Shrub 2 to 3 feet.

23 T. VILLOSA (Pers. ench. 2. p. 329.) plant herbaceous, branched, pubescent; leaves with 7-9 pairs of obovate-cuneated, retuse leaflets, which are silvery-villous beneath and pilo-se above; stipulas setaceous; racemes opposite the leaves, nearly terminal, many-flowered; legumes linear, mucronate, densely villous, 4-5-seeded. ½. S. Native of the East Indies. Galéga villosa, Lin. spec. 1063.—Pluck. aln. t. 59. f. 6.—Burn. zeyl. t. 33. Flowers white?

Silky Tephrosia. Shrub 2 feet.

25 T. PURPUREA (Pers. ench. l. c.) plant herbaceous, branched; leaves with 7-9 pairs of oblong-cuneated, somewhat mucronate leaflets, hardly pubescent beneath; stipulas subulate; racemes opposite the leaves or terminal; legume linear, much compressed, 5-8-seeded, finely pubescent. ½. S. Native of the East Indies, and Ceylon. Galéga purpurea, Lin. suppl. 5. p. 19. Roxb. Hort. beng. 57. Sieb. fl. manr. exsic. no. 156. Burn. zeyl. t. 32. This differs from the plant of Linnaeus in the legumes, which are said to be terete. Flowers purple. Stamens monadelphous. This plant is prescribed by Indian doctors in cases of dyspepsia, hicerig, and tympanitis.

26 T. HIRTA (Hamilt. in Lin. trans. 13. p. 546.) sulphurose, erect, tomentose; branches somewhat tetragonal; leaves with 4-5 pairs of cuneate, emarginate leaflets, which are glabrous above, but beset with long, adpressed hairs beneath; stipulas broad from the base; racemes opposite the leaves, leafy, pedunculate; legume falcate, pendulous, hairy, 6-seeded. ½. S. Native of the East Indies. Flowers bluish, but with the keel white. Stigma bearded.

Haery Tephrosia. Shrub ½ foot.

27 T. LANCEFOLIA (Link, Enum. 2. p. 259.) plant sulphurose; leaflets obverse lanceolate, emarginate, mucronate, clothed with close-pressed hairs beneath; stipulas subulate; racemes terminal; legumes terminal, straight, spreading. ½. S. Native country unknown. This species is said to be as like T. purpurea, but the flowers are cream-coloured, not purple. De Candolle has a specimen which was sent from the Calcutta Botanic Garden, under the name of T. lanceefolia, which is scarcely distinct from T. purpurea.

28 T. PROCUMBENS (Hamilt. in Lin. trans. 13. p. 547.) plant sulphurose, procumbent, filiform, pilose; leaves with 4-5 pairs of stalked, cuneiform, hairy, mucronate leaflets; stipulas setaceous; racemes opposite the leaves, leafy, legume straight, pilose, compressed, 9-seeded. ½. S. Native of the East Indies. Calyx 5-cleft, with setaceous segments, length of corolla.

Procumbent Tephrosia. Pl. procumbent.

29 T. DOMINGENSIS (Pers. ench. 5. p. 350.) plant herbaceous, branched, glabrous; leaves with 7-9 pairs of linear-cuneated, obtuse, mucronate leaflets, which are clothed with adpressed pubescence beneath; stipulas lanceolate-subulate; racemes axillary; legumes pendulous, minutely pubescent. ½. S. Native of St. Domingo, in sterile places. Galéga Domingénia, Willd. spec. 3. p. 1249. Flowers small, pale red.

St. Domingo Tephrosia. Pl. 1 foot.

Perrin's Tephrosia. Pl. 1 foot?

31 T. MUCRONATA (D. C. prod. 2. p. 251.) shrubby, erectish, branched, pubescent; leaves with 8 pairs of ovate, mucronate, villous leaflets; peduncles axillary, longer than the leaves, 1-2-flowered; legume pubescent. ½. G. Native of the Cape of Good Hope. Galéga mucronata, Thunb. fl. cap. 609. Flowers probably red.

Mucronate-leafletted Tephrosia. Shrub.

32 T. LEFOSCAHIYA (D. C. prod. 2. p. 251.) plant herbaceous, erect, branched, hardly pubescent; leaves with 7 pairs
of oblong, rather cuneate, retuse, mucronate leaflets, the young ones silky beneath; stipulas subulate; racemes elongated, slender, opposite the leaves, or terminal; flowers distant, and arise as well as the legumes erect.<br>© S. Native of Senegal. Flowers purple. Stamens monadelphous.

Slender-spiked Tephrosia. Pl. 1 foot.

39 T. maxima (Pers. ench. 2. p. 329.) glabrous; leaflets oval-lanceolate, obtuse, mucronate, striated beneath; stipulas lanceolate; racemes terminal, very long; pedicels tern, rising from the axils of the bracteae, which are ovate and acuminate; calyxes and legumes glabrous. © S. Native of Ceylon. Galéga maxima, Lin. spec. 1063. exclusive of the synonyme of Burman, which is said to have short, 2-flowered pedicels and abruptly pinnate leaves.

Largest Tephrosia. Shrub 1 to 2 feet.

34 T. argentea (Pers. ench. 2. p. 329.) suffruticose, clothed with silvery tomentum; leaves with 7-8 pairs of oblong, obtuse leaflets, which are silky beneath; stipulas ovate, but subulate at the apex, rather yellow; racemes least terminal; pedicels yellow; calyxes villos. © S. Native of the East Indies. Galéga argentea, Lam. dict. 2. p. 599. Galéga barba-jóvis, Burm. ind. 172.—Pluk. alm. t. 52. f. 1. Flowers purple.

Var. β, glabrescens (D. C. prod. 2. p. 252.) branches and leaves sparingly pubescent. © S. Native of the East Indies. Stipulas 3-nerved.

Silvery Tephrosia. Shrub 2 feet.

35 T. COLUTEA (Pers. ench. 2. p. 329.) shrubby, branched, hoary-tomentose; leaflets 5-7 pairs, oblong-ovate, retuse; stipulas lanceolate, tomentose; peduncles axillary and terminal; legume straight, erect. © S. Native of the East Indies. Galéga Colutea, Burm. ind. 172.—Pluk. alm. t. 166. f. 3. Flowers purple. Stamens diadelphous.

Colutea-like Tephrosia. Shrub 2 feet.

36 T. venustrula (H. B. et Kunth, nov. gen. ame. 6. p. 450.) shrubby; leaves with 5-7 pairs of lanceolate, obtuse, mucronate leaflets, and are as well as the calyxes clothed with adpressed canescent pubescence; stipulas ovate, acuminate; racemes opposite the leaves, furnished with one leaf at the base; flowers in fascicles; legume somewhat cultriform, pubescent. © S. Native of Cumana, about Borbones. Flowers red.

Pretty Tephrosia. Shrub 1 to 2 feet.

37 T. PISCATORIA (Pers. ench. 2. p. 329.) shrubby; leaves with 5-6 pairs of oblong, obtuse leaflets, which are rather pilose beneath; stipulas subulate; pedicels 2-edged; legume straight, ascending, rather villous. © S. Native of the East Indies, and in the islands of the Pacific ocean. Galéga littorâlis, Forst. prod. no. 277. G. piscatoria, Alt. hort. kew. 3. p. 71. Flowers purple. This species is used to intoxicate fish in the East Indies, as the T. toxicariâ is in the West Indies.

38 T. reflixâ (D. C. prod. 2. p. 252.) shrubby, pubescent; bracts rather pubescent; leaves with 5 pairs of oblong leaflets, each ending in a reflexed mucron; peduncles axillary, generally 1-flowered, longer than the leaves; legumes rather hairy. © S. Native country unknown. Flowers red. Stamens monadelphous. Reinštã reféxã, Moench. suppl. 45.

Reflexed-pointed-leaved Tephrosia. Shrub 1 to 2 feet.

39 T. LEUCÂNTHA (H. B. et Kunth, nov. gen. ame. 6. p. 460. t. 577.) shrubby; leaves with 3-8 pairs of oblong-lanceolate, obtuse, mucronate leaflets, which are clothed with adpressed pubescence on both surfaces, but canescent beneath; racemes terminal, usually twin; flowers in fascicles; calyxes covered with silky strigile; legume tomentose. © S. Native of Mexico, near Guanaxuato. Said to be allied to T. Virginiana. Flowers white.

White-flowered Tephrosia. Shrub 2 feet.

Coronilla-leaved Tephrosia. Shrub 1 to 2 feet.

41 T. COLONIÆA (Hamilt. Lin. trans. 13. p. 545.) legumes glabrous, acutely-recurved; leaves with 8-10 pairs of smooth leaflets; racemes opposite the leaves, sessile; stipulas subulate. © S. Native of the East Indies. Stamens diadelphous. Calyx pilose, 5-toothed. Indigo is obtained from this plant in India, and it is cultivated for that purpose.

42 T. tinctoria (Pers. ench. 2. p. 329.) shrubby, glabrous; leaves with 5 pairs of oblong, obtuse, emarginate leaflets, silky and villous beneath; peduncles axillary, spicate, length of leaves; legumes straight, pendulous. © S. Native of Ceylon, where it is called Anil. Crácaca, no. 302. Lin. fl. zeyl. Galéga tinctoria, Lin. spec. 1063. Flowers purple or flesh-coloured. It is from this plant that the inhabitants of Ceylon prepare their indigo, which yields a die of a pale blue colour.

Dyers Tephrosia or Ceylon Indigo. Shrub 1 to 3 feet.

43 T. CAPENSIS (Pers. ench. 2. p. 329.) plant suffruticose, decumbent, glabrous; leaves with 4-5 pairs of oblong, mucronate leaflets; stipulas lanceolate-subulate; peduncles opposite the leaves, very much elongated; flowers racemose, distant; legumes erect, pubescent. © G. Native of the Cape of Good Hope. Galéga Capensis, Thund. fl. cap. 602. Jacq. icon. rar. t. 574. Flowers purple. Stamens monadelphous.

44 T. TOMENTOSA (Pers. ench. 2. p. 329.) plant clothed with villous tomentum; leaves with 4-6 pairs of linear, obtuse, somewhat mucronate leaflets, which are glabrous above; stipulas subulate; racemes opposite the leaves; pedicels in threes; legume straight, ascending. © G. Native of Arabia Felix. Galéga tomentosa, Vahl. symb. 2. p. 84. Lathyrus tomentosus, Forsk. descr. 135. but not of Cav. Flowers blue, with a white keel.

Tomentose Tephrosia. Shrub 1 to 2 feet.

45 T. CINEÆA (Pers. ench. 2. p. 328.) plant herbaceous, decumbent, clothed with cinerose, silky down; leaves with 4-6 pairs of linear, obtuse, mucronate leaflets, which are covered with silvy villi beneath; stipulas lanceolate; racemes opposite the leaves; pedicels solitary; legumes straight, spreading. © S. Native of Jamaica and St. Domingo. Galéga cinerea, Lin. amen. 5. p. 403. Jacq. icon. rar. t. 575. Flowers violaceous.

46 T. LITTORÁLIS (Pers. ench. 2. p. 329.) plant herbaceous, decumbent, clothed with cinerose canescent down; leaves with 5 pairs of oblong-cuneate, emarginate leaflets; stipulas subulate; racemes opposite the leaves, terminal, and 3 times longer than them; pedicels aggregate; legume straight, spreading, rather pubescent. © S. Native of Carthagena and the Caribbee Islands. Galéga littorâlis, Lin. syst. 565. Vicía littorâlis, Jacq. amen. t. 124. Flowers purple. Stamens monadelphous.

47 T. BRACHYSTACHYIA (D. C. prod. 2. p. 253.) plant suffruticose, erect, pubescent; leaves with 5 pairs of oblong-cuneate, emarginate leaflets, which are silky beneath, lower pairs approximating the stem; racemes axillary, shorter than the leaves; legume straight, spreadingly-pendulous, 9-10-seeded. © S. Native of the East Indies. Flowers purple. Stamens monadelphous. Legumes hardly pubescent even when young.
Short-spiked Tephrosia. Pl. 1 to 2 feet.
48 T. hypargyrea (D. C. in ann. scienc. nat. 4. p. 99.) plant suffruticoso, erect; stem angular, rather velvety; leaves with 2-4 pairs of leaflets, which are glabrous above but clothed beneath with silky-silvery down; the lower leaflets roundish and approximating the stem, superior ones oval-oblong, terminal one very large; peduncles axillary; legumes straight, secund, rather deflexed, 10-seeded, pubescent. ʃ. S. Native of the East Indies. T. heterophylla, Fisch. cat. hort. gor. This is a very beautiful and distinct species. The flowers are small and purple, and the stamens are monadelphous. Peduncles sometimes shorter, sometimes longer than the leaves.

49 T. Maria'na (D. C. prod. 2. p. 253.) plant suffruticoso, erect; stem terete, villous; leaves with 4 pairs of oblanceolate leaflets, which are glabrous above, and silky-silvery beneath, the lower ones approximating the stem; stipulas lanceolate, elongate; villous; flowers axillary, crowded, almost sessile, and disposed in a somewhat terminal raceme, legume straight, erect, velvety-villous, 10-12-seeded. ʃ. S. Native of the Marianne Islands. Leaflets nearly 2 inches long.

Mariano Island Tephrosia. Shrub.
50 T. Lagasca'na (D. C. prod. 2. p. 253.) plant clothed with cinerous tomentum; branches terete; leaves with 4 pairs of obovate-oblong, obtuse, rather mucronate leaflets; lower pair approximating the stem; stipulas subulate; peduncles opposite the leaves, almost terminal, and longer than them; legume ascending, straight, velvety, 10-12-seeded. ʃ. S. Native country unknown.

Lagassac's Tephrosia. Shrub 2 feet.

Straight Tephrosia. Fl. May, June. Clt. 1774. Sh. 2 to 3 ft.
52 T. sena (H. B. et Kunth, nov. gen. amer. 6. p. 458.) branches rather angular, glabrous; leaves with 4 pairs of somewhat obovate-oblong, emarginate, mucronate, puberulous, rather glaucous leaflets; racemes opposite the leaves, furnished at the base with one leaf; flowers in fascicles; legumes erectish, and are as well the calyces covered with strigose pubescence. ʃ. S. Native of Popayan, on the banks of the river Cauca, near Buga, where the leaves are used in place of senna by the inhabitants.

Buga Senna. Shrub.
53 T. line'a'ris (Pers. ench. 2. p. 330.) branches pubescent; leaves with 4-5 pairs of linear, narrow leaflets, which are silky beneath; stipulas filiform; racemes axillary, much elongated; flowers distant; bracteas conforming to the leaves; legume narrow, and is as well the vexillum pubescent. ʃ. S. Native of Guinea, among grass. Galága linearis, Wildl. spec. 3. p. 1248. Indigofera angustifolia, Perr. in litt. Stem flexuous. Flowers red.

54 T. flacc'osa; stem suffruticoso, erect, flexuous, branched, pubescent; leaves with 5 pairs of linear, emarginate, mucronate, soft, pilose leaflets; stipulas subulate; flowers somewhat spicate, terminal; legume compressed, clothed with soft pilil. ʃ. S. Native of the island of St. Thomas, in the Gulf of Guinea, among grass. Flowers flesh-coloured.

Flexible-stemmed Tephrosia. Shrub 1 foot.
55 T. pál'len's (Pers. ench. 2. p. 233.) shrubby, pubescent; leaves with 4-5 pairs of obovate-oblong, acute leaflets, which are pubescent beneath; stipulas subulate; legume straight, spreading, ciliated. ʃ. G. Native of the Cape of Good Hope. Galága pallens, Ait. hort. kew. 3. p. 71. G. humilis, Thunb. fl. cap. 601, but the legume is said to be recurved. Flowers pink.

Branched Tephrosia. Shrub.

Dwarf Tephrosia. Pl. diffuse.
58 T. Apollín'ea (D. C. prod. 2. p. 254.) suffruticoso, diffuse, clothed with adpressed pubescence; leaves with 2-3 pairs of obovate-oblong, emarginate leaflets, which are silky beneath; racemes opposite the leaves, length of leaflets; legume erectly-spreading, 6-7-seeded, rather pubescent. ʃ. G. Native of Egypt, in corn fields. G. Apollínea, Deill. fl. ang. p. 144. t. 53. f. 5. Flowers blue. Stamens diadephous according to the figure.

59 T. spí'nósa (Pers. ench. 2. p. 330.) shrubby; branches canescent; stipulas spinose; leaves with 3 or 4 pairs of cuneate, emarginate, smoothish leaflets; flowers few, axillary, nearly sessile; legume falcate, 5-6-seeded, beset with adpressed very inumate pubescence. ʃ. S. Native of Coromandel, Timor, and Java, on the margins of fields. Galága spínósa, Lin. fl. suppl. 333. Stamens monadelphous.

Spry Tephrosia. Shrub.
60 T. Timor'í'exsis (D. C. prod. 2. p. 254.) plant herbaceous, diffuse, clothed with canescent hairs; leaves with 3-4 pairs of obovate-oblong, obtuse leaflets, clothed with silky villi beneath, and each terminated in a straight mucrone; stipulas linear-subulate; peduncles 2-3, axillary, very short, 1-flowered; legume erect, straight, velvety, 8-10-seeded. Q. S. Native of the Island of Timor. Perhaps sufficiently distinct from T. pímina.

Timor Tephrosia. Pl. diffuse.
61 T. Fíx'íata (Pers. ench. 2. p. 330.) plant herbaceous, decumbent, glabrous; leaves with 4-6 pairs of obovate, acute leaflets, which are dotted beneath; stipulas ovate; peduncles axillary; flowers umbellate; legumes ensiform, pubescent. ʃ. G. Native of the Cape of Good Hope. Galága pímotá, Thunb fl. cab. 602. Flowers purple.

Pinnae-leaved Tephrosia. Shrub decumbent.
62 T. Bifílorá (D. C. prod. 2. p. 254.) plant shrubby, hardly pubescent; leaves with 2 or 3 pairs of oval-lanceolate, obtuse leaflets, which are silky beneath, lower ones smallest, terminal one very large; stipulas subulate, villous; flowers twin, almost sessile, axillary; legume pubescent, rather incurved at the apex. ʃ. S. Native country unknown. Galága bifílora, Poir. suppl. 2. p. 699. Flowers purple. Calyx very villous. Very like T. hypargyrea, and especially T. nervósa.
63 T. Nervosa (Pers. ench. 2. p. 328.) branches angular, pubescent; leaves with 1-2 pairs of elliptic-obtuse leaflets, which are narrowest at the base, quite glabrous above, and pinnately veined, but clothed with white tomentum beneath, the terminal leaflet largest; peduncles axillary, length of leaves, furnished with one leaf under the head of flowers; legumes linear, smooth.

Nerved-leaved Tephrosia. Shrub 2 to 3 feet.

† Species not sufficiently known.

* Leaves inappari-pinnate.

64 T. stipulairis (D. C. prod. 2. p. 254.) shrubby, quite smooth; leaflets oblong-linear, acute; stipules large, almost opposite, connate, acute, nerved; legume linear-lanceolate. >. S. Native of South America. Brissonia stipularis, Desv. journ. bot. 1814. 1. p. 74.

Stipular Tephrosia. Shrub.

65 T. trapeziformis (D. C. prod. 2. p. 255.) stems elongated, decumbent, quite smooth; leaflets oblong, pilose beneath; pili stiff and few; legume compressed, pilose, trapeziform. >. S. Native of the East Indies. Brissonia trapeziformis, Desv. l. c.

Trapeziformed Tephrosia. Shrub decumbent.

66 T. uniflora (Pers. ench. 2. p. 329.) leaflets oblong, rather retuse, mucronate; calyx villous; legumes compressed, villous, a little arched, solitary, axillary. Native of Senegal.

One-flowered Tephrosia. Pl. 1 foot.

67 T. capitulata (Link. enum. 2. p. 329.) leaflets ovberversely lanceolate, obutate, emarginate, silky beneath; racemes terminal, short, furnished with a leaf; legumes hairy. >. S. Native of the Island of Owyhee.

Heeded Tephrosia. Pl. 1 foot.

68 T. striata (Pers. ench. 2. p. 328.) herbarious, erect, glabrous below, villous above; leaflets alternate, oblong, obutate, mucronate, finely pubescent; racemes terminal, drooping. G. Native of the Cape of Good Hope. Galága striáta, Thumb. fl. cap. 602.

Striated Tephrosia. Pl. 1 to 2 feet.

69 T. myrtifolia (D. C. prod. 2. p. 255.) plant herbaceous, flexuous, glabrous; leaves with 3 pairs of elliptic-oblong, obutute, somewhat mucronate, striated leaflets; stipulas subulate; racemes opposite the leaves; legumes linear, glabrous, spreading. G. Native of the Cape of Good Hope. Coromilla myrtifolia, Burm. cap. 22.

Myrtle-leaved Tephrosia. Pl. 1 foot.

70 T. Rheedii (D. C. prod. 2. p. 255.) suffruticoso, branched, diffuse; leaves with 4-5-pairs of oblong, somewhat obovate, obutute, mucronate leaflets; peduncles longer than the leaves, few-flowered. >. S. Native of Malabar, in sandy places. Man-Todda-vaddi, Rheed, mal. 9. t. 22. Rochéa, Scoop. introd. 296. no. 1340. Flowers apparently with only 3 petals, in consequence of the carina being very short, pale yellow.

Rheed's Tephrosia. Sh. 1 foot.

** Thermiodae (from òpóse, thermod, a lupine, and ichté, ichté, like; plants resembling the lupine in having palnate leaves). Leaves palrnately 5-foliate, having 2 little stipulas at the top of the pedicle. Stipulas and stipels becoming hard and spinaceous. Leaflets complicate, margined with a nerve. Flowers unknown.

Perhaps a proper genus.

71 T. lupiniformis (D. C. prod. 2. p. 255.) plant shrubby, pubescent; leaflets lanceolate, spreading; leaflets 5, oblong, cuneate, obtuse, clothed beneath with appressed silky down. >. S. Native of the Cape of Good Hope. Galága lupinifólia, Burch. cat. afr. austr. no. 2488.

Lupine-leaved Tephrosia. Shrub 1 to 2 feet.

72 T. digitata (D. C. prod. 2. p. 255.) plant suffruticoso, with hispid slender branches; leaflets lanceolate, spreading; leaflets 5, oblong-linear, acuminate at both ends, sparingly pubescent beneath; racemes axillary, and as wide as the petioles very long. >. S. Native of Senegal. Petioles 5 inches long. Flowers distant, usually twin. Calyx permanent, with acuminate segments. Corolla and stamens unknown. Legume linear, compressed, pubescent, 5-seeded. Digtate-leaved Tephrosia. Shrub 1 foot.

** Glycinoidae (from glycin and idea, similar; the plants contained in this division agree with Glycine in having trifoliolate leaves). Leaves either pinnately or palmately trifoliate.

73 T. totta (Pers. ench. 2. p. 323.) plant herbaceous, clothed with hairs like tomentum, ascending; leaflets oblong, mucronate, longer than the petiole; stipulas ovate, opposite the leaves; flowers terminal, stern, somewhat umbellate. G. Native of the Cape of Good Hope. Galága totta, Thumb. fl. cap. 601.

Hottentot Tephrosia. Pl. ascending.

74 T. sericea (Pers. ench. 2. p. 328.) stem suffruticoso, very short; branches tomentose, as well as the leaflets, which are ovate; flowers axillary, solitary; legumes lanceolate, villous. >. G. Native of the Cape of Good Hope. Galága serica, Thumb. fl. cap. 603. but not of Lam.

Silky Tephrosia. Shrub 1 foot.

75 T. falcata (Pers. ench. 2. p. 328.) plant herbaceous, erect, hairy; branches filiform; leaflets sessile, oblong, acute; flowers terminal, solitary; legumes falcate, erect, silky. G. Native of the Cape of Good Hope. Galága falcata, Thumb. fl. cap. 602.

Felante-podded Tephrosia. Pl. 1 foot.

76 T. pusilla (Pers. l. c.) plant herbaceous, erect, pubescent; leaflets sessile, ovate, mucronate, silky beneath, longer than the petiole; flowers lateral, pedunculate, solitary; legume elliptic. G. Native of the Cape of Good Hope. Galága pusilla, Thumb. fl. cap. 602.

Small Tephrosia. Pl. 1/2 foot?

Trifoliáte Tephrosia. Shrub.

Ternate-leaved Tephrosia. Shrub 1 to 3 feet.

Thread-leaved Tephrosia. Pl. 1 foot.

80 T. uloinosa (Spreng. syst. 3. p. 232.) shrubby, climbing; leaflets oblong, acuminate, glabrous; flowers racemose; peduncles 3-flowered. >. S. Native of the East Indies. Robinae ulininos, Roxh. and Wild.

Bag Tephrosia. Shrub cl.

81 T. velutina (Spreng. syst. 3. p. 232.) shrubby, twining; leaflets oblong, obtuse, villous on both surfaces; racemes few-flowered; legumes lanceolate, pubescent. >. S. Native of St. Domingo.

Vellety Tephrosia. Shrub tw.

82 T. longifolia (Pers. ench. 2. p. 328.) plant shrubby, twining; leaflets lanceolate, obtuse; racemes few-flowered; Hh
legumes villous. \( \gamma \). C. S. Native of South America. Galága longifolia, Jacq. icon. rar. 3. t. 572. Flowers purple. Legume linear. Racemes few-flowered.

Long-leaved Tephrosia. Ch.? Shrub tw.

* * * * Mimosoideae (from Mimosa and idea, like; the plants resemble some species of Mimosa in having abruptly-pinnate leaves). Leaves abruptly pinnate.

83 T. mimosoides (Pers. ench. 2. p. 530.) plant suffruticose, scandent; leaves with 12 pairs of linear, obtuse, mucronate leaflets, beset with adpressed pili on both surfaces; racemes axillary, pedunculate; legumes pendulous, compressed. \( \gamma \). C. S. Native of the East Indies. Galága mimosoides, Willd. spec. 3. p. 1249. Flowers probably red.

*Mimoso-like Tephrosia.* Shrub cl.

* * * * * Simplicifolium (from simplex, simple, and folium, a leaf; the leaves are simple). Leaves simple.

84 T. frutescens (D. C. prod. 2. p. 256.) stem shrubby; leaves ovate-roundish; flowers lateral, panicled. \( \gamma \). S. Native of Campeachy. Galága frutescens, Mill. dict. no. 3. Flowers scarlet.

Frutescens Tephrosia. Shrub.

Cult. All the species of this genus grow best in a mixture of loam and peat, and are easily propagated by seeds, or by young cuttings planted in sand, with a bell-glass placed over them; those of the stowe species in heat.

CV. AMORPHA (from α, priv. and μορφή, morphe, form; in reference to the deformity of the corolla, from the want of the vexillum and keel). Lin. gen. 369. Lam. ill. t. 621. D. C. prod. 2. p. 256.—Bonafídia, Neck. elem. no. 1364.

LIN. SYST. Monadelphía, Decándria. Calyx 5-toothed, obconically campanulate. Vexillum ovate, concave. Wings and keel wanting. Style filiform, straight, glabrous. Stamens exserted, monadelphous at the very base. Legume compressed, ovate, or lunulate, 1-celled, 1-2-seeded.—North American shrubs, with impari-pinnate leaves, many pairs of leaflets, which are full of pellucid dots, and usually furnished with stipules at the base. Stipulas of the stem deciduous. Racemes spicate, elongated, usually in fascicles at the tops of the branches. Flowers blue or violet, or bluish-violet.

1 A. Fruticosa (Lin. spec. 1003.) shrub glabrous, or a little villous; leaflets elliptic-oblong, lower ones distant from the stem; calyx rather villous, with 4 of the teeth obtuse, and 1 acuminate; vexillum glabrous; legume few-seeded. \( \gamma \). H. Native of North America. Mimosa fruticosa, H. & B. et Kunth, nov. amer. 6. p. 489. t. 302. D. C. prod. 2. p. 257.

LIN. SYST. Didádelphía, Decándria. Calyx obconically-campanulate, 5-toothed, upper teeth rather remote, lower one longest. Petals 5, disposed in a papilionaceous manner. Vexillum oblong, and the two keel petals distinct. Stamens didadelphous. Ovary bivolum. Style filiform, hooked at the apex. Legume unknown.—An unarmed tree, with impari-pinnate leaves, composed of many pairs of stipellate leaflets, and arc, as well as the calyces beset with glands. Racemes terminal, cylindrical. Flowers white. This genus comes very near Amorpha.

1 E. Amorphoides (H. B. et Kunth, 1. c.) \( \gamma \). G. Native of Mexico, near St. Augustin de las Guevas and Guanaxauto. Dalbergia amorphoides, Spreng. syst. app. 268.

Amorpha-like Eysenhardtia. Tree 12 to 20 feet.

Cult. A mixture of loam and peat will suit this shrub, and young cuttings will strike root in sand, under a bell-glass, in heat.

LIN. SYST. Didádelphía, Decándria. Calyx obconically-campanulate, 5-toothed, upper teeth rather remote, lower one longest. Petals 5, disposed in a papilionaceous manner. Vexillum oblong, and the two keel petals distinct. Stamens didadelphous. Ovary bivolum. Style filiform, hooked at the apex. Legume unknown.—An unarmed tree, with impari-pinnate leaves, composed of many pairs of stipellate leaflets, and arc, as well as the calyces beset with glands. Racemes terminal, cylindrical. Flowers white. This genus comes very near Amorpha.

1 E. Amorphoides (H. B. et Kunth, 1. c.) \( \gamma \). G. Native of Mexico, near St. Augustin de las Guevas and Guanaxauto. Dalbergia amorphoides, Spreng. syst. app. 268.

Amorpha-like Eysenhardtia. Tree 12 to 20 feet.

Cult. A mixture of loam and peat will suit this shrub, and young cuttings will strike root in sand, under a bell-glass, in heat.

CVII. NISSOLIA (in honour of William Nissole, an industrious French botanist. He was a member of the Academy of Montpelier, and author of some papers in its Transactions; he was born in 1647 and died in 1735.). Jacq. amer. 198. Lin. gen. no. 853. Lam. ill. t. 600. D. C. prod. 2. p. 257, but not of Tourn.

LIN. SYST. Monadelphía, Decándria. Calyx campanulate, 5-toothed. Corolla papilionaceous. Stamens 10, monadelphous, with a dorsal fissure or didadelphous. Legume stipitate, 1 or
few-seeded. 1-celled, or transversely few-celled, ending in a leafy, membranous wing, which is either ligeulate or cutiform.—

Usually climbing shrubs, with impari-pinnate leaves. Perhaps this genus is more nearly allied to *Hedysarea* or *Dalbergia*.

**SECT. I. NISSOlia'ria (an alteration from the generic name).** D. C. prodr. 2. p. 237. Nissolia, Gür. fruct. 2. p. 309. t. 145. Pers. ench. 2. p. 276. Calyx 3-toothed, naked on the outside, the teeth acute. Petals of keel connected. Stamens monadelphous, with a fissure in the middle. Legume, according to Gaertn., terete below the wing, separating transversely into 2 or 3 1-seeded cells, but according to Jacquin the legume is 1-celled and 1-seeded. Pedicels 1-flowered, in fascicles.

1. **N. furticosa** (Jacq. amer. 198. t. 145. f. 44. hort. vind. 187.) stems twining, and are smoothish as well as the pedioles; leaflets ovate, mucronate, smoothish; pedicels 3-4, aggregate, axillary; teeth of calyx acute. $\gamma$. Native of Carthage in woods, and in the plains of Mexico, near Queretaro, ex H. B. et Kunth, nov. gen. amer. 6. p. 504. Flowers yellow. *Shrubby* Nissolia. Fl. July, Nov. C. 1766. Sh. cl.

2. **N. Hirsuta** (D. C. prodr. 2. p. 257.) stems twining, and are as well as the pedioles hairy; leaflets ovate-oblong, more hairy beneath and on the margins; pedicels 15-20, aggregate, axillary; teeth of calyx sessile, very short. $\gamma$. Native of Mexico, near Guanaxuato.

**Hairy** Nissolia. Shrub tw.

**SECT. II. GOMEZ'ium (in honour of Juan Gomez, a Portuguese botanist).** Calyx naked on the outside, with 5 rounded lobes. Petals of keel connected at the apex only. Stamens diadelphous. Legume indehiscent, 1-seeded. Perhaps a proper genus.

4. **N. arborea** (Jacq. amer. 199. t. 174. f. 48.) stem arborescent, erect, leaflets 1-2 pairs with the odd one oblong and acuminate, rather pubescent beneath; flowers sessile. $\gamma$. Native of Carthage and Martinico in woods. Segments of the calyx roundish. Flowers white.

**Arborescent** Nissolia. Shrub 12 feet.

5. **N. glabra** (Link. enum. 2. p. 221.) stem erect; leaflets 1-2 pairs, with an odd one, oval, acuminate, quite smooth; flowers pedicellate, racemose. $\gamma$. Native country unknown. Flowers white. Nearly allied to *N. arborea*.

**Smoothish** Nissolia. C. 1823. Shrub 6 to 12 feet.

**SECT. III. Machæ'rium (an alteration from the Guiana name of *N. ferruginea*).** Pers. ench. 2. p. 276. D. C. prodr. 2. p. 258. Calyx with 5 rounded lobes, girdled by 2 concave, roundish bracteoles at the base. Petals of keel connected a little at the apex. Stamens monadelphous with a fissure in the upper side, or diadelphous. Legume indehiscent, 1-seeded. Perhaps a proper genus.

6. **N. diadelpha** (D. C. prodr. 2. p. 258.) leaflets 5-7, somewhat alternate, oval-oblong, mucronate, clothed beneath with rusty velvety down; flowers paniced, diadelphous; legume somewhat incurved, rather velvety. $\gamma$. Native of Cayenne. Legume 3-4 inches long and 5 lines broad, standing on a stipe 3 or 4 lines long.

**Diadelphous** Nissolia. Shrub tw.

7. **N. ferruginea** (Willd. spec. 3. p. 900.) leaflets 7-11, alternate, oval-oblong, mucronate, clothed with rusty velvety down beneath; flowers panicled; monadelphous; legume straightish, rather velvety. $\gamma$. Native of Guiana, on the banks of rivers. *N. quinata* Aubl. guian. 2. p. 743. t. 297. Lam. ill. t. 600. f. 4. Flowers violaceus.

**Rusty** Nissolia. Shrub tw.

**Acuminated** Nissolia. Shrub tw.

9. **N. leonophylla** (D. C. prodr. 2. p. 258.) leaflets 7, nearly opposite, oval-lanceolate, acuminate, glabrous on both surfaces; pedioles, panicles, and calyxes clothed with rusty velvety down; flowers monadelphous; legumes quite smooth, straightish. $\gamma$. Native of Guiana. A very distinct species.

**Smooth-leaved** Nissolia. Shrub.

**Robinia-leaved** Nissolia. Shrub.

**Many-leaved** Nissolia. Shrub.

12. **N. nigroptera** (Poir. suppl. 4. p. 98.) leaflets usually 5, ovate, obtuse, clothed beneath with cinereous pubescence, almost sessile; legume glabrous, bicarinate on the back, ending in a short wing. $\gamma$. G. Cultivated in the gardens of Teneriffe. Flowers white?

**Small-winged-podded** Nissolia. C. 1820. Sh.

† Species not sufficiently known.

13. **N. stipita** (D. C. in ann. sc. nat. 4. p. 99.) leaves unknown; legumes oblong, incurved, obtuse, quite smooth, standing on a stipe, which is as large and as broad as the pod. $\gamma$. Native of Brazil at Rio Janeiro, where it is called *Arasseiro*, not in Madagascar. Nissolia punctata, Lam. ill. t. 600. f. 1. Poir. dict. 4. p. 492. Mackæ'rium punctatum, Pers. ench. 2. p. 276. Flowers probably white.

**Stipitate**-fructed Nissolia. Shrub sarmentose.

**Reticulated** Nissolia. Shrub tw.

15. **N. aculeata** (D. C. prodr. 2. p. 258.) petioles furnished with 2 rather hooked prickles at the base of each; leaflets 31-33, alternate; flowers racemose; legumes hairy. $\gamma$. Native of Brazil, on hills by the sea-side, at Rio Janeiro. Mackæ'rium aculeatum, Raddi. pl. bras. add. p. 19.

**Prickly** Nissolia. C. 1824. Shrub tw.

16. **N. dumia** (Poir. suppl. 4. p. 99.) leaflets 5, almost glabrous, lanceolate, acute at both ends; flowers racemose; pedicels in fascicles, pubescent; legume hardly stipitate. $\gamma$. Native of South America.

**Retuse**-leaffletted Nissolia. C. 1819. Shrub tw.
18. **N. scadens** (König, ex Spreng. syst. 3. p. 191.) shrubby, scandent; leaves with 2 pairs of ovate-oblong, acute, rather coriaceous, smooth leaflets; flowers panicled. f. S. Native of the East Indies. Climbing Niasilla. Shrub cl.

**CULT.** For culture and propagation see *Eysenhardtia*, p. 234.

**CVIII. MULLERA** (in honour of Otto Frederick Muller, a Danish botanist, and one of the editors of *Flora Danica*). Lin. fil. suppl. 53. D. C. prod. 2. p. 259.

**L. syst. Monadelphus, Decandria.** Calyx campanulate, 5-toothed, apparently cut round about at the base after the teeth have fallen. Petals 5, monochasium, caducous. Stamens 10, monadelphous, having the tube compressed, falling off along with the calyx. Ovary sessile. Style filiform. Legume moniliform, having 1-5 1-celled 1-seeded, indehiscent, distinct joints. Seeds compressed, reniform. Flowers almost like those of a species of *Robinia*, but the stamens are monadelphous, the Fruit almost like that of *Sophora*, and the habit of *Pterocarpus*.

*Necklace-formed-puddled Mullera*. Clt. 1782. Sh. 6 to 7 ft. Cult. See *Eysenhardtia*, p. 234. for culture and propagation.

**L. syst. Monadelphus, Decadendria.** Calyx campanulate-urecostate, oblong-5-toothed. Corolla papilionaceous. Vexillum somewhat obovate, spreading-reflexed. Wings, vexillum, and keel about equal in length. Stamens diadelphous and monadelphous. Legume on a short stipe, oblong-lanceolate, straight, flat, membranous, 2-4-8-seeded. Seeds compressed, reniform. Radicle unequally inflexed.—Unarmed trees, from the West Indies and South America, with impari-pinnate leaves, opposite, exstipulate, stalked leaflets, and purplish flowers. This genus is not sufficiently defined. Perhaps these diadelphous species should be separated from the monadelphous ones, but the habit of both are very similar.

1. **L. punctatus** (H. B. et Kunth, nov. gen. amer. 6. p. 383.) leaves with 5-7 oblong, obtuse, glabrous leaflets, full of pulvullid dots, shining above, having the middle nerve rather prominent below; calyx glabrous; lower peduncles of raceme 2-flowered. f. S. Native of South America, near Cumana. Dalbergia punctata, Spreng. syst. app. 3. p. 268. Legume unknown.

**Dotted-leaved Lonchocarpus**. Tree 20 feet.

2. **L. macrophyllus** (H. B. et Kunth, l. c.) leaves with 9 elliptic-oblong, acuminate, dotless, glabrous leaflets, shining above, having the middle nerve and primary veins rather prominent; calyx clothed with brownish tomentum. f. S. Native of South America, near Angostura de Carara, on the banks of the river Magdalena. Dalbergia macrophylla, Spreng. syst. app. 268. This species is nearly allied to *L. Domíngensis*.

*Long-leaved Lonchocarpus*. Clt. 1818. Tree 40 feet.

3. **L. Domíngensis** (D. C. prod. 2. p. 259.) leaves with 11 oval, acuminate, glabrous, petiolulate leaflets; racemes axillary, shorter than the leaves; calyx somewhat truncate, bibracteate at the base, and are as well as the legumes pubescent. f. S. Native of St. Domingo. Dalbergia Domíngensis, Pers. encycl. 2. p. 276. L. Turpinii, Kunth, l. c. Stamens monadelphous. Legume 1-2-seeded. Flowers red.

*St. Domingo Lonchocarpus*. Clt. 1802. Tree 20 feet.

4. **L. violaceus** (H. B. et Kunth, l. c. in a note) leaves with from 7-11 ovate, obtuse, rather emarginate, glabrous leaflets, full of pulvulic dots, membranous, with the middle nerve rather prominent; calyx glabrous; peduncles of racemes 2-flowered. f. S. Native of Cartagena and Guadaloupe, in bushy places. Robinia violacea, Jacq. amer. 210. t. 177. f. 49. pict. 108. t. 262. f. 61. Flowers diadelphous, violaceous, large, having the scent of violets. Stamens somewhat monadelphous, the tenth one only free at the base.

*Violaceus*-flowered Lonchocarpus. Clt. 1799. Tr. 12 ft.

5. **L. pentalphylus** (H. B. et Kunth, l. c. in a note) leaves with 5-7 nervex, bluntly acuminate, quite glabrous leaflets; racemes shorter than the leaves; legumes lanceolate, glabrous, 1-3-seeded. f. S. Native of Porto-Rico. Dalbérgea pentalphylus, Poir. suppl. 2. p. 445. Flowers unknown.

*Five-leaved Lonchocarpus*. Tree 20 feet.

6. **L. heptaphyllum** (D. C. prod. 2. p. 269.) leaves with 7 lanceolate, obtusely mucronate, glabrous leaflets, pale beneath, and with the nerve and lateral veins rather prominent; racemes a little longer than the leaves; calyx 4-toothed; legumes oblong, narrow at the base, slender, glabrous, 2-3-seeded. f. S. Native of St. Domingo. Dalbérgea heptaphylla, Poir. l. c. suppl. 2. p. 416. Perhaps sufficiently distinct from *L. pentalphylus* and *L. violaceus*. Flowers purple.

*Seven-leaved Lonchocarpus*. Tree 20 feet.

7. **L. Leone'sis**; an erect, branched tree; leaflets oblanceolate, mucronate, undulate, entire; racemes axillary and terminal; flowers on short pedicels. f. S. Native of Sierra Leone. Corolla violaceous.

*Sierra Leone Lonchocarpus*. Tree 20 feet.

8. **L. albiflorus**; leaflets 7, ovate, acuminate, glabrous, entire; flowers on long peduncles or racemose, axillary; legume flat, pubescent. f. S. Native of the Island of St. Thomas, in the Gulf of Guinea. Flowers white.

9. **L. Formosanus** (D. C. prod. 2. p. 260.) leaflets 7, coriaceous, glabrous, oval, obtusely acuminate, having the nerve and lateral veins rather prominent; racemes panied; pedicels usually 2-flowered; calyx truncate, and is as well as the petals and legumes clothed with silky pubescence. f. S. Native of Africa, on the banks of the river Formosa. Robinia violacea, Beauv. fl. d'Ow. 2. p. 28. t. 76. Dalbergia Guineensis, Spreng. syst. app. 3. p. 266. Stamens monadelphous. Flowers violet.

*Formosa Lonchocarpus*. Tree 20 feet.

10. **L. sericeus** (H. B. et Kunth, l. c.) leaflets 7-11, oval, acuminate, coriaceous, glabrous above, but clothed with rufous, silky pubescence beneath, as well as the calyces, pedicels, and branches; racemes erect, length of leaves; pedicles very short, usually twin or 2-flowered; petals clothed with silky-silvery pubescence on the outside. f. S. Native of the Islands of Montserrat, St. Christopher, and Trinidad. Robinia sericea, Poir. diet. 6. p. 226. R. mollis, Vahl. in herb. Puer. Calyx truncate. Legume unknown. Stamens monadelphous.

*Silky Lonchocarpus*. Clt. 1826. Tree 20 feet.

11. **L. pyxidarium** (D. C. prod. 2. p. 260.) leaflets 7, ovate, acuminate, glabrous above, but clothed with adpressed villous-pubescent beneath; petioles, pedicels, and calyces clothed with short velvety down; racemes erect, shorter than the leaves; vexillum clothed with adpressed silky down on the outside. f. S. Native of Cuba, where it is called *Palo de Caja* or boxwood. Stamens monadelphous. This species comes very near to *L. sericeus*.

*Bax Lonchocarpus*. Clt. 1820. Tree 20 feet.

12. **L. latifolius** (H. B. et Kunth, l. c.) leaflets 7, ovate, short-acuminate, glabrous, pale beneath, having the nerve, and lateral veins rather prominent; racemes axillary, much longer
than the leaves, and are, as well as the pedicels and calyces, pubescent; corolla glabrous. 7. S. Native of Porto-Rico. Amerinum latifolium, Wildl. spec. 4. p. 611. exclusive of the synonyme, and therefore the same as Pterocarpus latifolis of Poir. dict. 4. p. 611. Calyx 5-toothed. Flowers of a purplish-violet colour. Stamens monadelphous. Ovary pubescent, linear, tapering to both ends.

Rose-coloured-flowered Lonchocarpus. Clt. 1700. Tree 20 to 30 feet. 15 L. ? Pterocarpus (D. C. prod. 2. p. 260.) leaflets 5, oval-oblong, acuminate, quite smooth, shining above, but glaucenesc beneath; racemes axillary, length of leaves; legume oblong, acuminated at both ends, winged upper suture. 7. S. Native of French Guiana. Flowers unknown. Legume 2 or 3 inches long, and 1-2-seeded from abortion.

Wing-fruited Lonchocarpus. Tree 20 to 30 feet. 16 L. Sejium (D. C. prod. 2. p. 260.) leaflets 11-15, ovate, bluntly acuminate, membranous, rather puberulous above, but glabrous and pale beneath; racemes shorter than the leaves; pedicles 1-flowered; calyx truncate; legumes glabrous, oblong-obtuse, compressed, callosus at the sutures. 7. S. Native of St. Martha, and at Carthagena, where it is used for hedges to gardens. Robinia sejium, Jacq. amer. 211. t. 129. f. 101. Flowers rose-coloured. Stamens diadelphous. Legume about 4 inches long, 4-seeded.

Hedge Lonchocarpus. Clt. 1821. Tree 30 feet. 17 L. Macrocarpus (D. C. prod. 2. p. 260.) leaflets 17, oblong, obtuse, beset with adpressed pili above, but glaucenesc and spotted with black beneath; calyx campanulate urceolate, nearly entire, puberulous; legume linear, compressed, with thickened margins. 7. S. Native about Campeachy. Robinia maculata, H. B. et Kunth, nov. gen. amer. 6. p. 394. This plant, along with the preceding species, may form a distinct genus, which may be called Glycyrinia.

Spotted-leaved Lonchocarpus. Tree 30 feet. 15 L. Swartzi Pseudacacia, (D. C. prod. 2. p. 261.) leaflets 5-7, oval, bluntly acuminate, glabrous, pale beneath; racemes shorter than the leaves; pedicles 2-flowered; calyx truncate; legumes glabrous, elliptic-oblong, compressed, few-seeded, rather callous at the sutures. 7. S. Native of St. Domingo. Robinia ssp., Swartz, prod. 106. Flowers rose-coloured. This species differs from L. stipitum in the flowers being smaller and monadelphous, not diadelphous.

Swartz’s Lonchocarpus. Tree 20 feet. 15 L. Nico’u (D. C. prod. 2. p. 261.) leaflets 7, ovate, acuminate, glabrous; branches sarmentose, rather climbing; racemes spike-formed; pedicels 1-flowered; calyx 5-toothed; legume elongated, glabrous, 4-seeded, rather callous at the sutures. 7. S. Native of French Guiana, in bushy places. Robinia Nicou, Aubl. guian. 2. p. 771. t. 308. R. scandens, Wildl. spec. 3. p. 1134. Flowers purple, diadelphous. There is a plant native of Cayenne which differs from the plant of Aublet in the leaflets being silky-pubescent beneath, and in the spikes being longer than the leaves. The twigs are cut and thrown into ponds and rivers for the purpose of intoxicating fish, in order to take them, as those of Tephraria toxicaria, see p. 229. Nicou is the Caribbee name of the tree.

Nicou Lonchocarpus. Shrub cl. 20 L. Oxyacrus (D. C. prod. 2. p. 261.) leaflets 7, oval, abruptly, acutely, and mucronately acuminate, glabrous, pale beneath; racemes shorter than the leaves; pedicles 2-3-flowered; calyx usually 5-toothed; legume oblong, acuminated at both ends, compressed, few-seeded, not tumid at the sutures. 7. S. Native of Guadaloupe. Flowers purple, monadelphous. Sharp-fruited Lonchocarpus. Tree 12 to 20 feet. 21 L. ? Amerinum (D. C. prod. 2. p. 261.) leaflets 7, ovate, acuminated on long pediolo, glabrous; racemes simple, loose, shorter than the leaves; calyx 5-toothed. 7. S. Native about Cartagena woods. Amerinum pinnatum, Jacq. amer. 200. t. 177. f. 50. Flowers yellow, monadelphous. Amerinum-like Lonchocarpus. Tree 14 feet.

Cult. For culture and propagation see Eysenhardtia, p. 234.

CR. ROBIA (in honour of Jean Robin, a French botanist, once herbalist to Henry IV. of France, author of Histoire des Plantes, 12mo. Paris, 1620. printed also with the second edition of Lonicer’s History of Plants. His son Vespasian was subdeemnator at the Jardin du Roo, and was the first person who cultivated the Pseudacacia in Europe). D. C. mem. vi. prod. 2. p. 261. — Pseudacacia, Tourn. inst. t. 417. Mecnch. meth. 145.—Robinia species of Lin. and others.

1 R. Pseudacacia (Lin. spec. 1043.) spines stipular; branches twiggy; racemes loose, pendulous, and are, as well as the legumes smooth; leaflets ovate. 7. H. Native of North America, from Canada to Carolina. Lam. ill. t. 666. f. 1. Duham. arbr. ed. nov. 2. t. 16. Æschynème pseudacacia, Roxb. Pseudacacia odorata, Meech. i. c. Flowers white, sweet-scented. Roots creeping, the fibres sometimes bearing tubercles. The Common, False, or Bastard Acacia, called Lozcast-tree in America, grows very fast whilst young, so that in a few years from seed the plants rise to 8 or 10 feet high, and it is not uncommon to see shoots of this tree 5 or 8 feet long in one summer. The branches are armed with stipular hooked prickles. The leaves have 8 or 10 pairs of bright green leaflets. The flowers come out from the sides of the branches in pretty long bunches, hanging down like those of Laburnum, white, and smelling very sweet; they appear in June, and when the trees are full of flowers they make a very fine appearance, and perfume the air round them, but they seldom continue more than one week. The wood is valued in North America for its durability. Most of the houses which were built at Boston in New England on the first settling of the English, were constructed of this timber. The tree being very liable to be broken by high winds, and the leaves not appearing till late in the summer, and
falling off early in the autumn, makes it less valuable for ornamental plantations. The wood when green is of a soft texture, but becomes very hard when dry, of a close grain, and finely veined, and is more valued in America by cabinet-makers than any other native timber whatever. It is as durable as the best white oak, and is esteemed preferable for axle-trees, masts, tennils for ships, and many other mechanical purposes. It has been employed with success in Virginia for ship-building, and is said to be superior to the American elm, clay, ash, &c. for that purpose. Posts for rail-fencing made of this tree stand wet and dry in the ground better than any other in common use, almost as well as posts of the swamp-cedar. It makes excellent fuel, and its shade is less injurious to grass than that of most other trees. The leaves afford wholesome food for cattle. A gentleman in New England sowed several acres of it for that purpose. Being very apt to throw out suckers from the running roots, and as it stots freely, it seems particularly calculated for coppice woods.

A locust-tree in New England 40 years old was in 1782 60 feet high and 4 feet 10 inches in girth at 3 feet from the ground. A cubic foot of Aceria in a dry state weighs from 48 to 52 pounds avoidupoise.

We compare its toughness in an unseasoned condition with that of oak, it will not be more than 8-100 less. Its stiffness is equal to 90-100 of oak, and its strength nearly 96-100, but were it properly seasoned, it might possibly be found much superior to oak in strength, toughness, and stiffness. A piece of unseasoned acacia 2 feet 6 inches long, and an inch square in the vertical section, broke when loaded with a weight of 247 pounds avoidupoise. Its medium cohesive force is about 11,500 pounds. (Dict. of Arch.)

Var. γ, crispa (D. C. l. c.) spines wanting; leaflets all or for the most part undulate curled.

Var. ε, umbraeflora (D. C. cat. hort. monsp. 157.) spines wanting; branches much crowded, smooth; leaflets ovate. This plant is common in gardens, but has not yet flowered. Robinia inermis, Dum. Cours. 6. p. 140. Commonly called Parasol Acacia. This variety is said to have been raised from the seed of R. pseudacacia, but it is more of a shrub than a tree.

Var. η, tortuosa (D. C. prod. 2. p. 261.) branches much crowded and twisted. H. R. pseudacacia tortuosa, D. C. cat. hort. monsp. 136. Racemes similar to those of R. pseudacacia, but are smaller and fewer flowered.

Bastard Acacia, False Acacia, or American Locust-tree. Fl. May, June. Clt. 1640. Tree 30 to 60 feet.

2 R. dubia (Foss. in Desv. journ. bot. 4. p. 204. but not of Poir.) spines very short; branches, petioles, peduncles, and calyxes furnished with a few glands, rarely clammy; leaflets ovate; racemes loose, pendulous; bracteas cuneate, cuneiform, ending each in a long bristle. H. Said to be a hybrid between R. pseudacacia and R. viscosa. R. hystrix, Audib. R. ambigua, Poir. suppl. 4. p. 690. and perhaps R. echinata, Mill. dict. no. 2. Flowers sweet-scented, pale rose-coloured. The pods, according to Miller, are thickly beset with short prickles.

Doubtful, Bastard, or False Acacia. Fl. May, Ju. Tree 60 ft.

3 R. viscosa (Vent. hort. cels. t. 4.) spines very short; leaflets ovate; branches and peduncles glandular and clammy; racemes crowded, erect; bracteas cuneate, deciduous, each ending in a long bristle; the 3 lower teeth of calyx acuminated. H. Native of North America, on the mountains of Georgia and Carolina, near rivers. Duh. arbr. ed. nov. 2. t. 17. R. glutinosa, Curt. bot. mag. 560. Flowers pale red mixed with white, scentless. Roots creeping.

4 R. hispida (Lin. mant. 101.) spines wanting; leaflets ob-ovate; branches hispid; racemes loose, hispid; the 3 lower teeth of calyx acuminated; legumes hispid. H. Native of Virginia and Carolina, on high mountains. Mill. fig. t. 244. Curt. bot. mag. 311. R. rosea, Duh. l. c. t. 18. R. montana, Bast. voy. 2. p. 138. Eeschymone hispidula, Roxb. Flowers large, rose-coloured, shewy, scentless. Plants many species are confused under the name of R. hispida. This is one of the most elegant of the species when in flower, it is usually grafted on the common sort, and flowers even when it is about 2 or 3 feet high, which renders it a very valuable plant for ornamental shrubberies, but it requires to be grown in a sheltered situation, otherwise the branches are very liable to be shatterd or blown off by high winds. In young trees grafted above ground, the fracture commonly takes place at the graft, so that a good preventive is to graft on a root, a little below the surface. Grafts in this manner are also much more certain of success.

Var. β, nana (D. C. prod. 2. p. 262.) plant hardly a foot high. Native of Carolina, in pine woods.

Hispid Bastard or Rose Acacia. Fl. May, Sept. Clt. 1748. Shrub 3 to 6 feet.

Upright Rose or Bastard Acacia. Fl. May, Sept. Sh. 6 feet.

6 R. macrophylla (Schrad. in litt.) spines wanting; leaflets ovate-roundish; branches and peduncles glabrous, the 3 lower teeth of calyx acuminated. H. Native of North America. Flowers large, rose-coloured, scentless. R. hispida var. macrophylla, D. C. prod. 2. p. 262.

Long-leaved Rose or Bastard Acacia. Fl. May, June. Shrub 6 to 10 feet.

† Trees and shrubs referred to Robinia by authors, which appear not to belong to the genus, and ought to be referred to some other genera; but they are not so sufficiently known as to enable us to refer them to their proper genera.

7 R. amara (Lour. coeh. p. 455.) unarmed; leaves impari-pinnate, usually with 5 pairs of ovate-oblong leaflets, which are white beneath; racemes long, erect; pedicels torn; legume almost terete, acuminated, glabrous. H. Native of Cochin-china and China. Flowers violaceous. Root very bitter, of a yellowish brown-colour.

Bitter-rooted Robinia. Shrub 4 feet.

8 R. glycyphylla (Poir. dict. 6. p. 227.) unarmed; leaves impari-pinnate, with 6-9 pairs of glabrous, ovate, obtuse, discoloured leaflets; stipulas subulate, stiff; racemes elongated; calyx subular; legume linear, compressed, obtuse, stipitate. H. Native of Martinique. Flowers small, white. Perhaps a species of Lonchocarpus.

Sweet-leaved Robinia. Tree 20 feet?

9 R. guineensis (Willd. ex Steud. D. C. prod. 2. p. 262.) unarmed; leaves impari-pinnate, with 5-6 pairs of elliptic, mucronate, glabrous leaflets; stipulas linear-subulate; racemes 5-6-flowered; branchlets and calyxes hispid. H. Native of Guinea. Cythisus hispidul, Willd. spec. 3. p. 1121.

10 R. latifolia (Mill. dict. no. 9. but not of Poir.) unarmed; leaves impari-pinnate, with 6-7 pairs of oblong acuminated leaflets, which are shining above, and pale beneath; racemes elongated; legumes 1-2-seeded, oblong-ovate. H. Native of Campeachy. Flowers rose-coloured. Perhaps a species of Lonchocarpus.

Broad-leaved Robinia. Tree 20 to 30 feet.
11. *R. glabra* (Mill. dict. no. 5.) unarmed; leaves impari-pinnate; leaflets oblong-obovate, obtuse, glabrous; peduncles racemose, crowded. ♂ S. Native of Camppeachy. Flowers small, yellowish-red. Perhaps a species of *Lonchocarpus*.

Glabrous Robinia. Tree.

12. *R. peudula* (Ord. dict. p. 25.) unarmed; leaves impari-pinnate, with 5-8 pairs of oval mucronulate leaflets; stipulas subulate; racemes twice the length of the leaves; pedicels twin, 1-flowered. ♂ S. Native of Peru, at the town called Huariaca. Flowers pale violet-coloured.

Pendulous-flowered Robinia. Tree.

14. *R. rubiginosa* (Mart. et Nees, nov. act. boun. 12, p. 31, exclusive of the synonyme of Poir.) shrub unarmed, diffuse; leaves impari-pinnate; leaflets 19-21, elliptic, obtuse, somewhat emarginate; pubescent beneath; racemes axillary, compound, and are, as well as the branches, clothed with rusty villi. ♂ S. Native of Brazil, about Tamburi and Valos. Flowers small, violaceous. Ovary crenulate.

Rusty Robinia. Shrub 10 to 12 feet.

15. *R. cuen
tines* (H. B. et Kunth, nov. gen. amer. 6, p. 392.) arboreous; leaflets 9, ovate-oblong, obliquely falcate, glabrous; racemes in fascicles, pendulous; calyx urceolate, 5-toothed, pubescent. ♂ S. Native of Cuba, near Batabana. Flowers pale rose-coloured. Fruit unknown.

Cuba Robinia. Tree 40 feet.

16. *R. ferrugine
ea* (H. B. et Kunth, nov. gen. amer. 6, p. 395.) arboreous; branches glabrous, unarmed; racemes rising before the leaves; calyx urceolate, 5-toothed, somewhat bilabiata, clothed with rusty tomentum. ♂ S. Native of Caracas. Flowers rose-coloured or white.

Ferruginous Robinia. Tree 20 feet.

17. *R. fla
dora* (Lour. orth. 456.) unarmed; leaves abruptly pinnate, usually with 5 pairs of oblong acutish leaflets; peduncles 5 together, each bearing 5 flowers. ♂ G. Native of the north of China. Root yellow, bitter. Flowers white. Perhaps a species of *Caragana*. The roots in decoction are febrifugal.

Yellow-rooted Robinia. Shrub 1 to 2 feet.

18. *R. pyrami
data* (Mill. dict. no. 7.) unarmed; leaves bi-pinnate; leaflets ovate, sessile, shining above, but pale beneath; panicles spicately pyramidal, erect. ♂ S. Native of Camppeachy. Flowers red. Perhaps a species of *Cesalpinia*.

Pyramidal-flowered Robinia. Tree.

Cult. All the true species of Robinia are very handsome when in flower, and are very proper plants for ornamental shrubs; the taller species to be placed at the back, and the shorter ones in front; they are either propagated by layers or by grafting the rarer on the commoner sorts, most commonly on the *R. pseudacacia*. Most of the species may be raised from seeds, which in some kinds ripen in plenty. The stowe and greenhouse kinds, which are certainly very doubtful species of the genus, should be treated in the same manner as the genus *Sabi
ea*.

CXI. POITEA (in honour of — Poitea, a French botanist and traveller in South America, author of Flore Parisienne, in conjunction with Turpin, and author of many botanical memoirs in the Annales du Museum). D. C. prod. 2, p. 263.—Poitea, Vent. choix. t. 36.

1 P. *galegoide* (Vent. choix. t. 36.) petioles wingless; leaflets 12-15 pairs, oblong, mucronate, and are, as well as the branches, clothed with adpressed pubescence; flowers and legumes nodding. ♂ S. Native of St. Domingo. Galega Berthii, Spreng. in herb. Balb. P. galegoideformis, Spreng. syst. 3, p. 275. Leaflets 3 lines long, and a line and a half broad. Flowers of a rose-purple colour.

Goat’s-rue-like Poitea. Shrub.

2 P. *viciafólia* (D. C. in ann. sc. nat. 4. p. 99.) petioles with a very narrow wing; leaves with 16-18 pairs of oblong mucronate leaflets, which are clothed with hairy pubescence, as well as the branchlets; flowers and legumes erect. ♂ S. Native of St. Domingo. Robinia viciifolia, Bertero in herb. Balb. Flowers white or pale rose-coloured. Leaflets an inch long, and about 3 or 4 lines broad.

Vetch-leaved Poitea. Shrub.

3 P. *campa
nilla* (D. C. prod. 2, p. 263.) petiole terete, filiform; leaves with 4 pairs of distant, ovate-oblong, rather mucronate leaflets, which are glaucous beneath, but smooth on both surfaces, as well as the branches and petioles. ♂ S. Native of St. Domingo, where it is called *Campanilla*. Robinia latifolia, Bertero in herb. Balb. Flowers white or pale rose-coloured. Leaflets an inch long, and half an inch broad, on long petiolules.

Campanilla Poitea. Shrub.

Cult. See *Sabi
ea* for culture and propagation.

Lin. syst. *Diadélphus*, *Decandria*. Calyx cup-shaped, campanulate, with a truncate, nearly entire border. Corolla papilionaceous. Keel obtuse, rather shorter than the vexillum. Stamens diadelphous, the free one and 4 others shorter than the rest. Style filiform, glabrous, circumnately incurved, as well as the stamens. Legume stipitate, compressed, linear, elongated, many-seeded, mucronate by the style. — Unarmed Caribbean shrubs, with abruptly-pinnate leaves, glabrous mucronate leaflets, axillary fascicles of 1-flowered pedicels, and purplish flowers.

1 S. *flórida* (D. C. l. c.) leaflets 8-9 pairs, elliptic-oblong; flowers rising before the leaves. ♂ S. Native of the American Islands, in St. John, Krabben Island, and St. Thomas. Robinia florída, Vahl. symb. 3, p. 89. t. 70.

Flowery Sabinea. Shrub 2 to 4 feet.

Doublet Sabinea. Shrub 2 feet.

Cult. A mixture of loam, peat, and sand will answer the species of *Sabi
ea*, and young cuttings will root if planted in a pot of sand with a hand-glass placed over them in heat.

CXIII. COURSETIÀ (in honour of Dumont de Courset,
and one of the editors of the Bon Jardiner).] D. C. in ann. sc.
at. 4. jan. 1825, p. 92. prod. 2. p. 264.

Lin. syst. Diadelpheia, Decandria. Calyx 5-cleft, with nearly
equal acute segments, 2 superior ones rather the shortest,
and joined together a little higher up than the rest. Vexillum ob-
cordate, shorter than broad. Keel obtuse, shorter than the wings.
Stamens diadelphous. Style incurved, thick at the base and
glabrous, but filiform at the apex and bearded with villi on all
sides. Stigma capitate, terminal, smoothish. Legume compres-
sed, 1-celled, 5-8-seeded, tapering to the apex, and mucro-
nate by the style.—Tomentose shrubs, with subulate stipsulas,
abruptly-pinnate leaves, with many pairs of ovate small leaflets,
the common petiole sometimes terminating in a bristle, but rarely
in an odd leaflet. Flowers yellow. This genus is allied to Rubi-
nia and Caragana, not to Lathyris or Echynemonae.

1 C. tomentosa (D. C. l. c.) the whole plant clothed with velvety
tomentum; leaves with from 30-32-pairs of leaflets; racemes 2-3-flowered, shorter than the leaves; calyx 5-cleft. Η. 
S. Native of Peru. Lathyris fruticosus, Cav. icon. t. 84. 

Tomentose Coursetia. Shrub 2 feet.

2 C. de'nia (D. C. prod. 2. p. 264.) branches clothed with
white villi; leaflets elliptic, acuteish, usually about 30 pairs, 
puberulous above, and villously tomentose beneath, and canescent;
racemes 15-20-flowered, length of leaves; calyx 5-toothed. Η. 
S. Native on the Andes about Paso, near the river Guarataria. 
Sesbanía dünia, H. B. et Kunth, nov. gen. amer. 7. p. 268. t.

Doublet Coursetia. Shrub 3 to 6 feet.

3 C. virgata (D. C. l. c.) plant smoothish; leaflets 10-15 pairs;
racemes 8-10-flowered; calyx 5-toothed. Η. S. Native of New Spain. 
Echynemonae virgata, Cav. icon. t. 293. Agáti virgáta, Desv. 
journ. bot. 3. p. 120. Legume glabrous, compressed, somewhat 
torulos, not articulated, apiculated by the thick style. Calyx not 

Twirrige Coursetia. Shrub 2 feet.

Cult. See Sabinea for culture and propagation, p. 289.

CXIV. SESBANÍA (Sesban is the Arabic name of the first 
species). Pers. ench. 2. p. 316. Desv. journ. bot. 3. p. 120. t.
4. f. 5.—Sesban, Poir. dict. 7. p. 127.—Sesbana, R. Br. in hort.
kew. 4. p. 300.—Echynemonae species of Lin. and others.— 
Coronilla species of Willd.

Lin. syst. Diadelpheia, Decandria. Calyx 5-cleft or 5-toothed 
(f. 38. a.) with the lobes nearly equal. Vexillum roundish, 
complicated, larger than the keel (f. 38. b.). Keel obtuse, 2-
bordered at the base. Stamens diadelphous, having the tube or 
shorn rather arried at the base. Legume elongated, slender 
(f. 38. c.), compressed, or somewhat cylindrical; the sutures 
thickened, not truly articulated, but rather torulos.—Shrubs 
or herbs, having the caulin stipules lanceolate. Leaves ab-
ruply pinnate, with many pairs of leaflets, having the petioles 
drawn out into a bristle at the apex instead of an odd leaflet. 
Peduncles axillary. Flowers racemose, usually yellow. Perhaps 
this genus, with the three following, ought to be referred to 
Tribe Hedysaraeæ.

1 S. Aegyptica (Pers. ench. 2. p. 316.) shrubby, glabrous; 
leaflets 10 pairs, oblong-linear, obtuse, and rather mucronate; 
racemes many-flowered; legumes compressed, and rather 
torulos, twice the length of the petiole. Η. S. Native of 
Senegal, Egypt, and the East Indies. Sesban, P. Alph. 52, with 
a figure. Æchynömene Sesban, Lin. spec. 1061. Coronilla 
Sesban, Willd. spec. 3. p. 1117. A. Sesban and A. Indica, 
Burm. fl. ind. 169 and 170. Vexillum roundish and dotless. 
Flowers yellow.

2 S. occidenta (Pers. ench. 2. p. 316.) shrubby, glabrous; 
leaves with 12-15 pairs of elliptic leaflets; racemes few-flowered; 
legumes terete, straight, 5-times longer than the petioles. Η. S. 
Native of South America or the Caribbean Islands. Coronilla 
occadentia, Willd. spec. 3. p. 1147.—Plum ed Burn. t. 123.
FIG. 1. Corona hairy according to Plumer, yellow.

3 S. cassiodes; shrubby, smooth; leaves with from 20-35 
pairs of lanceolate, obtuse, mucronate leaflets; stipulas subu-
late; peduncles axillary, 2-3-flowered; legumes long-linear, 
terete, longer than the leaves. Η. S. Native of Guaiacu. 
Æchynömene cassioideae, Ruiz et Pav. in herb. Lamb.

Cassia-like Sesban. Shrub 2 to 3 feet.

4 S. exasperata (H. B. et Kunth, nov. gen. amer. 6. p. 
534.) shrubby; branches angular, and arc, as well as the racis, 
prickly; leaves with about 30 pairs of linear, mucronate, rather 
fuscate, glabrous leaflets, but with the nerves and margins beset 
with adpressed; peduncles usually 3-flowered, one-half 
shorter than the leaves. Η. S. Native of South America, in 
sand at the river Aupres, and near La Laguna de Valencia. 
Corolla glabrous, yellow. Legume very long and cylindrical.

Rough Sesban. Shrub 3 to 4 feet.

5 S. aculeata (Pers. ench. 2. p. 316.) plant herbaceous and 
glabrous; racis of leaves rather 
prickly; leaves having about 25 
pairs of linear, obtuse, rather 
mucronate leaflets; racemes few-
flowered; legumes filiform, one-
half shorter than the petioles. Ω. 
S. Native of Malabar. Æchyn-
ömene Sesban, Jaq. coll. 2. p. 
283. Æ. hispinoae, Jaq. icon. rar. 
t. 504. Coronilla aculeata, Willd. 
l. c.—Rheed, mal. 9. t. 27. Burn. 
yelz. t. 41. There is a variety of 
this plant having only 12-15 pairs 
of leaflets. Flowers orange.

Cht. 1694. Pl. 5 to 6 feet.

6 S. Persuana; shrubby, smooth; leaves with 4-6 pairs of 
oboate, obtuse, mucronate leaflets, which are glaucous beneath; 
racemes short, few-flowered; stipulas ovate, subulate at the 
apse; peduncles prickly; legumes longer than the leaves, 
elongated, terete. Η. S. Native of Peru. Æchynömene spec.
Ruiz et Pav. in herb. Lamb.

Peruvian Sesban. Shrub 3 to 4 feet.

7 S. cana (Pers. l. c.) plant herbaceous, glabrous; 
racis of leaves smooth; peduncles 1-flowered, twin; legume 
filiform, compressed. Ω. S. Native of Malabar. Æchyn-
spec. 3. p. 1148. Flowers small, yellow. This plant, if treated 
as hemp, may be used for the same purposes.

Cht. 1800. Pl. 2 to 4 feet.

8 S. affinis (Schradt. sem. hort. goett. 1819.) plant 
herbaceous, smoothish; leaflets 12-18 pairs, oblong-linear, very 
blunt, mucronulate; racis of leaves smooth; racemes few-flowered; 
legumes compressed, pendulous, length of racis. Ω. S. Native of 
the East Indies. Æchynömene cannabina, Hortul. Flowers 
yellow.

Cht. 1800. Pl. 2 to 4 feet.

9 S. punctata (D. C. prod. 2. p. 264.) plant herbaceous,
glabrous; leaves having 10-30 pairs of oblong-linear, very blunt, mucronate leaflets; petioles pubescent above; racemes many-flowered; corolla 6-times longer than the calyx; legumes compressed, somewhat torulose, 3 or 4 times the length of the petiole. O. S. Native of Senegal. Flowers yellow, 8-9 lines long, having the vexillum spotted with purple on the outside.

**Spotted-flowered Sesban.** Fl. July, Aug. Clt. 1825. Pl. 2 to 3 feet.

10 S. *pachyacarpa* (D. C. prod. 2. p. 265.) plant herbaceous, glabrous; leaflets oblong-linear, very blunt, and rather mucronate; petioles smooth; racemes 4-6-flowered, somewhat corny-bose; corolla 3-times longer than the calyx; legumes rather terete, thick, 3-times the length of the rachis. O. S. Native of Senegal. Flowers yellow, but with the vexillum variegated with purple spots. Legume acuminate, 6-8 inches long.

**Thick-fruited Sesban.** Pl. 2 to 3 feet.

11 S. *picta* (Pers. ench. 2. p. 316.) plant herbaceous, glabrous; leaves with 12-16 pairs of oblong-linear obtuse leaflets; racemes many-flowered, nodding; corolla 3-times the length of the calyx; legumes filiform, when young terete, but at length becoming compressed, torulose, twice the length of the petioles. O. S. Native of New Spain. *Aschynomone* longifolia, Orb. decd. 9. p. 79. Flowers yellow. Stems and fruit purplish.

**Long-leaved Sesban.** Shrub 4 to 6 feet.

18 S. *sericiflora* (D. C. prod. 2. p. 266.) plant herbaceous; leaflets lanceolate, acute, mucronate, narrowest at the base, silky beneath. O. S. Native country unknown. Coronilla sericifera, Willd. enum. 773. Said to be nearly allied to *S. cannabina*.

19 S. *cochin-chinesis* (D. C. prod. 2. p. 266.) stem suffrutescose; leaves with 15 pairs of oblong, obtuse, mucronate leaflets; peduncles 3-flowered; legumes filiform, torulose, erect. O. S. Native of Cochinchina. Coronilla Cochinchinensis, Lour. coch. p. 432. Flowers yellow.

**Cochin-China Sesban.** Shrub 4 feet.

**Cult.** All the species of this genus require a heat of 70 degrees of Fahrenheit, or they will not thrive. The shrubby kinds are increased by cuttings, and the annual species by seeds, which sometimes ripen in this country.

---

**CXV. AGATI.** (Touri or Agati is the name of A. grandi-flora in the Sanskrit language.) Rheed. hort. mal. t. 51. Adans. fam. 2. p. 326. Desf. journ. bot. 5. p. 120 t. 4. f. 6.

**LIN. SYST. Diodèphus, Decædræ.** Calyx campanulate, truncate, obtusely 5-toothed, repand. Vexillum ovate-oblong, shorter than the wings. Wings oblong. Keel large, straightish, with its petals free at the base and apex. Stamens diadelphous, somewhat exserted, with the sheath furnished with large auricles above the base. Style filiform, straightish. Legume tapering into a stipe, compressed, linear, 2-valved, transversely many-celled inside, but with the upper suture prominent and truncate, not truly articulated. Seeds ovate, solitary in the cells.—Indian trees, with lanceolate stipulas, abruptly-pinnate leaves, having many pairs of leaflets; large flowers; few-flowered racemes, and with legumes a foot and a half long.

1 A. *grandiflora* (Desv. 1. c.) leaflets glabrous; legumes evidently compressed. O. S. Native of the East Indies, where it is called *Touri* or *Agati*.—Rheed. mal. 1. p. 95 t. 51. Rumph. amb. 1. t. 76. *Aschynomone grandiflora*, Lin. spec. 1556. Coronilla grandiflora, Willd. spec. 3. p. 1145. Sessania grandiflora, Poir. dict. 7. p. 127. Dölichos arboreus, Forsk. descr. 134. Flowers of a rusty-yellow colour according to Forsk, but according to Roxb. they are white or rose-red. The seeds are agreeable to domestic birds. The bark is bitter and tonic.

2 A. *coccinæa* (Desv. 1. c.) leaflets powdery; legumes rather terete. O. S. Native of the East Indies and the Society Islands. *Aschynomone coccinea*, Lin. fil. suppl. 330. Coronilla coccinea, Willd. 1. c. Sessania coccinea, Poir. 1. c.—Rumph. amb. 1. t. 77. Flowers red, rather smaller than those of the other species, but similar.

**Cult.** See *Sabinia* for culture and propagation, p. 239.

---

**CXVI. GLOTTIDIUM.** (from γλωττος or γλώττα, glotta, a tongue; in reference to the valves of the legume separating into two membranes each, which has been compared to the superior opening of the larynx.) Desv. journ. bot. 3. p. 119 t. 1. D. C. prod. 2. p. 266.
Lin. syst. *Diadelpha, Decándria.* Calyx 5-toothed, somewhat bilabiate, lower teeth rather the longest. Vexillum reniform, very short, and broad. Stamens diadelpous. Legumes on long stipes, compressed, flat, 2-valved, 2-seeded, l-celled; the valves separating into 2 membranes when mature, outer membrane coriaceous, inner one membranous and covering the seeds. Seeds compressed, transversely oblong.—Annual smooth herbs, having the primordial leaves ovate and simple, and the rest abruptly-pinnate, of many-pairs of leaflets. Racemes axillary, pedunculate. Flowers few, loose, yellow.

*Florida* Glottidium. Fl. July, Aug. Ckt. 1816. Pl. 5 to 7 ft. Cult. The seeds of this plant require to be sown in a pot filled with peat and sand, and placed in a hot-bed, and when the plants have grown 2 or 3 inches high, they should be planted into separate pots in the same kind of soil, and shifted into larger pots as they grow.

*CVII. PISCIDIA* (from piscé, a fish, and cæd, to kill or destroy; the leaves, bark, and twigs bruised are thrown into ponds or rivulets for the purpose of intoxicating fish, by which means they are easily taken). Lin. gen. 856. D. C. prod. 2. p. 267.—Piscipula, Locl. itin. 275.—Ichthyométhis, P. Browne, jam. 276.

Lin. syst. *Monadélphus, Decándria.* Calyx campanulate, 5-cleft. Corolla papilionaceous. Keel obtruncated. Stamens monadelphous, the tenth one free from the rest at the base. Style filiform, glabrous. Legume pedicellate, linear, furnished with 4 membranaceous wings; the seeds separated by spongy substance. Seeds ovate, compressed, having a lateral hylum. Embryo curved, with elliptic-oblong thickish cotyledons, and a hooked radicle.—West Indian trees, with broad impari-pinnate leaves, and terminal panicles of white and blood-coloured flowers mixed.

1 P. erythri'na (Lin. spec. 993. Jacq. am. 206.) leaflets ovate; legume standing on a stipe, which is three times the length of the calyx; wings interrupted. 7. S. Native of New Spain. And Jamaica on the mountains, where it is called Dog-wood by the English. Swartz, obs. 277. Luman. hort. jam. 1. p. 269. Kunth, nov. gen. amer. 6. p. 382. Erythrina piscipula, Lin. spec. ed. 1. p. 107. Slaone, jam. 2. t. 176. f. 4 and 5. Linn. ill. t. 605. f. A. Leaves rather coriaceous, Adult ones smooth. Flowers rising before the leaves, of a dirty-white colour. The bark of the root (leaves and twigs, Jacq.) is used with the same effects as the leaves and branches of Surinam poison. It is pounded and mixed with the water in some deep and convenient part of a river or creek, when it may spread itself; in a few minutes the fish that lie hidden under the rocks or banks rise to the surface, where they float as if they were dead; most of the larger ones recover after a time, but the smaller fry are destroyed. Jacquin observes that this quality of intoxicating fish is found in many other South American plants. The tree is considered in Jamaica as a good timber tree; the wood is hard and resinous, and lasts almost equally in or out of water. It is of a light-brown colour, coarse, cross-grained, and heavy. It makes excellent piles for wharfs. The stakes soon form a good living fence. The bark of the trunk is very restringent; a decoction of it is said to stop the immediate discharge of ulcers, especially when it is combined with the mango bark; it is said to cure the mange in dogs, and it would probably answer well for tanning leather.

2 P. *Carthagenensis* (Jacq. amer. 210. Lin. spec. 293.) leaflets obovate; stipe of legume hardly longer than the calyx; wings continuous. 7. S. Native of Jamaica, Guadaloupe, and Carthagena, on the mountains. Piscidia erythrina of Ait. hort. Ait, according to a specimen in the herbarium of L. Heritier, which has the underside of the leaves villous, and the young leaves very villous, and the lower leaflets ovate, but the terminal one is obovate.—Plum. ed. Barn. t. 133. f. 2. Lam. ill. t. 605. f. B. and C. Flowers dirty-white, rising after the leaves. Luman, hort. jam. 1. p. 270.

*Carthagena* Piscidia. Fl. May, June. Ckt. 1690. Tree 30 ft. Cult. Sandy loam suits these trees best, and cuttings may be rooted in sand under a hand-glass in heat.

Lin. syst. *Diadelpa, Decándria.* Calyx campanulate, rather truncate, with 5 small teeth. Corolla papilionaceous. Keel very blunt. Vexillum roundish, stipitate. Stamens diadelpous, having the free filament, as well as the staminiferous sheath, as if they were jointed at the base. Style filiform, glabrous. Legume on a long pedicel, oblong, compressed, coriaceous, ornamented with 4 wings rising near the margins of the sutures, and furnished with spongy substance between the seeds. Seeds ovate, rather Mexican shrubs, with oblong stipulas, abruptly-pinnate leaves, and simple racemes of flowers. This genus is nearly allied to *Piscidia*, but the stamens are diadelpous, and the leaves are abruptly, not impari-pinnate. Perhaps this genus is allied to *Coursetia*.

1 D. ful'ceae (D. C. prod. 2. p. 267.) leaves with 8-10 pairs of oblong obtuse leaflets; racemes almost 3-times shorter than the leaves. 7. S. Native of New Spain. Flowers scarlet. Piscidia punicea, Cav. icon. 4. t. 316. Æschynomenes minuta, Ort. dec. p. 28.

2 D. longi'fólia (D. C. prod. 2. p. 267.) leaves having 11-12 pairs of lanceolate acute leaflets; racemes a little shorter than the leaves. 7. S. Native of New Spain. Flowers yellow. Æschynomenes longifólia, Cav. icon. 4. t. 315. Piscidia longi'fólia, Wildl. spec. 3. p. 920.

*Long-leaved* Daubentonia. Fl. June, Aug. Ckt. 1820. Sh. 6 ft. Cult. To be propagated and cultivated in the same manner as that recommended for *Piscidia*.

Lin. syst. *Diadelpa, Decándria.* Calyx bilabiata, 5-toothed; teeth spreading, linear, subulate, 2 superior ones hardly shorter than the rest. Corolla papilionaceous; all the petals on very short claws. Keel obtuse. Stamens diadelpous, about equal in length to each other. Style glabrous, club-formed. Legume lanceolate, compressed, marginate, many-seeded.—St. Domingo shrubs, with abruptly-pinnate leaves, having the pétioles and stipulas ending in spiny mucrones, and the leaflets exstipulate. Young branches pubescent. Pedicels 1-flowered, in fascicles. Flowers purplish.

1 C. poly'ánthia (D. C. l. c.) leaves with 5-7 pairs of oblong leaflets, which are glabrous above, and clothed with hoary hairs beneath. 7. S. Native of St. Domingo among bushes, on the mountains. Robinia polyanthà, Swartz, fl. ind. occid. 2. p. 1260. Corynities polyanthà, Spreng. syst. append. 280.
Many-flowered Corynella. Shrub 5 to 6 feet. 2 C. Tauæifolia (D. C. L. c.) leaves with 2-5 pairs of elliptic leaflets, which are glabrous above, but puberulous on the nerves beneath. f. S. Native of St. Domingo. Robinia Dominica, Spreng. in herb, Ball. Corynits Dominica, Spreng. syn. append. 280. Perhaps sufficiently distinct from the preceding.

Fen-leaved Corynella. Shrub 5 to 6 feet. Cult. See Sabinea for the culture and propagation, p. 239.

CXX. CARAGANA (Caragan is the name of R. arborescens among the Mongols). Lam. dict. 1. p. 611. ill. t. 607. f. 1-2. D. C. prod. 2. p. 268. L. a. DiadéphiÁ, Decéndria. Calyx short, tubular, 5-toothed. Corolla obtuse, straight; the wings and vexillum about equal in length. Stamens diadelphous. Style glabrous. Stigma terminal, truncate. Legume sessile, young ones compressed, at length somewhat cylindrical and many-seeded, mucronate by the style. Seeds somewhat globose.—Trees or shrubs, natives of Siberia, and the East, with abruptly-pinnate leaves, mucronate leaflets, and the common petiole ending in a bristle or a spine, and axillary 1-flowered pedicels, which are usually in fascicles. Flowers usually yellow, perhaps in all except C. jubeita, which are white and reddish. The stipulas usually spinescent.

1 C. Altaiana (Poir. suppl. 2. p. 89.) leaves having 6 or 8 pairs of glabrous, obovate-roundish, retuse leaflets; petiole unarmed; stipulas spinescent; pedicels solitary; legumes rather compressed. f. H. Native of Dahuria, in sandy places. Robinia Altaiana, Pall. fl. ross. t. 42. exclusive of the variety. Lher. stirp. t. 76. Caragana microphylla, Lam. dict. 1. p. 615. Flowers yellow. Alttagana is the vernacular name of the shrub. Root with somewhat of the smell and taste of liquorice.

Small-leaved Caragana. Fl. April, June. 1819. Shrub 2 to 3 feet. 3 C. Arborescens (Lam. dict. 1. p. 615.) leaves with 4–6 pairs of oval-oblong villous leaflets; petiole unarmed; stipulas spinescent; pedicels in fascicles. H. Native of Siberia. Robinia Caragana, Lam. spec. 1044. Duhum. arb. ed. nov. 2. t. 19. Pall. ross. 1. t. 42. middle figure. Flowers yellow. The wood of this tree is hard and compact, very tough, yellow on the outside, but waved and striped with bay and red within. The leaves are said to be good food for cattle, and it is suggested that they contain a blue colouring matter like indigo. The seeds are good for poultry. The bark is tough, and fit for tyeing; the twigs may also be used as withes.

Arborescent Caragana. Fl. April, May. 1752. Tree 15 to 20 feet. 4 C. Chamlaü (Lam. dict. 1. p. 616.) leaves with 2 pairs of distant, oval, or obovate, glabrous leaflets; stipulas spreading, and are as well as the petioles spinescent; pedicels solitary; flowers pendulous. f. H. Native of China. Robinia Chamlaü, Lher. stirp. t. 77. Duhum. arb. ed. nov. 2. t. 21. Flowers large, yellow, at length becoming reddish. Root smelling like liquorice. Chamlaü is the Chinese name of the shrub.

Chamlaü or Chinese Caragana. Fl. May, June. CXXI. 1772. Shrub 5 to 12 feet. 5 C. Frutescens (D. C. prod. 2. p. 268.) leaves having 2 pairs of leaflets, approaching the top of the petiole, they are obvate-ovatum-cuneate; stipulas membranous; petiole furnished with a short spine at the apex; pedicels solitary, twice the length of the calyx. f. H. Native of Siberia, on the banks of the Volga, as well as of Tartary, and Tauria. Sweet, fl. gerd. t. 227. Robinia frutescens, Linn. spec. 1044. Pall. fl. ross. t. 43. C. digitata, Lam. dict. 1. p. 616. Flowers yellow, resupinate. Leaves with a yellow hue.

Var. a. laisifolia (D. C. prod. 2. p. 268.) leaflets glabrous, broadly ovate. Frequently in gardens. There is a variety of this with 2-flowered peduncles.

Shrubby Caragana. Fl. April, May. 1752. Sh. 2 to 3 ft. 6 C. mollis (Bess. enum. pl. voh. p. 29.) leaves with 2 pairs of oblong-cuneated leaflets, approximating the top of the petiole, clothed with soft villi; pedicel ending in a short spine; pedicels solitary. g. H. Native of Tauria and Podolia. Robinia mollis, Bib. fl. tan. suppl. 477. Robinia tomentosa, Fl. Hort. gos. 1859. Flowers yellow.

Soft Caragana. Fl. April, May. 1818. Sh. 2 to 3 ft. 7 C. grandiflora (D. C. prod. 2. p. 268.) leaves with 2 pairs of oblong-cuneated leaflets, approximating near to the top of the petiole, which is very short; stipulas and petioles spinescent; pedicels solitary, almost the length of the calyx, which is glabrous at the base. f. H. Native of the south of Iberia, near Tiflis. Robinia grandiflora, Bib. fl. taur. 1. p. 106. Young leaves pubescent, adult ones hoary, ex. Bib., but according to a specimen sent by Steven to De Candolle, the adult leaves are pale and glabrous. Legume terete, acute, brown, glabrous. Flowers an inch long, yellow.

Great-flowered Caragana. Fl. June, July. 1823. Sh. 8 C. Pygmea (D. C. prod. 2. p. 268.) leaves with 2 pairs of linear, glabrous leaflets, approximating at the top of the petiole, which is very short; stipulas and petioles spinescent; pedicels solitary, nearly the length of the calyx; calyx nearly equal at the base. f. H. Native of Siberia, on the Altai mountains, and of Dahube. Robinia pygmea, Linn. spec. 1044. Pall. ross. t. 1. t. 45. Amm. ruth. f. 35. Leaflets acute, crowded, usually in the axils of trifid spines. Flowers yellow.

Var. β, arenaria (Fisch. in litt.) leaflets linear-cuneate; pedicels rather longer than the calyx. g. H. Native of Siberia, on the banks of the river Tschuia.

Pygmy Caragana. Fl. April, May. 1751. Sh. 1 to 2 ft. 9 C.arenaria (Donn, Hort. cant. Sims, bot. mag. 1886.) leaves with usually 4 pairs of obcordate leaflets; pedicels usually twin, shorter than the flowers; stipulas subulate. H. Native of Siberia. Flowers yellow. This plant has not been seen by us unless in a seedling state.

Redowski? Caragana. Fl. April, May. 1837. Shrub. 11 C. spinosa (D. C. prod. 2. p. 269.) leaves with 2–4 pairs of cuneate-linear, glabrous leaflets; stipulas small, spinose, adult petioles permanent, strong, and spinose, twice the length of the leaflets; flowers solitary, almost sessile. f. H. Native of Siberia, near the Selenga and Kiecha in dry sandy places on mountains. Lindbl. bot. reg. 1021. Robinia spinosa, Linn. mant. 269. Robinia ferox, Pall. ross. t. 44. itin. t. E. e. f. 2, and 3. Robinia spinossissima, Laxm. nov. act. pet. t. 15. t. 30, f. 4. C. ferox, Lam. dict. 1. p. 315. Flowers yellow. Legume rather compressed. This shrub is well adapted to make impenetrable hedges, on account of its long branches and strong thorns. It is
said also to be a native of China, about Pekin, where they stick the bushes in clay on the tops of their walls, to prevent persons from getting or looking over them.

*Spinose* Caragana. Fl. April, May. Clt. 1775. Sh. 4 to 6 ft.

12 *C. trachanthes* (Poir. suppl. 2. p. 90.) leaves with 2–4 pairs of oblong-lanceolate, silky leaflets, each ending in a little spine; stipulas spiny; adult petioles permanent, strong, and spinose, twice the length of the leaflets; pedicels solitary, short, legume hoary-villosus. *H.* Native of Siberia, among granite rocks by the Baikal. Robinia trachantheae, Pall. nov. act. petr. 10. t. 7. astr. 115. t. 86. Robinia macracanth, Lodd. cat. Flowers yellow, drooping.

*Goats'-thorn-like* Caragana. Fl. April, May. Clt. 1816. Sh. 3 C. jubata (Poir. suppl. 2. p. 89.) leaves with 4 or 5 pairs of oblong-lanceolate, lanuginously-ciliated leaflets; stipulas sessile; petioles somewhat spinose, adult ones deflexed, filiform, permanent; pedicels solitary, very short; legume glabrous.

† A species not sufficiently known.

14 C. fruticosa (Bess. cat. hort. censr. p. 116.) said to be allied to *C. arbori-sens*, but differs in the flowers being larger and solitary, and in the young legumes being red.

Shrubby Caragana. Shrub 2 to 3 feet.

*Cult.* All the species of this genus are well adapted for shrubberies. They are usually propagated by layers and by seeds. The species are all deciduous.

**Lam. syst. Diadelphia, Decandria.** Calyx 5-cleft, the lobes acuminate. Keel obtuse. Stamens diadelphous. Style villous and straight at the base, but glabrous incurred at the apex. Stigma terminal. Legume sessile, oblong, somewhat cylindrical, incarnate, 1-celled; valves concave, beset with soft hairs, as well as with stiff, glandular bristles, mixed.—A deciduous shrub, with lanceolate stipulas, impari-pinnate leaves, and axillary pedunculate racemes of yellow flowers. This genus differs from *Cytisus* in the stamens being diadelphous, and in the pinnate leaves.

1 C. Wolga'rica (Fisch. in litt.). *H.* Native of Siberia, on dry hills, and in arid places about the Volga. Cytisus nigricans, Pall. in. t. 3. p. 764. t. G. g. f. 3. ed gall. append. no. 358. t. 101. f. 1. Cytisus pinatus, Pall. fl. ross. t. 47. Cytisus Wolgaricus, Lin. fil. suppl. 327. Duham. arbor. med. iv. p. 48. C. Wolgariae, Lam. Edencapitus Wolgensis, Spreng. syst. 3. p. 226. Leaflets 6 or 7 pairs, orbicular, velvety beneath as well as the calyces.

**Volga** Calophaca. Fl. May, June. Clt. 1786. Sh. 2 to 3 ft. **Cult.** This shrub is well adapted for the front of shrubberies, and is increased by layers or by seeds. Being rather tender it should be protected by a mat in winter.

**CXXIV. Colutea** (said to be from kolos, kolou, to amputate; the shrubs are said to die if the branches are lopped off. *Kolovea* is also the name of a plant in Theophrastus). R. Br. in hort. kew. ed. 2. vol. 4. p. 325. Colutea species of Lin. and others.

**Lam. syst. Diadelphia, Decandria.** Calyx 5-toothed. Vexillum flat, bicellular, larger than the keel, which is obtuse. Stamens diadelphous. Stigma lateral, hooked under the top of the style. Style bearder longitudinally behind. Legume stipitate, ovate, boat-formed, inflated, scarious.—Deciduous
shrubs, with small stipulae, impari-pinnate leaves, and axillary few-flowered racemes, which are a little shorter than the leaves. 1 C. arborescens (Lin. spec. 1045.) leaflets elliptic, retuse; peduncles usually bearing about 6 flowers; gibbosities on the vexillum short; legume closed. h. H. Native of middle and south Europe, in hedges and bushy places, on Mount Venusius, even in the ascent to the crater, where hardly any other vegetable is to be found. D. C. astr. nov. 1. Duham. arbor. ed. nov. 1. t. 22. Curt. bot. mag. t. 81. C. hirsuta, Roth. f. germ. t. 1. p. 305. Flowers yellow. The C. arborescens of Burn. fl. cap. 22. is probably a species of Tephrósidea. The leaves are recommended as answering all the purposes of senna, and Allioni gives particular directions for the preparation of them. A larger dose seems to be required to produce the same effect. The seeds to the quantity of a drachm or two excite vomiting.

2 C. cruesta (Ait. hort. kew. 3. p. 55.) leaflets obtuse, emarginate, glaucous; peduncles 4 or 5-flowered; vexillum with small, obtuse gibbosities; legume gaping at the apex. H. H. Native of the islands in the Archipelago, Thiera, and the Levant. D. C. astr. no. 3. Lher. stipr. nov. 2. t. 41. C. orientalis, Lam. sect. 1. p. 353. ill. 624. f. 3. Duham. ed. nov. 1. t. 23. C. sanguinea, Pall. C. ápta, Schmidt, arb. t. 119. C. húmílis, Scop. Flowers of a reddish-copper colour, but with the vexillum having a yellow spot at the base. This species differs from the foregoing in the smaller different coloured flowers, in the wings being shorter than the keel, and in the pod being open at the apex.

3 C. Háléppica (Lam. sect. 1. p. 353. ill. 624. f. 2.) leaflets roundish-elliptic, very obtuse, mucronate; peduncles 3-flowered; gibbosities of vexillum elongated and ascending; legumes closed. H. H. Native of fields about Aleppo. D. C. astr. no. 2. C. Pocciócki, Ait. hort. kew. 3. p. 55. Schmidt, arb. t. 129. C. sóláríum, Mill. sect. 2. t. 100. C. procímbium, Lher. stipr. nov. 2. t. 42. Flowers yellow. A smaller shrub than C. arborescens.

4 C. médica (Willd. enum. 771.) leaflets obcordate, glaucescence; peduncles usually 3-flowered; legumes closed at the apex. H. H. Native of Europe. Wats. dendr. Brit. 140. Flowers orange-coloured.

Intermediate Bladder-Senna. Fl. June, Aug. Sh. 6 to 8 feet.

5 C. nípa les (Hook, bot. mag. 2622.) leaflets roundish-elliptic, retuse; racemes drooping, few-flowered; callosities of vexillum papillose; legumes rather coriaceous, pubescent. H. H. Native of Napu. Flowers yellow.

† Species not sufficiently known.

6 C. ? áschinomgòides (Scop. insub. 3. p. 22. t. 12.) plant herbaceous; leaflets lanceolate, obtuse, glabrous, acuminated by the nerve. H. G. Native of the Bahama Islands. Perhaps a species of Picteria.

Áschinomgonèse-like Bladder-Senna. Fl. 2 feet.

7 C. americana (Mill. sect. no. 5.) shrubby; leaves with 3 pairs of oval leaflets; peduncles 2-3-flowered; legumes compressed. H. S. Native of Vera Cruz. Perhaps a species of Cásalpinia. Flowers yellow.—Phák. alm. 111. t. 165. f. 3.

American Bladder-Senna. Shrub 6 to 8 feet.

Cult. The species of Bladder-Senna are proper for shrub-beries, as they flower in great profusion, and continue in flower the most of the season. They thrive in any common soil, and are increased by seeds, which ripen in abundance, or by cuttings, planted in the autumn. The two last species require to be sheltered in a greenhouse.

CXXV. SPIRÆOPHYSA (SA from σπερα, sphere, a sphere, and φυσω, physe, a bladder; in reference to the shape of the legumes, which are spherical and bladerry). D. C. legum. mem. vi. prod. 2. p. 270. — Plâca species of Pallis.

1 S. saśula (D. C. prod. 2. p. 271.) stem erect, rather hairy; leaves with 6 or 7 pairs of oblong, ovate leaflets, which are glabrous above, but rather hairy beneath with adpressed bristly hairs. H. H. Native of Dahuria, in salt fields, about Lake Tatei. Plâca saśula, Pall. tin. t. 9. f. 1 and 2. ed. gall. append. no. 387. t. 88. f. 1 and 2. Lin. fl. suppl. 336. Colûcta Dahuríca, Spreng. syst. 3. p. 242. Flowers very red, almost like those of a species of Lathyrus.

Salt Sphærophysa. Pl. ½ to 1 foot.

2 S. cáxica (D. C. prod. 2. p. 271.) stems erect, and are as well as the leaves clothed with adpressed pubescence; leaves with 8 pairs of oval, obtuse, mucronate leaflets. H. H. Native of the plains between Caucasus and the Caspian Sea. Colûcta Cásica, Bieb. fl. taur. suppl. 1429. Plâca sálica, Bieb. caps. 210. Flowers of a dirty pale-purple colour, and marked with more obscure veins. Perhaps only a variety of the first, according to Steven in litt.

Caspian Sphærophysa. Fl. Jul. Aug. Clt. 1818. Pl. 1½ ft. Cult. The species of this genus succeed in common garden soil, or in pots in a mixture of loam and peat; they are very difficult to preserve in gardens on account of the want of that saline principle in which they grow in the places of their natural growth; and in order to preserve them in the gardens, they require to be watered with salted water occasionally. They are increased by seeds, which occasionally ripen in this country.

CXXVI. SWAINSONIA (in honour of Isaac Swainson, F.R.S. F.L.S. who was a great cultivator of plants about the end of the last century. His garden was at Twickenham in Middlesex. The present superintendent of the Cambridge Botanical Garden, Mr. Biggs, was gardener to Mr. Swainson for many years). Salisb. part. 28. R. Br. in hort. kew. ed. 2. vol. 4. p. 326. D. C. prod. 2. p. 271. Loxidium, Vent. Lin. syst. Dindelphía, Decádhria. Calyx bicallose at the base, 5-toothed. Vexillum flat, large. Stamens diadelphous, Carina obtuse, rather longer than the wings. Stigma terminal. Style bearded longitudinally behind but beardless in front. Legume turgid.—Suffrutescent plants, natives of New Holland, having the habit of Lessertia, with impari-pinnate leaves, and elongated, axillary racemes of purple or scarlet flowers.

1 S. galegifòlia (R. Br. in hort. kew. ed. 2. vol. 4. p. 326.) suffrutescent, erect; leaves with 9 pairs of oval, somewhat emarginate leaflets; pedicel of legume evidently longer than the permanent filaments. H. G. Native of New South Wales. Vicia galegifólia, And. bot. rep. t. 319. Colûcta galegifólia, Sims, bot. mag. t. 792. Flowers red.

2 S. albeflóra; stem shrubby, erect; leaves with 5-11 pairs of oval obtuse leaflets; racemes longer than the leaves. H. G.
Native of New Holland. S. gallegi'dia, var. albiflora, Lindl. bot. reg. 994. Flowers white.

3 S. coronilla'e'fòlia (Salisb. pat. no. 28.) suffruticose, erect; leaves with 9-11 pairs of obovate, emarginate leaflets; pedicel of legume a little shorter than the permanent filaments. G. Native of New South Wales. Sims, bot. mag. 1725. Leaves smaller than those of the other species. Flowers of a violaceous purple colour.

4 S. le'essert'ia (D. C. in ann. sc. nat. 4. p. 99.) stems rather herbaceous, erect; leaves with 6-7 pairs of elliptic-oblong, rather obtuse leaflets; pedicel of legume very short. G. Native of New Holland, on the southern coast. S. astragali'fòlia, Hortul. Peduncle 2 or 3 times longer than the leaves. Stipula ovate, obtuse. Younger leaves clothed with hoary pubescence, adult ones almost glabrous. Flowers red, smaller than those of the other species.

Cult. All the species are elegant, delicate shrubs, which deserve to be cultivated in every greenhouse. They grow freely in a mixture of loam, peat, and sand, and young cuttings root readily if planted in a pot of sand, with a bell-glass placed over them, or they may be raised from seeds, which are often produced in gardens.

Lin. syst. Diadal'phi, Dec'andria. Calyx half 5-cleft. Vexillum flat. Keel obtuse. Stamens diadelpous. Stigma capitata. Style bearded transversely in front at the apex, but beardless behind. Legume saucious, indelicate, compressed, or inflated, the uppermost side the shortest. —Herbs, rarely subshrubs, natives of the Cape of Good Hope, with impari-pinnate leaves, and axillary peduncles bearing racemes of purplish nodding flowers.

1 L. anu'na (D. C. l. c. prod. 2. p. 271.) leaves with 8-10 pairs of leaflets, which are glabrous above, the lower ones oblong and emarginate and the upper ones linear; racemes longer than the leaves; calyces bibracteate, beset with black hairs. G. Hook, exot. fl. t. 84. Colutea herba'cea, Lin. spec. 1045. Colutea annua, Murr. comm. geot. 5. p. 40. t. 7. f. 12 and 13.—Comm. hort. amst. 2. t. 44. Flowers red.

2 L. diff'us'a (R. Br. in Hort. Kew. ed. 2. vol. 4. p. 327.) stems diffuse, herbaceous; leaves with 8-10 pairs of elliptic-linear, rather emarginate leaflets, which are rather hairy on both surfaces; racemes pedunculate, longer than the leaves; calyces bracteate, beset with black hairs. G. Gal'ega dubbia, Jacq. Icon. rar. 3. p. 576. Flowers purple.

3 L. peren'na's (D. C. astrag. p. 37.) stem herbaceous, erect; leaflets oval, silky beneath, pubescent above; calyces bracteate; racemes longer than the leaves, loose, elongated, pedunculate; flowers numerous, drooping. G. Colutea peren'na's, Jacq. Hort. vindi. 3. t. 3. Murr. comm. geot. nov. 5. p. 38. t. 7. Colutea fistulos'a, Hortul. Legume stipitate, compressed. Corolla with a pale base and red or purple apex.

4 L. ful'chra (Sims, bot. mag. 2064.) stem erect, suffrutose; leaves with 7 pairs of ovate, acute, smoothish leaflets; racemes pedunculate, somewhat capitulate, longer than the leaves; flowers secund. G. Flowers red or purplish. Legume unknown.

5 L. macro'sta'chya (D. C. in ann. sc. nat. 4. p. 108.) stem erectish, suffrutose at the base; leaves with 4-6 pairs of elliptic-oblong, obtuse leaflets, which are rather pubescent on both surfaces, the terminal leaflet is longest; racemes pedunculate, loose-flowered, 2 or 3 times longer than the leaves. G. Burch. cat. geogr. aed. 2356. Flowers red or purple. Young legumes compressed, pendulous, few-seeded.

Long-spiked Lessertia. Shrub 1 to 2 feet.

6 L. brachy'sta'chya (D. C. legum. mem. vi. prod. 2. p. 272.) stem erect, suffruticose at the base; leaves with 6-8 pairs of linear-oblong, obtuse leaflets, which are rather pubescent beneath, the terminal leaflet longer than the others; racemes much shorter than the leaves; legumes oblong, straight, pubescent, 10-seeded. G. Burch. cat. geogr. aed. no. 3353. Flowers red or purplish. Legumes securid, membranous, pubescent, about an inch long, each standing on a short stipe.

7 L. fal'cio'ria (D. C. legum. mem. vi. t. 46.) stem erect; leaves with 8 pairs of elliptic-oblong, obtuse leaflets, which are pubescent beneath; racemes 3-4-flowered, one half shorter than the leaves; legumes oblong, falcately curved, 10-seeded. G. Flowers purple or red. Legumes like those of the preceding species, but falcate, therefore the species is intermediate between L. brachystachya and L. annularis.

8 L. frutico'sa (Lindl. bot. reg. 970.) stem erect, suffruticose; leaves with 5-6 pairs of linear-oblong, obtuse leaflets; stem, petiolar, and peduncles, as well as the branches, pilose; racemes erect, flowerless, a little longer than the leaves; legumes oblong, sessile, 4-seeded. G. Flowers purple.

† Species not sufficiently known.

9 L. anu'laria's (Burch. cat. no. 1597. voy. 1. p. 304.) stem erect, a span high; legume flat, contracted into the form of a ring. G. Flowers red or purple.

Stiff Lessertia. Shrub ½ foot.

11 L. pub'e'scens (D. C. prod. 2. p. 272.) stem herbaceous, erect, pubescent; leaves with many pairs of lanceolate, villous leaflets; racemes oblong; calyces hairy. G. Colutea pubescent, Thunb. l. c. Legume oblong, glabrous, hardly an inch long. Corolla fuscous.

Pubescent Lessertia. Pl. 1 foot.

12 L. prostra'ta (D. C. prod. 2. p. 272.) stem herbaceous, diffuse, pubescent; leaves with many pairs of lanceolate, acute, villous leaflets; peduncles usually 2-flowered. G. Colutea prostrata, Thunb. l. c. Legume ovate, pubescent, hardly stipitate.

Prostrate Lessertia. Pl. prostrate.

13 L. excis'a (D. C. prod. 1. c.) stem herbaceous, decumbent, pubescent; leaves with many pairs of obovate, cut leaflets; racemes usually terminal. G. Colutea excisa,
LEGUMINOSÆ. CXXVII. LESSERTIA.

Thunb. l. c. Corolla blood-coloured. Legume ovate-sciinciform, slightly pubescent.

Cut-leafletted Lessertia. Pl. decumbent.

14 L. obtusa (D. C. l. c.) stem frutescent, erect; leaves with many pairs of linear, obtuse, hairy leaflets; racemes nearly terminal. ♂ G. Calyces clothed with cinereous pubescence. Legume glabrous. Colutea obtusa, Thunb. l. c.

Obtuse-leafletted Lessertia. Shrub 1 to 2 feet.

15 L. linearis (D. C. l. c.) stem herbaceous, erect, glabrous; leaves with many pairs of linear, acute leaflets; racemes elongated. ♀ G. Colutea linearis, Thunb. l. c. Legume ovate, glabrous, not half an inch long.

Linear-leafletted Lessertia. Pl. 1 ft.

16 L. vesicaria (D. C. l. c.) stem herbaceous, decumbent, villous; leaves with many pairs of ovate, mucronate leaflets; legumes glabrous, bladdery, dehiscent at the apex. ♂ G. Colutea vesicaria, Thunb. l. c.

Bladdery-podded Lessertia. Pl. decumbent.

17 L. tomentosa (D. C. l. c.) stem herbaceous, very short, and tomentose; leaves with 6-7 pairs of ovate, hairy leaflets; racemes ovate; calyces hairy. ♂ G. Colutea tomentosa, Thunb. l. c. Legume ovate, inflated, hairy.

Tomentose Lessertia. Pl. ½ foot.

18 L. procumbens (D. C. l. c.) stem suffrutescent, procumbent; leaves with 12-14 pairs of ovate-linear, tomentose leaflets; peduncles very long, 3-4-flowered. ♀ G. Flowers purple. Legume compressed, falcate. Colutea procumbens, Thunb. l. c.

Procumbent Lessertia. Fl. June, July. Clt. 1759. Pl. proc. Cult. This is a genus of delicate little shrubs and herbs. Their culture and propagation is the same as for Swainsonia. The seeds of the annual kinds should be sown in pots early in the spring, and placed in the greenhouse, where the plants will soon rise, and when they have grown 2 inches high, they should be planted separately in small pots, and shifted into larger ones as they grow.

1 S. frutescens (R. Br. l. c.) leaflets elliptic-oblong, and are as well as the calyces and branches canescent from advanced pubescence; peduncles few-flowered. ♂ G. Colutea frutescens, Lin. spec. 1045. Curt. bot. mag. 181. Burm. cap. prod. 22. Mill. fig. t. 99. A hoary shrub, with large elegant showy scarlet flowers.

2 S. microphylla (Burch. cat. pl. afr. austr. no. 1510. ined. D. C. prod. 2. p. 273.) leaflets oblong-linear, and are, as well as the branches and calyces, pubescent; peduncles 2-3-flowered. ♂ G. Flowers purple or scarlet.

Small-leaved Sutherlandia. Shrub 2 to 3 feet.

Cult. The species of Sutherlandia are very showy when in flower, being profusely clothed with large scarlet pea blossoms. A mixture of loam and peat is the best soil for them, and they may be propagated by young cuttings in sand under a bell-glass, but the easiest and best method is by seeds, which ripen plentifully in the gardens. The S. frutescens will stand the winter if planted in a sheltered situation, protected by a mat in severe weather.

Subtribe V. Astragaliæ (plants agreeing with Astragalus, in the legumes being transversely 2-celled, in consequence of the upper suture being bent in so much). Adans. fam. l. c. D. C. prod. 2. p. 273. Legume (f. 39. c. f. 40. c.) longitudinally 2-celled or half 2-celled, in consequence of the upper suture being bent in so much. Stamens diadelphous, with 9 joined and one free. Stamens herbaceous or suffrutescent. Leaves pinnate; primordial ones alternate.

CXXIX. PHACA (from φαχα, phaca, to eat, or φαχα, phace, a lentil; a name adopted from Dioscorides for this genus). Lin. gen. no. 891. D. C. astr. no. 111. R. Br. in hort. kew. ed. 2. vol. 4. p. 358. D. C. prod. 2. p. 273.

* Flowers white or cream-coloured.*

1 P. Baetica (Lin. spec. 1064.) stem erect, pilose; stipulas lanceolate; leaves with 7-10 pairs of ovate mucronate leaflets, which are villous beneath; keel longer than the vexillum; legume oblong, boat-formed, compressed. ♀ H. Native of Spain, Portugal, and Mauritania. D. C. astr. no. 1. Astragalus Lusitanicus, Lam. dict. 1. p. 312.—Moris. oxon. sect. 2. t. 8. f. 1. Flowers white, about the size and shape of those of Sutherlandia. The seeds are roasted and ground, and used as a substitute for coffee in Hungary.

3 P. alpina (Jacq. icon. rar. 1. t. 151.) stem erect, branched, pubescent; stipulas linear-lanceolate; leaves with 5-6 pairs of ovate-oblong, obtuse, pubescent leaflets; legumes compressed, half ovate, acute, smoothish. ♀ H. Native of the Alps of Europe, the Pyrenees, and of Siberia. D. C. astr. no. 3.—Gmel. sib. 4. t. 14. Astragalus penduliflorus, Lam. fl. fr. Flowers yellow.

4 P. tritoma (D. C. astr. no. 7. t. 1.) stem almost erect, pubescent; stipulas acuminate, rather concreta at the base; leaves with 5-6 pairs of ovate, obtuse, pubescent leaflets; peduncles rather shorter than the leaves, few-flowered; legumes

FIG. 39.

Three-flowered Bastard-Vetch. Pl. ½ to 1 foot.

5. P. villosa (Nutt. gen. amer. 2. p. 97.) plant almost stemless, hairy; leaflets oblong-oval, glabrous above; peduncles shorter than the leaves, or equal in length to them; spike few-flowered, somewhat capitate; legume clothed with canescent villi, terete, and cymiform. 2. H. Native of Carolina and Georgia, in sandy pine-woods, and on hills about the Missouri, as well as of China. Astragalus villosus, Michx. fl. bor. amer. 2. p. 67. Flowers cream-coloured.

Filius Bastard-Vetch. Pl. ½ foot.

8. P. cepitosus (Nutt. gen. amer. 2. p. 98.) stemless, tufted, and clothed with canescent villi; leaves with 3-5 leaflets, which are disposed in a digitate manner, and are acute at both ends; flowers aggregate, without a scape; stipules membranous, without any regular or decided form; legume pubescent, sub-cylindrical. 2. H. Native of North America, on hills at the confluence of the rivers Savanne and Missouri. Astragalus trilobellus, Pursh. fl. amer. sept. 2. p. 740; but not of Pall. Flowers cream-coloured. Leaflets lanceolate.

Tufted Bastard-Vetch. Pl. ½ to ¾ foot.

7. P. arenaria (Pall. it. 4. t. 19. f. 3-4. ed. gall. append. no. 388. t. 91. f. 3-4.) stems spreading, ascending, glabrous; stipules membranous, without any regular or decided form; legume pubescent, sub-cylindrical. 2. H. Native of North America, on hills at the confluence of the rivers Savanne and Missouri. Astragalus trilobellus, Pursh. fl. amer. sept. 2. p. 740; but not of Pall. Flowers cream-coloured. Leaflets lanceolate.

* * Flowers purplish, sometimes painted with white and violet.

8. P. mollis (H. B. et Kunth, nov. gen. amer. 6. p. 496. t. 585.) stems short, diffuse, clothed with soft tomentum; leaves with 7-8 pairs of oblong, obtuse, silky, tomentose leaflets; racemes on long peduncles, of a cylindrical-oblong form, dense, and many-flowered; calyces soft and thin. 2. G. Native of Mexico, in valleys near Casave. Flowers purplish. The legume being unknown the genus is doubtful.

Soft Bastard-Vetch. Pl. diffusely pubescent.

9. P. densifolia (Smith in Rees' cyclop. 27. no. 9.) stems decumbent, branched, and smooth; stipules ovate, concave; leaves with 16-20 pairs of ovate margirinate leaflets, which are villous beneath; peduncles length of leaves; racemes dense, oblong; legumes ovate, turgid, almost smooth. 2. H. Native of California. Flowers drooping, reddish.

Dense-leaved Bastard-Vetch. Pl. decumbent.

10. P. glabra (Clar. bull. philom. no. 61. D. C. astr. no. 4.) stem branched, prostrate, glabrous; stipules broad, ovate; leaves with 6-7 pairs of oval-oblong, acute, glabrous leaflets; peduncles longer than the leaves; wings of flowers entire; legume stipitate, turgid, glabrous. 2. H. Native of Provence, on the Lower Alps. Corolla white, tipped, and margined with violet.

11. P. Gerardi (Vill. dauph. 3. p. 474.) stem diffuse, branched, prostrate; leaves and stipules clothed with velvety pubescence, and ciliate; peduncles rather longer than the leaves; wings of flower oblong, and rounded at the apex; legumes ovate, rather velvety. 2. H. Native of Dauphiny. Flowers white, having the carina tipped with purple.

12. P. australis (Lin. mant. 103. and 448.) stem branched, tufted, ascending, glabrous; stipules ovate; leaves with 6-8 pairs of linear-lanceolate, glabrous leaflets, having the terminal one sessile; peduncles longer than the leaves; wings bifid at the apex, longer than the keel; legumes stipitate, ovoid, at length glabrous. 2. H. Native of the Alps of Europe and the Pyrenees. Jacq. misc. 2. t. 3. D. C. astr. no. 8. Lodde. bot. cab. 490. P. Halleri, Vill. dauph. 4. p. 473. Colutea australis, Lam. dict. 1. p. 334. Corolla pale, having the keel tipped with purple.

Var. 3. Altaica (Fisch. in litt.) stem almost erect. 2. H. Native of the Altai mountains. Perhaps a proper species.

13. P. astragalina (D. C. astr. no. 9.) stems short, pubescence smooth; stipules ovate, acute; leaves with 9-10 pairs of ovate leaflets, which are beset with adpressed pubescence on both surfaces; peduncles about the length of the leaves; wings entire, shorter than the keel; legumes stipitate, pendulous, when young beset with black hairs. 2. H. Native of the Alps of Switzerland, Savoy, Austria, Pyrenees, and on the Altaia mountains in Siberia. In July, 1831, this plant was found in plenty by Dr. Graham and others in Scotland on the Clava mountains, north of Forfar in Angushire. Astragalus alpinus, var. Lin. spec. 1070. Oed. fl. dan. 1. t. 51.—Lodd. bot. cab. 429. Flowers white, tipped with lilac. Root creeping.

14. P. lapponica (D. C. prod. 2. p. 274.) stems elongated, ascending, glabrous; stipules ovate, acute; leaves with 9 pairs of oval leaflets, which are glabrous above, and clothed with pubescent pubescence beneath; peduncles longer than the leaves; wings entire, longer than the keel; legumes sessile, pendulous, half-bilocular, when young beset with black hairs. 2. H. Native of the Alps of Lapland and Sweden, and of Dahuria near Ochotsk. Astragalus alpinus, var. Lin. l. c. P. Lapponica, Wahl. Flowers purplish. This I fear is not distinct from the last.

15. P. o osobodens (D. C. prod. 2. p. 274.) stem elongated, ascending, glabrous; stipules ovate, acute; leaves with 5-7 pairs of oval-oblong leaflets, which are glabrous above and hardly pubescent beneath; peduncles longer than the leaves; racemes elongated; wings entire, longer than the keel; legumes sessile, semi-bilocular, pendulous, when young beset with black hairs. 2. H. Native of the Alps of Norway and Lapland. Astragalus obsoledens, Horn. in fl. dan. 8. t. 1836. Astrag. leontinus, Wahl. fl. lap. p. 191. t. 12. f. 4. but not of Jacq. Flowers purplish.

16. P. Brachytropus (Stev. mem. soc. hist. nat. mosc. 4. p. 55.) stems ascending, smooth; stipulas broad, short, and bluntish; leaves with 6 pairs of oblong-elliptic leaflets, which are smoothish above and rather pubescent beneath; peduncles longer than the leaves; racemes short; wings entire, longer than the keel; legumes on short pedicels, when young hairy. 2. H. Native of Eastern Caucasus, Bibl. suppl. 485. Flowers purplish.

Short-beaked Bastard-Vetch. Pl. ascending.

† A species not sufficiently known.

17. P. trifoliatia (Lin. mant. 270.) stem branched, filiform; stipulas lanceolate; leaves trifoliolate; leaflets oval, obtuse; legumes semi-oriabulac. • H. Native of China. Smith, in Rees' cyc. Perhaps a species of Glycine or Flemingia, according to Smith. Perhaps a species of Crotalaria, according to the specimen in Delessert's herbarium at Paris.
**Trifoliate-leaved Bastard Vetch.** Pl. procumbent.  

**Cult.** Most of the species grow well in the open borders in common garden soil; the dwarfier kinds are well adapted for ornamenting rock-work, but the rarer and more tender species should be grown in pits in a mixture of sand, peat, and loam. They are all increased by dividing the plants at the root, or by seeds, which generally ripen in this country, which last is by far the best method. The seeds of the annual kinds only require to be sown in the open border in spring.

**CXXX. OXYTROPIS (from **oxyz**, sharp, and **tropis**, a keel; in reference to the keel of the flower ending in an exserted mucron at the back of the apex). D. C. astr. no. 4. ed. maj. p. 19. and 55. prod. 2. p. 275.—Astragalus species of Lin. and others.  

**Lin. syst. Diadclphia, Decandria.** Calyx 5-toothed (f. 40. a.). Keel of corolla ending in an exserted mucron on the back at the apex (f. 40. b.). Stamens diadphlophous. Legume (f. 40. c.). bilocular, or half bilocular in consequence of the upper suture being bent in so much.—Herbs with impari-paniculate leaves, axillary or radical peduncles, bearing spikes of flowers. There are a number of species with inflated legumes, which would constitute a good section of the genus, but from the fruit of most of the species being but slightly known or altogether unknown, it is at present impossible to separate them, and consequently they are here arranged according to habit.

§ 1. **Acaulis** (from **acaulis**, stemless; in reference to the species contained in this division being without stems). D. C. prod. 2. p. 275. Plants without stems or with very short ones. Stipulas adnate to the petiole. Leaves with many opposite pairs of leaflets, not verticillate.

* Flowers purplish or white.

1. O. **Montana** (D. C. astr. no. 1.) plant almost stemless, villous, the hairs on the petioles and scape spreading; leaflets elliptic-lanceolate; scapes a little longer than the leaves; racemes short; bracteas one half shorter than the calyces; legumes erect, terete-oblong, villous, acuminate by the style, half bilocular. 2. H. Native of Europe, on the mountains. Astragalus montanus, Lin. spec. 1070. Jaq. austr. t. 167. Calv. bot. mag. 483. Seep. earn. t. 45. Placa montana, Crantz. austr. 422. Flowers of a bluish-purple colour, almost like those of Placa astragalina. Calyx purplish.

2. O. **Boeckleis** (D. C. prod. 2. p. 275.) plant almost stemless, the hairs on the scapes and stipulas spreading and stiff, on the petioles there are but few; leaflets elliptic-lanceolate, glabrous beneath and pilose above; scapes longer than leaves; flowers capitulate; bracteas length of calyx, which is beset with black stiff hairs. 2. H. Native of Tschuktschar Land in the Bay of St. Lawrence, and Kotzebue’s Sound. Stipulas pale.

**Northern Mountain Milk-vetch.** Pl. ¼ foot.  

3. O. **cyanesc** (Bieb. fl. taur. suppl. 502.) plant almost stemless, hoary, and pilose; the hairs on the petioles and scapes are adpressed; leaflets elliptic-lanceolate; scapes longer than the leaves; racemes short; bracteas one-half shorter than the calyces; legumes oblong, ovate, villous, at length spreading. 2. H. Native of Iberia. Astragalus montanus, Bieb. fl. taur. 2. p. 197. exclusive of the synonyms. O. montana, Stev. mem. soc. mosc. 4. p. 54. Flowers spreading, blue, larger than those of O. montana, and the keel ending in a longer mucron.

**Var. α, Albana** (Stev. l. c.) scapes declinate; legumes ovate, pubescent. 2. H. Native of the Alps about Chinalug.  

4. O. **Argyreia** (D. C. prod. 2. p. 276.) plant almost stemless; stipulas white, membranous, hairy; leaflets elliptic-oblong, clothed with adpressed, silky, silvery down on both surfaces; pedioles, scapes, and calyces beset with spreading villi; scapes twice the length of the leaves; flowers erect, disposed in capitulate spikes; bracteas linear, length of calyx. 2. H. Native of the Altaian mountains. Flowers deep-purple. Legumes unknown.

**Silvery Mountain Milk-Vetch.** Pl. 1 foot.  

5. O. **Uralensis** (D. C. prod. 2. p. 276.) plant stemless, clothed with silky hairs in every part; leaflets ovate, acute; scapes solitary or twin, longer than the leaves; calyx clothed with silky down, as well as the leaflets; heads of flowers round and dense; bracteas oblong, one to each flower; legumes oblong, tumid, pointed, shaggy, erect, bilocular. 2. H. Native of Siberia, on the Ural Mountains, Alps of Austria, Pyrenees, &c. In Scotland on mountains in sandy soil; plentiful near Burnt Island in Fife sheriffdom. Astragalus Uralensis, Lin. spec. 1071. Smith, engl. bot. t. 466. Light fl. sect. 401. t. 17. Pall. astrar. t. 42. F. A. Placa Uralensis, Wahl. carp. 737. Flowers of a rich bluish-purple colour, rarely white. This is an elegant plant. The Siberian plant is more villous than silky; it may perhaps be a distinct species. The plant is also a native of Arctic America.

6. O. **Cerulea** (D. C. astr. no. 2.) plant stemless and silky; leaflets lanceolate; scapes nearly twice the length of the leaves; flowers spicate, lower ones drooping a little; legumes ovate, ventricose, almost 1-celled, acuminated, glabrous. 2. H. Native of Siberia, on high mountains about Lake Baikal. Astragalus coriaceus, Pall. ill. 3. p. 293. Astrar. Baicalensis, Pall. astrar. p. 64. t. 52.—Gmel. sib. 4. t. 26. f. 2. Flowers blue. Mucron of keel equal in length to the wings.

**Blue-flowered Mountain Milk-Vetch.** Pl. ½ foot.  

7. O. **Arctica** (R. Br. chl. melv. p. 20.) plant almost stemless, silky; leaflets opposite and alternate, ovate-oblong; heads subumbellate, few-flowered; legumes erect, oblong, and are, as well as the calyces, clothed with black pubescence. 2. H. Native of Melville Island in the Arctic sea. &c. This species approaches O. Uralensis, but the leaflets are smaller, acute or obtuse, and much more numerous, and the flowers are disposed in umbels, not in spikes.

**Arctic Mountain Milk-Vetch.** Pl. ¾ foot.  

8. O. **Legantha** (Pers. ench. 2. p. 331.) plant stemless and glabrous; leaflets lanceolate; scapes hardly longer than the leaves, rather pilose; spikes almost globose; bracteas shorter than the calyx; the 2 upper teeth of the calyx shorter, and more distant than the rest. 2. H. Native of Eastern Siberia, among rocks. Flowers white, but according to Pall’s figure they are reddish. Legume unknown.

**White-flowered Mountain Milk-Vetch.** Pl. ¼ foot.  

9. O. **Argentata** (Pers. ench. 2. p. 331.) plant almost stemless; leaflets lanceolate; scapes hardly longer than the leaves, rather pilose; spikes almost globose; bracteas shorter than the calyx; the 2 upper teeth of the calyx shorter, and more distant than the rest. 2. H. Native of Siberia, in the Kirghisian Steppe. Astragalus argentatus, Pall. astrar. p. 60. t. 48. Flowers white, but with a tinge of blue. Legume unknown.

**Silvered Mountain Milk-Vetch.** Pl. ¼ foot.  

10. O. **Amphigala** (D. C. astr. no. 4.) plant stemless and hairy or smoothish; leaflets ovate, with rather villous margins; scapes longer than the leaves; spikes of flowers oblong; bracteas lanceolate, and are, as well as the calyces, hairy; legumes erect, ovate, acuminated, somewhat bilocular. 2. H. Native throughout Siberia. Astragalus ambiguus, Pall. astrar. p. 54. t. 43.—Gmel. sib. 4. t. 30. Flowers purplish-blue.

K k
11 O. filiformis (D. C. astr. no. 16. exclusive of the synonyms) plant almost stemless, glabrous; leaflets lanceolate-linear; 2 or 3 times longer than the leaves; flowers spicate, lower ones distinct; teeth of calyx short; beak of keel shorter than the wings.  2. H. Native of Dahuria in deserts, near the river Amoor, and on Mount Odin-Tschelon. Flowers small, bluish-purple. Very nearly allied to O. cardiceps, but differs in the plant being glabrous, the flowers being one-half smaller, and in the beak of the keel being shorter than the wings.

Filiform Mountain Milk-Vetch. Pl. ½ foot.

12 O. setosa (D. C. astr. no. 5.) plant stemless; leaflets lanceolate, glabrous, but pilose on the edges; 2 to 6 times longer than the leaves, clothed with hoary hairs; heads of flowers ovate-elliptic; bracteae pilose, about equal in length to the calyx, which is woolly; calyceal teeth unequal, subulate, elongated.  2. H. Native of Siberia, on the higher Altaiian mountains. Atragalus setosus, Pall. astr. p. 5. Flowers purpureal.

Brizzly Mountain Milk-Vetch. Pl. ½ foot.

13 O. lambeiti (Pursh, fl. amer. sept. 2. p. 740.) plant stemless, silky or pilose in every part; leaflets lanceolate, acute, rather remote; scape rather longer than the leaves; flowers spicate or capitated; bracteae lanceolate-linear, rather shorter than the silky calyx.  2. H. Native of North America, on woodland hills about the river Missouri. Sims, bot. mag. 2147. Lindl. bot. reg. t. 1054. Atragalus Lamberti, Spreng. syst. p. 308. Flowers large, blue and white mixed.

14 O. grandiflora (D. C. astr. no. 6.) plant stemless; leaflets oblanceolate-lanceolate, clothed with adpressed silky down; 2 to 6 times longer than the leaves; flowers disposed in loose spikes; yellow obvate, dilated; legumes oblong, membranous, acuminate, and of the style, pubescent, pilosular.  2. H. Native of Siberia, especially beyond the Baikal. Atragalus grandiflorus, Pall. astr. p. 57. t. 46. Willd. spec. p. 3. 1811. Flowers large, of a deep rose-colour. Bracteae shorter than the calyx. Vexillum emarginate.

Var. γ, leptóptera (D. C. l. c.) wings of flower oblong; vexillum obtuse; bracteae shorter than the calyx.  2. H. Native of Siberia, at Nerstinsky Savod near Doroninsk. O. grandiflora, Fisch. in litt. Flowers bluish-purple, not rose-coloured. Perhaps a proper species, or the same as O. Lamberti.

15 O. candidans (D. C. astr. no. 7.) plant stemless, canescent; leaflets ovate-lanceolate, pubescent; 2 to 6 times longer than the leaves; flowers oblong, almost glabrous above; scapes erect, twice the length of the leaves; spikes ovato-oblong; bracteae lanceolate, obtuse, half-bilobular, hardly pubescent, ending each in a long pilose acumens.  2. H. Native of Eastern Siberia, at the river Lena. Atragalus candidans, Pall. astr. p. 61. t. 49. Flowers very pale blue.

White-leaved Mountain Milk-Vetch. Pl. ½ foot.

16 O. caudata (D. C. astr. no. 8.) plant stemless; leaflets oblong, acute, pubescent beneath, and almost glabrous above; scapes erect, twice the length of the leaves; spikes of flowers oblong, dense; bracteae shorter than the calyx, which is cylindrical.  2. H. Native of Siberia, on the Altaiian mountains. Atragalus spicatus, Pall. itin. 2. append. no. 118. t. 10. ed. gall. append. no. 741. t. 84. Astr. caudatus, Pall. astr. p. 62. t. 50. Flowers purpureal. Legume half bilobular.

Tailed-legumeed Mountain Milk-Vetch. Pl. ½ foot.

17 O. songarica (D. C. astr. no. 9.) plant stemless; leaflets lanceolate, silky; scapes erect, twice the length of the leaves; flowers spicate, in spikes, the lower ones almost opposite; bracteae shorter than the calyx.  2. H. Native of Siberia, in elevated fields on the Altaian promontory. Atragalus Songaráicus, Pall. astr. p. 65. t. 51. Flowers violaceous. Legume ovate, acute, pubescent.

18 O. sylvatica (D. C. astr. no. 15.) plant stemless; leaflets ovato-rounded, acute, clothed with silky down; scapes longer than the leaves; spikes ovato, dense; bracteae longer than the calyx; legumes inflated, membranous, clothed with brown pili.  2. H. Native of Dahuria and Siberia, on the Altaian mountains in pine woods, and on their margins. Phacé sylvatica, Pall. itin. ed. gall. append. no. 381. t. 86. 1. Astragalus, Wild. spec. p. 1800. Astr. sylicolus, Pall. astr. p. 95. t. 78. Flowers purpureal. There is a variety of this species having 3 or 4 leaflets in a whorl.

Wood Mountain Milk-Vetch. Pl. ½ foot.

19 O. longirostris (D. C. astr. no. 17. t. 5.) plant stemless, and rather silky; leaflets linear-oblong, acuminate; 2 to 6 times longer than the leaves; spikes ovato; bracteae shorter than the calyx; keel of flower furnished with a long mucronate acumens.  2. H. Native of Siberia, at Lake Baikal, in the fissures of rocks. Flowers purpureal. O. Gmelini, Fisch. ex Steven.

20 O. brevirostris (D. C. astr. no. 19. t. 6.) plant almost stemless; leaflets 23-29, lanceolate, glabrous; scapes hairy, about equal in length to the leaves; spikes ovato, dense; bracteae shorter than equal in length to the calyx; legumes ovato, inflated, almost 1-celled, apiculated by the style, and are, as well as the calyces, beset with black pubescence.  2. H. Native of Siberia, on the Altaian mountains, and in pine woods. Atragalus Altalicus, Pall. astr. p. 56. t. 45. O. Altalicus, Pers. Stipulae large, membranous, joined together. Flowers bluish-purple.

21 O. leptophylla (D. C. astr. no. 12.) plant stemless, glabrous; leaflets 9-13, linear-liliform; scapes reclinate, length of leaves; flowers few, almost capitate; bracteae shorter than the calyx, which is hairy; legume inflated, membranous, almost 1-celled, pubescent.  2. H. Native of Siberia, on high plains between the rivers Onon and Argun. Flowers of a deep rose-colour. Atragalus leptophyllus, Pall. astr. p. 88. t. 66. f. a. but not of Des.—Gmel. sib. 4. t. 24. B.

22 O. capitosus (Pers. ench. 2. p. 333.) plant stemless; leaflets from 13-15 in number, oblong, glabrous; scapes bearing about 5 flowers, about equal in length to the leaves; bracteae shorter than the calyx, which is villous; legumes inflated, ovato-acuminate, pubescently-tomentose, almost 1-celled.  2. H. Native of Dahuria, on rocks and among gravels. Atragalus capitosus, Pall. astr. p. 70. t. 57. Astr. vesicarius, Pall. itin. but not of Linnaeus. O. phylodes var. glabra, D. C. astr. no. 14. f. 1. Flowers purpureal.

Tufted Mountain Milk-Vetch. Pl. ½ foot.

23 O. amphullata (Pers. ench. 2. p. 333.) plant stemless; leaflets from 7-13 in number, lanceolate, and silky; scapes usually bearing about 3 flowers each, equal in length to the leaves; bracteae shorter than the calyx; legumes inflated, ovato-globose, tomentose, almost 1-celled.  2. H. Native of Siberia, on rocks at the river Yenesoe, and about the Baikal. Atragalus amphullatus, Pall. astr. p. 69. t. 56. f. B. O. phylodes var. villosa, D. C. astr. no. 14. t. 2. f. 2.

Cruet-shaped-podded Mountain Milk-Vetch. Pl. ½ foot.
23 O. nigrescens (Fisch. in litt. D. C. prod. 2. p. 278.) plant almost stemless, having numerous procumbent leaflets; leaflets 7-11 in number, elliptic, acutish, villous; stipulas and calyces almost black hairs; peduncles 2-flowered, length of leaf; legumes oblong, inflated, pubescent, 1-celled. (Pall.) *2. H. Native of the north-east of Siberia between the Aldan and the ocean, and in the island of St. Lawrence. Flowers bluish-purple, rather large; the keel furnished with a small mucrone, which is hardly evident. Astragalus nigrescens, Pall. a. a. p. 65. t. 53.

*Flowers cream-coloured.

26 O. campestris (D. C. astr. no. 10.) plant stemless; leaflets many pairs, lanceolate, acute, hoary, and rather hairy; scapes hoary, about equal in length to the leaves; spikes ovate-oblong, dense-flowered; flowers erect; bracteas a little shorter than the calyx, which is hairy; legumes ovate, inflated, erect, hairy, half-bilocular. *2. H. Native of Europe, on the Alps. In Scotland upon a high rock on one of the mountains at the head of Clova, Angus-shire, near the White-water, in great abundance. Astragalus campestris, Lin. spec. 102. Smith, engl. bot. vol. 36. 2522. Astra. sordidus, Willd. spec. 1313. with erroneous remarks. A. sordidus, Pers. ench. 2. p. 333. Astr. Uralensis, Oed. fl. dan. 1041. Phaea campistris, Wahl.—Hall. helv. t. 15.—Schuchz. trav. alp. 4. p. 330. with a figure. In size and habit much like O. Uralensis, but the leaflets are narrower, more numerous, much less silky, being only besprenkled with shining hairs, and sometimes quite smooth, except on the mid-rib. Flowers cream-coloured, the keel and wings tinged with purple.

27 O. sulphurea (Fisch. in litt.) plant stemless; leaflets from 37-41 in number, lanceolate, when young clothed with adpressed silky pubescence, at length only besprinkled with a few hairs; scape a little longer than the leaves; spikes capitate; flowers spreading; bracteas about equal in length to the calyx; legume hairy? *2. H. Native of Siberia, on the Altai mountains at the metal mines. O. campstiris γ sulphurea, D. C. prod. 2. p. 278. Flowers cream-coloured. This species is very like the European O. campstiris, but differs in the leaflets being more numerous, and in the flowers being larger.

28 O. viscosa (Vill. dauph. 3. p. 469. t. 43.) plant stemless; leaves with about 20 pairs of linear, acute, rather clammy leaflets; scapes and leaves erect; flowers 7-9 at the top of each scape; calyx clothed with clammy pubescence; legumes oblong, recurved, velvety. *2. H. Native of Switzerland and Dauphiny.

O. campstiris var. β, viscosa, D. C. astr. no. 10. Flowers white.

29 O. fusciscia (D. C. astr. no. 11.) plant stemless; leaves with many pairs of lanceolate-linear, clammy, glabrous leaflets; scapes rather longer than the leaves, woolly at the apex; spikes capitate, few-flowered; bracteas shorter than the calyx; legumes erect, terete, inflated, rather incurved, pubescent. *2. H. Native of the Alps of Dauphiny, Switzerland, and Piedmont. Astragalus fuscicus, Vill. dauph. 3. p. 468. t. 43. Astr. Halleri, All. pedem. no. 1276.—Hall. helv. no. 407. Flowers cream-coloured.

30 O. squamulosa (D. C. astr. no. 15. t. 3.) plant stemless and glabrous; leaves with many pairs of linear leaflets; scapes shorter than the leaves, each bearing usually 2 or 3 flowers at the apex; calyces covered with little scales; bracteas shorter than the calyx, and are, as well as the stipulas, ciliolate; legumes ovoid. *2. H. Native of Dahuria, in arid fields at the river Courba. Flowers cream-coloured.

Sclav-calyced Mountain Milk-Vetch. Pl. ¼ to ½ foot.

2. 5. Verticillariis (from verticillatus, whorled, or in a whorl; in reference to the leaflets being disposed somewhat in whorls on the petiole). D. C. prod. 2. p. 279. Leaflets all or for the most part somewhat verticillate, or with 2-3 or 6 rising from the same centre, or dot from the petiole.

31 O. splendens (Doulg. mss.) plant stemless, clothed with silky villi; leaflets ovate-lanceolate, acute, crowded; scapes much longer than the leaves; flowers in interrupted spikes; bracteas lanceolate-linear, longer than the calyx, silky, as well as the calyces. *2. H. Native of North America, about the Red river. Flowers blue, and probably mixed with white. Leaflets rising 2-3-4 together from the petiole.

Splendid Mountain Milk-Vetch. Pl. 1 foot.

32 O. microphylla (D. C. astr. no. 20.) plant stemless; leaflets rising in pairs from the petiole, or somewhat verticillate, oblong, obtuse, hairy beneath; scape longer than the leaves; spikes ovate; calyces rather mucrinated, and woolly. *2. H. Native of Siberia, in sandy islands in the river Selenga, and in Lake Baikal. Astragalus microphyllus, Pall. astr. 92. t. 76. Phaea microphyllus, Pall. itin. ed. gall. in 8vo. append. no. 382. t. 90. f. 1. Astr. polyphyllus, Willd. spec. 3. p. 1300. Flowers large, purple. This appears to be intermediate between the character of this and the preceding division of the genus.

33 O. baikalensis (Pers. ench. 2. p. 353.) plant stemless; leaflets lanceolate, clothed with silky wool, disposed somewhat verticillately; scapes pilose, rather longer than the leaves; flowers few, capitate; legumes ovate, inflated, acuminate, membranous, pubescent. *2. H. Native of Siberia, about Lake Baikal. Astragalus Baicalensis, Pall. astr. 93. t. 77. f. 1. Flowers white, tinged with blue.

Baikal Mountain Milk-Vetch. Pl. ½ to ¾ foot.

34 O. inaniana (D. C. prod. 2. p. 279.) plant stemless; leaflets linear, acute, pubescent, in pairs, or 3 or 4 in a whorl; scape erect, about equal in length to the leaves; spike capitate, few-flowered; bracteas rather longer than the calyx, which is pubescent. *2. H. Native of Siberia, at the river Ina on the mountains of Tugerg, but very rare. Astragalus inanarius, Willd. spec. 3. p. 1302. Astr. Inarious, Pall. astr. p. 94. t. 77. f. 2. Flowers purple. Stipulas large, sheathing, silky.

Ina Mountain Milk-Vetch. Pl. ¼ to ½ foot.

35 O. pumila (Fisch. in litt. D. C. prod. 2. p. 279.) plant x k 2
legumes, lancedolate, arched, acuminate. \( \mathfrak{Y} \). H. Native of Siberia, on mountains at the river Yenesee, and at lake Baikal. Phacé muriçhá, Lin. suppl. Pall. itin. ed. gall. append. no. 385. t. 89. f. 1. Astragalus muriçhítus, Pall. astrar. p. 89. t. 73. Flowers yellow, ex Lin.

**Muriated Mountain Milk-Vetch.** Pl. \( \frac{\pi}{2} \) to \( \frac{3}{2} \) foot.

§ 3. *Tragacanthideae* (from \( \tau \rho \alpha \gamma \alpha \tau \gamma , \) tragos, a goat, \( \alpha \omega \alpha \nu \eta , \) a tendril, and \( \alpha \omicron \nu \omicron \alpha , \) idea, similar; in reference to the plants contained in this section resembling the Goat’s-thorn, in being spiny). *D. C. prod.* 2. p. 280. *Stems elongated, shrubby.* *Stipulas adnate.* Petioles permanent, at length becoming spines.

42 O. *tragacanthoides* (Fisch. in litt. *D. C. prod.* 2. p. 280.) stem erect, branched; petioles becoming hardened into strong spines; leaves with 5 or 6 pairs of elliptic-oblung leaflets, which are clothed with adpressed silky down on both surfaces; peduncles few-flowered, length of leaves; calyx clothed with soft hairs, at length becoming inflated. \( \mathfrak{Z}. \) F. Native of the Altai mountains, at the river Baschka-us, where it was detected by Mardofkin, in July 1822. This is a very elegant plant, having larger flowers than any other species, they are purple. The keel is furnished with a long beak. The legumes, according to Fischer, are bladdery, almost globose, acuminate, and hairy.

**Tragacanth-like Mountain Milk-Vetch.** Shrub 1 foot.

§ 4. *Caulescentes* (a diminutive of *caulis*, a stem; the plants contained in this section are furnished with stems). *D. C. prod.* 2. p. 280. *Stems elongated.* *Stipulas not adnate to the petiole.* *Leaflets rising in pairs from the petiole,* not in whorls.

* Flowers cream-coloured.

43 O. *piilosá* (D. C. astr. no. 27.) stems erect, beset with soft hairs as well as the rest of the plant; leaflets lanceolate, acute; peduncles axillary, longer than the leaves; spikes ovate-oblong; legumes erect, terete, hooked at the apex, villous. \( \mathfrak{Z}. \) H. Native of Europe, Tauria, and of Siberia, on mountains near the river Oby. Sims, bot. mag. 2483. Astragalus pilósus, Lin. spec. 1065. Jayc. astrar. t. 51. Pall. astr. t. 80. Lodd. bot. cab. 544.—Gmel. sib. 4. t. 16. Flowers pale-yellow.

**Pilose Mountain Milk-Vetch.** Fl. June, Aug. Cl. 1732. Pl. 1 foot.

44 O. *Pallas’s* (Pers. ench. 2. p. 334. Bieb. fl. supr. suppl. 502.) plant caulescent, prostrate, pubescent or villous; leaflets oblong-elliptic, acutish; peduncles rather longer than the leaves; spikes capitate; legumes erect, oblong-terete, mucronate, hairy. \( \odot . \) H. Native of Tauria, among stones near Sudak. Astragalus lanátus, Pall. astrar. p. 108. t. 81. Bieb. fl. taur. 2. p. 188. Flowers very pale cream-coloured, much more so than the last species.

* ** Flowers purple or white.

45 O. *terés* (D. C. astr. no. 28.) plant caulescent, erect, almost glabrous; leaflets linear-oblong, acute, rather pubescent; peduncles twice the length of the leaves; flowers few, about 7 or 8, disposed in a loose spike; legumes erect, cylindric, mucronate, glabrous. Native of Siberia, at the river Oby, at the place where the Irish falls into it. Corolla purplish-blue.

**Terete-podded Mountain Milk-Vetch.** Pl. 1 foot.

46 O. *floribundus* (D. C. astr. no. 30.) plant caulescent, erect, rather pilose; leaflets linear, acute at both ends, puberulous; stipulas lanceolate; peduncles axillary, at first shorter than the leaves, but at length longer; flowers spicate; le-
gumes oblong-subulate, 1-celled, pubescent. H. Native of Siberia, in sandy places along the banks of the river Irtysh. Astragalus floribundus, Pall. astr. p. 47. t. 37. Flowers numerous, elegant, of a purplish rose-colour.

*Bundle-flowered Mountain Milk-Vetch*. Pl. 3/ to 1 foot.

47 O. glabra (D. C. astr. no. 31. t. 8.) plant caulescent, prostrate, glabrous; leaflets lanceolate-elliptic, acuminate; peduncles much longer than the leaves; flowers in spikes, remote; legumes pendulous, pubescent. H. Native of Siberia, Altai, and Dauluria. Very like the following. The hairs on the legume are blackish, but the other parts of the plant are clothed with appressed pubescence or smooth.

48 O. deflexa (D. C. astr. no. 32.) plant rather pilose; stems ascending; leaflets ovate-lanceolate, pubescent; peduncles much longer than the leaves; flowers disposed in spikes; legumes pendulous, hairy, 1-celled, gaping at the apex. H. Native of Siberia, about the Baikal on the mountains in cold springs, and North America on the banks of the Saskatchewan. Astragalus deflexus, Pall. act. petr. 1776. t. 15. Lher. stipr. t. 80. A. biann. Jacq. icon. rar. t. 153. Astra. parviflorus; Lam. Astra. retrorufus, Pall. astr. t. 57. Thum biann. Meech. meth. 162. Flowers purple.

49 O. Fischeri (D. C. prod. 2. p. 281.) plant caulescent, assurgent, or procumbent, pubescent; stipulas distinct; leaflets oblong-linear, rather obtuse; peduncles longer than the leaves; flowers spicate, rather distant; wings obtuse, somewhat emarginate; mucrone of keel elongated, about equal in length to the wings. H. Native of Siberia, on the Altaiian mountains. Flowers small, bluish-purple. O. versicolor, Fisch. in litt. but very distinct from Astragalus versicolor.

Var. β, macrantha (D. C. l. c.) flowers larger and rose-coloured; leaves and calyces much more villous. H. Native of Siberia. Perhaps a proper species.

50 O. vagnata (Fisch. in litt. D. C. prod. 2. p. 281.) plant caulescent and ascending, sparingly pubescent; stipulas concretes; leaflets elliptic; peduncles a little longer than the leaves; spikes of flowers somewhat capitate; wings obtuse, keak of legume equal in length to the wings. H. Native of Siberia, on the Altaiian mountains at the metal mines. Flowers large, blue. It differs from O. Fischeri macrantha in the stipulas being joined into one. Legumes unknown.

*Sheathed-stipuled Mountain Milk-Vetch*. Pl. ascending.

51 O. tenella (Fisch. in litt. D. C. prod. 2. p. 281.) stems short, diffuse, or procumbent, pubescent; stipulas concretes; leaflets elliptic or oblong-linear, acute, clothed on both surfaces with adpressed silky down; peduncles longer than the leaves; flowers disposed in a spike, rather distant; wings entire; mucrone of keel about equal in length to the wings; legumes nearly terete, acute, straight, 1-celled. H. Native of Scythia. Flowers small, bluish-purple.

*Tender Mountain Milk-vetch*. Pl. diffuse.

52 O. dichoptera (D. C. astr. no. 33. exclusive of the species) plant caulescent; ascending, pubescent; stipulas joined; leaflets oblong, acute; peduncles equal in length to the leaves; flowers capitate; wings emarginate; mucrone of keel small. H. Native of Siberia. Flowers blue.

*Cult. All the species of this genus are very elegant when in bloom, and being for the most part dwarf evergreen plants, are very proper for ornamenting rock-work, or the front of flower-borders. For this purpose the seeds of the species, whether perennial or annual, should be sown where the plants are to remain, especially those which are intended for rock-work, as it has been observed that no species of this genus thrives after being transplanted. The rarer kinds may be kept in pots, well drained with sherds, in a mixture of peat, sand, and a little loam, and treated as other alpine plants.*

CXXXI. ASTRAGALUS (from ἀστραγαλός, astragalos, vertebra or talus; the seeds in the legumes in some species being squeezed into a squarish form in the legume, or perhaps ὁσπερ, ὁστερ, a star, and γάλα, gale, milk. It is also the name of a shrub of Greek writers). D. C. astrag. no. 5. ed. maj. p. 22. and p. 79. prod. 2. p. 281.—Astragalus species of Linnæus and others.

Lin. syst. Diadelpheia, Decandria. Calyx 5-toothed. Keel of flower obtuse. Stamens diadelphous. Legume biserial or half-biserial, from the upper surface being bent in so much.—Herbs or subshrubs. The species of this genus are very distinct, but are very difficult to define. The following sections and divisions have been adopted with a view to define them more completely, viz. 1. Purpurascen. Stipulas free from the petiole. Flowers purplish. This section contains the following divisions: Hypoglottidiod, Dissisflora, Onobrychoidei, Sesamie, Isearss, and Anulatare, see species 1 to 94.

II. Ochroleci. Stipulas free from the petiole. Flowers cream-coloured. To this section belongs the following divisions: Bucerîætes, Synoqueâriet, Cicurîcoidei, Galepigîres, Alcopoeroidei, Christiâni, see species 95 to 154.

III. Tragancanthæ. Stipulas adnate to the petiole. Petioles permanent, usually becoming hardened into spines. To this section belong two divisions, viz. Tragacanthæ and Chropbdoidei, see species 155 to 196.

IV. Podocarææ. Stipulas adnate to the petiole. Petioles never becoming indurated. To this section the following divisions belong, viz. Antheîloidea, Caprinæ, Incinæ, and Rodieîfloræ, see species 197 to 237.

Series I. Purpurascen. (So called from the flowers being purple or purplish). D. C. prod. 2. p. 281. Stipulas free from the petiole. Flowers purplish. § 1. Hypoglottidiod (Іπω, кυρ, under, and γλωττα, glotta, a tongue: in reference to the shape of the pods). D. C. prod. 2. p. 281. Flowers purplish or white. Stipulas free from the petiole, but joined together, therefore they appear as if they were bifid at the apex and opposite the leaves.

1 A. Hypoglottis (Lin. mant. 274.) stems prostrate, rather hairy; stipulas ovate, concretes; leaves with numerous, little, ovate, obtuse, dark-green leaflets, sometimes rather emarginate; heads of flowers roundish; peduncles longer than the leaves, ascending; bracteas one half shorter than the tube of the calyx; the hairs on the calyces as well as those on the peduncles are black and white mixed; legumes ovate, deeply channelled along the back, compressed, hairy, hooked at the point, bilocular; cells 1-seeded. H. Native of Europe, on hills and mountains, also of Barbary, Tauria, Siberia, North America; and in Britain, on open mountainous heaths, in a chalky or sandy soil, also on the sea-coast; upon Newmarket and Royston heaths, on Swaffham heath, Norfolk; Gogmagog hills. Plentiful near Dencaster, on several parts of the sea-coast of Scotland, particularly beyond Newhaven, Edinburgh. D. C. astr. no. 18. t. 14. Smith, engl. bot. 274. A. martianus, Huds. 323. Oed. fl. dan. 614. Pall. astr. t. 34. A. Dànicus, Retz. obs. fasc. 3. p. 41. Hoffm. A. glauces, Vill. Oxytropis montana, Spreng. fl. hal. 207. with a figure, ex. Wallr. sched. 329. A. epiglotis, Dicks. hort. sie, fasc. 1-13.

2. A. *dasyglottis* (Fisch. in litt. D. C. prod. 2. p. 282.) plant diffuse, nearly glabrous; stipulas concrete, opposite the leaves; leaflets elliptic-oblong, somewhat emarginate; spikes of *flowers* capitate; peduncles a little longer than the leaves; bracteas about equal in length to the tube of the calyx; calyx beest with white hairs; legumes erect, ovate-triquetrous, hairy, disposed in heads; cells 1-seeded. 2. H. Native of Siberia, on the Altai mountains. Root creeping. Flowers purple, blue, and white mixed. Very nearly allied to *A. hypoglossis*.

3. A. *purpureus* (Lam. dict. 1. p. 314.) plant diffuse, pro- cumbent, rather villous; stipulas concrete, opposite the leaves; leaflets obovate, bidentate at the apex; spikes of flowers capitate; peduncles longer than the leaves; legumes erect, ovate- triquetrous, hairy, disposed in heads; cells 3-seeded. 2. H. Native of Provence, on the mountains, Piedmont, and the Appennes. D. C. astr. no. 17. t. 12. Flowers purplish blue.

4. A. *teniolus* (Desf. atl. 2. p. 186. D. C. astr. no. 10. but not of Lin.) plant decumbent, hoary, and villous; stipulas concrete, opposite the leaves; leaflets elliptic-linear, about 15 or 17 pairs; peduncles shorter than the leaves; spikes capitate; vexillum elongated. 2. H. Native of Barbary, near Cafiya, in sand. Flowers rose-coloured. Legumes unknown.

*Fine-leaved Milk-Vetch*. Pl. decumbent.

5. A. *lotoides* (Lam. dict. 1. p. 316.) plant prostrate, gla- braous; stipulas not known; leaves with about 4 or 5 pairs of obovate, nearly obcordate leaflets; flowers 4 or 5 in an umbel; peduncles length of leaves; legumes prismatic, triquetrous, erect, subulate at the apex. 2. H. Native of China. A. Sinicus, Lin. mant. 103. Sims, bot. mag. 1850. Flowers rose-coloured. Lamarck’s name has been adopted in preference to that of Linneaus in consequence of its being more expressive of the habit of the plant, and to prevent its being confounded with *A. Chinensis.* The specimen in the Linnean herbarium with the name of *A. Sinicus* is certainly a species of *Coronilla* very near *C. variia*.

6. A. *vicecormis* (D. C. astr. no. 19.) plant trailing and clothed with adpressed pubescence; stipulas half-concrete; leaves with from 10-15 pairs of obovate or obcordate leaflets; spikes 5-7-flowered; peduncles angular, a little longer than the leaves; legumes oblong, acute, erect, villous. 2. H. Native of Cap- padocia. A. humifusus, Wildl. spec. 3. p. 1286. Flowers bluish-purple.

*Vicia-formed Milk-Vetch*. Pl. trailing.

7. A. *onobrychoides* (Bieb. cesp. 185. fl. taur. 2. p. 184.) plant rather diffuse, suffruticoso at the base, clothed with adpressed pubescence; stipulas concrete, opposite the leaves; leaves with 8-10 pairs of elliptic leaflets; spikes of flowers capitate, on long peduncles; vexillum linear, longer than the wings; legumes ovate-oblong, erect, villous, terminating in a hooked point. 2. H. Native of Iberia, Persia, and Caucas- us. A. canescens, D. C. astr. no. 39. t. 16. A. cephalotes, Pall. astr. no. 32. t. 24. Flowers beautiful purple.

8. A. *bicolor* (Lam. dict. 1. p. 317.) plant almost stemless, suffrutose, hoary; stipulas concrete, opposite the leaves; leaves with from 6-9 pairs of oblong-linear leaflets; spikes of flowers capitate; peduncles twice the length of the leaves; ca-
255

LEGUMINOSÆ. CXXXI. ASTRAGALUS.

17 A. Garbancillo (Cav. icon. 1. t. 85.) plant erect, suffrutescose, and rather villous; stipulas concrete, opposite the leaves; leaflets 10-12 pairs, oblong, obtuse; racemes pedunculate, longer than the leaves; legumes inflated, pilose. f. S. Native of Peru, in the valley of Canta. Flowers pale violet. The plant is said to be noxious to cattle. Garbancillo is the vernacular name of the plant in Peru. Calyx covered with black hairs.

Garbancillo Milk-Vetch. Shrub 1½ ft.

18 A. Donianaus (D. C. prod. 2. p. 283.) plant prostrate, beset with a few scattered adpressed hairs; leaves with 8-10 pairs of oval, alternate, mucronulate leaflets, which are pubescent beneath, but when young silky; stipulas connate; peduncles axillary, few-flowered, twice the length of the leaves; legumes subulate, silky. f. H. Native ofNipanl, in Gossang-sthan. Flowers purple, having a broad vexillum. Root long, thick, and woody, dividing into many arms at the base. A. macrorhizus, D. Don, prod. fl. nep. 245.

19 A. arenariaus (Lin. spec. 1069.) plant diffuse, tomentose from white adpressed down; stipulas concrete, opposite the leaves; leaflets linear-obtuse; peduncles 4-5-flowered, rather shorter than the leaves; legumes stipitate, rather tumid, tomentose, thrice the length of the breadth. f. H. Native of Denmark and Sweden, in sandy places. Retz. obs. 2. no. 73. p. 3. t. 3. D. c. a. no. 1. Corolla blue. The stems are erect, according to Retzius, but according to Willdenow and Linneæus they are prostrate. Root creeping.

20 A. Bayonneësis (Lois. fl. gall. 247.) plant diffusely-pubescent, somewhat tomentose from white, adpressed down; stipulas concrete, opposite the leaves; peduncles 4-6-flowered, about equal in length to the leaves; legumes almost sessile, rather tumid, tomentose, thrice the length of the breadth. f. H. Native of the west of France, in sand by the sea-coast, at Bayonne. B. D. c. fl. suppl. 573. A. Austriacus, Thore, but not of Lin. Flowers bluish-purple.

21 A. Verriègosus (Moris, elch. sard. p. 12.) plant pilose and decumbent; stipulas concrete, opposite the leaves, lanceolate-subulate; leaves with 10-12 pairs of ovate-oblong leaflets; racemes longer than the leaves, many-flowered; legumes arched, oblance, acuminate, rather mucronulate, pilose. f. H. Native of Sardinia. Flowers purple.

Warted-podded Milk-Vetch. Pl. decumbent.

22 A. Macrópterus (D. C. prod. 2. p. 288.) plant erect and smoothish; young stipulas concrete and opposite the leaves, but at length becoming free; leaflets linear-lanceolate, acute; peduncles 2 or 3 times the length of the leaves; flowers nodding, disposed in interrupted spikes; wings much longer than the keel, and about equal in length to the vexillum; legumes oval-linear, straight, glabrous, apiculated by the style, hardly double the length of the calyx. f. H. Native of Dahuria and Siberia. Astragalus and Oxytropis macróptera, Fisch. in litt. but there is no mention on the keel to be seen. Flowers purple.

Long-winged Milk-Vetch. Pl. 1 foot.

23 A. Vaginaetæ (Pall. a. no. 49. t. 36.) plant erect, pubescent; stipulas concrete, opposite the leaves; leaflets linear-lanceolate, acute; peduncles longer than the leaves; flowers drooping, disposed in dense spikes; legumes linear, straight. f. H. Native of Siberia, at the Uba, Jenescce, and Bajkal. Flowers of a whitish-purple colour, or white and purple mixed. This species is very nearly allied to A. versicolor, and probably only the same. The plant is also a native of North America.

Sheathed-stippled Milk-Vetch. Pl. 1 foot.

24 A. Versicolor (Pall. a. no. 48. t. 35.) plant erect and glabrous; stipulas concrete, opposite the leaves; leaflets linear, acute; peduncles bearing a crowded spike of flowers each, which is longer than the leaves; flowers drooping; legumes triquetrous, erect, glabrous. f. H. Native of eastern Siberia, on rocks. Flowers pale-blue at first, but at length changing to a deeper blue. It is probably not distinct from A. vagninaetæ.

Party-coloured-flowered Milk-Vetch. Pl. ½ to 1 foot.

25 A. Tauricus (Pall. astr. no. 51. t. 38. exclusive of the synonyms) plant spreading and tufted, clothed with adpressed silky down; leaflets linear, acute; stipulas membranaceous, concrete, opposite the leaves; peduncles spike-like, thrice the length of the leaves; legumes ovate, acute, 2-4-seeded. f. H. Native of Tauria, in gravelly or chalky places. Flowers purple, varying to white, ex Bieb. taur. 2. p. 192. Oxytropis Tauricus, Pers. ench. exclusive of the synonyms. A. cretaceus, Pall. ind. taur.

§ 2. Dissitiflori (from dissitais, distant, and flos, a flower; in reference to the flowers being distant in the racemes). D. C. prod. 2. p. 284. Stipulas distinct, not adhering to the petiole. Flowers purplish or white, distant in the racemes. Legumes straight.

26 A. Austriacus (Lin. spec. 1070.) plant diffusely-pubescent; leaflets glabrous, linear, truncate-emarginate; racemes pedunculate, longer than the leaves; wings of corolla bifid; legumes somewhat triquetrous, pendulous. f. H. Native of Spain, Dauphiny, Austria, Italy, Tauria, in dry exposed places, and of Russia, on the banks of the Volga. Jacq. austr. 195. Vind. 283. D. c. a. no. 1. A. dichópterus, Pall. astr. t. 39. Allied to Oxytropis dichóptera. Flowers with a blue vexillum, but the rest purple.

27 A. Olotyus (D. C. prod. 2. p. 284.) plant diffuse; leaves with 6-7 pairs of linear, glabrous, entire, acutish leaflets; racemes pedunculate, twice or thrice the length of the leaves; wings of corolla obtuse. f. H. Native of the Altai mountains, and in the Kirghisean steppe. A. Austriacus, Fish. in litt. The plant is very like the A. Austriacus, but differs in the wings of the corolla being entire; also like A. melilóitoides, but differs from it in the leaves having many pairs of leaflets. The flowers are pale, according to the dried specimen.

28 A. Melilóitoides (Pall. itin. ed. gall. t. 33. f. 1. and 2. a. t. 41.) plant erect, glabrous; leaflets oblong, emarginate; racemes pedunculate, thrice the length of the leaves; wings of corolla entire; legumes erect, ovate, didymous, 2-seeded, wrinkled. f. H. Native of Siberia, Altai, Dahuria, and China. D. C. a. no. 37. Flowers purple.

Melilot-like Milk-Vetch. Pl. 2 to 3 feet.

29 A. Sulcatus (Lin. spec. 1063.) plant erect, glabrous; stem furrowed; leaflets linear-lanceolate; racemes pedunculate, longer than the leaves; wings of corolla entire; legumes erect, rather triquetrous, half-bilocular. f. H. Native of Siberia, in grassy places, and the Tartar desert. Jacq. hort. vind. t. 40. D. C. a. no. 35. Tum lineær, Mönch. A. leptostachyus, Pall. astr. t. 40. but not of Willd. Flowers pale-violet but with a white keel, tipped with brown.

30 A. Cra'aca (D. C. a. no. 2. t. 9.) plant diffuse; leaflets oval-oblong, emarginate, pubescent; racemes pedunculate, about equal in length to the leaves; wings of corolla entire; legumes pendulous, stipitate, ovate-oblong, compressed, half-bilocular. f. G. Native of Peru.
Leguminosae.

Cracea-like Milk-Vetch. Pl. diffuse.
31 A. prostratus (Hook, in Beech. voy. p. 18.) plant diffuse; leaflets pubescent, obuse; stipulas concrete, but free from the petiole; racemes pedunculate, much longer than the leaves; flowers loose, almost sessile; calyces clothed with black pubescence.

Prostrate Milk-Vetch. Pl. prostrate.
32 A. gracilis (Nutt. gen. amer. 2 p. 100.) plant erect, slender, pubescent; leaflets oblong-linear, remote; racemes pedunculate, longer than the leaves; legumes very short, drooping, elliptic-ovate, rather triquetrous, pubescent, 1-celled, usually containing 4 seeds.

Horned-podded Milk-Vetch. Pl. procumbent.
33 A. ceratophyllum (Bieb. suppl. 492) plant depressed, clothed with silky villi; leaflets oblong-elliptic; peduncles longer than the leaves; racemes somewhat capitate; legumes subulate, triquetrous, erect, 4-times longer than the calyx, clothed with adpressed bristles.

Horn-like-podded Milk-Vetch. Pl. depressed.
40 A. macròlobus (Bieb. suppl. 493.) plant depressed, clothed with white adpressed hairs; leaflets oblong-elliptic; peduncles rather longer than the leaves; racemes somewhat capitate; legumes subulate, triquetrous, erect, beset with adpressed bristles, thrice the length of the calyx.

Long-podded Milk-Vetch. Pl. depressed.
41 A. virgátus (Pall. astr. t. 18. exclusive of the synonymes) plant erect, suffruticos, rather cunesse; leaves with about 6 pairs of linear-lanceolate acute leaflets; racemes spicate, much elongated; the lower flowers very remote; legumes oblong, triquetrous, twice the length of the calyx.

42 A. hyrcánxus (Pall. astr. no. 29. t. 22.) plant erect, suffruticos, pubescent; leaves with 5 pairs of linear acute leaflets; racemes usually 5-flowered, hardly longer than the leaves; legumes oblong, ineruncate, villous, twice the length of the calyx.

Hyrcanian Milk-Vetch. Pl. 1 to 2 feet.
43 A. brachýlobovs (D. C. prod. 2 p. 285.) plant erect; shrubby at the base, clothed with adpressed silky white down; leaves with 2-3 pairs of linear acute leaflets; racemes pedunculate, much longer than the leaves; 5-8-flowered; legumes oblong, pubescent, mucronate by the style, hardly longer than the calyx.

Annual Milk-Vetch. Pl. diffuse.
45 A. biflorus (Viv. fl. lyb. 44. t. 20. f. 1.) plant erect, clothed with cunesse hairs; stipulas very short; leaves with 5-6 pairs of elliptic leaflets; peduncles longer than the leaves, usually bearing only 2 flowers; calyces covered with stiff black hairs.

Native country as well as the legumes unknown. Perhaps belonging to a different section of the genus.
Two-flowered Milk-Vetch. Pl. 1/2 to 1 foot.

* Legumes curved.

46 A. leptophyllus (Desf. atl. 2. p. 188. t. 207.) plant procumbent, suffrutescent, and rather pubescent; leaflets obcordate; racemes longer than the leaves; legumes pendulous, falcate, compressed, when young pubescent. 2. H. Native of Barbary, on the mountains. A. Tunetanus, Willd. spec. 3. p. 1277. Flowers white.

47 A. ornithopodioides (Lam. dict. 1. p. 312.) plant suffrutescent, tufted and diffuse, hoary and villous; leaflets ovate; racemes longer than the leaves; legumes pendulous, falcate, compressed, when young pubescent. 2. H. Native of North America, in the pastures of the Saskatchewan, &c. Phaca pectinata, Hook. fl. bor. amer. 141. t. 54. Flowers large, purple.

Pectinated-leaved Milk-Vetch. Pl. 1 foot.

53 A. pectinatus (Dougl. ms.) plant erect, pubescent; leaflets filiform; racemes dense flowered, pedunculate, longer than the leaves; bracteas a little longer than the pedicels. 2. H. Native of North America, in the pastures of the Saskatchewan, &c. Phaca pectinata, Hook. fl. bor. amer. 141. t. 54. Flowers large, purple.

54 A. onobrychis (Lin. spec. 1076.) plant diffuse or erect, pubescent; leaves with 7-16 pairs of oblong leaflets; spikes of flowers oblong-ovate, pedunculate, longer than the leaves; vexillum linear, twice the length of the wings; legumes ovate, triquetrous, rather villous, erect, twice the length of the calyx, ending in a straight point; cells 4-seeded. 2. H. Native of Europe and Siberia. D. C. astr. no. 24. Bieb. fl. taur. no. 1432. Flowers purple. An elegant plant. Of all the varieties there are white flowers.

Var. b, Moldaviae (D. C. l. c.) plant dwarf; leaflets ovate-oblong, glabrous; spikes of flowers ovate. 2. H. Native of Moldavia. Plant procumbent.

Var. c, major (D. C. l. c.) plant erect; leaflets ovate or oblong; spikes of flowers oblong. 2. H. Native of Siberia. A. onobrychis stipulicuaceus et maximus, D. C. astr. no. 24. —Gmel. sib. 4. t. 21.

55 A. avuncus (Bieb. fl. taur. 2. p. 195. plant ross. cent. 2. t. 80.) plant diffuse and hoary; leaves with 5-10 pairs of elliptic small leaflets; spikes short, pedunculate, longer than the leaves; vexillum much longer than the wings; legumes ovate-oblong, rather villous, ending in a long oblique acumen. 2. H. Native of Caucasus, among broken rocks. Flowers purple. Very like the preceding species.

56 A. fla'cicudis (Bieb. fl. taur. 2. p. 196.) plant procumbent and villous; leaves 8-10 pairs of elliptic, somewhat emarginate leaflets; spikes few-flowered, pedunculate, about equal in length to the leaves; vexillum much longer than the wings; legumes triquetrous, prismatic, erect, acute, hairy. 2. H. Native of Iberia, very common. A. hybridus, Gmel. trav. 1. t. 18. A. vinineus var. Pall. astr. no. 28. Flowers purple. Legume bent downwards at the apex.

Placecid Milk-Vetch. Pl. procumbent.

57 A. vimineus (Pall. astr. no. 28. t. 21.) plant erect, suffruticos; leaves with 4-6 pairs of lanceolate acute leaflets; spikes somewhat capititate, pedunculate, longer than the leaves; vexillum much longer than the wings; legumes spreading; oblong-lanceolate, villous, apiculated by the style. 2. H. Native of Siberia, Iberia, and about Odessa. A. corinitus, Pall. itin. 2. app. p. 499. no. 122. A. Odesinass, Bess. enum. no. 944. ex cont. 2. no. 1573. Steins glabrous. Leaves beset with adpressed pubescence. Calyx clothed with black hairs. Corolla purple? Legume clothed with white hairs.

58 A. racemus (Pall. astr. no. 26. t. 19 but not of Kork.) plant shrubby, erect; leaves with 8-10 pairs of linear-lanceolate acute leaflets; spikes capititate, few-flowered, pedunculate, longer than the leaves; vexillum much longer than the wings;
legumes erect, oblong-lanceolate, villous, apiculated by the style.

17. F. Native of Eastern Siberia, and beyond the Baikal. D. C. astr. no. 27.—Gmel. sib. 4. t. 24. f. A. Flowers white, tipped with purple. Very like the preceding species.

59 A. saximontia (Pall. astr. no. 24. t. 173.) plant erect, shrubby; leaves with 5 pairs of linear acute leaflets; spikes of flowers capitulate, pedunculate, twice the length of the leaves; vexillum much longer than the wings; legumes spreading, elongated, linear, channelled on the back, clothed with adpressed pubescence. F. F. Native of Siberia, in the Kirghisian steppe. Flowers purple. Habit of the two preceding species.

Little-tree Milk-Vetch. Shrub.

60 A. suffruticosus (D. C. astr. no. 5. exclusive of the synonyms,) plant diffuse, suffruticosus, villous; leaflets ovate-oblong, 7-10-pairs; spikes capitulate, few-flowered, pedunculate, about equal in length to the leaves; vexillum a little longer than the wings; calyx rather inflated and villous. F. F. Native of Siberia, beyond the Baikal. Flowers purple. Perhaps this species belongs to a different section.

Suffruticosae Milk-Vetch. Shrub.

61 A. aborigino-rum (Richards. in Frankl. journ. append. p. 746.) plant suffruticosus, erect; leaves with 5 pairs of lanceolate-linear hoary-pubescent leaflets; racemes axillary, loose, exceeding the leaves. H. H. Native of Arctic America. Flowers white or rusty; the keel decidedly blue. The roots are long and yellow like liquorice. The Crees and Stone Indians gather them in the spring as an article of food.

Aboriginal's Milk-Vetch. Shrub 1 foot.

62 A. adsurgens (Pall. astr. no. 44. t. 31.) plant ascending, smoothish; leaves with 11-12 pairs of lanceolate-acute leaflets; stipulas acuminate, length of leaves; spikes of flowers oblong, pedunculate, longer than the leaves; vexillum longer than the wings; legumes oblong, terete, and somewhat tetragonal, subulate on the back, apiculated by the style, erect, clothed with adpressed pubescence. H. H. Native of Siberia beyond the Baikal. Flowers bluish purple.

Var. β. prostratus (Fisch. hort. gor.) stems prostrate. H. H. Native of Siberia about Irkulska.

63 A. laxmannii (Jacq. hort. vind. 3. p. 37.) plant erect or diffuse, smoothish; leaves with 11-13 pairs of oblong-lanceolate leaflets; spikes of flowers pedunculate, oblong, longer than the leaves; vexillum much longer than the wings; legumes oblong, trigonal, mucronate, having a furrow on the back. H. H. Native of Siberia and North America, on the plains of the Missouri river. Flowers pale-purple or pale-blue. A. Laxmannii of Pall. astr. t. 80. differs in its more rigid habit. The American plant appears to be upright. Jaconius's one is procumbent.

64 A. agrestis (Doug. mss.) stem erect, smooth; leaflets ovate-lanceolate, obtuse, beset with adpressed hairs; peduncules elongated, longer than the leaves; spikes of flowers capitulate; calyx villous; bracteas lanceolate, not half so long as the calyx. H. H. Native of North America, near the Columbia river in fields. Flowers purple.

Field Milk-Vetch. Pl. 1 foot.

65 A. borysthicus (Doug. mss.) plant erect, densely clothed with hoary silky vill; leaflets obovate-linear, obtuse, beset with adpressed hairs; peduncules elongated, longer than the leaves; spikes of flowers capitulate; calyx villous; bracteas lanceolate, not half so long as the calyx. H. H. Native of North America, near the Columbia river. Flowers purple. An elegant plant.

Dorycnium-like Milk-Vetch. Pl. 1 foot.

66 A. microcarpus (D. C. astr. no. 29.) plant erect, glabrous; leaves with 10-12 pairs of elliptic leaflets; spikes of flowers capitulate, pedunculate, equal in length to the leaves; vexillum oblong, a little longer than the wings; legumes ovate, compressed, pubescent, rather acute. H. H. Native of Siberia, in plains near the river Ob. Flowers purple.

Smalle-fruited Milk-Vetch. Pl. 1 foot.

Bearded Milk-Vetch. Pl. ½ foot.

68 A. labradoricus (D. C. prod. 2. p. 287.) plant procumbent, clothed with minute pubescence; leaflets ovate; spikes of flowers pedunculate; legumes secund, straight, acuminated at both ends, pendulous. H. H. Native of the north of Canada and Labrador. A. secundus, Michx. fl. bor. amer. 2. p. 67. but not of D. C. Flowers of a deep purple-colour. Perhaps belonging to a different section.

Labrador Milk-Vetch. Pl. procumbent.

69 A. missouriensis (Nutt. gen. amer. 2. p. 99.) plant almost stemless, rather diffuse, clothed with canescent villi; stipulas ovate; leaves with 5-10 pairs of small obovate-elliptic leaflets; spikes of flowers capitate, standing on peduncles, which are a little longer than the leaves; calyx covered with black hairs; legumes oblong, acuminated, transversely-dilated, nearly globose, half-bilocular. H. H. Native of Upper Louisiana, on hills about the Missouri. Oxytropis argenteus, Pursh. fl. sept. amer. 2. p. 473. exclusive of the synonyms. Flowers purple, but there is a variety with white flowers also. Perhaps belonging to a different section.

Missouri Milk-Vetch. Pl. ¼ foot.

70 A. carvocarpus (Ker. bot. reg. t. 176.) plant having numerous, prostrate, assurgent stems, rising from the same root, clothed in every part with hoary silky down; stipulas ovate, acute; leaves with 9-12 pairs of elliptic leaflets; peduncles shorter than the leaves; racemes loose-flowered; legumes nut-shaped, inflated, fleshy, mucronate, glabrous, many-seeded. H. H. Native of Louisiana. A. crassicarpus, Fras. cat. 1813. A. carnosus, Nutt. gen. amer. 2. p. 100. but not of Pursh. Flowers of a pale-violet colour. Perhaps belonging to a different division of the genus.

§ 4. Sexwémi (Sensen is the Arabic name of some species. D. C. prod. 2. p. 287. Stipulas distinct, not adhering to the petiole. Flowers purplish, disposed in dense spikes or heads. Legumes straight. Roots annual.

71 A. pentadótis (Lin. mant. 274.) plant diffusely-procumbent, rather villous; stipulas ovate; leaves with 4-9 pairs of obovate retruse-emarginate leaflets; peduncles rather longer than the leaves; legumes half-ovate, somewhat triquetrous, cleft into and scarios, which are usually piliferous, disposed in heads; cells 1-celled. H. H. Native of Spain and Barbary, on hills. D. C. astr. no. 16. Cav. icon. t. 188. A. cristatus, Gouan. ill. 59. A. echinatus, Lam. A. procumbens, Mill. A. dasygótis, Pall. Flowers blue and white.

Five-tongued or Five-podded Milk-Vetch. Fl. Ju. Jul. Pl. pr. 72 A. olacex (Lin. spec. 1097.) plant procumbent, clothed with canescent villi; stipulas ovate-lanceolate; leaves with 8-13 pairs of small, oblong, acutish leaflets; peduncles longer than the leaves; vexillum linear; legumes erect, ovate, triquetrous, mucronate, villous, disposed in heads; cells 1-seeded. H. H. Native of Spain and the south of France, in arid places. D. C. astr. no. 22.—Clus. hist. 2. p. 242. with a figure. Allied to the smaller
variety of *A. hypoglottis*, but differs in that the stipulas being free, not connate. Flowers purplish.

*Mittlert* Milk-Vetch. *Fl. June, July.* *Ct. 1856.* *Pl. pro-
cumbent.*

73 A. *oxyloclòtis* (Stev. in Bieb. fl. taur. 2. p. 192.) plant dif-
 fuse, puberulous; stipulas subulate; leaves having 5-9 pairs of
oblong emarginate leaflets; peduncles length of leaves, or rather
shorter; legumes sulate, acute, rather hoary, disposed in stellate
heads; cells 6-seeded. **O. H.** Native of Tauria, on hills about
Sudak. A. sesamens, Pall. *astr. no.* 104. exclusive of the syn-
onymes. Flowers unknown, but probably blue.

*Sharp-tongued* or *Sharp-podded* Milk-Vetch. *Fl. June, July.*
*Ct. 1817.* *Pl. diffuse.*

74 A. *séciolòtis* (Stev. in litt. *D. C. prod.* 2. p. 288.)
plant diffuse or rather procumbent; stipulas linear-subulate;
leaflets cuneate, emarginate, 6 or 8 pairs, smoothish; peduncles
one-half shorter than the leaves, and are, as well as the stems,
hoary; legumes spreading, crowded, furrowed, acrate, glabrous;
cells 3-4-seeded. **O. H.** Native about Astracan. Flowers
probably purplish. Perhaps this and the preceding species are
referable to division six, *Annulàtêres*.

*Smooth-tongued* or *Smooth-podded* Milk-Vetch. *Pl. spread.*

75 A. *cruciatûs* (Link, *num* 2. p. 256.) plant procumbent,
hoary, and villous; stipulas lanceolate; leaves with 6-8 pairs of
oblong-linear acutish leaflets; peduncles a little shorter than the
leaves; legumes between terete and compressed, dilated at the
base, clothed with shorted villi, and disposed in stellate heads;
cells 5-7-seeded. **O. H.** Native of Egypt and Siberia. A.
*stella*, Bieb. *fl. taur.* 2. p. 191. ex Fisch. in litt. Flowers vio-
laceous?

procumbent.*

76 A. *stella* (Goun. ill. 50.) plant diffusely procumbent,
clothed with hoary villi; stipulas lanceolate; leaves with 8-10
pairs of elliptic-oblong leaflets; peduncles length of leaves or
shorter; legumes almost terete, furrowed on the back, micro-
vasive, hairy, first in a head, but at length becoming stellately
disposed; cells 5-10-seeded. **O. H.** Native of the south of
no.* 7.-Loeb. *icon.* 2. t. 85. Flowers blush-purple. There is
a variety of this plant with acute leaflets.

77 A. *tribulóides* (Delile, ill. fl. *spp.* p. 22.) plant diffusely
procumbent, or almost stemless, clothed with hoary villi; stip-
ulas lanceolate; leaves with 7-9 pairs of elliptic-oblong leaflets;
heads of flowers axillary, sessile; legumes nearly terete, hairy,
furrowed on the back, disposed in stellate heads; cells 5-7-
seeded. **O. H.** Native of Egypt, in deserts. Perhaps distinct

Flowers purplish.

*Caltrop-like Milk-Vetch.* *Fl. June, Jul.* *Ct. 1817.* *Pl.
pr.*

78 A. *sesea* *mèus* (Lin. spec. 1068.) plant diffuse, villous,
and rather canescent; stipulas lanceolate; leaves with 9-10 pairs
of elliptic, emarginate leaflets; heads of flowers axillary, sessile;
le-
gumes terete, nearly terete, acuminate, villous, furrowed on the
back, disposed in heads; cells 7-8-seeded. **O. H.** Native of the
south of Europe and the north of Africa. *D. C. astr.* no. 8.
blush purple.*

§ 5. *Vesicârii* (from *vesico*, the bladder; in reference to the
calyxes in all the species contained in this division being in-
to the petiole. *Flowers purplish or white.* Calyces bladdery.

79 A. *lineâtus* (Lam. *lact.* 1. p. 314.) plant diffusely pro-
strate, clothed with villous pubescence; leaves with 8-10 pairs of
elliptic-oblong leaflets; peduncles longer than the leaves;
calyxes bladdery, rather villous, lined, and contracted at the
mouth, inclosing the legume, which is pilose. **O. H.** Native of
11. t. 1. *Flowers purplish.*

*Lined-calved Milk-Vetch. Pl. prostrate.*

80 A. *megalântîs* (*D. C. astr.* no. 58. t. 20.) plant diffuse,
rather hoary from adpressed down; leaflets oblong-elliptic; pe-
duncles shorter than the leaves; calyces inflated, clothed with
black adpressed down; legumes very hairy, length of calyx.
**O. H.** Native of Siberia, about Zmooct. *Cajanus megalânthûs.*
Sprung. Flowers large, pale. Stipulas sometimes joined togeth-
er at the very base. Said to be nearly allied to *A. vai-
fulûs.*

*Large-flowered Milk-Vetch.* *Pl. diffuse.*

81 A. *vesica* *mèus* (Lin. spec. 1071.) plant diffusely procumbent,
hoary from adpressed silky down; leaves with 5-7 pairs of
elliptic leaflets; peduncles longer than the leaves; calyx
bladdery, clothed with black adpressed down, and long white
spreading hairs; legumes hairy, a little longer than the calyx.
**O. H.** Native of the south of France, Hungary, and Tauria,
A. *dealbatus*, Pall. *astr. taur.* 29. f. 1. *Flowers having the vex-
ilum purple, the wings yellow, and the keel white, tipped with
yellow, rarely with all the petals cream-coloured.*

82 A. *aimca* *mèus* (*D. C. astr.* no. 59. t. 21.) plant tufted and
erectish, suffruticose at the base, canescent from adpressed down;
leaves with 3-4 pairs of ovate leaflets; peduncles a little longer
than the leaves; calyces bladdery, clothed with adpressed black
down; legumes hairy, ovate, compressed. **O. H.** Native of
Russia, between the Volga and the Don, at Sarepta, also of
Oxytropis *dealbatus*, Pers. *Flowers white or pale yellow.*

*White-stemmed Milk-Vetch.* *Pl. 3/4 foot.*

83 A. *arûcâneus* (Bertol. *med.* ex *Vis.* *pl. dalm. in bot.
zn.* no. 18.) plant silky; stems diffusely procumbent, herba-
aceous, permanent at the base; peduncles terminal, very long,
and loosely racemose; leaves with 5-7 pairs of linear leaflets;
stipulas distinct; wings entire, shorter than the vexillum; le-
gume straight, terete, acuminate. **O. H.** Native of Dalmatia.
Nearly allied to *A. vesicârius* but differs in the legumes being
terete and silky.

*Silvery Milk-Vetch.* *Pl. procumbent.*

§ 6. *Annulâtêres* (from annulôris, of a ring; in reference to the
shape of the legumes which are twisted into the form of a ring).

*D. C. prod.* no. 289. Stipulas distinct, not adhering to
the petiole. *Flowers purplish or white.* Legumes arched. *Roots
annual.*

84 A. *nuttalâllînus* (*D. C. prod.* no. 289.) plant decumbent;
leaflets elliptic, emarginate; peduncles 2-flowered, longer
than the petiole; legumes falcate, having 2 keels, glabrous;
seeds truncate. **Q. ? s.? 2.? H.** Native of North America,
in plains at Rod river. A. *micranthus*, Nutt. in *journ.* *sc.

t. 59.) plant herbaceous, procumbent, rather pilose; leaflets
obcordate, cuneate; peduncles length of leaves; legumes gla-

l. 2
brous, warty, beaked, arched, and most tumid at the base. 

\( \text{H. Native of Portugal, in barren sandy places. Corolla} \)

\( \text{sometimes white and sometimes purple.} \)

**Boat-fruited Milk-Vetch.** Fl. June, Jul. Clt. 1860. Pl. pr. 86. A. STRATATTELLES (Bieb. fl. taur. 2. p. 189.) plant diffuse, glabrous; leaflets cuneiform, somewhat emarginate; peduncles 3-flowered, shorter than the leaves; legumes ovate-oblong, tumid, glabrous, deflexed, a little arched. \( \text{H. Native of Tauria, about Sudak. Bieb. pl. ross. cent. 1. t. 20.} \) no. 1472. Corolla blue or white. Vexillum hardly longer than the wings, and obtuse keel.

**Striped Milk-Vetch.** Pl. diffuse.

87 A. ABLADIRAC (Forsk. aegypt. 159.) plant diffuse, clothed with cinereous villi; leaflets few, ovobate; peduncles few-flowered, length of leaves; young legumes straight, subulate, pubescent, adult ones glabrous, spotted, resupinate and arched. \( \text{H. Native of Egypt.} \) D. C. astr. append. no. 6. t. 7. A. mammatus, Lam. dict. 1. p. 316. A. subulatus, Desf. fl. atl. 2. P. 186. but not of Pall. Flowers small, rose-coloured.

88 A. TRIMORPHUS (Viv. fl. lyb. p. 44. t. 10. f. 2.) plant erect, and clothed with canescent hairs; lower leaves with 1-3 leaflets, upper ones impari-pinnate, with a few pairs of elliptic-oblong, acute leaflets; peduncles 2-3-flowered, a little longer than the leaves; legumes cylindrical, incurved, clothed with adpressed villi. \( \text{H. Native on the shores of Libya, in the Great Syrtis. Flowers purple.} \)

89 A. MIRABRITU (D. C. astr. no. 30. t. 13.) plant tufted and rather diffuse, pilose; leaflets elliptic-oblong; peduncles few-flowered, length of leaves; legumes slender, erect, hispid, when young they are straight, but when mature they are arched. \( \text{H. Native of Egypt, in the desert. Flowers pale, with the vexillum elongated.} \)

**Hispid-podded Milk-Vetch.** Pl. 1 f.

90 A. SCORPIONIDES (Poirr. in Willd. spec. 3. p. 1280.) plant erectly-spreading, pubescent; leaflets oblong, obtuse, emarginate; stipulas lanceolate; flowers axillary, 1-2, almost sessile; legumes hooked, subulate, pubescent. \( \text{H. Native of Spain,} \)

\( \text{about Madrid. A. subbilobatus, Lag. Flowers blue. This plant,} \)

\( \text{when growing in a dry place, hardly exceeds an inch in height,} \)

\( \text{but when growing in moist rich places it rises to a foot.} \)

Perhaps not distinct from A. canaliculatus, of Willd. emm. suppl. 189.

**Scorpion-like-podded Milk-Vetch.** Fl. June, Jul. Clt. 1816. Pl. 1 inch to 1 foot.

91 A. MARCOTUS (Delhil. fl. aegypt. 113. t. 39. f. 3.) plant diffusely-prostrate, rather hispid; leaflets ovobate, emarginate; peduncles 3-4-flowered, shorter than the leaves; legumes hooked and arched, almost cylindrical, glabrous, furrowed on the back, almost bilocular. \( \text{H. Native about Alexandria, and in the} \)

\( \text{Marocado marsh. Flowers blue.} \)

**Marado Milk-Vetch.** Fl. June, Jul. Clt. 1817. Pl. pr. 92 A. ARROGUS (Bert. aegypt. 38. rar. dec. 3. p. 35.) plant erectly-spreading, rather pubescent; leaflets oblong-cuneated, emarginate bilobately at the apex; peduncles usually 1-flowered, about equal in length to the leaves; legumes arched, furrowed, on the back a little smooth, transversely and reticulately wrinkled. \( \text{H. Native of Egypt. A. crusátus, Balb. cat.} \)

\( \text{taur. append. 1. p. 8. A. cranátus, Schultes, obs. 186. Flowers blue} \)

\( \text{or purplish.} \)

**Wrinkled-podded Milk-Vetch.** Pl. 1 f.

93 A. RETICULATUS (Bieb. suppl. fl. taur. 491.) plant diffuse and glabrous; leaflets oblong-cuneate and emarginate; peduncles usually 5-flowered, shorter than the leaves; legumes hooked, subulate, furrowed on the back, quite smooth, transversely and reticulately veined. \( \text{H. Native of Middle Iberia, at Sar} \)

\( \text{repair. Flowers blue. A very small plant.} \)

94 A. CANALICULATUS (Willd. emm. suppl. 52.) stems erect; leaflets oblong, retuse; stipulas oval; flowers axillary, solitary, nearly sessile; legumes hooked, profoundly channelled on the back. \( \text{H. Native of Europe. Flowers white.} \)

**Channelled Milk-Vetch.** Fl. June, Jul. Clt. 1816. Pl. 1 to 2 feet.

Series II. **Ochradæ (from \( \omega \chi \rho \delta, \) ochra, yellow, and \( \lambda \nu \varepsilon \kappa, \) leucos, white; the colour of the flowers is between white and yellow, that is cream coloured. D. C. prod. 2. p. 290. Stipulas free from the petiole. Flowers cream-coloured.

\( \text{§ 7. Bucérates (from \( \beta \omega \nu \beta, \) boves, an ox, and \( \varepsilon \rho \kappa \alpha, \) kras, a horn; in reference to the form of the pods. D. C. prod. 2. p. 290. Stipulas neither adhering to the petioles nor together.} \)

\( \text{Flowers cream-coloured. Legumes usually arched. Roots annual.} \)

95 A. CONTORUTUPLICATE (Lin. spec. 1068.) plant procumbent, villously-pubescent; leaflets ovobate, emarginate; racemes pedunculate, 4-times shorter than the leaves; legumes contortuplicate, channelled on the back, villous. \( \text{H. Native of Siberia, Tauria, and Hungary, in grassy places. Pall. astr. t.} \)

\( \text{79.—Gmelin. sib. 4. t. 28. D. C. astr. no. 29.—Buxb. cent. 3.} \)

\( \text{p. 22. t. 59. Flowers pale yellow. This plant varies wonderfully in size, according to the soil in which it grows.} \)

96 A. TRIMUS (Lin. spec. 1073.) but not of Bieb.) plant diffuse, villously-pubescent; leaflets elliptic, emarginate; peduncles 2-5-flowered, a little shorter than the leaves; legumes hooked, subulate, rather pubescent, broadly furrowed on the back, and 2-keeled. \( \text{H. Native of Egypt and the island of} \)

97 A. HAMUS (Lin. spec. 1067.) plant diffuse, pubescent; leaflets cuneate, emarginate, glabrous above; peduncles 6-flowered, shorter than the leaves; legumes hooked, furrowed on the back, almost terete, subulate at the apex, when young pubescent, but when adult smooth. \( \text{H. Native of dry exposed places, from Spain to Tauria, and of Mauritania.} \)

\( \text{Goert. fruct. t. 154. D. C. astr. no. 51.—Moris. exon. sect. 2. t. 9. f. 10. A. Austrsien, Delaarb. A. biceps, Willd. emm. suppl. p. 51. according to Link and Fisheer. The plant is} \)

\( \text{either prostrate or diffuse, and the peduncles bear from 2-8} \)

\( \text{flowers; they are pale-yellow; it goes commonly under the} \)

\( \text{name of caterpillars in the gardens, in reference to the shape} \)

\( \text{of the pods.} \)

**Var. \( \beta, \) macrocarpus (D. C. prod. 2. p. 290.) plant decumbent or erect; peduncles equal in length to the leaves. Led. hort. dopr. p. 23. Legumes 3-times larger than those of the species.} \)

98 A. EONERAS (Willd. emm. suppl. 52.) plant diffuse and pubescent; leaflets elliptic, emarginate; stipules lanceolate, acuminate; racemes 8-10-flowered, pedunculate, twice or thrice shorter than the leaves; legumes hooked, compressed at the apex, somewhat pubescent, channelled on the back. \( \text{H. Native country unknown.} \) Flowers pale yellow. Sometimes the plant is erect.

99. *Brachyurus* (Ledebo. cit. horti. dorp. 1822. p. 3.) plant procumbent; leaflets elliptic, mucronate; stipulas ovate; racemes pedunculate, shorter than the leaves; legumes nearly erect, incurved, subulate. O. H. Native of the North of Persia, and probably of the south of Tartia. A. trimetris, Bieb. fl. taur. 2. p. 190. Legumes much shorter than those of *A. hamatus*, and the plant is also much smaller. Flowers pale yellow.

100. *Gennikulatus* (Desf. atl. 2. p. 186. t. 205.) plant diffuse, hoary from villi; stipulas lanceolate; leaves obovate, emarginate, about 11-12 pairs; racemes pedunculate, longer than the leaves; legumes depressed, ending each in a long mucron, arately hooked upwards, tubercular, and puberulous. O. H. Native of Syria and Cappadocia. The fruit of the Cappadocian plant is much larger than those of the Syrian one. Flowers pale yellow.

*Joel* Milk-Vetch. Pl. diffuse.

101. *Tuberulous* (D. C. astr. no. 60. t. 22.) plant erect, hispid at the apex; stipulas lanceolate; leaflets obovate, emarginate, about 11-12 pairs; racemes pedunculate, longer than the leaves; legumes depressed, ending each in a long mucron, arately hooked upwards, tubercular, and puberulous. O. H. Native of Syria and Cappadocia. The fruit of the Cappadocian plant is much larger than those of the Syrian one. Flowers pale yellow.

*Tuberulous*-fruit Milk-Vetch. Pl. 1 foot.

102. *Eveotiss* (Lin. mant. 274.) plant procumbent, clothed with hoary villi; stipulas lanceolate, and are, as well as the calyces, clothed with black villi; leaves with 6-7 pairs of oblong-linear leaflets; spikes of flowers capitiate, on very short peduncles; legumes depressed, somewhat cordate, acuminated, with somewhat reticulate margins, spreading, and pubescent. O. H. Native of Spain, Barbary, the Levant, and south of France. D. C. astr. no. 56.—Herm. inul. bot. p. 77. Riv. tetr. 109. f. 1. Flowers pale yellow.

103. *Triangularis* (D. C. prod. 2. p. 291.) stem erect, smoothish, trigonal; stipulas membranous, acuminated, villous; leaves with 8-10 pairs of elliptic-oblong, obtuse, emarginate leaflets; spikes of flowers pedunculate, longer than the leaves; legumes pendulous, triquetrous, few-seeded, straight, independently 2-celled. O. H. Native country unknown. Phacă triangularis, Zea in Horn. hort. hafn. suppl. 65. Flowers pale yellow.

104. *Barbicus* (Lin. spec. 1068.) plant procumbent, pubescent; stipulas membranous, ovate, acuminated; leaves with 10-15 pairs of obovate retuse leaflets; spikes of flowers on very short peduncles; legumes erect, triquetrously-prismatic, glabrous, straight, but hooked at the apex. O. H. Native of Spain, Barbary, Sicily, and the Levant. A. cuniculatus, Mench. A. triangularis, Munt. phyt. t. 110.—Riv. tetr. irr. t. 105.—Bocc. sic. & t. 4. Flowers pale yellow. The plant under this name in the gardens is erect; it is therefore perhaps the preceding species. In Hungary the seeds are roasted, ground, and used as a substitute for coffee.

§ 8. *Synochreas* (from *syn*., together, and *wpros*, ochros, yellow; the stipules are joined together, and the flowers are yellow). D. C. prod. 2. p. 291. *Stipulas free from the petiole, but joined together*. Flowers cream-coloured. Root perennial.

105. *Emarginatus* (D. C. astr. no. 47.) plant almost stemless and ascending, clothed with somewhat tomentose villi; stipulas membranous, concretes with 20-25 pairs of ovate emarginate leaflets; spikes of flowers obtuse, dense, on radical peduncles or scapes, which are much longer than the leaves; legumes roundish, hairy. O. H. Native of the Levant. Flowers pale yellow.

*Var. α, densifolius* (Lam. dict. 1. p. 317.) leaflets small, much crowded. Rauw. hodap. 123. t. 29.

106. *Capitatus* (Lin. spec. 1064.) plant cauline, erect; leaflets emarginate; spikes capitulate, on elongated peduncles. O. H. Native of the Levant. Flowers purple.

107. *Fraenars* (Willd. spec. 3. p. 1294.) plant procumbent, and almost stemless, glabrous; stipulas concretes, marcescent; leaves with 8-10 pairs of elliptic acutifoliate leaflets, which are pubescent beneath; peduncles about equal in length to the leaves; spikes of flowers obtuse; racemes ovate, membranous; legumes glabrous. O. H. Native of Cappadocia. A. glaber, D. C. astr. no. 44, but not of Mikhx. A. orientalis minimus follis vicie et floribus ex viridii-flavescentibus odoratissimis, Tourn. cor. 29. Flowers greenish yellow.

*Fragrant* Milk-Vetch. Pl. procumbent, an inch long.

108. *Microphyllum* (Lin. spec. 1067. Willd. spec. 3. p. 1577.) plant diffuse, smoothish; lower stipulas free, upper ones concretes; leaves with 15-18 pairs of puberulous leaflets, the lower ones oblong and emarginate, the upper ones linear and rotate; peduncles longer than the leaves; legumes erect, crowded in spikes, inflated, ovate, hairy. O. H. Native of Siberia in pastures; also of Thuringia and Hereyma, if the synonyme of Willd. be rightly attached. The fruit is that of *A. cicer*, but the leaves and stipulas are different. Flowers pale yellow. The specimen in the Linnaean herbarium is pubescent, with 6-7 pairs of roundish emarginate leaflets.

109. *Semibiculauris* (D. C. astr. no. 64. t. 23.) plant erect, rather ascending, smoothish; lower stipulas concretes, upper ones distinct; leaves with 9-11 pairs of elliptic-oblong acute leaflets; peduncles longer than the leaves; legumes erect, disposed in heads, oblong-triquetrous, half-biculose. O. H. Native of Siberia, about Ziczof. Flowers pale yellow.

110. *Resupinatus* (Bieb. fl. taur. suppl. p. 493.) plant with short diffuse stems, and clothed with adpressed pubescence in every part; stipulas concretes; leaves with 5-10 pairs of elliptic acutifoliate leaflets; peduncles about equal in length to the leaves; legumes oblong, nearly terete, arching, resupinate, and rather pilose. O. H. Native of middle Iberia. A. physodes var. perpusilla, Bieb. fl. taur. 2. p. 198. Flowers pale yellow.

111. *Retans* (Willd. hort. berl. 2. t. 88.) plant procumbent, creeping, glabrous; some of the stipulas concretes, and others free; leaves with 12-13 pairs of linear, lanceolate, obtuse, mucronate leaflets; racemes pedunculate, hardly shorter than the leaves; legumes lanceolate, pubescent, half-biculose. O. H. Native of Mexico. Flowers white. Allied to *A. odoratus*, according to Link. There is a specimen in the Lamberton herbarium, which agrees with this in every particular, but the leaves
are hairy on the under surface, and the peduncles are equal in length to the leaves.

112 _A. odo-ratus_ (Lam. dict. 1. p. 311.) plant erect, and rather ascending, pubescent; stipules concrep.; leaves with 11-14 pairs of oblong acute leaflets; peduncles length of leaves; bracteas smaller than the calyx; legumes oblong, terete, glabrous, spreadingly reflexed. **2. H.** Native of the Levant. D. C. astr. no. 67. t. 54. Habit of _A. nigricans_, but differs in the stipula being concrep. Flowers pale yellow, sweet-scented.

119 _A. stipulatus_ (D. Don, prod. fl. nep. p. 246. and in bot. mag. 2380.) plant erect, glabrous; stipules concrep., foliose; leaves with 8-16 pairs of oval-oblong, or obovate mucronulate leaflets; peduncles about the length of the leaves; flowers disposed in loose spikes, at first erect, but at length drooping; legumes compressed, stipitate, glabrous, drooping. **2. H.** Native of Upper Nipal at Corasan. Corolla greenish-white, tinged with red. A. lanceolatus, Hamilton, in herb. Lamb. Corolla stipulata, ibid. Habit of _A. glycyphyllos._ Stipulas 2 inches long, and half an inch broad.

_Large-stipulated Milk-Vetch._ Fl. June, July. Clt. 1822. Pl. 2 to 2 1/2 feet.
115 _A. fraxinifolius_ (D. C. astr. no. 71.) plant erect, smooth; stipules concrep., marcescent; leaves with 6-7 pairs of ovate acuminate leaflets, which are pubescent beneath; peduncles shorter than the leaves; legumes pendent, subulate, trilobed, sessile, a little arched and glabrous. **2. H.** Native of the Levant. Tourn. cor. 29. Flowers yellow. _Like A. stipulatus._

_Ash-leaved Milk-Vetch._ Pl. 2 to 3 feet.

§ 9. _Ciceroddei_ (from _cicer_, the chick-pea, and _idea_, similar; plant similar to the chick-pea in habit). _D. C. prod._ 2. p. 292. _Stipulas neither adhering to the pedicels nor to each other, Flowers cream-coloured, disposed in pedunculate spikes. Roots perpendicular. Legumes sessile._

116 _A. glycyphyllus_ (Lin. spec. 1067.) plant prostrate, glabrous; stipulas ovate-lanceolate, entire; leaves with 4-5-7 pairs of oval, bluntish, smooth leaflets; peduncles shorter than the leaves; spikes of flowers ovate-oblong; legumes almost terete, obscurely triangular, with a slight longitudinal furrow, curved upwards, pointed, smooth, and even. **2. H.** Native of Europe and Siberia. In Britain in woods, thickets, borders of fields, or on the sides of hills, on a chalky or gravelly soil. Smith, engl. bot. t. 203.—Riv. tetr. irr. t. 105. Flowers sulphur-coloured. The leaves have at first a sweetish taste, soon changing on the palate to a nauseous bitter. Cattle are not fond of them, nor is this plant applied to any agricultural use. _Sweet-leaved or Liquorice-Vetch._ Fl. June, July. Britain. Pl. prostrate, 2 to 3 feet long.
117 _A. glycyphylloides_ (D. C. prod. 2. p. 292.) plant procumbent, pubescent; stipulas oblong, leafy, rather stipitate; leaves with 7 pairs of oval leaflets; peduncles shorter than the leaves; spikes of flowers ovate-oblong; legumes acute, 5-toothed; legumes spreading, disposed in something like a spike, subulate, trilobed, straight, glabrous. **2. H.** Native of Iberia. Flowers pale yellow.

118 _A. secundus_ (D. C. astr. no. 55.) plant prostrate, glabrous; stipulas ovate-oblong, with pubescent margins, and are, as well as the bracteas, leafy; leaves with 4-5 pairs of ovate leaflets; peduncles longer than the leaves; flowers secund, spreading; calyx truncate; legumes stipitate, compressed, oblong, glabrous. **2. H.** Native of the south of Siberia. Flowers pale yellow. Allied to _A. glycyphyllus._

_Secund-flowered Milk-Vetch._ Pl. prostrate.
119 _A. secundiflorus_ (D. C. astr. no. 45.) plant almost stemless and suffrutescence, clothed with silky pubescence; stipulas lanceolate; leaves with 11-13 pairs of oblong-elliptic leaflets; peduncles a little longer than the leaves; spikes capitulate; legumes ovate, silky, acute from the style. **2. H.** Native of the Levant. A. orientalis minus flore glemorato virescente. Tourn. cor. 29. Flowers greenish yellow.

Silky Milk-Vetch. _Pl. 1/2 to 3/4 foot.
120 _A. strigulosus_ (H. B. et Kunth, nov. gen. amer. 6. p. 494.) stems herbaceous, procumbent, clothed with strigose pubescence, as well as the under side of the leaves, but they are glabrous above; leaves with 9-10 pairs of oblong-obtuse leaflets; stipulas ovate-oblong, acuminate; racemes cylindrically oblong, with longer pedicels; calyx light with black stipers. **2. H.** Native of Mexico, in temperate parts. Flowers pale-yellow. Perhaps belonging to a different division.

_Strigose Milk-Vetch._ Pl. procumbent.
121 _A. kahniacus_ (D. C. prod. 4. p. 292.) plant diffuse, tomentose; stipulas broad, short, acute; leaves having 5-7 pairs of orbicular leaflets; peduncles length of leaves; flowers disposed in spicate racemes, erect; calyx when in fruit inflated; legumes stipitate, ovate, smooth. **2. F.** Native of Egypt, between Cairo and Soueys. A. longiflorus, Delil. fl. egyp. 112. t. 39. f. 2: but not of fall. Flowers pale yellow.

_Cairo Milk-Vetch._ Pl. diffuse.
122 _A. pergeranus_ (Vahl. symb. 1. p. 57.) plant diffuse, clothed with hairy tomentum; stipulas lanceolate; leaves having 11-13 pairs of obovate acuminate leaflets; peduncles length of leaves or shorter than them; flowers disposed in spikes, lower ones remote; legumes somewhat triquetrous, a little arched, hairy. **2. H.** Native of Egypt. D. C. astr. no. 72. t. 27. Flowers pale-yellow. There is a variety of this plant with fewer flowers, which are sessile in the axils of the leaves.

_Foreign Milk-Vetch._ Pl. diffuse.
123 _A. depressus_ (Lin. spec. 1073.) plant almost stemless or diffuse, clothed with canescence pubescence; stipulas ovate, membranous; leaflets 9-11 pairs, ovate; peduncles shorter than the leaves; legumes terete, depressed, straight, drooping, glabrous. **2. H.** Native of the south of Europe, in rugged exposed places, and on mountains. All. ped. no. 1277. t. 19. f. 3. D. C. astr. no. 48. Lodd. bot. cab. 680. Flowers cream-coloured. A. helmintocarpus, Vill. mosp. 42. t. 25. f. 2. daumph. 3. p. 456. t. 42. f. 2. but Villars describes his plant as having no peduncle, the leaflet hoary, cut at the apex, and the legume oblong-elliptic and thickening.

124 _A. leucopilus_ (Smith, in Lin. trans. 1. p. 258.) plant prostrate, clothed with canescence villi; stipulas ovate, trapezoid, membranous; leaves with 12-14 pairs of obcordate leaflets; peduncles shorter than the leaves; legume terete, depressed, acute, deflexed, glabrous. **2. H.** Native country unknown. Very like the preceding species, but the flowers are nearly white at first, but at length changing to a dirty purplish colour.

126 A. Glaber (Michx. fl. bor. amer. 2. p. 66. but not of D. C.) plant low and smooth; leaves with 10-11 pairs of elliptic-oblong, obtuse or emarginate leaflets; peduncles longer than the leaves; flowers disposed in racemose spikes; legumes distant, spreading, depressed, incurved. 2. H. Native of Georgia and South Carolina, in sandy woods. Flowers white.

Smooth Milk-Vetch. Pl. 1/2 to 1 foot.

126 A. Cléver (Lin. spec. 1067.) plant diffusely procumbent, rather pubescent; stipulas lanceolate; leaves with 10-13 pairs of elliptic-oblong mucronate leaflets; peduncles longer than the leaves; flowers disposed in spike-like heads; legumes inflated, hairy, mucronate. 2. H. Native of Europe, in mountain meadows and hedges. D. C. astr. no. 57. var. a. J. caci. n. s. 3. t. 231. — All. pedem. no. 1266. t. 41. f. 2. — Div. tetr. irr. t. 108. — Moris. oxon. sect. 2. t. 9. f. 9. Corolla pale-yellow.

Chick-pea Milk-Vetch. Fl. July, Aug. Clt. 1570. Pl. proc. 127 A. Vélinosus (Lin. spec. 1066.) plant erect, somewhat diffuse, and rather pubescent; stipulas lanceolate, acuminate; leaves with 10-11 pairs of elliptic-oblong leaflets; peduncles about equal in length to the leaves; flowers disposed in spikes; bracteae about equal in length to the calyx; legumes rather reflexed, terete, glabrous, with a longitudinal furrow on the back. 2. H. Native of Siberia, in humid meadows. Pall. astr. t. 26. D. C. astr. no. 66. — Gmel. sb. 4. t. 17. 18. Flowers pale yellow, the top of the keel violet-coloured.

128 A. Micranthes (Desv. journ. bot. 1814. 1. p. 78. but not of Nutt.) plant diffuse, rather pubescent; stipulas ovate; leaves having 11-12 pairs of elliptic, obtuse leaflets; peduncles twice the length of the leaves; flowers disposed in spikes; bracteae shorter than the calyx; legumes deflexed, somewhat trigonal, smoothish. 2. H. Native country unknown.

129 A. Canadensis (Lin. spec. 1066.) plant erect, rather pubescent; stipulas lanceolate, acuminate; leaves having 10-12 pairs of elliptic-oblong, bluntish leaflets; peduncles about equal in length to the leaves; flowers disposed in spikes; bracteae shorter than the calyx; legumes erect, oblong, terete, glabrous. 2. H. Native of North America, from Canada to Carolina. D. C. astr. no. 65. Dodart. icon. t. 65. — Dill. ellth. 46. t. 39. f. 45. Corolla yellow. Root creeping.

130 A. Caroliniana (Lin. spec. 1066.) plant erect, glabrous; stipulas ovate, acuminate; leaves with 20 pairs of oblong leaflets, which are pubescent beneath; peduncles longer than the leaves; flowers disposed in spikes; bracteae length of pedicels; legumes erect, ovate, tumid, beaked. 2. H. Native of Virginia and Carolina, on mountains. — Dill. ellth. t. 39. f. 45. Flowers pale yellow.

132 A. Falciformis (Desf. amend. ad. D. C. astr. no. 69.) plant erect, glabrous; stipulas lanceolate, acuminate; leaves with 10-15 pairs of elliptic, obtuse, leaflets; peduncles rather shorter than the leaves; legumes compressed, drooping, falcate, rather stipitate. 2. H. Native of Algiers, at the foot of Mount Atlas. A. falcatus, Desf. fl. atl. 2. p. 182. t. 206. Flowers pale yellow or greenish yellow.

133 A. Asper (Jacq. icon. rar. 1. t. 152.) plant erect, straight, rough from hairs, which are fixed by their centre; stipulas linear-lanceolate; leaves with 12-15 pairs of lanceolate leaflets; peduncles much longer than the leaves; flowers spicate, erect; legumes oblong, trigcuetrous, acuminate, clothed with adpressed pubescence. 2. H. Native of Siberia, Tauria, Caucasus, Hungary, &c. D. C. astr. no. 68. A. chloranthus, Pall. astr. no. 34. t. 25. Flowers greenish yellow, tipped with orange.

134 A. Chlorostachys (Linll. miss.) this plant comes very near A. stipitatus and A. galegifórmis, both in habit and character. It is cultivated in the English gardens, but we have not been able to procure a specimen, and therefore the description remains a desideratum. 2. H. Native of Nipaul. Flowers greenish-yellow. A. malachyphillus, Hort.

135 A. Pallascens (Bieb. fl. unc. suppl. p. 489.) plant ascending, canescent; stipulas lanceolate; leaves with 5-6 pairs of linear-elliptic leaflets; peduncles much longer than the leaves; flowers disposed in spicate racemes, rather distant; legumes erect, oblong, and somewhat trigcuetrous, clothed with adpressed pubescence, acuminate mucronate. 2. H. Native of Siberia, between the Don and the Volga. Flowers cream-coloured. This plant would have been brought into the division Dissitifórce, if it had not been for the colour of the flowers.

136 A. Chinese (Lin. fil. dec. 1. t. 83.) plant erect, glabrous; leaves with 12-13 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; flowers pendulous, racemose; legumes ovate, inflated, hardly mucronate. 2. H. Native of China. Flowers pale yellow, but finally become white.

137 A. Galégifórmis (Lin. spec. 1066.) plant erect, glabrous; leaves with 12-13 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; flowers pendulous, racemose; legumes trigcuetrous, mucronate at both ends. 2. H. Native of Siberia, and Iberia. Pall. astr. no. 38. 29. D. C. astr. no. 61. Flowers pale yellow.

138 A. Drummondii (Dough. in Hook, fl. bor. amer. p. 153. t. 57.) plant glabrous; stems flexuous; leaves with 10-12 pairs of ovate-lanceolate, obtuse, mucronate leaflets; bracteae subulate, about the length of the pedicels, or perhaps longer; peduncles a little longer than the leaves, pubescent as well as the petioles, and under side of the leaves as well as the calyces. 2. H. Native of North America. Flowers yellow. Like A. galegifórmis.

Drummond's Milk-Vetch. Pl. 2 feet.

139 A. Succulentii (Dough. mass.) plant strong and very villous; stems flexuous; leaflets obovate, obtuse; stipular broad, triangular; bracteae subulate, about the length of the tube of the calyx; racemes about the length of leaves. 2. H. Native of North America, on the barren grounds of the Columbia. Flowers apparently yellow. Legumes flat, smooth.

Crouching Milk-Vetch. Pl. 1 foot.

**Race-mose-flowered Milk-Vetch.** Pl. 2 to 3 feet.

141 A. _floer's-vulnis_ (D. C. prod. 2. p. 294.) plant almost erect, glabrous; leaves with 6-7 pairs of elliptic, emarginate leaflets; peduncles longer than the leaves: flowers erect, racemose; legumes pendulous, ovate, depressed, reticulatedly veined. 2. H. Native of New Holland, on the eastern coast, and the island of Timor. The cauline stipulas are distinct, and deeply bi or tridentate. The style is compressed, ensiform, and bearded at the apex on the upper side. Legume on a short stipe, with the cells 2-seeded. Perhaps this plant will constitute a new genus.

**Winged-styled Milk-Vetch.** Pl. 1 foot.

§ 11. _Allopecuroides_ (from αλοπέκα, _alopex_, a fox, _ovra_, _oura_, a tail, and _εικος_, _eidos_, form; in reference to the shape of the spikes of flowers, which has been likened to a fox's tail). _D. C. prod._ 2. p. 294. *Stipulas not adhering to the pedicels. Stems erect, straight._ Flowers yellow, disposed in thick dense spikes, which are either sessile, or on very short peduncles, in the axils of the leaves.

142 A. _alope'cias_ (Pall. astr. p. 12. t. 9.) plant erect; leaflets elliptic, villous; stipulas lanceolate; spikes sessile, cylindrical, almost the length of the leaves; tube of calyx woolly, somewhat glbose, with the segments subulate, and rather longer than the corolla. 2. H. Native of Siberia, at Lake Aigal, in the Songaristan desert. Flowers pale yellow.

**Foz Milk-Vetch.** Pl. 3 to 3 ft.

143 A. _macro'pha'lus_ (Willd. spec. 2. p. 295.) plant erect; stem glabrous; leaflets oblong-elliptic, glabrous; stipulas large, acuminate; spikes of flowers globose, pedunculate; teeth of calyx subulate, length of tube, but shorter than the corolla. 2. H. Native of Iberia, on hills, and of Galatia, in fields. _Bieb._ fl. taur. 2. p. 183. *A. orientalis, Pers.? Flowers yellow._

**Large-headed Milk-Vetch.** Pl. 3 to 4 feet.

149 A. _obusif'fas'_ (D. C. prod. 2. p. 295.) plant erect; stem and leaves clothed with velvety villi; leaflets broadly obovate, very obtuse; stipulas narrow-lanceolate; spikes globose, containing about 8 or 10 flowers, pedunculate; calycine teeth subulate, length of tube, but shorter than the corolla. 2. H. Native of the Levant, between Mossoul and Bagdad. Leaflets 11-15, never more, by which it is easily distinguished from all the other species of this division.

**Obuse-leaved Milk-Vetch.** Pl. 2 to 3 feet.

§ 12. _Christiania_ (so called from the similarity of the species to _A. Christianus_ of Lin., which is called by Dioscorides _Christian-a radix_ or _Christian-root_; in reference to the country in which it grows wild). _D. C. prod._ 2. p. 295. *Stipulas adnate to the pedicel, but not joined together. Flowers cream-coloured, disposed in glomerate, almost sessile racemes in the axils of the leaves._

150 A. _macro'car'pus_ (D. C. astr. no. 73. t. 28. but not of Pall.) plant erect, hairy; stipulas lanceolate; leaves with 11-14 pairs of ovate-oblong leaflets; flowers glomerate, almost sessile, axillary; legumes inflated; ovate-globose, mucronate, glabrous, large. 2. H. Native of the Levant. Flowers pale yellow.

**Long-fruited Milk-Vetch.** Pl. 2 to 3 feet.

151 A. _ste'ver'sa'nis_ (Pall. astr. no. 18. t. 12.) plant erect, rather hairy; stipulas ovate-lanceolate, acuminate; leaves having 10-12 pairs of ovate-oblong leaflets; flowers glomerate, almost sessile, axillary; legumes inflated, ovate-globose, mucronulate, callos, tomentose. 2. H. Native of the south of Siberia, at the river Ultecha. Flowers pale yellow.

**Siever's Milk-Vetch.** Pl. 2 to 3 feet.

152 A. _christ'i'a'nis_ (Lin. spec. 1064.) plant erect, hairy; stipulas membranous, lanceolate, acuminate; leaves with 12-24 pairs of elliptic-lobulate leaflets; flowers glomerate, sessile in the axils of all the leaves; legumes ovate, wrinkled, glabrous. 2. H. Native of Judea, and between Aleppo and Mossul, and of Armenia. _Tour._ voy. 2. p. 254, with a figure. A. _floridus_, _Scop._ ins. 2. p. 108. Flowers yellow.

**Christian Milk-Vetch.** Fl. Jul. _Ch. 1787._ Pl. 2 to 3 ft.

153 A. _toment'o's'_ (Lam. dict. 1. p. 312.) plant erect, clothed in every part with soft tomentum; stipulas lanceolate; leaves with 20-25 pairs of ovate-lobulate, somewhat emarginate leaflets; flowers glomerate, almost sessile in the axils of the leaves; legumes oblong, terete, acuminate, callos, hairy. 2. H. Native of Egypt. _D. C. astr._ no. 80. t. 29. A. _fruticosus_, _Forsk._ agg. 139. Flowers yellow.

154 A. _si'e'ver'ni'_ (D. C. prod. 2. p. 295.) stem erect, clothed with hoary, silky, adpressed hairs; stipulas membranous, acuminate; leaves having 20-25 pairs of elliptic, obtuse leaflets, when young clothed with canescent villi; flowers axillary, almost sessile; legumes triquetrous, acuminate, pubescent. 2. H. Native of Egypt. A. _tragoun._ _Sieb._ pl. excis. but not of D. C. Flowers pale-yellow. Allied to the preceding

---

*Leguminosae.* _CXXXI. ASTRAGALUS._

---
species, and like it having the petioles permanent, and therefore falls into section Tragacanthae.

Series III. Tragacanthae (from τραγος, tragos, a goat, and ακένθα, akentha, a spine; in reference to the similarity of the species to A. tragacantha, which is vulgarly called goat's-thorn). D. C. prod. 2, p. 295. Stipulas adnate to the petioles. The petioles are permanent, and at length become hardened spines.

* Flowers sessile in the axes of the leaves.

155 A. trigo (D. C. astr. no. 81.) flowers axillary, sessile, solonry, concealed under the stipulas; legumes trigonal, acuminate, sterile from pubescence; leaflets with 6-7 pairs of leaves, which are clothed with hoary wool. F. Native of Egypt. Flowers yellowish.

Trigonal-fruited Goat's-Thorn. Shrub ½ to 1 foot.

156 A. cryphiocarpus (D. C. astr. no. 82.) flowers solitary, axillary, latent; legumes ovate, hairy, 2-seeded; leaves having 4-6 pairs of linear leaflets, which are as well the stipules quite glabrous. F. Native of Armenia. Trag. orientalis humilima folis fвеч., &c. Tourn. cor. 29. Flowers pale yellow.

Hidden-fruited Goat's-Thorn. Shrub ½ to 1 foot.

157 A. borba jovis (D. C. astr. no. 83.) flowers solitary, latent; calyxes 5-parted, very villous; legumes ovate, glabrous, almost 1-celled, 1-2-seeded; leaves having 3-5 pairs of oblong, acute, hoary-tomentose leaflets. F. Native of Armenia. Trag. orientalis humilima argentea, &c. Tourn. cor. 29. Tragacantha argentea, Mill. Corolla purpurlsh?

Jupiter's-beard Goat's-Thorn. Shrub ½ to 1 foot.

158 A. microcephalus (Willd. spec. 3. p. 1332.) flowers axillary, sessile, somewhat capitate; calyxes woolly, 5-cleft; leaves having 4 pairs of lanceolate, hoary, mucronate leaflets. F. Native of Armenia.

Small-headed Goat's-Thorn. Shrub ½ foot.

159 A. eriocaulos (D. C. astr. no. 84.) flowers axillary, solitary, latent; calyxes usually hardly 5-cleft; leaves with 4-5 pairs of oblong acute leaflets, which are woolly, as well as the stems. F. Native of Armenia. Trag. orientalis folius incanis caele et ramulis tomentosis, Tourn. cor. 29. Corolla cream-coloured? Legume unknown.

160 A. caucasicus (Pall. astr. p. 2. t. 2.) flowers 2-3-together, axillary, sessile; calyxes 5-cleft, clothed with woolly villi; legumes 1-celled, 4-seeded; leaves having 5-7 pairs of oblong-linear leaflets, which are clothed with hoary tomentum. F. Native of Caucasus, on barren rocks. Flowers white (Bieh.), cream-coloured (Pall.). Stipulas when young clothed with white tomentum, but at length becoming glabrous. Bieh. fl. taur. 2. p. 205. Willd. spec. 3. p. 1331. exclusive of the synonyme of Tournafort.

Caucasian Goat's-Thorn. Fl. June, July, Cit. 1824. Sh. ½ ft.

161 A. a'vmmifer (Labbill. jourr. phys. 1790. p. 46. with a figure,) flowers 3-5-together, axillary, sessile; calyxes 5-cleft, and are, as well as the legumes, woolly; leaves having 4-6 pairs of oblong-linear glabrous leaflets. F. Native of Mount Lebanon. Flowers yellow, rising from the axis of all the leaves, as well as in the preceding species, and therefore they appear in something like a spike. Gum tragacanth flows from this plant, but more sparingly than from A. vernus. D. C. astr. no. 85. exclusive of the synonyme of Tournafort.

Vol. II.

Gum-bearing Goat's-Thorn. Fl. June, July. Sh. ½ to 1 ft.

162 A. existus (Oliv. voy. 3. t. 44) flowers 2-3-together, axillary, sessile; calyxes tomentose, obtusely 3-toothed; leaves having 8-9 pairs of linear hispid leaflets. F. F. Native of the Levant. A. grinnifer var. β, hispidulus, D. C. astr. no. 85. Young stipulas clothed with silky villi, adult ones glabrous. According to Olivier, a traveller in the Levant, the greater part of the gum-tragacanth which is imported into Europe is obtained from this plant. Tragacanth exudes from it naturally from July to September, either from wounds made in the shrub by animals, or from fissures occasioned by the force of the juice during the great heats of summer. According as the juice is more or less abundant, tragacanth exudes in twisted filaments, which sometimes assume the form of a small worm, elongated, rounded, and compressed, rolled up upon itself or twisted. The finest and purest tragacanth assumes this form. It is almost transparent whitish, or of a yellowish white. It also exudes in large tears, which preserve more or less of a vernacular form. This is more of a reddish colour, and more contaminated with impurities. The quantity of tragacanth furnished by Persia is very considerable. Much is consumed in that country in the manufacture of silk, and the preparation of comfits. It is exported to India, Bagdad, and Bussorah. Russia also gets some by way of Bakou. Tragacanth, though generally called a gum, differs very much from gum Arabic in its properties. It is opaque, white, difficultly pulverizable, unless when thoroughly dried, and the mortar heated, or in frost, and it cannot be said to be properly soluble in water, for it absorbs a large quantity of that fluid, and increases in bulk. It is totally insoluble in alcohol. Its mucilage differs from that of gum-Arabic in being precipitated by the superacetate of lead and oxymuriate of tin, and not by silicized potass, or the oxymuriate of iron. In pharmacy tragacanth is employed for forming powders into troches, and rendering them tough cohesive substances, by beating them with mucilage of tragacanth, and then drying the mass. For electuaries it is improper, as it renders them sticky on keeping. It is also an improper adjunct to active powders, as it swells up on attempting to mix them with water. It is a demulcent, and may answer the purposes of gum-arabic, being better adapted for allaying tickling cough, and soothing the fæces in catarrh afflection, owing to its great viscosity.

True Tragacanth or Goat's-Thorn. Shrub ½ to 3 feet.

163 A. setiferus (D. C. prod. 2. p. 295.) flowers and leaflets unknown, but the last fall very soon off the plant; there are fascicles of silky bristles, rising from the axis of the spines. F. Native of the Levant. This species is hardly known, but from the habit it is allied to the preceding plant, but it differs from it in having axillary fascicles of bristles.

Bristle-bearing Goat's-Thorn. Shrub ½ foot.

164 A. erianthus (Willd. spec. 3. p. 1332.) flowers axillary, sessile, aggregate; calyxes globose, woolly; leaves with 5 pairs of oblong, acute, glabrous leaflets. F. F. Native of Armenia. Petioles yellowish.

Woolly-flowered Goat's-Thorn. Shrub ½ foot.

165 A. breviflorus (D. C. astr. no. 89. t. 31.) flowers axilary, sessile, somewhat capitate; calyx 5-cleft, rather longer than the corolla, having woolly, plumose, filiform lobes; leaves with 6-7 pairs of lanceolate villous leaflets. F. F. Native of Armenia. Lodd. bot. cab. 1388. Trag. orientalis folius angustissimis, flore purpurascens, Tourn. cor. 29. A. cricóphilus, Willd. spec. 3. p. 1333. Flowers purple.

Var. β, glaber (D. C. l. c.) leaflets longer and glabrous. F. Native of Persia. Perhaps a distinct species.

166 A. a'vnes (Willd. act. berl. 1794. p. 29. t. 1. f. 6.) flowers axillary, sessile, disposed in globose heads; calyx 5-
parted, with plumose segments, shorter than the corolla; leaves with 5-6 pairs of oblong-linear smoothish leaflets. ㎏.  F. Native of Armenia.  D. C. astr. no. 90. t. 32. f. 1. Trag. orientalis humilis floribus luteis dense congestis, &c. Tourn. cor. 29. Flowers yellow.

Golden-flowered Goat’s-Thorn. Shrub ½ foot.

167  A. leucoxylon (Willd. spec. 3. p. 1533.) flowers axillary, sessile, aggregate; calyx cleft into 5 parts beyond the middle; lobes foliiferum, bearded, plumose, shorter than the corolla; leaflets elliptic-lanceolate, ending each in a spine-like mucrone, and clothed beneath with adpressed silky villi. ㎏.  F. Native of Galatia (Willd.). Troade (Oliv.). Flowers purple. Very like the two preceding species, but differs from them in the form of the leaflets.

Feathery-calxyl Goat’s-Thorn. Shrub ½ foot.

168  A. contorta (Willd. in act. berl. 1794. p. 29. t. 1. f. 1.) flowers axillary, sessile, 4-5-gathered; calyx 5-parted; the lobes foliiferum, and bearded with wool, shorter than the corolla; leaves with 4-5 pairs of oblong, mucronate, hoary-villosus leaflets. ㎏.  F. Native of Armenia and Caucasus. D. C. astr. no. 86. t. 32. f. 2. Bieb. fl. taur. suppl. p. 500. A. pyreoe-phyllus, Stev. in soc. mos. 4. p. 57. Flowers white.

Compact Goat’s-Thorn. Shrub ½ foot.

169  A. arnaeana (Bieb. fl. taur. 2. p. 205.) flowers axillary, 2-3-together; calyx 5-parted, with setaceous woolly segments, which are shorter than the corolla; leaflets lanceolate, ending each in a spiny mucrone, and clothed with hoary hairs. ㎏.  F. Native of Tauria and Caucasus, on barren hills. A. Poecurium, Pall. astr. p. 1. t. 1. but not of Vahl. A. compactus var. β. D. C. Willd. Flowers flesh-coloured. The legume is 1-celled according to Pallas.

Lamb’s-Thorn. Shrub ½ foot.

170  A. oleaeifolius (D. C. astr. no. 57.) flowers axillary, sessile, disposed in globose whorls around the branches; calyx 5-cleft, woolly, villous; leaves with 6-10 pairs of oblong, glaucescent, smoothish leaflets. ㎏.  F. Native of the Levant. Trag. orientalis D. C. astr. no. 384. but not of Lher. Flowers yellowish.

Olive-leaved Goat’s-Thorn. Shrub ½ foot.

171  A. longifolius (Lam. dic. 1. p. 322.) flowers axillary, sessile, disposed in somewhat globose whorls; calyx 5-parted, woolly, a little shorter than the corolla; leaves with 9-12 pairs of oblong glabrous leaflets, each ending in a spine-like mucrone. ㎏.  F. Native of Armenia. D. C. astr. no. 88. t. 30. A. pugniformis, Willd. spec. 3. p. 1384. but not of Lher. Flowers yellowish.

Long-leaved Goat’s-Thorn. Shrub ½ to 1 foot.

172  A. denuda tus (Stev. mem. mosq. 4. p. 57.) flowers axillary, sessile, glomerate; calyx 5-parted, with setaceous woolly lobes; leaves with 7 pairs of lanceolate, mucronate, grey, pubescent leaflets. ㎏.  F. Native of eastern Caucasus, on the higher mountains. Bieb. fl. taur. suppl. p. 501. Corolla small, with the vexillum stiata. Young leaves rather tomentose in winter, but becoming smooth in summer.

Naked-leaved Goat’s-Thorn. Shrub ½ foot.

173  A. pseuda-tragacaña (Pall. astr. p. 3. t. 3.) flowers axillary, sessile, 7-8-together; calyxes woolly, with setaceous lobes, which are longer than the tube; leaves with 8-9 pairs of oblong, acutish, awnless leaflets, clothed with hoary pili. ㎏.  F. Native of eastern Caucasus, in subalpine places among rocks. Flowers yellowish. This plant is very like A. aristatus, but differs in the flowers being sessile.

False Goat’s-Thorn. Shrub ½ foot.

174  A. creticus (Lam. dic. 1. p. 321.) flowers axillary, sessile, aggregate; calyx 5-parted, with setaceous plumose lobes, which are a little longer than the corolla; leaves with 5-8 pairs of oblong, acute, tomentose leaflets. ㎏.  F. Native of Candia, on Mount Ida. D. C. astr. no. 91. t. 53. Trag. Creticus inams, &c. Tourn. cor. 29. Flowers purple, striped. Gum tragacanth also flows from this shrub, but very sparingly.

Cretan Goat’s-Thorn. Shrub ½ to 1 foot.

175  A. stellatus (Bieb. ginn. palerm. no. 4. Rafin. car. p. 72.) flowers axillary, sessile, aggregate; calyx 5-parted, very villous, shorter than the corolla; leaves with 4-5 pairs of oblong acutish leaflets, which when young are villous, but afterwards become glabrous. ㎏.  F. Native of Sicily, on high mountains, especially on Mount Etna. Flowers white, or tinged with purple (Rafinique). A. tragacantha, Bern. Ucr. hort. panorm. p. 316.

Seicadian Goat’s-Thorn. Shrub ½ foot.

176  A. echinus (D. C. astr. no. 92. t. 82.) flowers axillary, sessile, twin; calyx woolly and villous, 5-toothed, shorter than the corolla; leaves with 4-5 pairs of oblong-lanceolate, acutish, hoary leaflets. ㎏.  F. Native of the Levant on rocks, and of Eastern Caucasus. A. Câplicus, Bieb. fl. taur. 2. p. 204. suppl. 500. A. Cretensis, Pall. astr. p. 6. exclusive of the synonymes. Flowers white, with the vexillum striped with purple.

Hedgehog Goat’s-Thorn. Shrub ½ foot.

* * Flowers axillary, pedunculate.

177  A. echinodes (Lher. stirp. 170.) peduncles 2-flowered, shorter than the leaves; calyxes hardly pubescent, 5-toothed; leaves with 4-5 pairs of linear-lanceolate hoary leaflets. ㎏.  F. Native of Candia. A. echinodes, Willd. spec. 3. p. 1326. A. Creticus, Willd. acad. berol. 1794. p. 23. t. 2. f. 2. exclusive of the synonymes. Flowers white, but the vexillum is marked with red lines.

Bugloss-like Goat’s-Thorn. Shrub ½ foot.

178  A. olympicus (Pall. astr. p. 4. t. 4.) peduncles very short; calyx ovate, tubular, silky, 5-toothed; leaves with 6 pairs of oblong, bluntish, hoary leaflets; legumes cylindrical, mucronate, twice the length of the calyx. ㎏.  F. Native of Armenia, on Mount Olympus. A. leucophyllus, Willd. spec. 3. p. 1351. Flowers white, almost sessile. Legumes distinctly pedunculate.

Olympic Goat’s-Thorn. Shrub ½ to 1 foot.

180  A. Massiliensis (Lam. dic. 1. p. 320. D. C. astr. no. 96.) peduncles usually 4-flowered, about equal in length to the leaves; calyxes cylindrical, with 5 short blunt teeth; leaves with 2-11 pairs of elliptic hoary leaflets. ㎏.  H. Native of Marseilles and Narbonne, in sandy places, as well as of Corsica and Mauritania. A. tragacantha, Pall. astr. t. 4. f. 1. 2. Duh. arb. 2. t. 100. Woodv. med. bot. 267. t. 98. Wats. dent. brit. 84.—Lob. icon. 2. t. 57. Garid. aix. 469. t. 104. &c. Flowers white. This plant is usually grown for tragacanth, from which the gum is obtained, but it certainly produces nothing like gum tragacanth.

181  A. aristatus (Lher. stirp. 170.) peduncles very short, usually 6-flowered; calyces teeth long and setaceous; leaves with 6-9 pairs of oblong-linear, mucronate, pilose leaflets; legumes

**Ammel.-calyxed Goat's-Thorn.** May, Jul. Cult. 1791. Sh. 4 ft. 182 A. Genargeœs (Moris. clench, sad. p. 11.) peduncles usually 5-flowered, shorter than the leaves; teeth of calyx narrow, acute, very short; leaves with many pairs of elliptic, cuneate leaflets. H. Native of Sardinia, on the heights of Genargenteum. Flowers cream-coloured, with the keel tinted with dark purple. Like A. Massiliensis and A. aristatus.

**Genargeœs Goat's-Thorn.** Shrub ½ foot.

183 A. Bracteolatus (D. C. astr. no. 102.) peduncles rather longer than the leaves, bearing ovate spikes of flowers; calyx clothed with adpressed pubescence, cylindrical, with lanceolate-subulate teeth; leaves with 7-8 pairs of oblong leaflets, which when young are clothed with silky pubescence, but at length becoming glabrous. H. Native of Galatia, on hills. A. pumilus, Willd. spec. 3. p. 1325. Trag. orientalis huniflora, Fl. sparsus, Tourn. cor. 29. Bracteas linear-subulate. Flowers white in the dried specimens.

**Bracteolate Goat's-Thorn.** Shrub ¼ to ½ foot.

184 A. astr. (Lam. dict. 1. p. 521.) peduncles 6-flowered, somewhat corymbose, about equal in length to the leaves; calyx cylindrical, rather villous, acutely 5-toothed; leaves with 7-9 pairs of lanceolate leaflets, glabrous in the adult state. H. Native of Armenia, Wild. act. berol. 1794. p. 25. D. C. astr. no. 98.—Tourn. cor. 29. Flowers yellow.

**Narrow-leaved Goat's-Thorn.** Shrub ½ foot.

185 A. retusus (Willd. act. berol. 1794. p. 24. t. 2. f. 3. exclusive of the synonyme) peduncles 4-flowered, rather shorter than the leaves; calyx clothed with adpressed, silky villi, cylindrical, 5-toothed; the teeth lanceolate; leaflets obovate, and somewhat retuse. H. Native of the Levant. Flowers reddish in a dried state. Like A. Massiliensis.

**Retuse-leaffletted Goat's-Thorn.** Shrub ½ foot.

186 A. Damsceœs (D. C. prod. 2. p. 198.) peduncles 4-6-flowered, somewhat spicate, rather longer than the leaves; calyxes cylindrical, clothed with adpressed silky villi, 5-toothed, the teeth lanceolate; bracteas ovate, membranous, shorter than the tube of the calyx; leaves with 15-16 pairs of elliptic, somewhat mucronate leaflets, which are villous on both surfaces. H. Native about Damascus. Flowers white in the dried specimens. A. retusus, D. C. astr. no. 99. t. 35. but not of Willd.

**Damsceœs Goat's-Thorn.** Shrub ¼ foot.

187 A. Lagopoides (Lam. dict. 1. p. 312. var. D. C. astr. no. 103.) spikes of flowers ovate, pedunculate, longer than the leaves; calyx very hairy, 5-cleft, the lobes setaceous; bracteae ovate, acuminated, deciduous, membranous, longer than the tube of the calyx; leaves with 7-8 pairs of oblong leaflets, ending each in a spine-like mucrone, and clothed with adpressed villi. H. Native of Armenia. A. lagopoides, Vahl. symb. 1. p. 64. Willd. in act. berol. 1794. p. 28. t. 1. f. 4. Flowers purple, spreading.

**Var. D. Périssé (D. C. prod. 2. p. 299.) calyxes rather bladdery; spikes of flowers on long peduncles; flowers imbricated; leaflets broader. H. Native of Persia, between Kermanna and Amadan. Perhaps a proper species.**

**Hore's-foot-like Goat's-Thorn.** Shrub ¼ foot.

188 A. Lagurus (Willd. act. berol. 1794. p. 28. t. 1. f. 2.) spikes of flowers ovate, pedunculate, longer than the leaves; calyxes very villous, at length a little inflated, 5-cleft; the segments subulate, about equal in length to the corolla; bracteas membranous, ovate, acuminated, length of flowers; leaves with 4-5 pairs of oblong-leaflets, each ending in a spine-like mucrone, and clothed with adpressed villi. H. Native of Armenia.

D. C. astr. no. 104. t. 36. A. lagopoides a, Lam. Flowers imbricated, yellow.

**Hare's-tail-spiked Goat's-Thorn.** Shrub ½ foot.

189 A. Vaginautus (D. C. astr. no. 105. t. 37.) spikes of flowers ovate, dense, pedunculate, longer than the leaves; calyxes rather length inflated, villous, acutely 5-toothed; bracteas equal in length to the calyx; stipulae acuminated, very long, sheathing; leaves with 7-10 pairs of oblong leaflets, each ending in a spine-like mucrone, and clothed with pubescence beneath. H. Native of the Levant. Flowers cream-coloured. Petioles almost unarmned.

**Sheathing-stipuled Goat's-Thorn.** Shrub ½ foot.

190 A. Cephalantheus (D. C. astr. no. 106. p. 38.) flowers disposed in round pedunculate heads, 3-times longer than the leaves; calyxes clothed with silky hairs, 5-toothed; bracteas small; leaves with 7-9 pairs of oblong-linear leaflets, which are clothed with hoary, adpressed, silky villi. H. Native of Persia. Petioles almost unarmned.

**Headed-flowered Goat's-Thorn.** Shrub ½ foot.

191 A. Tetrhódoerus (D. C. prod. 2. p. 299.) spikes of flowers ovate-roundish, pedunculate, twice or thrice longer than the leaves; calyxes a little inflated, hairy; the segments subulate, rather longer than the tube of the corolla; bracteas ovate, acuminated, deciduous, length of corolla; leaves with 5-6 pairs of linear leaflets, each ending in a spine-like point, and clothed with adpressed hoary villi. H. Native of the Levant. Flowers pale in the dried specimens, adult ones without the bracteas.

**Hair-lobbled-calyxied Goat's-Thorn.** Shrub ½ foot.

192 A. Tu'mides (Wild. act. berol. 1794. p. 26.) flowers usually solitary, on short peduncles; calyxes villous, inflated, contracted at the mouth, 5-toothed; leaves with 4-6 pairs of oblong leaflets, which are clothed with adpressed pubescence. H. Native of Spain, in the province of Aragon, Egypt, and the Levant, in sandy places. Russ. aplep. 1. 5. A. Rauwölffii, Vahl. Colunita sinopis, Forsk. descr. Spines long. Axillary leaves small, with a few pairs of leaflets, which are about equal in length to the pedicels. Flowers pale yellow.

193 A. Tu'mides (D. C. prod. 2. p. 299.) peduncles a little longer than the leaves; flowers 3-8, distant, disposed in a kind of raceem; bracteas membranous, length of pedicels; calyxes villous, 5-toothed, cylindrical, at length a little inflated; leaves with 10 pairs of obovate, hairy, small leaflets. H. Native of the Levant, between Bagdad and Kermanna. This plant is very like A. anthylloides, but differs in the petioles being spiny. Flowers probably purple.

**Twisted Goat's-Thorn.** Shrub ½ to 1 foot.

194 A. coluteoides (Wildl. act. berol. 1794. p. 27.) peduncles a little longer than the leaves, each bearing 4-5 distant flowers in a kind of spike; bracteas setaceous, very short; calyxes villous, inflated, 5-toothed; leaves with 15-20 pairs of obovate, small, hoary, hairy leaflets. H. Native on Mount Lebanon. Rauw. trav. 281. with a figure. Anthyllis tragacanthoides, Labill. dec. syr. 2. p. 16. t. 9. Flowers purple.

**Bladder-senna-like Goat's-Thorn.** Shrub ½ foot.

§ 14. Chromonopodi (from χρωνος, chronos, time, and τοσος, pouc, pouc podos, a foot; in reference to the permanent nature of the footstalks of the leaves). D. C. prod. 2. p. 299. Petioles permanent, but never hardening into spines. The old leaflets remaining a long time on the end of the petiole, after the lateral M M 2
leaflets have fallen. Stipulas not adnate to the petioles. Stamens distinct or diadelphous, with a short sheath. Perhaps a proper genus.

195 A. amarus (Palg. astr. p. 8. t. 6.) plant erect, glabrous; stipulas spreading, lunate, leafy; leaves with 2-5 pairs of ovate, remote leaflets; spikes pedunculate, elongated, thinly flowered; calyx almost cylindrical; stamens distinct. F. Native of the Caspian desert, on the gypseous hills called Arasar. This plant agrees with *A. coluteoides* in the inflorescence, but differs in the calyx not being inflated, and from all the species in the stamens being distinct, but of this rare plant the fruit has not been seen.

*Bitter Milk-Vetch.* Shrub 1 foot?

196 A. opiosus (D. C. prod. p. 300.) plant erect, canescent from adpressed villi; stipulas wanting; leaves with 8-10 pairs of remote, ovate leaflets; spikes elongated, pedunculate, thinly flowered; calyx globose at the base; stamens diadelphous, joined at the base but a very little way. F. Native between Missoul and Bagdad. Very like *A. amarus,* but very distinct, and with it will form perhaps a connecting genus to Astragalus.

Gibbous-calyxed Milk-Vetch. Shrub.

Series IV. *Podochromeiti* (pouc pouc, pou pods, a foot, and ωχρος, ochro, yellow, in reference to the footstalks of leaves or petioles never hardening into spines, as those of the last series, but remaining weak and pliable, and in the flowers being usually yellow). D. C. prod. 2. p. 300. Stipulas adnate to the petioles. Petioles permanent, but never hardening into spines.

* Corollas yellowish, rarely purple.

197 A. calycinus (Bieb. fl. taur. 2. p. 199. pl. cent. ross. 1. t. 9. ex suppl. p. 406.) plant stemless, rather glaucous and canescent from adpressed pili, which are fixed by their centre; leaves with 5-13 pairs of obovate leaflets, the lower ones remote; scapes longer than the leaves; spikes of flowers oval-oblong; calyces inflated; legumes somewhat trigonous, acute, many-seeded. H. Native of Caucasus and at the river Kuna. Flowers cream-coloured. Calyx sometimes beset with hairs, like those on the leaves.

Large-calyced Milk-Vetch. Pl. ½ to 3/4 foot.

198 A. halicaebus (Lam. dict. 1. p. 320.) plant stemless, glabrous; leaves with 21-31 lanceolate-linear leaflets; scapes longer than the leaves; flowers spicate, remote; calyces globose, bladdery; legumes hardly half-bilobular, 2-seeded. H. Native of Armenia. Phaca vesicaria, Schreb. dec. p. 5. 3. 5.

199 A. riysaloïdes (D. C. prod. 2. p. 300.) plant stemless, rather hairy; leaflets 5-7, ovate, obtuse, smoothish; scapes longer than the leaves; flowers rather remote, disposed in spikes; calyces hairy, globose, bladdery. H. Native of the Levant. Flowers yellowish. The leaves are like those of *A. calycinus,* and the flowers are like those of *A. halicaebus.*

200 A. anthylloides (Lam. dict. 1. p. 320. D. C. astr. no. 124. t. 42. but not of Pall.) plant almost stemless, clothed with hoary villi; leaflets 27-35, ovate; peduncles twice the length of the leaves; flowers distant on the spikes; calyces hairy, bladdery; legumes hardly half-bilobular, 2-seeded. H. Native of Armenia. Phaca inéma, Vahl. symb. 1. p. 57. Flowers yellow. This plant is very like *A. coluteoides,* but differs in the petioles being unarmed.

*Anthyllis-like Milk-Vetch.* Pl. ½ to ¾ foot.

201 A. cardiogenus (D. Dou, prod. fl. nep. 245.) plant stemless; leaves with many pairs of oval, mucronulate, densely pilose leaflets; flowers solitary, almost sessile; calyces inflated, saccate at the base; legumes nearly tereete, straight, very villous. H. Native of Nipaul, in Gosaimganth. Root long, woody. Flowers large, yellow, with the vexillum pilose on the back.

202 A. vulnerabilis (D. C. prod. 2. p. 300.) plant almost stemless, twisted, low, hairy; leaflets 7-11-13, obovate, the terminal one sessile; peduncles hardly longer than the leaves; flowers few, capitulate; calyces hairy, reticulated, becoming at length bladdery; corolla clothed with adpressed silky villi. H. Native of Asia Minor. Phace haliacabds, Willd. spec. 3. p. 1254. Flowers yellowish.

203 A. sspurilus (Pall. itin. ed. gall. append. no. 877. astr. p. 17. t. 15.) plant stemless and canescent from adpressed villi, which is fixed by the centre; leaflets 9, elliptic-oblong; scapes hardly longer than the leaves; spikes dense, ovate; calyx hairy, at length bladdery; corollas glabrous; legumes half-bilobular, 2-seeded. H. Native of Siberia, in sandy islands in the rivers Selenga and Ouda, and at Lake Baikal. Flowers cream-coloured.

*Hop Milk-Vetch.* Pl. ¾ to ¾ foot.

204 A. laguroides (Pall. itin. ed. gall. Svo. append. no. 376. t. 91. f. 2.) plant stemless, and clothed with adpressed villi; leaflets 5-7, elliptic-oblong; scapes about equal in length to the leaves; spikes ovate, dense; calyces hispid, at length bladdery; legumes bilobular, 2-seeded. H. Native of Siberia, in plains about the river Selenga. A. lagurus, Pall. astr. p. 18. t. 16. but not of Willd. A. lagurooides, D. C. Willd. This species is very like *A. lupinus,* but differs in the flowers being purple.

*Hare's-tail-like Milk-Vetch.* Pl. ½ to ¾ foot.

205 A. inflatus (D. C. astr. no. 12.) plant caulescent, nearly erect, glabrous; stipulas lanceolate, adnate to the petiole; leaflets 9, linear-lanceolate; spikes globose; peduncles longer than the leaves; calyces inflated, tomentose; legumes ovate. H. Native of Siberia, in the Kirghisian steppe. A. anthylloides, Pall. astr. no. 19. t. 15. A. anthylloides, Pall. astr. no. 19. t. 13. but not of Lam. A. fragilifrons, Willd. spec. 3. p. 1261. Flowers cream-coloured.

*Inflated-calyced Milk-Vetch.* Pl. ¾ foot.

206 A. follicularis (Pall. astr. p. 19. t. 14.) plant stemless, canescent from adpressed hairs, which are fixed by their centre; leaflets 13-21, lanceolate; scapes straight, longer than the leaves; spikes cylindric; calyces clothed with blackish adpressed down, at length becoming bladdery. H. Native of the Kirghisian steppe, at the Uan, and near Salair. A. stricta, Sievers ex Fisch. in litt. Oxýtropis follicularis, Pers. exb. the carina is obtuse.

*Follicular-fruited Milk-Vetch.* Pl. ½ to ¾ foot.

207 A. nóelis (Bieb. fl. taur. suppl. p. 495.) plant almost stemless and rather villous; leaflets 25-29, elliptic, obtuse, young ones hairy; scapes shorter than the leaves; flowers spicate; calyces hairy, at length becoming bladdery, the teeth subulate; legumes very hairy, covered by the calyx. H. Native of Siberia, on hills about Tiflis. A. eriocarops, Bieb. fl. taur. 2. p. 196. but not of D. C. Flowers yellowish.

*Soft Milk-Vetch.* Pl. ½ foot.

208 A. Helminth (Fisch. in litt. D. C. prod. 2. p. 301.) plant almost stemless, canescent from adpressed bristles; leaflets 13-17, elliptic, rather mucronulate; scapes length of leaves; flowers 6-8, disposed in a kind of capitulate spike; calyces membranous, at length pubescent; legumes hairy, longer than the
Calyx, 2. H. Native of the Ural mountains, at the metal mines of Woskres-Senskoi. Flowers yellow. Perhaps this plant belongs to a different section.

_Helm's Milk-Vetch._ Pl. ½ foot. **Corollas white. Calyces hardly bladdery. Perhaps this will constitute a proper section.**

209 _A. galactites_ (Pall. astr. p. 85. t. 65.) plant stemless, rather cespitose from adpressed bristles; leaflets 11-15, oblong; flowers radical, aggregate, almost sessile; legumes minute, 2-seeded, inclosed in the calyx, which is pubescent, membranous, and rather inflated. 2. H. Native of Siberia, beyond the Baikal, and of Dahuria, in naked gravelly places. Corolla white, but becoming of a pale yellow colour on drying, and almost as long as the leaves.

_Milky-Vetch._ Pl. ½ foot.

210 _A. ambiguum_ (Pall. itin. ed. gall. append. no. 127. t. 83. f. 2. astr. p. 7. t. 5.) plant prostrate, clothed with hoary down; stipulas ovate, obtuse; leaves with 2-5 pairs of ovate-leaflets; flowers axillary, rather radiant, twin, on short peduncles; calyces cylindrical, hairy. 2. F. Native of Eastern Siberia, on sandy hills. D. C. astr. no. 91. Legume ovoid, mucronate, half-bisulcate. Flowers white. Plant small. Petioles permanent and unarmed, as in division Chronopodi. **Sand-viper Milk-Vetch._ Pl. May, July. Cilt. 1820. Sh. pr. § 16. _Caprini_ (from caprini, of a goat; in reference to the leaves of _A. caprini_, the ciliate of which have been compared to a goat's beard). D. C. prod. 2. p. 301. Stipulas adhering to the petioles at the base. Petioles unarmed. Flowers yellow. Calyces not bladdery.

211 _A. ovatus_ (D. C. astr. no. 107.) plant somewhat caulescent, procumbent, villous; leaflets 20-23, ovate; peduncles longer than the leaves; spikes of flowers ovate-oblong; bracteas and calyces villous; legumes glabrous. 2. H. Native of Armenia. Flowers cream-coloured according to the dried specimens, ex. Tourn. cor. 28. Perhaps belonging to a different section.

_Ovate-spiked Milk-Vetch._ Pl. procumbent.

212 _A. dasycotypicalis_ (Pall. astr. p. 79. t. 65. itin. ed. gall. append. no. 375. t. 85.) plant caulescent, erect, clothed with soft hairs; leaflets 21-23, elliptic, obtuse, rather mucronate; peduncles hardly shorter than the leaves; spikes of flowers ovate-roundish; calyces villous, 5-cleft; legumes ovate-lanceolate, hairy. 2. H. Native of Siberia and Caucasus, the Ukraine, and Hungary, in sandy and calcareous fields. A. ericéphalus, Waldst. et KIt. pl. rar. hung. t. 46. Flowers yellow, with the vexillum pubescent.

_Thick-flowered Milk-Vetch._ Pl. 1 foot.

213 _A. multiramosus_ (D. C. prod. 2. p. 301.) plant short, caulescent and pubescent; leaflets 41-61, elliptic, obtuse at both ends; racemes pedunculate, rather loose, elongated, hardly shorter than the leaves; calyces cymbiform, 5-toothed; corolla glabrous; legumes mucronate, velvety, twice the length of the calyx. 2. F. Native of the Levant, between Bagdad and Kermanka. Flowers 8-10, distant, yellow.

_Many-paired-leaved Milk-Vetch._ Pl. ½ foot.

214 _A. caprinius_ (Lin. spec. 1071.) plant almost stemless, erect, pubescent; leaflets 23-29, ovate-oblong, ciliated; peduncles one-half shorter than the leaves; flowers racemose, spreading; segments of the calyx subulate; corolla glabrous; legumes ovate, inflated, stipitate, sparingly pilose. 2. H. Native of Barbary and the Levant. D. C. astr. no. 109.—Moris. oxon. 2. p. 24. f. 3. Flowers yellow.

215 _A. longiflorus_ (Pall. astr. p. 73. exclusive of the synonym of Buxb. and Lin.) plant almost stemless, rather hairy; leaflets 11-15, obovate, retuse, or emarginate; racemes loose, shorter than the leaves; teeth of calyx lanceolate-subulate; corolla very long, glabrous; legumes ovate, turgid, mucronate, smooth, when young filled with pulp. 2. H. Native of the desert of Tartary and of the Volga, as well as at Lake Underskoi. Flowers yellow. The plant from the Volga differs from the rest in the legumes being almost sessile.

_Var. a. brevicaulis_ (D. C. prod. 2. p. 303.) peduncles much shorter than the leaves; bracteas hardly exceeding the pedicels. Pall. astr. t. 60.—Gmel. sib. 4. t. 27.

Var. _b. procèrèr_ (D. C. prod. 2. p. 302.) peduncles exceeding the leaves; bracteas thrice the length of the pedicels. Pall. astr. t. 60. β.

216 _A. d'urgeri_ (Pall. astr. p. 75.) plant stemless, rather hirsute; leaflets 23-35; racemes loose, much shorter than the leaves; teeth of calyx lanceolate-subulate; corolla glabrous; legumes stipitate, ovate, mucronate, hard, turgid, clothed with woolly pubescence, adult ones glabrous and 1-celled. 2. H. Native of Russia, on rocks. Flowers yellow.

_Var. a. ovatus_ (Pall. astr. t. 61.) leaflets ovate; legumes large. 2. H. Native of Tartary, Tartary, and Siberia.

Var. _b. Uralénsis_ (Pall. astr. t. 62. f. 2. β) leaflets oblong-linear. 2. H. Native of the Ural mountains, at the river Don.

217 _A. ligusticus_ (D. C. astr. no. 114. t. 39.) plant somewhat caulescent, woody, grey; leaflets 49-51, oblong-linear; peduncles few-flowered, much shorter than the leaves; teeth of calyx lanceolate-subulate; corolla glabrous; legumes sessile, compressed, villous. 2. H. 2. H. Native of Siberia, in sandy fields impregnated with salt, at the river Irish. Flowers yellow.

_Woody-stemmed Milk-Vetch._ Pl. ½ to ½ foot.

218 _A. periphytus_ (D. C. astr. no. 111.) plant almost stemless, hairy; leaflets 21-27, ovate, acute; flowers almost sessile; aggregate; teeth of calyx linear-subulate; wings of corolla pubescent; ovary sessile, woolly. 2. H. Native of Siberia. Flowers yellow.

_Dowandy-flowered Milk-Vetch._ Pl. ½ foot.

219 _A. faraceus_ (Bieb. suppl. p. 496.) plant stemless; leaflets 35-45, oblong or ovate, pilose; scapes few-flowered, much shorter than the leaves; teeth of calyx lanceolate; corolla glabrous; legumes compressed, sessile, ovate, mucronate, and quite smooth, even when young. 2. H. Native of Siberia, on hills, and of other provinces in the east. A. tumidus, Bieb. fl. taur. 2. p. 198. but not of Wild. Flowers yellow, drooping. Allied to _A. longiflorus_ and _A. d'turgner._

_Bean-like Milk-Vetch._ Pl. ½ to ½ foot.

220 _A. laniarius_ (Désf. atl. 2. p. 181. t. 202.) plant stemless and clothed with soft hairs; leaflets 17-31, elliptic or oblong; flowers almost sessile, aggregate; teeth of calyx lanceolate; corolla glabrous; legumes compressed, ovate, mucronate, sessile, when young very hairy, but when in an adult state sparingly pilose. 2. H. Native of Mauritania, Egypt, Phrygia, and Iberia, in barren sandy places and on hills. Flowers yellow, sometimes pedunculate.

_Var. _b. subglabrous_ (D. C. prod. 2. p. 302.) leaflets almost glabrous; calyxes and petioles hairy at the base. 2. H. Native of the Levant.—Buxb. cent. 3. p. 35. f. 2. and hence the _A. tragacanthoides_ of Willd. spec. p. 1323. Flowers radical.

221 _A. exsugar_ (Lin. mant. 275.) plant stemless, clothed with soft hairs; leaflets 21-27, ovate; flowers almost sessile,
aggregated; teeth of calyx long and subulate; corolla glabrous; legumes ovate, acuminate-mucronate, hairy, sessile, and rather compressed. 2. H. Native of Wallia, Thuringia, Austria, Hungary, and the Ukraine. Jacq. icon. rar. t. 561. Pall. astr. 64. Astragaloids syphilitica, Mönch. Flowers yellow. The plant is used to cure syphilis in Hungary.

Scapeless Milk-Vetch. Fl. May, July. Clt. 1787. Pl. 4 ft. 222 A. Schanginianus (Pall. astr. p. 67. t. 73.) plant somewhat caulescent and loosely lamunigine; leaflets 22-31, ovate-oblong, peduncles very short, somewhat racemose; teeth of calyx long, subulate; corolla glabrous; legumes triquetrous, acuminate, pubescent, calyces. 2. H. Native of Siberia, at the Catunja and in the desert of the Don. Leaves about a foot. Flowers yellow.

Declinate-stemmed Milk-Vetch. Pl. procumbent. 224 A. Nummosusus (Lam. dict. t. 1. p. 317. exclusive of the subsp. Donaticus) stems subulate; leaflets 21-23, ovate, mucronate, or emarginate; flowers almost sessile, aggregated; teeth of calyx lanceolate-subulate; corolla glabrous; legumes compressed, ovate, mucronate, hairy. 2. H. Native of Armenia. A. orientalis acutus fere flore lucito. Tourn. cor. 29. ex Willd.

Moneywort Milk-Vetch. Pl. ½ to ¾ foot. 225 A. Diffusus (Willd. spec. 3. p. 1321.) plant almost stemless, beset with cinereous hairs; leaflets 19-23, elliptic-lanceolate; flowers almost sessile, aggregate; bracteas and calycine teeth setaceous, longer than the tube, and very pilose; legumes ovate, rather triquetrous, acuminate, hairy. 2. H. Native of Thuria, in fields adjacent to the Caucasus, and in the Caspian and Tartarian deserts. Bibb. fl. taur. 2. p. 202. A. dolichophyllus, Pall. astr. p. 84. t. 68. Flowers pale cream-coloured. This plant is allied to A. testiculatus.

Humble Milk-Vetch. Pl. depressed. 227 A. debus (D. C. astr. no. 115.) plant almost stemless, beset with cinereous villi; leaflets 19-21, linear-oblong; flowers almost sessile, aggregate; calycine teeth about equal in length to the tube; legumes compressed, acuminate, villous, half-bilocular. 2. H. Native of Tartary. Flowers very pale cream-coloured. Perhaps sufficiently distinct from the following species.

Doubtful Milk-Vetch. Pl. ⅓ to ⅔ foot. 228 A. Buckturniæus (Pall. astr. p. 76. t. 62. f. A.) plant stemless, clothed with hoary pubescence; leaflets 59-43, oblong; peduncles few-flowered, very short, deinate when in flower; calyx 5-toothed; legumes oblong-cylindrical, acuminate, collous, half-bilocular. 2. H. Native of Siberia at the rivers Uba, Catunja, and Bucktorn. Flowers yellow. Legume, according to Fischer ⅔ an inch long and hoary.

Short-spiked Milk-Vetch. Pl. ⅔ to ¾ foot. 230 A. ochrites (Vahl. symb. 1. p. 60.) plant stemless, clothed with hoary-silvery down; leaflets 12-16 pairs, elliptic-oblong, calyces at the apex; sepals twice the length of the leaves; spikes of flowers dense, ovate-glabrous; bracteas linear, about equal in length to the calyx. 2. H. F. Native of Armenia. D. C. astr. 120. Flowers yellow.

Globose-spiked Milk-Vetch. Pl. ⅔ to ¾ foot. 231 A. cylindraceus (D. C. astr. 115.) plant stemless and clothed with hoary-silvery down; leaves with 14 pairs of elliptic-oblong leaflets; peduncles longer than the leaves; spikes cylindrical; bracteas setaceous, longer than the calyx. 2. H. F. Native of Armenia. Allied to the preceding species. Perhaps both are wrongly placed in the present section. Flowers pale-yellow.

Cylindrical-spiked Milk-Vetch. Pl. ⅓ to ¾ foot. 232 A. lanae (Labill. dec. syr. t. 2. p. 21. t. 10. but not of Pall.) plant stemless, clothed with hoary villi; leaflets 11-23, ovate; peduncles rather shorter than the leaves; spikes of flowers ovate, dense; legumes ovate-cordate, triquetrous, compressed, acute, villous. 2. H. Native of Mount Lebanon. A. Libnanitis, Willd. spec. 3. p. 1305. A. hisrituisimus, D. C. astr. no. 46. t. 19. Flowers yellow. Perhaps this plant belongs to another section.

233 A. Monspessulanus (Lin. spec. 1072.) plant almost stemless, clothed with hoary pubescence or almost glabrous; leaflets 21-41, ovate or lanceolate, outer ones rather the smallest; sepals exceeding the leaves; teeth of calyx long, and subulate; legumes terete, subulate, a little arched, adult ones glabrous. 2. H. Native of the south of Europe and Mauritania, in fields. Cam. cip. 929. with a figure. Curt. bot. mag. 210. Flowers either purple, pale, or white. Stems almost wanting when growing in a dry situation, but in rich earth or in a moist place they are elongated. Leaves hoary when the plant grows in dry exposed situations, but in a moist situation they are almost glabrous.

Var. β, polygala (D. C. prod. 2. p. 304.) spikes of flowers shorter; legumes almost glabrous, even when young; leaflets ovate-roundish, almost glabrous. 2. H. Native of the south of Caucasus. A. polygala, Pall. astr. p. 110. t. 83.

Montpelier Milk-Vetch. Fl. June, Aug. Clt. 1710. Pl. ⅔ to ¾ foot, or prostrate. 234 A. sanguinolentus (Bieb. cap. 190. fl. taur. 2. p. 209.) plant stemless; leaflets elliptic, obilute, hoary beneath; sepals deinate, longer than the leaves; legumes oblong, compressed, rather arched, glabrous, spotted with blood-colour. 2. H. Native of Eastern Caucasus, on dry exposed hills. A. incanua var. Pall. astr. 84. f. 2. A. clavatus β, brevibracteatus, D. C. astr. no. 127. Flowers yellowish green. Perhaps this species is referrible to section Caprinii.

Bloody-spotted-legumed Milk-Vetch. Pl. ⅓ to ¾ foot. 235 A. incanua (Lin. spec. 1072.) plant stemless, hoary; leaflets 13-17, ovate; sepals hardly exceeding the leaves; spikes capitate; calycine teeth subulate, short; legumes nearly cylindric, hoary from short down, incurved at the apex, and ending in a subulate mucrone, hardly ⅓ times the length of the calyx;
cells 5-6-seeded. **H.** Native of the south of France, in dry fields and among stones. Magn. bot. monsp. p. 52, with a figure. A. incanus, Pall. astr. t. 84. Flowers purplish.

**Var.** _Barbieri_ (Dufour, ann. gen. sc. 7. p. 297.) legumes hoary, at length very hard, oblong, not ovate, a little incurved, subulate; cells usually 5-seeded. **H.** Native of Spain, in the province of Valéncia, on arid hills at St. Philip.

**Hoary Milk-Vetch.** Fl. June, July. Cfr. 1795. Pl. 3 to ½ ft.

236 _A. incanus_ (Desf. atl. 2. p. 182. t. 203.) plant stemless, hoary; leaflets 17-27, elliptic; scapes longer than the leaves; spikes of flowers capitulate; teeth of calyx subulate; legumes oblong, cylindrical, tapering to the base, incurved at the apex, glabrous, hardly 3-times the length of the calyx; cells 3-5-seeded. **H.** Native of Algiers, in sandy places. D. C. astr. 128. Flowers pale-purple.

**Incurved-podded Milk-Vetch.** Pl. ½ foot.

237 _A. clava'itus_ (D. C. astr. no. 127. t. 44.) plant almost stemless, hoary; leaflets 11-21, roundish-obovate; scapes longer than the leaves; flowers disposed in spikes, spreading; legumes erect, glabrous, somewhat clavate, incurved at the top; cells 4-5-seeded. **H.** Native of Armenia. Flowers greenish yellow in a dried state. Perhaps the same as _A. cinereus_ of Willd. spec. 3. p. 131.

**Clava-tegumed Milk-Vetch.** Pl. ½ to ½ foot.

238 _A. nummular'oides_ (Desf. emend. D. C. astr. no. 131.) plant stemless and hoary; leaflets 17-23, obovate; scapes longer than the leaves; flowers few, disposed in short spikes; calyxes beset with black villi, 5-toothed; legumes elliptic, venricose, silky, hardly longer than the calyx; cells 3-seeded. **H.** Native of sandy places near Siiba, in Tunis. A. nummularius, Desf. atl. 2. p. 182. t. 204. exclusive of the synonyms. A. rotundifolius, Willd. spec. 3. p. 1317. Flowers rose-coloured.

**Money-wort-like Milk-Vetch.** Pl. ½ to ½ foot.

239 _A. macrorhin’zus_ (Cav. icon. 2. p. 28. t. 123.) plant stemless, hoary; leaflets 17-23, obovate; scapes longer than the leaves; flowers few, disposed in short spikes; calyxes beset with black villi, 5-toothed; legumes elliptic, venricose, silky, hardly longer than the calyx; cells 3-seeded. **H.** Native of Sandy Spin, in fields about Madrid. Flowers red. A. montanus, Bro. ex Steud.

**Long-rooted Milk-Vetch.** Pl. ½ to ½ foot.

240 _A. brachyca'pus_ (Bieb. fl. taur. 2. p. 201. cent. 2. p. 58.) plant stemless, pubescent; leaflets 15-21, oblong-elliptic; scapes longer than the leaves; spikes many-flowered, at length elongated; calyxes clothed with black and white hairs mixed; legumes erect, obovate, length of calyx, when young clothed with adpressed pubescence; cells 2-3-seeded. **H.** Native of Caucasus. Sims, bot. mag. 2398.—Buxb. cent. 3. t. 38. f. 1. Flowers of a dirty purple colour.

241 _A. glareo'seus_ (Dougl. miss.) stems short, procumbent; plant clothed with hoary silky villi; stipulus free, permanent; leaflets numerous, obovate; peduncles or scapes bearing from 3-10 flowers at the apex; bractoeae lanceolate, subulate, twice the length of the pedicels. **H.** Native of North America, from the confluence of Lewis and Clarke's river with the Columbia to the Rocky mountains. Flowers large, purple. Habit of a species of _Oxytropis._ This species belongs more properly to section Onobrychoidei than to the present section.

**Gracel Milk-Vetch.** Pl. ½ to ½ foot.

242 _A. pu'ssii_ (Dougl. miss.) plant tufted, woody at the base, densely clothed with hoary silky villi; stipulus distinct, permanent; leaflets numerous, elliptic; bracteas subulate, twice the length of the pedicels; peduncles or scapes shorter than the leaves, bearing few flowers at the apex. **H.** Native of North-west America, on the low hills of the Spokane River. Flowers yellow. Habit of a species of _Oxytropis._ This plant belongs more properly to section _Ciceroidae._

**Parsh's Milk-Vetch.** Pl. ½ to ½ foot.

250 A. RUFOSEXUS (Pall. a. p. 86. t. 70.) plant almost stemless, clothed with cineraceous villi; leaflets oblong, obtuse; scapes shorter than the leaves, or about equal in length to them; legumes oblong, acute, 2-celled. 2. H. Native of the south of Tauria, on rocks. Flowers purplish. Calyxes rather turgid.

Var. a. excipus (Pall. a. t. 70.) scapes very short or hardly any; leaflets oblong-linear. Var. b. caulacens (Pall. a. t. 70. B.) scapes length of leaves; leaflets oblong, fewer; calyxes rather bladdery. 2. H. Native of the Ural mountains. Perhaps a proper species.

Broken-rock Milk-Vetch. Pl. 1/2 to 1/2 foot.

251 A. reducatus (Pall. a. p. 100. t. 82.) plant almost stemless, hairy, and rather canescent; leaflets 25-35, elliptic-oblong, glabrous above; scapes a little higher than the leaves; flowers disposed in elongated spikes; legumes erect, hairy, incurved, cylindrical, hooked downwards, channelled above, 5-times the length of the calyx. 2. H. Native of Tauria, in sandy places at the Volga, and about Sarepta. A. cineraceus longipes, D. C. a. t. 41. Flowers purple or white.

Var. b. brevipes (D. C. a. t. 41.) scapes shorter than the leaves; leaflets elliptic-ovate, few, 2. H. Growing along with the species.

Hooked-podded Milk-Vetch. Pl. 1/2 to 1/2 foot.

252 A. HIRSUTUS (Vahl. symb. 1. p. 59. D. C. a. n. 103. t. 43.) plant stemless, clothed with hoary villi; leaflets 7-9, elliptic; scapes rather longer than the leaves; flowers capitate; calyx villous, 5-cleft, at length cleft above; legumes nearly globose, apiculated, hairy, 2-celled. 2. H. Native of Armenia on hills. Colour of flowers unknown.

Hairly Milk-Vetch. Pl. 1/2 to 1/2 foot.

253 A. ERICAEPES (D. C. a. n. 103. t. 47. but not of Bibb.) plant stemless, villously-hairy; leaflets 21-27, elliptic, obtuse; scapes exceeding the leaves; spikes of flowers ovate; calyx villous, 5-toothed; ovary very hairy. 2. H. Native country unknown. Flowers purple.

Woolly-fruited Milk-Vetch. Pl. 1/2 to 1/2 foot.

254 A. POMELIO (Pall. a. n. 66. t. 54.) plant almost stemless, branched, prostrate; leaflets 7-9, lanceolate, small, pubescent; peduncles 1-flowered, very short; legumes oblong, inflated, pubescent. 2. ?. H. Native of Eastern Siberia, in the Arctic region. Flowers unknown. Perhaps only a variety of A. pumilus.

Pygmy Milk-Vetch. Pl. prostrate.

255 A. Poliello (Pall. a. n. 67. t. 55.) plant almost stemless, with many little shoots rising from the neck; leaflets 9, lanceolate-linear, hoary, and rather pilose beneath; flowers twin, almost sessile. 2. H. Native of the Kuril islands. Flowers large, pale violet. Calyx 5-cleft, clothed with white or brown hairs. Legumes unknown. Dwarf Milk-Vetch. Pl. 1/2 foot.

256 A. Geminiflorus (Humb. et Bonpl. pl. equin. 1. p. 126. t. 37.) plant almost stemless, branched, prostrate; leaflets 19-21, approximate, complicate, oblong, silky, small; flowers twin, almost sessile; legumes ovate, acuminate, silky, 2-seeded. 2. F. Native of South America, in the kingdom of Quito, in high cold places; frequent on mount Antisana. Flowers violaceous.

257 A. UNIFLORUS (D. C. a. n. 104. t. 50.) plant almost stemless, branched, prostrate, glabrous; leaflets 13-17, linear, obtuse; stipules joined; flowers almost sessile, solitary. 2. G. Native of Peru, at Huass-Huasi. Flowers purplish.

One-flowered Milk-Vetch. Pl. prostrate.

† Species not sufficiently known.

258 A. uncatus (Lin. spec. 1072.) plant almost stemless and scapose; leaves with 8-9 pairs of obcordate leaflets, each terminating in a bristle; legumes subulate, hooked, longer than the leaves. 2. F. Native about Aleppo. Oxytropus uncatus, Pers. ench. 2. p. 33.? Said to be allied to A. trimus. Flowers almost white.

259 A. ARCTICUS (Willd. enum. suppl. 51.) plant stemless; leaflets ovate-lanceolate, pilose, silky beneath; scapes ascending, longer than the leaves; legumes lanceolate, a little inflated. 2. H. Native country unknown. Corolla shewy violet.

Arctic Milk-Vetch. Pl. 1/2 to 1/2 foot.

260 A. ? OCHOA (Ell. sketch. 2. p. 227.) plant glabrous, pubescent; leaves with 7-9 pairs of small obcordate leaflets; peduncles elongated; lobes of calyx subulate. 2. H. Native of the south of Georgia, near St. Mary. Flowers white. Legumes unknown.

Obovate-leaffletted Milk-Vetch. Pl. prostrate.

262 A. RADICANS (Horn. hort. hafn. 2. p. 708.) stolons rooting; leaflets ovate-lanceolate; scapes nearly erect, length of leaves; flowers in ovate heads; legumes oblong, flat, glabrous. 2. H. Native country unknown.

Rooting Milk-Vetch. Pl. creeping.

263 A. SYRIACUS (Lin. spec. 1069.) plant pubescent, caulescent and procumbent; leaflets few pairs, linear-lanceolate; heads of flowers pedunculate, longer than the leaves; flowers reflexed; legumes oblong-obovate, tomentose, ending in a long beak. 2. H. Native of Syria. The plant in the Linnean herbarium under this name certainly belongs to section Onobrychis.

Syrian Milk-Vetch. Pl. procumbent.

264 A. PASTELLIANUS (Pollin. pl. veron. 1816.) plant caulescent, diffuse, and silky; leaves with 6 pairs of linear bluish leaflets; spikes capitate, on long peduncles; legumes ovate, silky, exceeding the calyx. 2. H. Native of fields about Verona, among stones on mount Pastello.

Pastello Milk-Vetch. Pl. diffuse.

265 A. LUNATUS (Pall. a. p. 44.) plant caulescent, glabrous; leaves with usually 15 pairs of linear-lanceolate leaflets; peduncles very long, sulate, 10-flowered; legumes triquetrous, rather lunate, erect, glabrous. 2. H. Native of Persia. Buxb. cent. 5. t. 56. f. 2.? Oxytropis lunata, Pers. ench. p. 593. According to Fischer this is a true species of Astragalus, intermediate between A. falcatus and A. hamatus.

Lunate-podded Milk-Vetch. Pl. 1 foot.

Cult. All the species of this genus are worthy of cultivation in every collection. The shrubby kinds, or those belonging to section Tragacanthae, grow well in any light dry soil, and are increased by cuttings or seeds. The herbaceous perennial kinds thrive well in any kind of earth, though they prefer a dry light soil, and they are easily increased by dividing the plants or by seeds; the last mode is preferable, as the greater part of the species are very liable to die if even transplanted or divided at the root. The dwarfer kinds are well adapted for ornamenting rock-work, or to be grown in pots as alpines in a mixture of loam.
peat, and sand. Those marked frame require the protection of a frame or greenhouse in winter. The seeds of the annual species only require to be sown in the open border early in spring. Those species belonging to divisions Alpecoideae, Tragacanthae, Incini, Dissitiflori, and Onobrychoidei are the most worthy of cultivation.

Lin. syst. DäänBIllia, DäänBIrëia. Calyx bifractate at the base, campanulate, 5-cleft, upper segments broadest. Petals 5, disposed in a papilionaceous corolla, with the vexillum entire, about the length of the wings. Keel minute. Stamens diadelphous. Legume somewhat cylindrical, 1-celled, many-seeded, filled with medulla, which vanishes at maturity, with the valves always separating in a spiral manner. Seeds reniform, small, scrobiculate.—Stemless herbs, with impari-pinate or simple leaves, that is, having the terminal leaflet only remaining, which is jointed at the top of the petiole. Scapes ascending. Flowers umbellate, red, or violaceous. Perhaps Astragalus Sinicus of Lin. belongs to this genus.

CXXXIII. BiseërruIla (from bis, twice, and sërruIa, a little saw; in allusion to the legumes, which are toothed on both sides, giving them the appearance of a little saw). Lin. gen. no. 893. Lam. ill. t. 622. D. C. astr. no. vi. prod. 2. p. 307.

Cult. The seeds of this plant only require to be sown in the open border in spring.

VOL. II.
**LEGUMINOSÆ. CXXXIV. SCORPIURUS. CXXXV. CORONILLA.**

**Sub-evillous Caterpillar.** Fl. Ju. July. Clt. 1731. Pl. proc. 5 S. acetofolia (Linn. f. lyb. p. 43. t. 19. f. 4.) legumes clothed with short hairs, having the inner ribs naked, and 6 or 8 of the outer ones bearing crowded, stiff, very short prickles. O. H. Native of Cremonia, in sandy places, and of Corsica, about Bonifacio. Flowers yellow.

**Acute-leaved Caterpillar.** Fl. Ju. July. 1825. Pl. proc. 6 S. vermiculata (Linn. spec. 1650.) legumes glabrous, with the inner ribs almost obsolete, but the outer ones bearing crowded stipitate tubercles, which are obt../ly dilated at the apex. O. H. Native of the region of the Mediterranean, in corn-fields. Moris, hist. sect. 2. t. 11. f. 5. Gaertn. fruct. 2. p. 155. Flowers yellow, but with the vexillum streaked with red, solitary on the peduncles. Legumes thick.

**Purple-flowered Caterpillar.** Fl. June, July. Pl. trailing. Cult. These plants are preserved in gardens more for the oddness of the shape of their pods than for their beauty, and being all hardy annuals the seeds of them only require to be sown in the open border in spring, where they are intended to remain, and thinned afterwards if they rise too thick.

**CXXXV. CORONILLA (from corona, a crown; in reference to the disposition of the flowers in heads or umbels at the tops of the peduncles).** Neck. elem. no. 1319. Lam. ill. t. 630. D. C. prod. 2. p. 809.—Coronilla species of Lam. and others.

**Lam. St. Diodali Planta, Decandria.** Calyx campanulate, short, 5-toothed (f. 41. a.), the 2 superior teeth approximate, and joined together higher up than the rest. Claws of petals usually longer than the calyx. Corina acute. Stamens diadelphous. Legume nearly terete, slender, at length separating into oblong 1-seeded joints (f. 41. c.). Seeds ovate or cylindrical (f. 41. f.).—Shrubs or herbs, with impari-pinnate leaves, and axillary peduncles, bearing at the tips their umbels of pedicellate flowers.

1 C. Emerus (Linn. spec. 1046.) shrub, glabrous; stipulae small; leaflets 5-7, obovate; peduncles 3-5-flowered. O. H. Native of middle and south Europe, and of Tauria, in hedges, and among bushes. Sims, bot. mag. 445. Emerus major, Mill. fig. t. 132. f. 1. and minor, f. 2. C. pauciflora, Lam. fl. fr. Flowers yellow.

**Agreeable Coronilla or Scorpion-Senna.** Fl. April, June. Clt. 1596. Shrub 3 to 4 feet.

**Sect. II. CORONILLA (see genus for derivation).** Tourn. inst. t. 419. Desv. Journ. bot. 3. p. 119. t. 4. f. 3. Legume rather compressed, evidently separating into joints (f. 41. c.). Claws of petals hardly longer than the calyx.

* Flowers yellow.

2 C. buxnea (Linn. spec. 1047.) shrubby, glabrous; stipulae small; leaflets 5-7, linear-lanceolate, obtuse, rather fleshy, lower ones remote from the stem; umbels 5-7-flowered. O. H. Native of the south of France. Ker. bot. reg. 880. Lod. bot. cab. 232.—Barrel. icon. t. 133.—J. Bauh. hist. 1. p. 2. t. 383. f. 2. Branches rush-like, terete, almost naked, slender. Flowers bright yellow.

3 C. stipularia (Lam. dict. 2. p. 120.) shrubby, glabrous; stipulas roundish, large, deciduous; leaflets 7-9, ovate, mucronate, glaucous, lower ones remote from the stem; umbels 6-8-flowered. ∴ F. Native of the south of Italy, in Goat's Island, in Sicily near Palermo, and probably of Spain. C. orbicularis, Moench. C. Valentina, Lin. spec. 1947. exclusive of the synonyme of Clusius, and therefore the name. Curt. bot. mag. 185. C. Hispánica, Mill. dict. no. 4.? Flowers deep yellow, very fragrant at night.

**Large-stipled Coronilla.** Fl. Mar. Nov. Clt. 1596. Sh. 3 ft. 4 C. pentaphylla (Desf. atl. 2. p. 171.) shrubby, glabrous; stipulas ovate, mucronate, deciduous; leaflets 5-7, cuneiform, mucronate, usually emarginate; umbels 10-20-flowered. ∴ F. Native of Algiers on hills. Mill. fig. t. 289. f. 2.? Five-leafletted Coronilla. Fl. June, July. Clt. 1700. Shrub 2 to 4 feet.

5 C. argentea (Linn. spec. 1048.) shrubby; leaflets 11, silky, terminal one largest. ∴ F. Native of Candia. Mill. fig. t. 289. f. 1. ex Ait. Hort. Kew. 4. p. 532. This is a very doubtfully beautiful white, sweet-scented.

**Siftery Coronilla.** Fl. May, June. Clt. 1664. Sh. 2 feet. 6 C. glauca (Linn. spec. 1047.) shrubby, glabrous; stipulas small, lanceolate; leaflets 5-7, ovate, very obtuse, glaucous, lower ones remote from the stem; umbels 7-8-flowered. ∴ F. Native of France about Narbonne, and of Sicily, and probably of Spain. Curt. bot. mag. t. 13. Mill. fig. 289. f. 1. Flowers beautiful yellow, fragrant in the day time, but scentless at night.

**Glaucous Coronilla.** Fl. May, Sept. Clt. 1722. Sh. 2 to 4 ft. 7 C. Minima (Linn. spec. 1048.) suffruticoso, procumbent, glabrous; stipulas concrete, small, opposite the leaves, bidentate at the apex, the upper ones largest, membranous, and deciduous; leaflets 7-13, ovate-roundish, obtuse or retuse, lower ones remote from the stem; umbels 7-8-flowered; legume 4-winged, toothed. ∴ H. Native of the southern parts of Europe, on the lower mountains. Flowers yellow. This species is usually confused with C. minima.

**Least Coronilla.** Fl. June, July. Clt. 1658. Pl. prostrate or ½ foot.

8 C. vagina (Lam. dict. 2. p. 121.) plant suffruticoso, prostrate; stipulas concrete, large; leaflets roundish; legumes 4-winged, toothed. ∴ F. Native of the southern parts of Europe, on the lower mountains. Flowers yellow. This species is usually confused with C. minima.

**Sheath-edged Coronilla.** Pl. prostrate.

9 C. coronata (Linn. spec. 1048.) plant suffruticoso, erect, or ascending, glabrous; stipulas concrete, small, opposite the leaves, bidentate at the apex; leaflets 5-11, ovate, rather mucronate, glaucous, lower ones approximating the stem; umbels many-flowered; legumes compressed, tetragonal, erect. ∴ H. Native of the southern parts of Europe, in arid places. Jacq. austr. t. 95. D. C. fl. franc. 4. p. 608. but not of Bieb., nor Sims. C. pterocarpa, Dufour, ann. sc. phys. 7. p. 307. C. Valentina, Lam. fl. fr. 2. p. 663. but not of Lam.—Clus. hist. 1. p. 98. f. 2. (fig. 41.)
10 C. MONTA'NXA (Scop. carn. ed. 2. p. 912. t. 44.) plant herbaceous, erect, glabrous; stipulas concreto, opposite the leaves, oblong, emarginate, deciduous; leaflets 7, ovate, mucronate, rather glaucous, lower ones approximating the stem; umbels 15-20-flowered. Fl. H. Native of Germany, Carniola, and Switzerland, on the mountains. C. coronàta, Bieb. fl. taur. 1434. Sims, bot. mag. 907.—Riv. tetr. t. 207. (f. 41.)

12 C. SQUAM'ATA (Cav. icon. t. 155.) plant herbaceous, erect; stipulas lanceolate-ovate, membranous, somewhat ciliate; leaflets 9-11, ovate, pubescent, lower ones remote from the stem; umbels 7-8-flowered; legumes scurfy from scales. Fl. H. Native of Spain, near the town of Lamota del Cuervo. Flowers yellow.

13 C. PARVIFÓRA (Willd. spec. 3. p. 1155.) plant herbaceous, much branched, rather scabrous from reflexed stiff hairs; leaflets 9, cuneate, emarginate, glabrous; stipulas ovate, very minute; umbels 5-flowered; peduncles longer than the leaves; legumes terete, arched. Fl. H. Native of Candia and Tauria, on exposed hills. C. Crética herbae, &c. Tourn. cor. 44. C. Valentia, Pall. ined. Bieb. fl. taur. 2. p. 173. Very like C. Crética, but differs in the flowers being yellow.

Small-flowered Coronilla. Pl. ½ foot.

** Flowers purple, pink, or white.

14 C. VIMINÁLIS (Salisb. par. t. 13. Ait. hort. kew. ed. 2. vol. 4. p. 331.) suffrutescens; stipulas ovate, membranous, soon falling off; leaflets 13-21, ovate, retuse, mucronate, glaucous, lower ones approximating the stem; umbels 6-10-flowered. Fl. H. Native of Mogador. Branches hardly angular. Flowers large, pale, having the vexillum lined with red lengthwise, changing from pale to deeper purple.

Twirly Coronilla. Fl. May, Nov. Cl. 1798. Sh. 2 to 4 ft.
15 C. CRÉTICA (Lin. spec. 1848.) plant herbaceous, ascending; glabrous; stipulas small, acute; leaflets 11-13, cuneate, retuse, the lower ones remote from the stem; umbels 5-6-flowered. Fl. H. Native of Candia, Tauria, and Italy, on hills. Flowers white, having the vexillum streaked with red, and the keel dark purple. Jacq. hort. vind. t. 25. C. parviflora, Monch. Astrolóbium Créticum, Desv.

16 C. VA'RIA (Lin. spec. 1848.) plant herbaceous, diffuse, flexuous, glabrous; stipulas distinct, lanceolate; leaflets 9-13, oblong, elliptic, mucronate, lower ones approximating the stem; umbels 15-20-flowered; legumes angular, very long, straight. Fl. H. Native of Europe and Tauria, in fields and meadows. Curt. bot. mag. 258. Mill. fig. t. 106.—Clus. hist. 2. p. 237. f. 2. Astragálas glaucoides, Gmel. ined. t. 21, ex Bieb. Flowers pink, rarely white, at length drooping. Root creeping. This plant was formerly proposed to be cultivated as a proper food for cattle; and it was found that it grew very readily, and might be very beneficial to the farmer. In a good soil the stems will grow even 5 feet long, and be tender their whole length, so that a small spot of ground will supply a considerable quantity of fodder, especially in dry seasons. Horses and cows seem to eat it greedily. However, Mr. Curtis remarks that its bitterness will be an objection to its being cultivated for cattle.

17 C. GLOBÓSA (Lam. dict. 2. p. 129.) herbaceous, glabrous; stipulas small, acute; leaflets oblong-elliptic, 11-13, obtuse, lower ones distant from the stem; umbels globose, 20-30-flowered; legumes pendulous. Fl. H. Native of Candia in fields. C. Crética herbaceae flore magnó candido, Tourn. cor. 44. Flowers pink or white. Perhaps only a variety of C. váría. Globose-flowered Coronilla. Fl. July, Nov. Cl. 1800. Pl. diffuse.

† Doubtful species.

18 C. SCÆNÆNS (Lin. spec. 1048.) stem scendent, flaccid; leaflets 5, ovate; peduncles axillary, twin, 1-flowered, prickly; legumes terete, articulated, glabrous.—Native of South America.

Climbing Coronilla. Pl. cl.
19 C. MULTIFÔLIA (D. C. prod. 2. p. 310.) plant suffrutescent, glabrous; stipulas small, lanceolate; leaflets 7-9, oblong-acute, obtuse, lower ones approximating the stem; umbels 15-20-flowered. Fl. F. Native of Spain. Branches terete, spreading, flexuous. Flowers pale, perhaps yellow, perhaps white.

Many-flowered Coronilla. Shrub 1 to 2 feet.
20 C. hirsût'À (D. C. prod. 2. p. 310.) stem herbaceous, erect, clothed with white hairs, as well as the peduncles and leaves; leaves with 6-8 pairs of oval obcordate leaflets; stipulas leafy, roundish-cordate; peduncles longer than the leaves; umbels globose, 8-12-flowered; calyx beset with black hairs. Fl. G. Native of the Cape of Good Hope. Coronilla argentea, Burm. cap. 22. Thunb. fl. cap. 592. Ægumium unknown.

Flourish Coronilla. Pl. 1 foot.

Cult. All the species of Coronilla, both shrubby and herbaceous, are worthy of cultivation in every collection, for the beauty of their flowers, as well as for the neatness of their herbage. The hardy shrubby kind, C. E'remium, is very proper for the front of shrubberies. It thrives in any kind of soil, and flowers the greater part of the year. Ripened cuttings of it root freely if planted in autumn in the open ground. The frame and greenhouse shrubby kinds are beautiful plants of easy culture; they grow best in a mixture of loam and peat, and cuttings of them strike readily in sand under a hand-glass; they may be turned out into the open border in spring, where they will make shaw bushes and flower all the summer, and if the winters are not very severe they will live with very little protection. The hardy perennial herbaceous kinds are most handsome when cultivated in pots, and placed among other alpine plants. C. váría globósa and Íberica are very hardy, but become troublesome if planted in the open ground, as their roots run so much as to injure every other plant near them, and they are afterwards difficult to eradicate. C. coronáta minima and montana are well adapted for rock-work, but do not long exist in such a situation, as they are apt to be killed in severe winters. The annual species, C. Crética, requires the treatment of other hardy annuals.

CXXV. ASTROLOBIUM (from αστρον, astron, a star, and λόφος, lobos, a pod; in reference to the disposition of the pods like the rays of a star). Desv. journ. bot. 3. p. 121. t. 4. p. 10. D. C. prod. 2. p. 311.—Orthniphus species of Lin. and others.

LIN. SYSTE. Diadoûphia, Decandria. Calyx bracteless, tubular, nearly equally 5-toothed. Keel of corolla small, compressed. Stamens didelphus. Legume nearly terete, constantly con-
posed of numerous 1-seeded, indescent, cylindrical joints, which are truncate at both ends. — Smooth European herbs, with impari-pinnate leaves. Stipulas wanting or very small, when present they are joined in one, opposite the leaves, and therefore bidentate at the apex. Flowers yellow, capitate, destitute of the bractea to the head of the flowers.

1 A. **EBRACTEA'TUM** (D. C. prod. 2. p. 311.) peduncles about equal in length to the leaves, bracteate at the apex; leaves all pinnate; leaflets elliptic-oblong, many-pairs, equal in size and shape, lower ones distant from the stem; legumes terete, arched. O. H. Native of Portugal, Spain, south of France, and Italy, in gravelly places. Ornithopus levigatus, Smith in Rees' cycld. no. 5. Ornith. estipitulatus, Thore, chl. land. 311. O. ebracteatus, Brogt. fl. lus. 2. p. 159. Scopiriidus pinnatus, Mill. dict. no. 5. O. nudiflorus, Lag. varied. esp. 2. p. 40. O. durus, D. C. fl. fr. no. 4059, but not of Cav. O. pygmaeus, Viv.—Dalech. hist. 1. p. 487. f. 1. Flowers small, yellow.

**Bractless Star-Vetch.** Fl. June, July. Clt. 1700. Pl. pros. 2 A. **DU'RéUM** (D. C. prod. 2. p. 311.) peduncles a little longer than the leaves, almost bracteate at the apex; stipulas concrrete, sheathing; lower leaves simple, the rest pinnate, with few pairs of obcordate leaflets, the lower ones approximating the stem; legumes arched, rather tetragonal. O. H. Native of Spain, about Valencia and Madrid in bushy places, and of Portugal in vineyards. Ornithopus durus, Cav. icon. 1. p. 31. t. 41. O. heterophyllus, Brogt. phyt. t. 67. fl. lus. 2. p. 160. Flowers yellow.

**Hard-podded Star-Vetch.** Fl. Ju. July. Clt. 1816. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

3 A. **REPA'NeillDUM** (D. C. prod. 2. p. 311.) peduncles a little shorter than the leaves, bracteate at the apex; stipulas concrcrete, sheathing; lower leaves simple, ovate, and emarginate, upper ones pinnate; leaflets oblone, lower ones roundish, approximating the stem; legumes rather nodose, a little incurved. O. H. Native of Barbary in fields towards Lacalle. Ornithopus repandus, Lam. ill. t. 631. f. 4. Pair. dict. 4. p. 620. O. lotoloides, Viv. Flowers yellow.

Pl. $\frac{1}{2}$ foot.

Cult. The seeds of these plants only require to be sown in the open ground in spring. None of the species are worth cultivating, except in botanical gardens.

**CXXVII. ORNITHOPUS** (from ornus, a bird, and πως, pous, a foot; the legumes are like the claws of a bird, and are disposed somewhat in the same manner). Desv. journ. bot. 3. p. 121. t. 5. f. 14. D. C. prod. 2. p. 311.—Ornithopus species Lin. and others. Lam. ill. t. 631.—Ornithopodium, Tourn. inst. t. 524. Moczn. meth.

Linn. syst. *Daidelphias, Decandria.* Calyces distinct, about equally 5-toothed, bracteate. Keel of corolla small, compressed. Stamens diadelphous. Legume compressed, with many 1-seeded indescent joints, which are truncate at both ends, but having parallel margins.—European, villous, annual herbs, with impari-pinnate leaves, small stipulas which are adnate to the petioles, axillary peduncles, bearing a few-flowered umbel at the top of each. Flowers small, white or rose-coloured. All the species have a pinnate bracteate under each head of flowers.

1 O. **COMPRESSUS** (Lin. spec. 1049.) peduncles shorter than the leaves; leaves villous, upper ones having the lower pair of leaflets approximating the stem; legumes compressed, pubescent, wrinkled, incurved at the apex; the joints oval. O. H. Native of the south of Europe and the north of Africa, in sandy places. Berg. phyt. t. 191. Ornithopodium comprassum, All. ped. no. 1245. Flowers small, yellow.

2 O. **FLORIBUS** (Lin. spec. 1049.) peduncles longer than the leaves; leaves rather villous, upper ones having the lower pair of leaflets approximating the stem; legumes rather compressed, glabrous, curved upwards, the joints elliptic, moderately compressed. O. H. Native of every part of Europe and the North of Africa, on heaths and gravelly pastures; plentiful in Britain. Smith, engl. bot. 369. Od. fl. dan. 307. Curt. Lond. 6. t. 53. Flowers small, usually 2 or 3 in a head, having the vexillum and wings white, and beautifully veined with crimson, and the keel green.

*Far. b. nodosus* (Mill. dict. no. 2.) root bearing ovoid tubercles; legumes pubescent. O. H. Native of Europe, in several parts of Britain and of France, very common about Paris. The tubercles, which are said to be on the roots of this variety, are to be found on the roots of almost all leguminous plants, which arise from morbid excrescences.

3 O. **SARIVUS** (Brogt. fl. lus. 2. p. 160.) peduncles longer than the leaves; leaflets pubescent; oval in the lower leaves, and lanceolate in the superior ones, the lower pairs approximating the stem; legumes hardly arched, with roundish compressed knots. O. H. Native of Portugal and other parts of the south of Europe, in rather wet sandy places and meadows. O. roesus, Dufour. in litt. O. perpusillus b. intermedius, Roth. fl. germ. 2. p. 215. Ornithopodium majus, C. Bauh. pin. 350. Ger. emac. 1241. f. 3.—Moris. hist. sect. 2. t. 10. f. 13. Flowers white and red, mixed.

Cultivated Bird's-foot. Fl. May, July. Clt. 1818. Pl. pr. Cult. The seeds of these plants only require to be sown in the open ground, in spring. None of the species are worth cultivating, except in botanical gardens.

**CXXXVIII. HIPPOCREPIS** (from hippo, a horse, and krepis, a shoe; in reference to the shape of the recesses of the pods, which are curved in such a manner as to give them a likeness to a horse's shoe). Lin. gen. 885. Lam. ill. t. 630. D. C. prod. 2. p. 312. Ferrum-equinum, Tourn. inst. t. 225.

Lin. syst. *Daidelphias, Decandria.* Calyces 5-crested (f. 42. a.) with the lobes equal and acute. Carina of corolla 2-edged (f. 42. b.). Stamens diadelphous. Style filiform, acute. Legume having numerous, 1-seeded joints, curved (f. 42. c.), hence the upper side of the legume appears as if it were cut, from having numerous rounded recesses. Seeds cylindrical or compressed, oblong, curved, fixed to the middle part of the joint, and therefore the umbilicus is in the middle of the curve.—Herbs or subshrubs, with impari-pinnate leaves and yellow flowers, which are sometimes solitary and axillary, sometimes sessile, but usually disposed in umbels on the tops of the axillary peduncles.

§ 1. Roots perennial. Legumes sinuated, with the joints curved, forming a broad open recess between each pair.

1 H. **Balearia** (Jacq. misc. 2. p. 305. icon. rar. 1. p. 149.) shrubby, erect; peduncles longer than the leaves, bearing an
umbel of flowers at the apex; legumes glabrous, a little arched.

5. **H. scabra** (D. C. prod. 2. p. 312.) peduncles twice the length of the leaves, bearing an umbel of flowers at the apex; legumes arched, scabrous at the seeds, the rest clothed with a kind of lepiplated pubescence. O. H. Native of Spain, in the kingdom of Murcia, near the city. Style long, compressed, permanent at the top of the legumes. 

10. **H. cilata** (D. C. prod. 2. p. 313.) peduncles rather shorter than the leaves; legumes arched, hispid at the seeds, and ciliated on one side. O. H. Native of Spain and Italy.

**Var. a.** peduncles 4-6-flowered. O. H. Native of Spain, near Aranjuez. H. ciliata, Willd. berl. mag. nat. ges. 1808. p. 175.

**Var. b.** peduncles 3-flowered. O. H. Native of Spain, in the provinces of Granada and Murcia. H. annua, Lag. nov. spec. 23. p. 299.

11. **H. biflora** (Spreng. pug. 2. p. 73.) peduncles very short, 2-flowered; legumes minutely ciliated on both margins. O. H. Native country unknown. Flowers twin, axillary, almost sessile, but the peduncles becomes elongated after flowering. Cilium of legume very short.

**Cult.** All the species of this genus are worthy of cultivation in every garden, on account of their neatness and beauty. The **H. Balsarica** is the only species which requires protection in a greenhouse in winter. It thrives in a mixture of loam and peat, and cuttings of it strike root readily under a hand-glass. The perennial herbaceous kinds are well fitted for ornamenting rock-work or banks: they are propagated by dividing at the root or by seeds. The annual species are also well fitted for rock-work, where their seeds should be sown early in spring.

---

**LEGUMINOSÆ. CXXVIII. HIPPOCREPIS. CXXXIX. SECURIDACA.** 277

**FIG. 42.**

**5. Roots annual. Legumes with roundish recesses.**

5. **H. scabra.** Stem branched, spreading; peduncles linear; legumes length of leaves, usually bearing 3 flowers at the apex; legumes slightly arched, twisted into a double circle. O. H. Native of Montpelier.

**Twice-twisted-podded Horse-shoe-Vetch.** Pl. spreading.

7. **H. multissiliquosa** (Lin. spec. 1050.) peduncles a little shorter than the leaves, 2-4-flowered; legumes quite smooth, circularly incurved. O. H. Native of Spain, Italy, south of France, and Barbary, in exposed stony or sandy places. Mill. fig. 278. f. 2. F. Ferrum equinum polyseratum, Col. ephr. p. 300, with a figure. F. multiflōrum, Monch. meth. 119. Plant smooth.

disposed in racemes (f. 43, g. f. 44, c.). Legumes compressed (f. 43, i, f. 44, g.).

CXL. Diphaca. (from ét, dist, twice, and φακεν, phake, a lentil or pea; in reference to the pods being composed of 2 1-seeded joints). Lour. coch. p. 454. D. C. prod. 2. p. 315.

Linn. syst. Diadélphia, Decándria. Calyx 5-cleft, permanent, propped by 2 lanceolate bracteas, the lowest longest. Corolla papilionaceous. Keel of 2 distinct petals. Stamens joined into 2 5-anthered bundles. Carpels 2, 1-seeded. Legume compressed, straight, articulated; joints striated, 1-seeded. This genus is allied to Dábelgria and Éskinémone, in the stems being equally diaphalous, but the fruit is articulated as in Hedysarum, and the plant is therefore placed in the same tribe.

Cochin-china Diphaca. Shrub 8 feet.

Cult. To be treated as other greenhouse plants.

Linn. syst. Diadélphia, Decándria. Calyx furnished at the base with 2 caducous bracteoles, campanulate, 5-cleft, 2 superior lobes obtuse and shorter than the others, 3 inferior ones acuminate and somewhat spinose. Vexillum of corolla rounded, complicated. Keel obtuse, a little shorter than the wings. Stamens diaphalous. Style filiform, glabrous. Legume stipitate, compressed, few-seeded, sometimes continuous, having the seeds separated by a kind of spiny substance, sometimes articulated, the joints 1-seeded, but some of them are abortive, never striated nor nerved. Seeds compressed, flat, ovate, rather truncate at the base. Cotyledons flat, green. Radicle lying above the commissure formed by the cotyledons.—Quite glabrous American shrubs, having the cauline stipules usually spinose, rarely unarmed. Leaves impari-pinnate, the leaflets exstipellate, having the middle nerve of each drawn out in a spine-like mucrone. Flowers axillary, disposed in loose racemes or solitary, yellow, the pedicels jointed at the apex, and bibracteolate; bracteoles caducous.

1 P. squamata (D. C. l. c. t. 47. f. 3.) leaves with 7-10 pairs of orbicular leaflets, each leaflet ending in a long spine-like mucrone, having the lateral veins hardly evident; stipulas spinose, erect; scales at the base of the branchlets, imbricated, and rather spinose; racemes loose, 3-7-flowered. G. S. Native of the island of St. Thomas, by the sea-side. Robinia squamata, Vahl. symb. 3. p. 88. t. 69. Robinia squamosa, Poir. dict. 6. p. 224. Caragâna spinosa, Rich. herb. Pedicels distant, elongated, nearly opposite. Flowers yellow. Legumes unknown.

2 P. arista (D. C. legum. mem. viii. t. 47. f. 5.) leaves with 7-10 pairs of obovate-orbicular, usually alternate leaflets, each leaflet ending in a long straight spine-like mucrone, having the lateral nerves prominent; stipulas spinose, spreading; racemes loose, 3-7-flowered. G. S. Native of St. Domingo, Santa Cruz, and Krabben Island. Éskinémone aristata, Jacq. hort. schenbr. t. 237. Poiriétia aristata, Desv. journ. bot. 3. p. 122. Flowers yellow. Legume of 3-4 joints. Very like the preceding species.

3 P. obcordata (D. C. l. c. t. 47. f. 1. prod. 2. p. 314.) leaves with 10-12 pairs of nearly opposite obcordate leaflets, each leaflet ending in a short, recurved, spine-like mucrone; stipulas ovate-lanceolate, unarmed. G. S. Native of St. Domingo. Racemes few-flowered. Legumes oblong, compressed, and perhaps 1-celled and 1-seeded from abortion, each standing on a longish stipe. Flowers unknown, but most probably yellow.

Obcordate-leafletted Picetia. Shrub 3 to 6 feet.

4 P. jussieu (D. C. l. c.) leaves with 3-4 pairs of alternate or opposite, oblong leaflets, each leaflet ending in a straight spine-like mucrone, the odd one longest; stipulas spinose, erect, small. G. S. Native of St. Domingo. Perhaps Pictetia Desvianzii, flowers red. Robinia aculeata, Juss. herb. where a specimen of it is preserved without either flower or fruit.

Jussieu's Picetia. Shrub 3 to 6 feet.

5 P. desvauxii (D. C. l. c. t. 47. f. 4.) leaves with 1-2 pairs of approximate oblong leaflets, which taper to both ends, and terminate in a straight spine-like mucrone; stipulas spinose, straight; pedicels axillary, 1-flowered; legume linear-oblong, obtuse continuous. G. S. Native of St. Domingo. Robinia spinifollis, Desv. journ. bot. 1814. 1. p. 78. Flowers small, yellow. Legume an inch long and about 3 lines broad, 5-6-seeded.

Desvaux's Picetia. Shrub 3 to 6 feet.

6 P. ternata (D. C. l. c. t. 47. f. 2.) leaflets 3, approximate, cuneate-oblong, terminating in a straight, short, spine-like mucrone; stipulas spinose, straight; pedicels axillary, 1-flowered; legume torulose, linear-oblong, acute. G. S. Native of St. Domingo. Éskinémone ternata, Speng. syst. in herb. Balb. Flowers yellow.

Ternate-leaved Picetia. Shrub 3 to 4 feet.

Cult. A mixture of loam, peat, and sand will suit the species of this genus, and young cuttings will root in sand under a hand-glass, in heat.

CXLIII. ORMOCARPUM (from ῥομος, ῥομος, a necklace, and καρπος, carpos, a fruit; in allusion to the shape of the pods, which are jointed, and may be likened to a necklace). Beauv. fl. d'or. 1. p. 95. Desv. journ. bot. 3. p. 122. t. 5. f. 16. D. C. prod. 2. p. 314.

Linn. syst. Diadélphia, Decándria. Calyx furnished with 2 permanent bracteoles at the base, 5-cleft, somewhat bilabiate, with all the lobes acute. Corolla papilionaceous, with a broad entire vexillum, and an obtuse 2-edged keel. Stamens diaphalous. Legume stipitate, many-jointed, with the joints articulated at both ends, usually striated and warded lengthwise, 1-seeded, distinctly separating.—Smooth shrubs, with simple leaves, having the petiole jointed at the apex, or impari-pinnate, or abruptly-pinnate leaves. Racemes short, axillary.

* Leaves simple, with the petiole jointed at the apex.

1 O. verrucosum (Beauv. l. c. t. 58.) leaves simple, ovate-lanceolate, acuminate; joints of legume striated and warded. G. S. Native of western Africa, in the kingdom of Waree. Mulèra verrucosa, Pers. ench. 2. p. 311. Leaves 3 inches long, but hardly an inch and a half broad. Flowers red.

Waired-podded Ormocarpum. Shrub 3 to 6 feet.

2 O. socula (Beauv. l. c. in a note) leaves simple, small; joints of legume furrowed, but not warded. G. S. Native of St. Domingo. Perhaps Pictetia Desvauxii. Flowers red.

Furrowed-podded Ormocarpum. Shrub 3 to 4 feet.

* * * Leaves impari-pinnate.

3 O. sennoide (D. C. prod. 2. p. 315.) leaves impari-pinnate, with 6-7 pairs of obovate, retuse mucronulate leaflets; joints of legume striated and beset with prickly tubercles. G. S.
Native of the East Indies. Hedysarum sennoïdes, Willd. spec. p. 1207. O. cassioide, Desv. l. c. Flowers red?

4 O. coronoloides; shrubby, erect, branched; leaves impari-pinnate; leaflets oblong, emarginate, glaucous; flowers lateral, pedunculate; legumes with 6-7 furrowed, glabrous joints, which taper at both ends. Ɋ. ɹ. Native of the island of St. Thomas, in Guinea, on a little island in Man-of-War Bay. 

Coronilla-like Ormocarpum. Shrub 6 feet.

*** Leaves abruptly pinnate.

5 O. Eleegans; shrubby, smooth except the young leaves, which are silky; leaves abruptly pinnate, with 8-10 pairs of ovate-lanceolate, mucronate leaflets; racemes axillary, not as long as the leaves; calyx smooth, slightly 5-lobed; vexillum large. Ɋ. ɹ. Native of Mexico. Legumes stipitate, 3-jointed; joints tapering to both ends. Calyx permanent. Flowers purple. 

Elegant Ormocarpum. Shrub 3 to 6 feet.

6 O. cocollæa; shrub rather villous, with 10-16 pairs of obovate-lanceolate, obtuse, mucronate leaflets; racemes shorter than the leaves; calyx campanulate, almost truncate. Ɋ. ɹ. Native of Mexico. Flowers apparently scarlet.

Scarlet-flowered Ormocarpum. Shrub 3 to 4 feet. 

Cult. See Ficellia, p. 278. for culture and propagation.

Lin. syst. Monadelphía, Decândria. Calyx campanulate, 3-cleft, 2 upper lobes roundish, large, 2 lateral ones minute, the lowest one oblong, keeled, and concave. Corolla with an orbicular vexillum, and with the wings applied to the keel. Stamens 10, monadelphous, with the tube or sheath cleft in front. Legume linear, compressed, many-jointed, with the joints truncate at both ends.—Climbing shrubs. Branches and petioles pubescent. Leaves abruptly pinnate, with 2 pairs of leaflets, full of pellucid dots. Peduncles axillary, 5-6-flowered. Bracteas 2, orbicular, opposite, at the origin of the pedicels. Flowers yellow. This genus is nearly allied to Poiretia, but is easily distinguished by the form of the calyx.

1 A. glandulosea (H. B. et Kurth, l. c.) leaflets obovate, somewhat emarginate; vexillum obcordate; legume with 5 joints. Ɋ. ɹ. Native of New Granada, near Loxa. 

Glandular Amicia. Shrub cl.

2 A. zeoglomeris (D. C. prod. 2. p. 315.) leaflets cuneate-obcordate, mucronate; vexillum broadly obovate; mucronate; legumes having 2 joints. Ɋ. ɹ. Native of Mexico. Zygomeris flava, Moc. et Sesse, fl. mex. icon. ined. According to the figure there are 2 of the stamens longer than the rest. 

Cult. See Ficellia, p. 278. for culture and propagation.

CXLIV. POIRETIA (in honour of J. L. M. Poiret, a French botanist and traveller in Barbary, editor of the supplement to Lamark's Dictionnaire de Botanique, 4 vols. 4to.). Vent. choix. t. 42. but not of Gmel. nor Smith, nor Cav. D. C. prod. 2. p. 315.—Turpinia, Pers. ench. 2. p. 314. but not of Bonpl. nor Rafin.

Lin. syst. Monadelphía, Decândria. Calyx campanulate, bilabiate, upper lip somewhat bidentate, lower one tridentate. Corolla with a semi-ornicular, emarginate vexillum, thrown back from the keel, with reflexed lips; wings spreading. Stamens 8-10, monadelphous, with the tube or sheath cleft in front. Stigma capitate. Legume with 3-4, compressed, 1-seeded, straight, truncate joints, separating at maturity.—Climbing shrubs, having the habit of Glyceine, with abruptly pinnate leaves, bearing 2 pairs of leaflets. Stipulas distinct from the petiole. Racemes short, axillary. Flowers covered with glandular dots.

2 P. psoraloides (D. C. prod. 2. p. 315.) stem erect, angular; leaves with 4 obovate leaflets, full of pellucid dots; flowers almost terminal, glomerate. Ɋ. ɹ. Native of Monte Video, at the bottom of mountains. Psoralea tetraphylla, Poiret, suppl. 4. p. 589. The leaves are sometimes composed of 3 or 5 leaflets from some cause or other. 

Psoralea-like Poiretia. Shrub 2 to 3 feet. 

Cult. See Ficellia, p. 278. for culture and propagation.

CXLV. PLANARium (from planarius, plain; in reference to the broad flat legumes). Desv. obs. legum. in Schlecht. Linnea. 2. p. 511.

Lin. syst. Diadêphía, Decândria? Calyx tubular, 5-toothed, and appearing as if hidden within 2 opposite bracteas. Corolla and stamens unknown. Legume constantly composed of numerous, terete, somewhat obconical, 1-seeded, indistinct joints.—An erect smooth herb, having 4 dotted, obovate, emarginate leaflets at the top of each petiole, with very short, axillary, solitary, 1-flowered pedicels, and yellow flowers. This genus is not sufficiently known, but it appears to be nearest allied to Poiretia, in the leaves being of 4 glandular leaflets.

Cult. The seeds of this plant require to be sown in pots and placed on a hot-bed in spring, and when the plants are strong enough they may be removed to the stove or greenhouse, or they may remain in the frame, where they will ripen seeds.

LEGUMINOSÆ. CXLVII. ZORNIA. CXLVIII. STYLOSANthes.

LIN. svt. Monadelphia, Decandria. Calyx campanulate, bilabiate, upper lip emarginate, lower one 3-toothed. Corolla inserted in the bottom of the tube of the calyx. Vexillum having prostrate sides. Keel bifidly lunulate. Stamens monadelphous. Anthers alternately globose and ovate. Legume compressed, 3-jointed; joints nearly orbicular, usually hirsut.—Glabrous herbs, full of pellucid dots. Stipulas sagittate, lower ones lanceolate, upper ones the largest, and forming girding bracteae. Leaflets 2 or 4, rising from the top of the petiole. Flowers yellow, surrounded by the large stipulas.

*Leaves having 2 leaflets rising from the top of each petiole.*

1. *Z. angustifolia* (Smith, in Rees' cycl. no. 1.) stems diffuse; leaflets oblong-lanceolate; bracteas ovate-sagittate, 5-nerved, ciliated, shorter than the legumes, full of glandular dots; prickles of legume covered with retrograde stiff hairs. S. Native of the Mauritius and the East Indies, in sandy places.—Rheed. pl. 9. t. 82. D. Z. diphylla a, Pers. 2. p. 318. Hedysarum diphyllum, var. a, Lin. syst. 560. exclusive of the synonyme of Sloane. In some specimens of this plant the legumes are prickly all their whole length, in others only at their apex. *Narrow-leafletted Zornia.* Fl. July, Aug. Clt. 1783. Pl. 1 to 1 foot.

2. *Z. glabrida* (Reichb. in Sieb. pl. exsic. senec. no. 40.) stems erect, branched; leaflets linear; bracteas ovate-sagittate, 5-nerved, dotless, and ciliated with long hairs, a little shorter than the legumes; legume with 3-4 joints, beset with glochidial prickles, which are covered with retrograde stiff hairs. S. Native of Senegal. *Glochidiated-podded Zornia.* Fl. July, Aug. Clt. 1823. Pl. 4 to 1 1/2 foot.

3. *Z. biarticulata*; stem branched; leaflets lanceolate, acute; spikes few-flowered; stipulas ovate, membranous, acute, 4-5-nerved, ciliated; legumes 2-jointed, echinate; prickles hooked at apex. S. Native of the Gold Coast, in sandy places. *Two-jointed-podded Zornia.* Pl. 3/4 foot.

4. *Z. gracilis* (D. C. prod. 2. p. 316.) stems erect; leaflets oblong-lanceolate; bracteas linear-sagittate, acuminate at both ends, 5-nerved, a little ciliated, full of glandular dots; prickles of legume beset with stiff retrograde bristles. S. Native of Guiana. *Slender Zornia.* Pl. 1/2 to 1 1/4 foot.

6. *Z. thymifolia* (H. B. et Kunth, nov. gen. amer. 6. p. 514.) stems diffuse, and are as well as the petioles pubescent; leaflets oblong, glabrous above, but puberulous beneath, having the margins dotted as well as the calyces; bracteas ovate, 5-nerved, puberulous and glandular beneath; legumes rather pilose, the joints reticulated with veins. H. T. Y. S. Native of Mexico, near Santa Rosa. *Var. β, clandestina*; plant larger and more branched; leaves dotless; bracteas a little dotted, glabrous, ciliated. S. Native of Mexico, near Jalapa. Z. thymifolia, Schlcht. et Cham. in Linnæa, 5. p. 582. Perhaps a proper species. *Thyme-leaved Zornia.* Pl. 1/4 to 1/2 foot.

7. *Z. levis* (Schlecht. et Cham. in Linnæa, 5. p. 582.) plant smooth; bracteas somewhat 7-nerved, sparsingly dotted, ciliated; legumes smooth, but rather puberulous between the joints; leaflets variable, ovate, or ovate-lanceolate, acute. S. Native of Mexico, near Jalapa. *Smooth Zornia.* Pl. 1/4 foot.

8. *Z. pubescentes* (H. B. et Kunth, nov. gen. amer. 6. p. 515.) stem erect, díchotomously branched, glabrous; branches and petioles clothed with villous pubescence; leaflets oblong-lanceolate, pubescent on both surfaces, and are glandless as well as the calyces; bracteas ovate, acute, ciliated, dotted; legumes hispid and mucrinated, having 5-6 joints. S. Native of South America, on the banks of the river Magdalena, near Honda. *Pubescent Zornia.* Pl. 1 to 2 feet.

10. *Z. marahameensis*; stems erect, branched, at the apex; leaflets lanceolate, acute; stipulas subulate; bracteas lanceolate, 5-nerved, acutæ, villös; legume with 3-4 hispid joints. S. Native of Maraham. *Maraham Zornia.* Pl. 1/4 foot.

**Leaves bearing 4 leaflets at the apex of each petiole.**

CXLVIII. STYLOSANthes (from στυλος, styllos, a style; ανθος, anthos, a flower; in allusion to the flower having a long style). Swartz, prod. 108. act. holm. 1789. p. 296. fl. ind. occ. 1280. t. 25. Lam. ill. t. 627. D. C. prod. 2. p. 517.

LIN. svt. Monadelphia, Decandria. Tube of calyx very long and slender, with a 5-parted limb; the lobes unequal. Corolla inserted in the throat of the tube of the calyx. Keel minute, bident at the apex. Stamens monadelphous, having the tube or sheath cleft in front. Ovary sessile. Style filiform,
LEGUMINOSÆ. CXLVIII. STYLOSANthes. CXLIX. ADEsmia.

very long and straight, crowned by a capitule, hispid stigma. Legume having 2-1 seeded joints, the upper joint acuminate and hooked at the apex, and then becoming the permanent base of the style.—Small herbs or subshrubs, with技 branching stems, trifoliate leaves, having the middle leaflet almost sessile. Stipulas adnate to the petioles. Spikes of flowers terminal, dense, imbricated by the stipulas and bracteas. Flowers small, yellow.

1 S. PROCUMBENS (Swartz, in act. holm. l. c. t. 11. f. 1. fl. ind. occ. 3. p. 1282.) stem suffruticoso, procumbent, clothed with adpressed pubescence at the apex; leaflets oblong, acute, glabrous, lined; spikes many-flowered. ½. S. Native of Jamaica, St. Domingo, Porto Rico, and Guadaloupe, in waste grassy fields. —Sloan. Hist. 1. t. 119. f. 2. Hedysarum hamatum a, Lin. spec. 1056. Ononis cerrifolia, Reichb. in Sieb. pl. exsic. seneç. no. 57.

2 S. Excipita (Deauv. fl. d'ow. 2. p. 28. t. 77.) stem erect, glabrous; leaflets ovate-oblong, glabrous, as well as the stipulas; spikes many-flowered, elongated. ½. S. Native of tropical Africa, on the western coast.

3 S. viscosa (Swartz, in act. holm. l. c. t. 9. f. 2. fl. ind. occ. 3. p. 1282.) shrubby, erect; branches clothed with clamy hair; leaflets elliptic, mucronate, ciliately serrated, hairy; spikes few-flowered. ½. S. Native of the south of Jamaica and Mexico, in sandy mountainous places. —Sloan. Hist. l. t. 119. f. 1. Hedysarum hamatum ß, Lin. spec. 1056.

4 S. mucronata (Willd. spec. 3. p. 1106.) stem suffruticoso; branches pubescently hairy; leaflets oblong-ovate, pubescent beneath, ciliately serrated; spikes few-flowered; bracteas ciliated. ½. S. Native of Ceylon and Tranquebar, in sandy places. —B Kurz. zeyl. t. 309. Hedysarum hamatum, Burm. ind. 167. Arachis fruticosa, Retz. obs. 5. p. 26., but the stems are said to be erect, but in the specimens which have been examined they appear to be diffuse, according to the description of Burmann, they are procumbent.

5 S. rigida (Spreng. syst. 3. p. 310.) stem shrubby; branches straight; leaflets almost sessile, oblong, mucronate, coriaceous, shining above, rather tormentose and runculate wrinkled beneath; spikes short, few-flowered; bracteas ovate, minute. ½. S. Native of Brazil.

Stiff Stylosanthes. Shrub 1 to 2 feet.

6 S. humilis (H. B. et Kunth, nov. gen. amer. 6. p. 506. t. 594.) stems tufted and somewhat dichotomously branched, and marked with a hairy line; leaflets oblong, and are as well as the calyces ciliated; stipulas hispid, falcate, subulate at the apex; flowers axillary, sessile; legumes ending in a hooked awn, reticulated, hispid. ½. S. Native of South America, on the Orinoca, near Carichena, in very warm places.

Humile Stylosanthes. Shrub procurem. 

7 S. glutinosa (H. B. et Kunth, l. c.) plant procumbent and clothed with clamy hairs; leaflets spatulate or obovate-oblong; flowers axillary, solitary, sessile; stipulas ovate-lanceolate, 4-merved. ½. S. Native of Mexico, near Acapulco, in sandy places. Flowers red.

Glutinous Stylosanthes. Pl. procumbent. 

8 S. tenuifolia; stem erect, branched; leaflets linear, acute, stiff; flowers numerous, disposed in terminal spikes. ½. S. Native of Maranham. 

Fine-leaved Stylosanthes. Pl. 1 foot.

9 S. Elatior (Swartz, in act. holm. l. c. t. 11. f. 2.) stem herbaceous, or erect, with one side pubescent only; leaflets lanceolate, glabrous; spikes few-flowered; bracteas lanceolate, ciliated. 2 f. Native of North America, from Pennsylvania to Carolina, and of Guadaloupe. —Pluk. alm. t. 447. f. 7. Tribolium biforunic, Lin. spec. 1088. Arachis aprica, Wal. carol. 182. S. hispida, Michx. but not of Rich.

10 S. gracillimus (H. B. et Kunth, l. c. t. 596.) stem erect, marked with a pubescent line, rather hispid at the apex; leaflets linear, puberulous; young stipulas and bracteas hispid; flowers disposed in terminal glomerate heads, which are involucrated with bracteas; legumes glabrous, ending in a hooked munrone, and having a few glandular tubercles at the apex. ½. H. Native of Mount Turimiriquiri, in the province of New Andalusia. Slender Stylosanthes. Pl. 3 to 4 feet.

11 S. Musipida (Rich. in act. soc. h. n. par. 1792. p. 112.) stems herbaceous, glabrous, diffuse; leaflets lanceolate, mucronate, hispid; stipulas and bracteas ciliated, hispid; spikes many-flowered. ½. S. Native of Cape Coast.

Guinean Stylosanthes. Shrub 1 foot.

12 S. Guineensis (Swartz, in act. holm. l. c.) stem herbaceous, erect, hispid; leaflets lanceolate, pubescent, longer than the petioles; stipulas and bracteas hispid; spikes many-flowered. ½. S. Native of French Guiana, in meadows, and near Mariquito, in New Granada. 2. B. et Kunth, nov. gen. amer. 6. p. 509. Tribolium Guianense, Aubl. guian. 2. p. 776. t. 309.

Cult. This genus contains plants of no beauty, and are therefore not worth cultivating, unless in botanical gardens. The annual species should be treated like the species of Zornia. The shrubby and perennial herbageous kinds like other stave plants. They are all most easily increased by seeds.

CXLIX. ADESMIA (from a. priv. and émos, desmos, a bond; in reference to the stamens being free). D. C. ann. sc. nat. 4. p. 94. jan. 1825. legum. mem. vii. prob. 2. p. 318.

Lin. syst. Decandria, Monogynia. Calyx 5-cleft, with the segments acute and nearly equal. Corolla papilionaceous. Vexillillum complicated above the rest of the petals when young. Keel curved and truncate at the apex. Stamens distinct, approximate. Legume compressed, transversely many-jointed, having the upper sutures straight and thickish, but the lower suture sinuate, lobed joints 1-seeded, nearly orbicular, at length separating from each other. Seeds compressed, reniformly orbicular.—South American herbs, with lanceolate stipulas, abruptly pinnate leaves, ending in a bristle, axillary, 1-flowered pedicels, or the flowers are disposed in something like racemes at the tops of the branches, in consequence of the upper leaves being abortive. Dr. Hooker's arrangement of the species of this genus is here adopted.

Sect. 1. A. Annulæ. Annual herbs, having the lower flowers axillary, solitary, and pedicellate, but the upper ones form a panicle at the tops of the branches, in consequence of the upper leaves being abortive. Flowers yellow. The plants contained in this section have the habit of Smithia.

2 A. Smith'ke (D. C. I. c.) stems decumbent, pubescent; leaves with 5 pairs of cuneate, emarginate, pubescent leaflets; pedicels axillary, 1-flowered, shorter than the leaves; joints of legume 4-8, pilose. @. S. Native of South America. Like A. maritacea, but the down on the stems is soft, not glandular, and clammy, and the pedicels are all axillary. Habit of Smithke.

Smith's Adesmia. Pl. decumbent.
3 A. hispiliida (D. C. I. c. t. 48.) stems diffuse, puberulous, and with the pedicles and peduncles scabrous from a few retrograde spines; leaves with 4-6 pairs of oblong, obtuse leaflets, which are a little toothed at the apex and pilose on the margins; pedicels axillary, 1-flowered; joints of legume 4-8, furnished in the centre with feathery bristles. @. S. Native of Peru. Aeschinomenae hispidula, Lag. nov. gen. et spec. p. 22. no. 297. Hedysarum pendumula, var. β, Poir. dict. 6. p. 449. ex Desv. Hedysarum uniforum, Domb. herb.

Hispila Adesmia. Pl. diffuse.
4 A. tenella (Hook, in Beech, voy. p. 19.) plant pubescently hairy, glandless; stems procumbent, simple; leaves with 3-4 pairs of obovate, obtuse, or retuse leaflets, and sometimes furnished with a terminal one; pedicels axillary, 1-flowered, lower ones equal in length to the leaves; calyce segments ovate-lanceolate; legume 2-3 mucrinated joints, equal in length to the calyx. @. H. Native of Chili, on hills near Valparaiso.

Tender Adesmia. Pl. procumbent.
5 A. angustipetala (Hook, in Beech, voy. p. 19.) plant pubescently hairy, glandless; stems procumbent; leaves with 4-5 pairs of remote, linear, bluntish leaflets; pedicels 1-flowered, lower ones shorter than the leaves; calyce segments lanceolate; legume 3-6-jointed, beset with a few plumose stiff bristles, twice the length of the calyx. @. H. Native about Valparaiso.

Narrit-leafletted Adesmia. Pl. procumbent.

Sect. II. Perennes. Perennial herbs, with very long, terminal leafless racemes, and panicles. Flowers yellow. Plants with the habit of Onobrychis.

6 A. dentata (D. C. in Ann. sc. nat. 4. p. 94. Jan. 1825. legum. mem. t. 49.) stem erect, beset with glandular pubescence; leaves with 4-5 pairs of obovate, obtuse, leaflets, which are deeply serrated at the apex, when young rather villous; joints of legume 4-8, mucrinated. @. S. Native of South America. Aeschinomenae dentata, Lag. nov. gen. et spec. p. 22. no. 297.

Toothed-leafletted Adesmia. Pl. 1 to 2 feet.
7 A. bicolor (D. C. I. c.) stems prostrate; leaves with 9-12 pairs of lanceolate, acute, entire, pubescent leaflets; stipules conforming to the leaves; racemes very long, opposite the leaves; joints of legume 6-8, rounded in front, and clothed with very short pubescence. @. S. Native of Monte Video, on rocks by the sea-side and in the sand. Hedysarum bicolorum, Poir. dict. 6. p. 448. Pedicels 6-8 lines long. Flowers rather large, red on the outside but yellow on the inside.

Two-coloured-flowered Adesmia. Pl. prostrate.
8 A. pendula (D. C. I. c.) stems diffuse, hardly pubescent; leaves with 7-9 pairs of oval-oblong, entire, pubescent leaflets; racemes elongated; lower flowers distinct; legumes pendulous, with 7-8 rather hispid joints. @. S. Native of Monte Video and Buenos Ayres. Hedysarum pendula, Poir. dict. 6. p. 448. var. a. Flowers yellow, but reddish on the outside.

9 A. punctata (D. C. I. c.) stems procumbent, beset with glandular pili; leaves with 9-12 pairs of linear, obtuse, entire, rather mucrinate, pubescent, ciliated leaflets; racemes spicate, crowded with flowers; joints of legume 4-8, oblong, hairy, and dotted with black. @. S. Native of Monte Video and Buenos Ayres. Hedysarum punctatum, Poir. dict. 6. p. 447. Calyce segments linear-subulate. Flowers apparently purplish on the outside.

Dotted-podded Adesmia. Pl. procumbent.
10 A. pampi (D. C. I. c. with a figure) stem ascending, leafy and villous at the base; leaves with 8-10 pairs of obovate, retuse, mucrinate, entire, rather pilose leaflets, when young pubescent beneath; racemes terminal, compound, very long, glabrous, pedunculate, many-flowered; calyx glabrous; base of vexillum with a tuft of hairs; legume with 2 joints, beset with soft plumose bristles. @. G. Native of Chili. Aeschinomenae pampi, Lag. nov. gen. et spec. p. 23. no. 298. Hedysarum papposum, Lher. ined. Flowers small, with a reflexed vexillum. Stamens probably only 5. Habit almost of Oxytropis deflexa.

11 A. longiseta (D. C. I. c.) plant decumbent, villous; leaves with 6-7 pairs of obovate, mucrinate leaflets, which are villous on both surfaces; racemes almost terminal; flowers distinct, on long pedicels; calyces glandular; legumes 2-jointed, beset with long, plumose stiff bristles. @. S. Native of South America. Herb almost with the habit of Anthyllis montana, the flowers of Ondis, the legumes of Onobrychis, and the stamens of Sophora.

Long-bristled-podded Adesmia. Pl. decumbent.
12 A. conferta (Hook, in Beech, voy. p. 20.) plant ascending, pubescent; leaves with 6 pairs of obovate-oblong, retuse, mucrinate leaflets; racemes terminal, compound, beset with black glands, many-flowered; fructiferous pedicels deflexed; calyce segments ovate; legume 3-4-jointed, mucrinated, and glandular. @. G. Native of Chili.

Crowded-flowered Adesmia. Pl. ascending.
13 A. fruticulosa; stem decumbent, pilose, as well as the petioles; leaves with numerous pairs of small, lanceolate, mucrinate leaflets; peduncles few-flowered, shorter than the leaves; legumes 3-4-jointed, hairy, and mucrinated. @. S. Native of Mexico. Aeschinomenae fruticulosa, N. E. herb. Lamb. Fruticulosae Adesmia. Pl. decumbent.
14 A. mimosoides; plant procumbent; branches and pedioles villously pubescent; leaves with numerous, linear, alternate, sessile, obtuse, mucrinate leaflets, which are oblique at the base; pedicles short, 1-flowered. @. S. Native of Mexico. Aeschinomenae mimosoides, N. E. in herb. Lamb. Mimosa-like Adesmia. Pl. procumbent.

Sect. III. Spinosae. Stems shrubby, spinose. There are numerous unpublished species belonging to this section in Dr. Gillies's herbarium.
15 A. spinosa (Hook, in Beech, voy. p. 19. t. 9. Lodg. bot. cab. 1691.) stem shrubby, much branched; branches striated, pubescent, divaricate, spinose; leaves with 6 pairs of small, orbicular leaflets, on short pedioles, pubescent; racemes of flowers somewhat capitulate, terminal, simple, spinose; bracteas orbicular; legumes 3-jointed, covered with long plumose bristles, which are stiff and naked at the base. @. G. Native of Valparaiso. Plant dichotomous, resembling furze. Stamens and petals free.

Small-leaved Adesmia. Fl. summer. Clt. 1826. Sh. 1 to 2 ft.
16 A. glutinisora (Hook, in Beech, voy. p. 19.) stem shrubby, branched; branches spreading, beset with glandular, glutinous hairs, spinose; leaves with about 3 pairs of elliptic, hairy leaflets; racemes elongated, terminal, simple, spinose, and are as well as the linear bracteas clothed with white hairs; legumes

7
3-jointed, very long, clothed with plumose bristles. ñ. G. Native of Chili, about Coquimbo.

Glatiana Adesmia. Shrub 1 to 2 feet.

Sect. IV. Fruticose. Plants shrubby, unarmed. 17 A. balsamifera (Hook, in Beech, voy. p. 20.) plants densely beset with resinous glands; stem much branched; leaves with usually 10 pairs of cuneate-oblong leaflets, usually ending in an odd one; legume 3-jointed, silky when young. ñ. G. Native of Chili, where it is called Jarilla. Mimosa balsamica, Feuill. chin. l. p. 134. The plant, besides being of great beauty, yields a balsam of a highly agreeable odour, which is perceptible at a great distance, and is found to be of great efficacy in healing wounds.

Balsam-bearing Adesmia. Shrub. 18 A. floribunda; plant erect, shrubby; branches pubescent; leaves with numerous pairs of lanceolate-oblong, mucronate, villous leaflets, which are obtrude at both ends and villous beneath as well as the petioles; peduncles axillary, few-flowered, aggregate, short, forming a panicked raceme at the tops of the branches, in consequence of the upper leaves being abortive. ñ. G. Native of Mexico. Æschinomene, spec. nov. N. E. in herb. Lamb. An elegant shrub.

Bundle-flowered Adesmia. Shrub 2 to 4 feet.

 Cult. The annual species should be treated in the same manner as that recommended for Myriadenus, see p. 279. The shrubby and perennial kinds will grow well in a mixture of loam, peat, and sand, and they may be propagated either by young cuttings, planted in sand, with a hand-glass placed over them; or those of the stover-species in heat, or by seeds, the latter mode to be preferred.

Linn. syst. Diodiplia, Decandria. Calyx 5-angled, biliate, upper lip bident, lower one trifid or tridentate. Corolla papilionaceous. Stamens 10, joined into 2 equal bundles or sets. Legume compressed, transversely articulated, straight, and exserted. Seeds compressed, solitary in the joints.—Tropical herbs and shrubs, with impari-pinnate leaves, having many pairs of leaflets, semisessituate stipules, axillary racemes of yellow flowers, each furnished with 2 opposite bracteas just under the calyx.

1. Æ. âspera (Lin. spec. 1060.) stem herbaceous, erect, terete; leaves with 30-40 pairs of linear leaflets, which are smooth as well as the legumes; racemes compound; peduncles, bracteas, calyces, and corollas hispid. ñ. S. Native of the East Indies and Cochlin-china. Æ. lagenaria, Lour. cochin. p. 446. Æ. subhirsuta, Roxb. Æ. lagenarius, Roxb. horn. beng. p. 57. Brey. cent. 51. t. 52. Stipules ending in a long acumens each. The centres of the joints of the legume are scabrous from tubercles.

The substance known by the name of rice-paper is the produce of Æ. âspera: when held between the eye and the light its beautiful cellular tissue is discoverable. Dr. Livingstone first brought from China to Europe a quantity of this substance, which he presented about 26 years ago to Miss Jane Jack, who was celebrated for the beauty and accuracy of her artificial flowers. Formed of rice-paper they obtained additional celebrity, fetched very high prices, and were eagerly sought for by persons of the greatest rank and most acknowledged taste. For a bouquet which Miss Jack presented to the late Princess Charlotte of Wales, she received the regal present of 70l.

When Dr. Livingstone first procured the rice-paper from the Chinese, the pieces did not exceed 4 inches square; they were dyed of various shades and colours, and cost about 6d. each square. Since that time the price has been much reduced, and the size of the pieces increased, so as to be upwards of a foot long and 5 inches across. The tinted pieces are employed by the Chinese for their artificial flowers, and the plain white for making drawings upon. Now this material is so much esteemed in Europe, that it is in request with people of all nations who visit Canton.

The same substance is also known in our possessions in the East Indies, where it grows abundantly in the marshy plains of Bengal, and on the borders of the jheels, or extensive lakes in every province between Calcutta and Hurdwar. The plant is perennial and of low growth, and seldom exceeds a diameter of 2½ inches in the stem. It is brought to the Calcutta bazaars in great quantities in a green state, and the thickest stems are cut into laminate, from which the natives form artificial flowers and various fancy ornaments to decorate their shrines at Hindoo festivals. The Indians make hats of rice-paper, by cementing together as many leaves as will produce the requisite thickness; in this way any kind of shape may be formed, and when covered with silk or cloth the hats are strong and inconceivably light. It is an article of great use to fishermen; it forms floats of the best description to their nets. The slender stems of the plant are bundled into fascines, about 3 feet long, and with one of these under his arm, does every fisherman go out to his daily occupation. With his net on his shoulders he proceeds to work without a boat, and stretches it into the deepest and most extensive lakes, supported by his buoyant faggot.

The cutting the material into laminate is performed vertically round the stem. The most perfect stems are selected for this purpose, but few are found sufficiently free from knots to produce a cutting of more than 9 or 10 inches in length. The Bengalite name of the plant is Shola, commonly pronounced Sola, Kuth-shola, and Phool-shola.

Rough Æschynomene. Fl. June, Jul. Ct. 1759. S. 6 to 8 ft. 2. Æ. senntula (Swartz, fl. ind. occ. 5. p. 1276.) stem shrubby, smooth, terete; leaves with 16-20 pairs of linear leaflets; legumes and racemes glabrous; peduncles branched, few-flowered; joints of legume 6-10, nearly quadrangular, smooth in the middle, but rather pilose at the upper suture. ñ. S. Native of Jamaica, Martinico, and Brazil, in sandy places; and on the banks of rivulets. Leaves falling on being touched. Flowers white.

3. Æ. macr'opoda (D. C. prod. 2. p. 320.) stem herbaceous, terete, sebaceous at the apex as well as the branches, peduncles, and petioles; leaves with 10-12 pairs of linear leaflets; peduncles few-flowered; joints of legume 5-7, smooth, the stipe 3 times the length of the lower joint. ð. S. Native of Senegal. Stamens monadelphous at the base, but easily separated into 2 bundles, even in a dried state. Stipulas small.

Var. ë. Beltsii (D. C. prod. 2. p. 320.) leaves with 10 pairs of glabrous leaflets; peduncles branched, few-flowered, clothed with glandular pubescence; joints of legume 4-6, sebaceous in the middle. ð. S. Native of Prince's Island, on the western coast of Africa. Æ. sensitiva, Beav. fl. d'ow. 1. p. 89. t. 53.

Long-footed-podded Æschynomene. Shrub 2 to 3 feet.

4. Æ. sulcat'a (H. B. et Kuth, nov. gen. amer. 6. p. 530.) arborescent; branches striated from furrows, rather flexuous, glabrous, when young hispid as well as the peduncles; leaves with 17-21 pairs of linear, mucronate leaflets, which are glabrous as well as the calyces; bracteas ciliated; joints of legume 7-9.
glabrous.  "S. Native of New Andalusia, near Bordones, in shady woods.

Furrowed-stemmed Æschynomene. Shrub 10 to 12 feet.

5. Æ. HISPIDULA (H. B. et Kunt, nov. gen. Amer. 6. p. 530.) arborenscent; branches straited and rather flexuous; racins, peduncles, and legumes hispid from tubercles; peduncles few-flowered; leaves with 15-20 pairs of oblong-linear, somewhat microroughous leaflets, which are glabrous as well as the calyces, stipulas and bracteas erioided.  "S. Native of South America, on the banks of the river Magdalena, near Bagilia. Æschynomene. Shrub to 6 to 10 feet.

6. Æ. LINDEA (Lin. spec. 1061.) stem herbaceous, erect, retic. glabrous as well as the leaves; leaves with 15-20 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted; joints 10-12, straight on one side and rounded on the other.  "S. Native of the East Indies and Guinea. Hedy-sarum, Neli Tali. Roxb. hort. Beng. 57.—Rheed. Mal. 9. t. 18. Flowers yellow.

7. Æ. GLABERIMA (Poir. suppl. 4. p. 76.) stem erect, retic., glabrous as well as the leaves; leaves with 30-55 pairs of linear leaflets; peduncles few-flowered; legumes glabrous, dotted, having 10-12 joints, which are straight on one side and rounded on the other.  "S. Native of the West Indies. Lam. ill. t. 629. f. 2.—Dr. Clinton. J. t. 118 f. 3. There is a variety of this plant having a dwarf, almost glabrous stem. Flowers brownish-yellow.

9. Æ. GUAYAQUILENSIS; shrubby; plant hispid; leaves with numerous pairs of linear, obtuse, mucronate, smooth leaflets, which are serrated at the apex; peduncles few-flowered, shorter than the leaves; bracts ovate, cordate, cuspidate. elliptically serrated; joints of legume 6-8, smooth, straight on one side and rounded on the other; stipulas semi-serrata.  "S. Native of Guayaquil. Æschynomene species, Guayaquil, Ruiz et Pav. in herb. Linn. aux. with the following two species.

Guayaquil Æschynomene. Shrub 2 to 3 feet.

10. Æ. PLURALICULATA; plant herbaceous, smooth, erect; leaflets linear, obtuse, glabrous; peduncles few-flowered; joints of legume 14-18, smooth; bracts large, serrated.  "S. Native of Guayaquil. Stipulas large, semi-serrata.

Many-jointed Festuciform Æschynomene. Pl. 2 to 3 feet.

11. Æ. scabra; plant herbaceous, hispid; leaves with numerous pairs of linear leaflets, which are obtuse at both ends; peduncles few-flowered; bracts serrated; joints of legume mucrinated in the centre.  "S. Native of Guayaquil.

Scabrous Æschynomene. Pl. 2 to 3 feet.

12. Æ. PAVULA (Poir. suppl. 4. p. 78.) stem suffruticosus, branches spreading, hispid at the apex; leaves with 10-15 pairs of glabrous, linear, obtuse, hardly mucronulate leaflets; racemes simple, few-flowered; joints of legume 4-5, semi-origulcous, puberulous.  "S. Native of the Mauritius. Perhaps a variety of Æ. Americana.

13. Æ. PUMILA (Lin. spec. 1061.) stem herbaceous, smooth, rather diffuse; leaflets linear, obtuse, mucronulate, 10-15 pairs; racemes few-flowered; legumes glabrous, having a few joints which are straight on one side and rounded on the other, and scabrous in the centre.  "S. Native of the East Indies.—Rheed. mal. 9. t. 21. Dwarf Æschynomene. Fl. July, Aug. Ct. 1818. Pl. ½ ft. 14. Æ. PLEURONEVIA (D. C. prod. 2. p. 321.) stem terete, almost erect, clothes with adpressed pubescence, as well as the petioles and nerves; leaves with 20 pairs of semi-lanceolate leaflets, having almost a lateral nerve; stipulas lanceolate, striated, not produced at the base; racemes few-flowered, almost terminal; legumes pubescent, with a few distinct joints, which are straight on one side and rounded on the other.  "S. Native of St. Domingo. Smithia Domingensis, Roth. herb. In some specimens of this plant the stamens are monadelphous, but in others they are diadelphous.

Side-nerved leafletted Æschynomene. Pl. 2 to 3 feet. 15. Æ. DIFFUSA (Willd. spec. 3. p. 1164.) stem herbaceous, smooth, diffuse; leaflets linear, obtuse; peduncles hispid, 1-flowered; joints of legume straight on one side and rounded on the other, and scabrous in the centre.  "S. Native of Trans-Quebec. Stem branched much at the base.

Diffuse Æschynomene. Pl. 1 to 2 feet.

16. Æ. SUBVISCOSA (D. C. prod. 2. p. 321.) stem herbaceous, erect, scabrous from small tubercules and pili, which are tipped with glands; leaflets linear, obtuse, glabrous; peduncles usually 2-flowered, and are as well as the legumes beset with glandular hairs.  "S. Native of the East Indies. Æ. viscosa, Roxb. hort. Beng. in Willd. emm. 776. but not of Mich. Æ. Roxbii, Spreng. syst. 3. p. 322. Flowers having the vexillum streaked and spotted with red, the wings of a dirty-yellow colour, and the keel violaceous at the apex.

17. Æ. GLANDULOSA (Poir. suppl. 4. p. 76.) stem shrubby, beset with glandular hairs; leaflets linear, mucronate; peduncles few-flowered; joints of legume 4-5, semi-tuberculate, furnished with small prickles in the centre.  "S. Native of Porto Rico. Very like Æ. Americana.

Glandular Æschynomene. Shrub 1 to 2 feet.

18. Æ. VILLOSA (Poir. suppl. 4. p. 76.) stem suffruticosus, terete, villous; leaflets linear, obtuse, nearly glabrous; racemes axillary, divaricate; legumes clothed with glandular pili.  "S. Native of Porto Rico. Corolla small, white. Perhaps not sufficiently distinct from Æ. glandulosa.

Villosa Æschynomene. Shrub 1 to 2 feet.

20. Æ. LATIFOLIA (Spreng. syst. 2. p. 322.) leaflets oblong, mucronate, glabrous; racemes many-flowered, bracteate, and are as well as the legumes hispid.  "S. Native of Monte Video.

Broad-leaved Æschynomene. Pl. 1 to 2 feet.

Puberulous Æschynomene. Shrub 1 to 2 feet.

22. Æ. my strix (Poir. suppl. 4. p. 77.) stem terete, and is as well as the petioles and peduncles rough from long, yellow bris-
icles; leaves with 10 pairs of oval-linear, obtuse, mucronate leaflets; peduncles compound, many-flowered, shorter than the leaves; pedicels recurved; legumes glabrous, having few joints. 6. S. Native of Cayenne. *Æ. cassioideæ*, Desv.

Porcupine *Æschynomene*. Shrub 1 to 2 feet. 23 *Æ. pacu'jua* (D. C. prod. 2. p. 531.) stem terete, beset with bristly, rather glandular hairs, as well as the pedicels, peduncles, and bracteas; leaves with 4-5 pairs of obovate, obtuse, rather mucronate leaflets, which are hardly pubescent; racemes many-flowered, compound; stipulas and bracteas ovate, acute, striated; legumes smoothish. 6. S. Native of Cayenne.

Var. ß, subovíbrá (D. C. l. c.) legume scabrous from short stiff down. Native of South America.

Pinn-paired-leafletted *Æschynomene*. Shrub 2 to 3 feet. 24 *Æ. micro'ntíia* (D. C. prod. 2. p. 531.) stems herba-ceous, procumbent, pubescent; leaves with 2-4 pairs of obovate-roundish, rather mucronate leaflets, which are scarcely pubescent; pedicels axillary, 1-2-flowered, length of leaves; joints of legume glabrous, compressed, nearly orbicular. 6. S. Native of Madagascar. Hedysarum mirandúhus, Poir. dict. 6. p. 446. Leaves impari-pinnate.

Small-flowered *Æschynomene*. Pl. prostrate. 25 *Æ. visci'ntla* (Michx. fl. bor. amer. 2. p. 75, but not of Wildl.) plant clothed with clammy pubescence; stems herba-ceous, slender, prostrate; leaves with 3-4 pairs of obovate leaflets; peduncle 1-2-flowered; legumes pubescent, with 2 oval-roundish joints. 6. H. Native of Florida and Cumberland Island, in sandy places. Nutt. gen. amer. 2. p. 111. *Æ. pros-trata*, Poir. suppl. 4. p. 76. This plant has very much the habit of a species of *Smithia*.

Falcate-podded *Æschynomene*. Pl. 1 foot. 27 *Æ. brasil'ína* (D. C. prod. 2. p. 522) stems diffuse, clothed with glandular pili; leaves with 5-6 pairs of ovate-elliptic, pubescent, rather ciliated leaflets; racemes divaricate, loose; joints of legume rather inflated, hispid, and clammy.—Native of Brazil, at Rio Janeiro. Hedysarum Brasi'liánun, Poir. dict. 6. p. 418.

Brazilian *Æschynomene*. Pl. diffuse. 28 *Æ. microphy'lla* (Desv. med. in herb. mus. paris. D. C. prod. 2. p. 522) stem terete, clothed with stiff villi; leaves with 20-30 pairs of pubescent, oblong, obtuse, much crowded, small leaflets; racemes much longer than the leaves; legumes glabrous, having 1-2 semi-ovate joints.—Native of Brazil. Bracteas 3, permanent at the origin of the pedicels, and 3 times shorter than them. Bracteoles 2, adpressed under the bilabiate calyx.

Small-leaved *Æschynomene*. Pl. 1 foot. 29 *Æ. e'léaers* (Schlecht. et Cham. in Linneo 5. p. 583) plant herbaceous; stems diffuse, weak, terete, beset with spreading pili at the apex; leaves with 5-8 pairs of elliptic, obtuse, mucronate leaflets, which are clothed with adpressed pili; stipulas lanceolate, ciliately-serrate; racemes 5-7-flowered, much longer than the leaves; legume on a long stipe, which is one-half the length of the legume, puberulous, and usually with 5 joints. 6. S. Native of Mexico, on hills near Jalapa, and at Hacienda de la Laguna. *Æ. mimosoides*, Sesse et Moc. mss. Stems rather flexuous.

Elegant *Æschynomene*. Pl. 3 feet. 30 *Æ. fascic'u'aris* (Schlecht. et Cham. in Linneo 5. p. 584) shrubby, erect, clothed with somewhat strigose, adpressed, cinerous down; branches angular; leaves with 20 or more pairs of linear, acute, mucronate leaflets, which are almost glabrous above; racemes short, axillary; flowers in fascicles, on short pedicels; legume on a short stipe, 4-jointed. 6. S. Native of Mexico, between La Laguna verde and Actopan. Leaves small. Legumes large. Stipe of legume hardly exerted from the calyx. Stirpules lanceolate, acuminate, nerves. Flowers yellow.

Fasciculater-flowered *Æschynomene*. Shrub 2 to 3 feet. 31 *Æ. diví'sa* (Nees et Mart. in nov. act. bonn. 12. p. 51) stem shrubby, smooth; pedicels strigose; leaves with 12-15 pairs of linear acute leaflets; peduncles 2-3-flowered, shorter than the leaves; joints of legume semi-ovariform, hispid; vexillum of 2 petals. 6. S. Native of Brazil. The vexillum is said to be obcordate, and constantly composed of 2 petals, which is a circumstance not to be found in any other papilionaceae flower, but perhaps the vexillum is only profoundly bipartite, or perhaps the flower is resupinate, and the 2-petalled keel has been taken for the vexillum.

*Divided* *Æschynomene*. Shrub 2 to 3 feet. 32 *Æ. hon'tíá (Nees et Mart. I. c. p. 32) branches hispid at the apex; leaves with 10-11 pairs of linear, obtuse, glabrous leaflets; legumes disposed in something like a corvymb, when young clothed with hispid pubescence, but glabrescent in the adult state; vexillum broad, entire. 6. S. Native of Brazil. Said to be nearly allied to *Æ. sensítilis*. Flowers yellow.

*Honest* *Æschynomene*. Shrub 2 to 4 feet. 33 *Æ. scop'ária* (H. B. et Kunth, nov. gen. amer. 6. p. 532) plant diffuse; branches elongated, twiggy, straight, angular, and are, as well as the calyces, clothed with silky-silvery down; leaves with 10-14 pairs of oblong, mucronate, half-cordate leaflets, which are clothed with adpressed down on both surfaces; peduncles axillary, twin, few-flowered; legumes puberulous, usually 3-jointed. 6. S. Native of Peru, near Guanabamba. Flowers yellow.

*Broom* *Æschynomene*. Shrub diffuse. 34 *Æ. mol'ílula* (H. B. et Kunth, l. c.) suffruticose; branches elongated, clothed with yellowish-silky down; leaves with 18-20 pairs of oblong-linear, mucronate, semi-cordate leaflets, which are pubescent on both surfaces, as well as the rachis and calyx; peduncles axillary, short, few-flowered; legumes falcate, 1-6-jointed, pubescent. 6. S. Native of South America, in the province of Jaen de Dacramoros. Flowers yellow.

*Soft* *Æschynomene*. Shrub 2 to 3 feet. 35 *Æ. piló'sa* (Poir. dict. 4. p. 450) stem herbaceous, pilose, compressedly tetragonal at the apex; leaflets oval, retuse, mucronate, glabrous; racemes hairy, many-flowered; joints of legumes scabrous in the centre. 6. S. Native of the East Indies. Nerves of leaves blackish.

*Pilose* *Æschynomene*. Pl. 1 to 2 feet. 36 *Æ. pur'be'sens* (Poir. dict. 4. p. 451) stem herbaceous, glabrous; branches spreading; leaflets elliptic, retuse, mucronate, pubescent; racemes terminal, glabrous, many-flowered; calyx 5-cleft; joints of legume rather scabrous. 6. S. Native of the East Indies.

*Pubescent* *Æschynomene*. Pl. 1 to 2 feet. 37 *Æ. brévifi'ólia* (Poir. dict. 4. p. 451) plant glabrous, and dwarf; stems filiform; leaves with 2 pairs of roundish, mucronate, glaucous leaflets; peduncles 1-2-flowered; calyx 5-toothed; legumes on long stipes, having 3-4 rather remote joints.—Native of Madagascar. Flowers yellow.

*Short-leaved* *Æschynomene*. Pl. ½ foot. 38 *Æ. his'rú'ta* (D. C. prod. 2. p. 522) stem scabrous and
hair; racemes 3-flowered; bracteas ciliately serrated; legumes hairy. C. S. Native of New Spain. E. hirta, Lag. nov. gen. et spec. 22, but not of Lam. Hirsute Eschynomene. Pl. 1 foot. 39 E. hiúta (Lam. ill. 629, f. 1. Poir. dict. 4. p. 450.) plant hispid in every part; stem herbaceous; branches terete; leaves with 7-9 pairs of oval-linear mucronulate leaflets; racemes terminal, many-flowered; calyx 5-parted, having the lobes nearly equal, and subulate at the apex; legumes hairy, with the joints tumid and tubercled in the centre. C. S. Native of the East Indies. Hairy Eschynomene. Pl. 1 to 2 feet. 40 E. arborea (Lin. spec. 1060.) stem arboreous, smooth; joints of legume semi-cordate, glabrous. C. S. Native of the East Indies. Flowers large, copper-coloured. Perhaps a species of Desmodium. Perhaps D. Mauritianum. Arboreous Eschynomene. Shrub 6 to 7 feet. 41 E. ? heterophylla (Lour. cochin. p. 446.) shrubby; branches tomentose; lower leaves ternate, with ovate leaflets, superior ones impari-pinnate, with roundish leaflets; peduncles many-flowered; calyx 4-toothed; stamens monadelphous; legumes pilo-se, with cordate joints. C. G. Native of the north of Cochin-china. Flowers small, white. This plant ought certainly to be removed from the present genus. Variable-leaved Eschynomene. Shrub 7 to 8 feet. 42 E. ? cleptana (Jacq. frang. 37. t. 42. f. 2.) stem arboreous; leaves glabrous, young ones decompound; legumes stipulate, glabrous, linear, the seeds intercepted by cellular substance; the sutures prominent, but retaining the joints. C. S. Native of Caracca. Perhaps a species of Mimosa. Rattling Eschynomene. Tree. Cult. The species of this genus require more than an ordinary degree of heat to preserve them through the winter, so that they are seldom kept alive through the winter in this country, and consequently never grow to a flowering state. Rich loam suits them best, and cuttings may be rooted in sand under a hand-glass in heat; however, they are not worth growing except in botanical gardens.

3 S. geminiflora (Roth. nov. spec. 352.) lips of calyx entire; racemes pedunculate, 2-flowered. C. S. Native of the East Indies. Flowers probably purple. Calyces or bracteas ending in a setose mucrone. On the pagina of the leaf the supine bristles or hairs are more copious than in S. sensitiva. Twin-flowered Smithia. Fl. July. Cilt. 1810. Pl. proc. 

† A doubtful species. 4 S. spica (Spreng. nev. entd. 2. p. 160.) spikes of flowers on very short peduncles, secund, distich, very hairy; leaves impari-pinnate; stem subulate; stamens monadelphous. S. S. Native of Senegambia. In every particular this plant differs from Smithia, but its legitimate genus is unknown. Spike-flowered Smithia. Shrub. Cult. See Loarea for culture and propagation.

CILI. LOUREA (the meaning of this name is unknown to us, but it is apparently the name of some neck). Neek. elem. no. 1318. Desv. journ. bot. 3. p. 122. t. 5. f. 18. D. C. prod. 2. p. 325, but not of Jaum. Lin. syst. Diadelphia, Decândria. Calyx campanulate, permanent, 5-cleft (f. 43. a.), with equal spreading lobes, when in fruit inflated and coning at the apex. Corolla papilionaceous, with an obcordate vexillum (f. 43. d.), and an obtuse keel (f. 43. b.). Stamens diadelphous (f. 43. c.). Legume with 4-6 flat 1-seeded joints (f. 43. i.), bent backward into plats (f. 43. i.), which nestle within the calyx.— Erect Indian plants, with setaceous stipules, simple or trilobar leaves, and long terminal racemes of purple or white flowers.

FIG. 43.
CLIII. URARIA. (A name not explained by its author. Desv. journ. bot. 3. p. 122. t. 5. f. 19.—Doddíá, Roxb. hort. Beng. p. 99. but not of R. Br.—Hedysarum species of Lin. and others.)

LIN. SYST. DIADELPHIA, DECAANDRIA. Calyx profusely 5-leafed, with sessaceous segments. Corolla papilionaceous. Stamens diadelphous. Legume with a few ovate 1-seeded joints, bent back into plats, nesting within the calyx.—Herbs, rarely shrubs, with impari-pinnate, ternate, or simple leaves, stipellate leaflets, lanceolate membranous acuminate stipulas, which are striated lengthwise, the upper ones answering the purpose of bracelets to the flowers, but soon falling off. Pedicels 1-flowered, rising in pairs from the axils of the bracelets, forming long, dense, simple, many-flowered racemes.

* Leaves impari-pinnate, with 2-4 pairs of leaflets.

1 U. ríčta (Desv. l. c.) stem shrubby, erect, velvety; leaves with 2-4 pairs of long lanceolate leaflets, which are smoothish above, and blotched with white, but pubescent and reticulately-nerved beneath; racemes very long and spicate; bracelets ciliated; segments of the calyx sessaceous, and very hairy. H. S. Native of Guinea, among grass all along the coast, and of the East Indies. Hedysarum pictum, Jacq. icon. rar. 3. t. 567. coll. 2. p. 362. Flowers purple.

2 U. cornoSá (D. C. prod. 2. p. 324.) stem shrubby; branches and petioles villous; leaves with 3 pairs of linear-lanceolate glabrous leaflets; racemes elongated, cylindrical; bracelets villous; segments of the calyx sessaceous, and very hairy. H. S. Native of the East Indies. Hedysarum comosum, Vahl. symb. 2. p. 84.

3 U. caraSTÁ (Desv. l. c.) stem shrubby, erect; leaves with 2-3 pairs of oblong leaflets; racemes elongated; pedicels hispid, recurved; the largest segments of calyx pilose and reflexed; legumes smooth. H. S. Native of the East Indies. Hedysarum crinitum, Lam. mant. 102. Burm. ind. p. 169. t. 56.

* * Leaves trifoliate, the terminal leaflets stalked.

5 U. lagópuS (D. C. in ann. sc. nat. 4. p. 100.) stem shrubby, very hairy at the apex; leaflets ovate, obtuse, mucronate, clothed with soft velvety pubescence beneath; racemes cylindrical, twice the length of the petiole; segments of the calyx sessaceous, and very hairy; bracelets hairy on the back. H. G. Native of Nipal. Flowers purple.

Hare's-foot Uraria. Fl. June, July. Ct. 1824. Sh. 2 to 4 fl.

6 U. aróreum; arborescent; leaflets oval, retuse, and are, as well as the branches, very hairy; stipules cordate, stem-chapping, cuspitate; racemes elongated, bracteate, densely clothed with stiff hairs; calycine segments lanceolate, feathery; legumes 3-seeded, pilate within the calyx. H. G. Native of Nipal. Hedysarum aróreum, Hamlt. in D. Don, prod. fl. nep. 245. Erythrina arórecens, Roxb. hort. Beng. p. 59. Trec Uaria. Tree 12 feet.

7 U. lagópHEALa (D. C. prod. 2. p. 324.) stem herbaceous; leaflets roundish, pilose beneath; panicle terminal, contracted, bracteate; peduncles and calyces very pilose; calyceal segments long and linear; legumes deflexed, glabrous, 5-jointed. 2. S. Native of Brazil. Hedysarum lagochéphalum, Link. enum. 2. p. 248. Flowers yellow.

Hare's-headed Uraria. Fl. July, Ct. 1824. Pl. 1 to 2 feet. 

* * * Leaves simple.

8 U. cercífolia (Desv. l. c. f. 10.) leaflet solitary at the top of the petiole, furnished with 2 stipels, roundish, and rather velvety beneath; racemes oblong, dense, terminal. H. S. Native of the East Indies. Hedysarum cercífolium, Stend. nom. 392.

Judas-tree-leaved Uraria. Shrub 2 to 3 feet.

9 U. cónfrillóa (Wall. pl. rar. asiat. p. 33. t. 37.) leaves simple, broadly ovate, corariate, villous on the under surface as well as the branches; racemes terminal, panicked, elongated, hairy; legume 2-3-jointed, villous, inclosed in the calyx; bracelets ovate, acuminate, clothed with silky pili. H. S. Native of the Burman Empire, near Prome and Meang, on the banks of the Irawaddi. Flowers small, of a whitish-rose colour.

Heart-leaved Uraria. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand will answer the species, and young cuttings will root in sand under a hand-glass in heat, but the species are more easily propagated by seeds.

LIN. SYST. DIADELPHIA, DECAANDRIA. Calyx 5-parted, with lanceolate, subulate, bearded segments. Corolla papilionaceous, shorter than the calyx. Stamens diadelphous. Legume straight, exserted, constantly composed of numerous, compressed, semi-ornicular, 1-seeded joints, which open at the convex suture.—American herbs, with pinnately trifoliate leaves, the leaflets ovate or oblong, and stipellate. Stipulas distinct from the petioles, rather serrous. Bracelets like the stipulas, but broader. Pedicels twin in the axils of the bracelets. Racemes terminal, crowded, almost constituting a panicle. Flowers small, bluish-purple. This genus differs from Uraria in the legume being straight and exserted, and from Desmódium in the calyx being 5-parted and bearded.

2 U. CAYENNE'SIS (D. C. leg. t. 51.) leaflets elliptic-ovate; calyx spreading after flowering; legumes smooth. 2. S. Native of Cayenne. Flowers bluish-purple. Racemes looser, and the pedicels are longer than the first species, but very similar.

Var. β, laxísúleá (D. C. prod. 2. p. 325.) leaflets elliptic-ovate, and a little more villous beneath than the species; legumes rather sebaceous; stamens monadophous. 2. S. Native of Cayenne. Perhaps a proper species.

Cayenne Nicolsonia. Pl. procumbent.

3 U. VENÚSTÀ (D. C. prod. 2. p. 235.) stems suffruticosse, erect, and are, as well as the petioles, clothed with adpressed pubescence; leaflets oblong-elliptic, clothed with silky, glauncescent pubescence beneath; racemes terminal, short, sessile; calyx pilose bearded; legumes with 1-3 semi-ornicular hairy joints. H. S. Native of Carouana, on the declivity of mount Parimquiri. Hedysarum venéstúla, H. B. et Kunth, f. c.

Pretty Nicolsonia. Shrub 2 feet.
4 N. villiosa (Schlecht. et Cham. in Linnæa. 5. p. 584.) plant herbaceous; stems erect, clothed with rusty spreading hairs; leaves elliptic, silky and glaucous beneath, but almost glaucous above; legumes puberulous, 3-jointed. 2. G. Native of Mexico. Axillary branches bearing the flowers at the apex, hardly longer than the leaves. Flowers disposed in dense racemes.

Vicinus Nicolsonia. Pl. 3 feet.

Cult. For culture and propagation see Uraria, p. 287.

CLV. DESMODIUM (from τευμος, deum, a god; in reference to the stamens being connected). D. C. legum. vi. prod. 2. p. 525.—Desmodium and Hedysarum, Desv. journ. bot. 3, p. 122. t. 5. f. 15 and 32. H. B. et K., nov. gen. amer. 6. p. 516 and 527.—Hedysarum species of Lin. and others.

Lin. syst. Diadellphiæ, Decádria. Calyx bibracteolate at the base, obscurely bilabiately to the middle, upper lip bifid, lower one 3-parted (f. 44. a.). Corolla papilionaceous, with a roundish vexillum (f. 44. b.) and an obtuse keel (f. 44. c.), which is shorter than the wings. Stamens diadelphous (f. 44. d.), with the filaments almost permanent (f. 44. f.). Legume of many 1-seeded, compressed, membranous or coriaceous, hardly dehiscent joints (f. 44. g.), which separate at maturity.—Herbs or small shrubs, for the most part natives within the tropics, with pinnately-trifoliate leaves, sometimes the lateral leaflets absent altogether, or very small, then the leaves in such cases are called simple. Stipels 2 at the base of the terminal leaflet, and one at the base of each lateral leaflet. Racemes of flowers terminal, usually loose. Pedicels stiff. 1-flowered, rising singly, but usually by threes from the axis of the bracteas. Flowers purple, blue, or white, smaller than those of Hedysarum. The plants belonging to this genus are not well defined.

1 D. Umbellatum (D. C. prod. 2. p. 525.) stem shrubby, branched, terete, smooth; branches pubescent; leaflets ovate, obtuse, glabrous above, but canescent beneath from short down; peduncules axillary, shorter than the petioles, bearing umbels of flowers at their apices; legumes clothed with adpressed villi. ٠، S. Native of Malacca, Ceylon, Java, and Madagascar. Hedysarum umbellatum, Lind. spec. 1035. Burm. ind. 166. Jacq. hort. sèchonbrr. 297.—Rumph. amb. 4. t. 52. Flowers white. Var. β, hirsutum (D. C. prod. 2. p. 326.) branches and petioles hairy; leaflets ovate, rather glabrous above, but hairy beneath; racemes shorter than the petioles, umbelliferous; legumes hairy. ٠، S. Native of the East Indies.

Umbellato-flowered Desmodium. Clt. 1801. Sh. 3 to 6 feet.

2 D. Australe (D. C. prod. 2. p. 326.) stem shrubby, branched, terete, glabrous; branches pubescent; leaflets elliptic, acute, glabrous above, but canescent beneath from short down; peduncules axillary, shorter than the leaves, somewhat umbelliferous; legumes smooth. ٠، S. Native of New Caledonia, and the island of Tanna. Hedysarum umbellatum, Forst. prod. no. 274. but not of Lin. Hedysarum australis, Willd. spec. 3. p. 1183. Very like the preceding species.

Southern Desmodium. Shrub 2 to 4 feet.

3 D. Lutescens (Desv. 1. c.) stem terete, pubescent; leaflets obovate-roundish, pubescent; racemes terminal, and as well as the legumes clothed with velvety villi. ٠، G. Native of China. Hed. lutescens, Poir. dict. 6. p. 417. Zornia lutescens, Steud. nom. 900. Flowers yellowish.

Yellowish Desmodium. Shrub 2 to 3 feet.

Sect. II. Pleurobium (from πλευρος, pleuron, a side, and λυθος, lobos, a lobe; in reference to the joints of the legumes being rather convex on one side). D. C. legum. vii. prod. 2. p. 326. Joints of legume membranous, nearly square, the lower side rather convex, and at length dehiscent. Leaves furnished with one leaflet, or pinnately-trifoliate, the lateral leaflets very small. Perhaps a proper genus.

* Piperodora (from περιν, pteron, a wing, and πονος, πονος, pous, podos, a foot; in reference to the footstalks of the leaves being winged). D. C. prod. 2. p. 326. Leaves having only one leaflet. Petioles winged; wing drawn out into a tooth on both sides at the apex.

4 D. Aurea (D. C. legum. mem. vi.) stems erect, glabrous, triquetrous; leaves ovate, acute, glabrous, 4 times longer than the winged petioles; legumes quite glabrous, and rather coriaceous. ٠، G. Native of the island of Timor. Pterolomia auriculatum, Desv. in herb. mus. par. Joints of legume 4 or 5, easily separating at maturity.

5 D. Triquetrum (D. C. prod. 2. p. 326.) stems erect, smoothish, triquetrous; leaves ovate-lanceolate, rather cordate, acuminate, 3 times longer than the winged petioles; legumes nearly sessile, hairy. ٠، S. Native of the East Indies. Hedysarum triquetrum, Lind. spec. 1052. Burm. ind. t. 52 f. 2. zeyl. t. 81.? Flowers purple.

6 D. Pseudotriquetrum (D. C. in ann. sc. nat. 1. p. 100. legum. mem. vi.) stems ascending, rather hairy, triquetrous; leaflets ovate-lanceolate, rather cordate, acuminate, twice the length of the winged petioles; legumes glabrous, but ciliated on both sutures with adpressed villi. ٠، G. Native of Nipal. Flowers purple.

7 D. Alatum (D. C. legum. mem. vi.) stems erect, somewhat tetragonal, glabrous; leaflets lanceolate, acuminated, 8 times longer than the petioles; legumes glabrous, membranous. ٠، S. Native of the East Indies, at Cawnpore. Hedysarum alatum, Roxb. hort. bent. 56. Joints of legume 5-6, sometimes irregularly triangular. Flowers purple.

** Gyranthia (from gyro, to whirl). D. C. prod. 2. p. 326. Leaves pinnately-trifoliate; petiole wingless.

8 D. Gyrans (D. C. prod. 2. p. 326.) plant glaucous; leaflets 3, elliptic-oblong, terminal one very large, but the lateral ones are very small; racemes numerous, disposed in a panicle; legumes pubescent. ٠، S. Native of Bengal. Hedysarum gyrans, Lind. fil. suppl. 332. Jacq. icon. rar. 3. t. 562. Flowers violaceous. The singular motion with which the lateral leaflets of this plant are endued is thus described in Linnaeus's supplement. "This is a wonderful plant on account of its singular motion, which is not occasioned by any touch, or irritation, or movement in the air, as in Mimosa O'zalis.
and *Dionaea*; nor is it so evanescent as in *Amorpha*. No sooner had the plants raised from seed acquired their ternate leaves than they began to be in motion in every direction; this movement did not cease during the whole course of their vegetation, nor were they observant of any time, order, or direction; one leaflet frequently revolved, whilst the other on the same pedicle was quiescent; sometimes a few leaflets only were in motion, then almost all of them would be in movement at once; the whole plant was very seldom agitated, and that only during the first year. It continued to move in the stave during the second year of its growth, and was not at rest even in winter." In our climate the lateral leaflets move up and down, either steadily or by jerks, particularly if the house in which it is growing be shut up very warm. This motion is most evident when the sun's rays are on the plant, it therefore appears to us that it is the action of the sun's rays upon it which occasions the motion of the leaflets. For further particulars see Brouss. Mem. acad. scienc. Paris, 1758 p. 616. Silvestr. bull. phiolom. 1. p. 67. t. 5. (f. 44.) Var. f. lateral leaflets almost wanting. ñ. S. Native of Nipanc. Wallrich. Hedys. gyrans, Roxb. hort. beng. p. 57.

9 D. gyrôdes (D. C. legum. vii. prod. 2. p. 326.) leaflets 3, elliptic, the terminal one large, and the lateral ones small; racemes numerous, disposed in a panicule; legumes hairy. ñ. S. Native of the East Indies, in Silhet. Hedysarum gyrôdes, Roxb. hort. beng. 57. The legume is very like that of *D. triquetrum*, but hairy. The plant is hoary in every part.

Gyrans-like Desmodium. Clt. 1817. Pl. 3 to 5 feet.

10 D. Timôriense (D. C. legum. mem. vii. prod. 2. p. 327.) leaflets 3, rhomboid, canescent from villi beneath, and with a few scattered hairs above; lateral ones one-half smaller than the terminal one; racemes numerous, disposed in a panicule; legumes short, pubescent. ñ. S. Native of the island of Timor.

Timor Desmodium. Pl. 3 to 4 feet.

**Sect. III. Chalânum** (probably from *chalâo*, *chalao*, to loose; from containing a loose heterogeneous mass of plants). D. C. legum. 2. p. 327. Joints of legume membranous, indehiscent, oval or orbicular, rarely oblong, convex on both sides, or with the superior side straightish, tapering to both ends.—Leaves simple or pinnately-trifoliate. Racemes loose, elongated, with 3 pedicels rising from each bract.

§ 1. Leaves simple, that is, only having one leaflet.

Var. f. Ênéa (D. C. legum. prod. 2. p. 327.) leaflets ovate-lanceolate, acuminate, silky beneath; stipulas exceeding half the length of the petioles. ñ. S. Native of the Philippine islands. Perhaps a distinct species.

12 D. Maculâtum (D. C. legum. prod. 2. p. 327.) stem erect, herbaceous; leaves ovate, obtuse or rather acute, spotted with white above, and clothed with adpressed pubescence beneath; legumes rather puberulous, having 5-6 semi-orbicular joints. ñ. S. Native of the East Indies. Hedys. maculatum, Lin. spec. 1051. Êshchynômene maculata, Poir.—Dill. hort. elth. 1. t. 141. f. 168. Flowers pale violet, or red and yellow. (Mill.)

Red-branched Desmodium. Shrub 2 feet.

Terminal Desmodium. Shrub 2 feet.

16 D. Perrottétii (D. C. legum. mem. vii. prod. 2. p. 327.) stems terete, or pubescent from short curved hairs; leaves ovate, rather acute, puberulous beneath, but villous when young, nearly glabrous above; panicle terminal; joints of legume ovate, equal, velvety. ñ. S. Native of Guiana. The leaves appear to be spotted with white in the dried specimens.

Perrottet’s Desmodium. Shrub 1 to 2 feet.

17 D. Ormocarpoides (D. C. legum. prod. 2. p. 327.) stem suffrutescence, erect, glabrous; leaves ovate, acuminate, glabrous; racemes nodding; legumes hairy from short down, with elliptic, elongated, compressed joints. ñ. S. Native of Java. Hedys. ormocarpoides, Desv. in herb. Desf. Hedys. adlucrens, Poir. suppl. 9. p. 15. but not of Vahl. Perhaps this plant is referrible to the first section.

Ormocarpum-like Desmodium. Shrub 2 to 3 feet.

18 D. Sagittárum (D. C. legum. prod. 2. p. 327.) stems herbaceous, terete, glabrous at the base; leaves linear, mucronate, puberulous, on short petals; racemes terminal, puberulous; legumes puberulous, with 4-6 compressed, roundish-elliptic joints. —Native country unknown.

Linear-leaved Desmodium. Pl. 1 to 2 feet.

19 D. Denudárum (D. C. legum. mem. vii. prod. 2. p. 328.) stems terete, suffruticos, glabrous; braches twiggy, puberulous, bearing leaves only at the base; leaves oblong-lanceolate, acute; stipulas and stipites sessile; racemes elongated, naked; pedicels usually twin. ñ. S. Native of St. Domingo, in dry pastures. Flowers purple.

Naked-branched Desmodium. Shrub 1 to 2 feet.

20 D. Angustifólium (D. C. legum. prod. 2. p. 328.) stems terete, suffruticose, glabrous; braches twiggy, puberulous; leaflets obtuse or rather acute, spotted with white above, and clothed with adpressed pubescence beneath; leaves having 5-6 semi-orbicular joints. ñ. S. Native of Mexico. Hedysarum angustifolium, H. B. et Kunth, nov. gen. amer. 6. p. 517. Flowers minute, purple.

21 D. Velutínum (D. C. legum. prod. 2. p. 328.) stems terete, pubescent; leaves ovate, clothed with velvety tomentum on both surfaces, mucronate; racemes terminal and axillary; calyx 5-parted; villous; legumes clothed with villous tomentum, having oblong compressed joints. ñ. S. Native of South Ame-

**Velety Desmodium.** Shrub to 3 to 3 feet.

23 D. *latifolium* (D. C. prod. 2. p. 328.) stems shrubby, terete, when young clothed with rufous velvety down, but at length becoming smooth; leaves broad, ovate, rather cordate, mucronulate, and repand, clothed with velvety villi on both surfaces; stipulas cordate at the base, cuspidate; racemes terminal and axillary; legume hairy, with 3-5 semi-orticulair joints.

27 D. *ciliare* (D. C. prod. 2. p. 328.) stems shrubby, with rufous down, becoming glabrous in the adult state; leaves broad, ovate-lanceolate, mucronulate, rather repand, clothed with velvety villi on both surfaces; stipulas subulate, hairy; racemes long, spike-formed, terminal, and axillary, forming a panicle; legumes hispid, with 3-4 semi-orticulair joints. 

28 D. *D. MAYRA'N'DICUM* (D. C. prod. 2. p. 328.) stem erect, pilose, branched; leaflets oblong, villous beneath; stipulas subulate; racemes panicled; joints of legume 3, rhomboid, reticulatet, and rather pilose. 

29 D. *Hedysarum* (D. C. prod. 2. p. 329.) stem erect, pubescent; leaflets oblong, obtuse, somewhat cordate at the base; stipulas lanceolate-subulate; panicle terminal; joints of legume semi-orbicular, reticulatet, and hispid. 

30 D. *Cilia're* (D. C. prod. 2. p. 329.) stem erect, rather pilose, slender; leaves approximate, on very short petioles; leaflets small, oval, obtuse; stipulas subulate; racemes axillary, subulate; legumes pilose, hispid. 

31 D. *Levigat'um* (D. C. prod. 2. p. 329.) stem erect, branched, pubescent; leaflets ovate-oblong, scabrists beneath; stipulas lanceolate, cuspidate; racemes panicled, bracteate; joints of legume oval, rough. 

32 D. *Bracte'osum* (D. C. prod. 2. p. 329.) stem simple, erect, glabrous; leaflets oblong-ovate, acuminate, glabrous; stipulas subulate; racemes terminal, few-flowered; bractes ovate, acuminated, striated, glabrous; joints of legume nearly oval. 

33 D. *Hedysarum* viridiflorum, Lin. spec. 1055. —Fl. hort. clth. t. 174. f. 171. Flowers pale purple, fading to blue, the vellum having a green spot at the base.

29 D. *Hedysarum* (D. C. prod. 2. p. 329.) stem erect, pubescent; leaflets oblong, obtuse, somewhat cordate at the base; stipulas lanceolate-subulate; panicle terminal; joints of legume semi-orbicular, reticulate, and hispid. 

28 D. *Hedysarum* (D. C. prod. 2. p. 328.) stem erect, pilose, branched; leaflets oblong, villous beneath; stipulas subulate; racemes panicled; joints of legume 3, rhomboid, reticulate, and rather pilose. 

27 D. *Hedysarum* (D. C. prod. 2. p. 328.) stem simple, erect, glabrous; leaflets ovate-oblong, acuminate, glabrous; stipulas subulate; racemes terminal, few-flowered; bractes ovate, acuminate, striated, glabrous; joints of legume nearly oval.

26 D. *Hedysarum* (D. C. prod. 2. p. 329.) stem erect, pilose, branched; leaflets oblong-ovate, acuminate, glabrous; stipulas subulate; racemes terminal, few-flowered; bractes ovate, acuminate, striated, glabrous; joints of legume nearly oval. 

25 D. *Hedysarum* (D. C. prod. 2. p. 329.) stem erect, branched, pubescent; leaflets ovate-oblong, scabrists beneath; stipulas lanceolate, cuspidate; racemes panicled, bracteate; joints of legume oval, rough.

24 D. *Hedysarum* (D. C. prod. 2. p. 329.) stem erect, pubescent; leaflets oblong, obtuse; stipulas subulate; racemes axillary, subulate; legumes pilose, hispid.

23 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, terete, when young clothed with rufous velvety down, but at length becoming smooth; leaves broad, ovate, rather cordate, mucronulate, and repand, clothed with velvety villi on both surfaces; stipulas cordate at the base, cuspidate; racemes terminal and axillary; legume hairy, with 3-5 semi-orticulair joints.

22 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, with rufous down, becoming glabrous in the adult state; leaves broad, ovate-lanceolate, mucronulate, rather repand, clothed with velvety villi on both surfaces; stipulas subulate, hairy; racemes long, spike-formed, terminal, and axillary, forming a panicle; legumes hispid, with 3-4 semi-orticulair joints.

21 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

17 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

16 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

15 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

14 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

13 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

12 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

11 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

10 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

9 D. *Hedysarum* (D. C. prod. 2. p. 328.) stems shrubby, and is, as well as the petioles, clothed with stiff hairs; leaves ovate, obtuse, pilose on both surfaces, very soft beneath, and glaucet; racemes panicled; legumes hairy.

39 D. pauciflorum (D. C. prodr. 2. p. 330.) stem decumbent, very humble and filiform; leaves on very long petioles; leaflets broad-ovate, acuminate, ciliated with pubescence; stipulas obsolescent; racemes terminal, pedunculate, few-flowered, hardly exceeding the leaves. 2. H. Native of the woods of Ohio, Kentucky, and Tennessee. Hedys. pauciflorum, Nutt. gen. amer. 2. p. 109. Flowers small, white.

Stiff Desmodium. Pl. 1 to 2 feet.

Rhomb-legilled Desmodium. Pl.

Lineated-stemmed Desmodium. Pl. creeping.

† North American species not sufficiently known.

44 D. pedunculatum (D. C. prodr. 2. p. 338.) stems herbae- cus, erect; leaflets ovate at the base, and acuminate at the apex, smooth, middle one longer than the petiole; racemes axillary, erect, very long. 2. F. Native of South Carolina. Hedys. pedunculatum, Mill. dict. no. 17. Flowers pale yellow.

Pediceled Desmodium. Pl. 1 foot.

45 D. grandiflorum (D. C. prodr. 2. p. 338.) leaflets ovate, veiny, smooth on both surfaces; racemes axillary, erect; flowers large; legumes pendulous, many-jointed.—Native of Carolina. Hedys. grandiflorum, Walt. car. 185. but not of Pall.

Great-flowered Desmodium. Pl. 2 feet.

46 D. repens (D. C. prodr. 2. p. 338.) stems procumbent; leaflets obcordate; racemes lateral. 2. H. Native of Virginia. Hedys. repens, Lin. spec. 1046.—B. hort. elth. 172. t. 142. f. 9, ex Lin. but Dillenius's plant is a native of the East Indies.

Creeping Desmodium. Pl. creeping.

** Mexican species.

Alaman's Desmodium. Pl. 1 to 3 feet.

48 D. stipuliferum (D. C. prodr. 2. p. 330.) stem erect, branched, pilose; leaflets ovate, rather obtuse; stipulas oblong, obliquely ovate-lanceolate, acuminate, ciliated; stipels large; racemes terminal, somewhat panicked. 2. G. Native of Mexico, on the mountains. Hedys. stipuliferum, Moc. et Sesse, fl. mex. icon. ined. Flowers purple.

49 D. infractum (D. C. prodr. 2. p. 330.) stem nearly erect, rather angular, bent at the leaves; leaflets ovate, acute, puberulous as well as the petioles and peduncles; stipulas ovate, acute; racemes axillary, simple; joints of legume 2, semi-orbicular, glabrous. 2. G. Native of Mexico, on the mountains. Hedys. infractum, Spreng. syst. append. 290. Flowers violaceous.

Bent-stemmed Desmodium. Pl. 1 to 2 feet.

51 D. cine'rum (D. C. prodr. 2. p. 330.) branches clothed
with white tomentum; leaflets elliptic, rather mucronate, having parallel veins, clothed with hoary silky tomentum on both surfaces; racemes elongated; joints of legume 1-5, deltoid, semi-oblanceolate, clothed with soft tomentose pubescence. card. S. Native between Acapulco and the city of Mexico, near Mascalita and Chipcingo. Hedys. cinereum, H. B. et Kunth, nov. gen. amer. 6. p. 526. Flowers purple.

_Late-flowering Desmodium._ Pl. 1 foot.

53 D. filica1um (Schlecht. et Cham. in Linneae. 5. p. 585.) stem erect, terete, clothed with the retrograde canescent tomentum upwards, but below with dense canescent pubescence; leaves on short petioles; leaflets oblong-elliptic, rather retuse and mucronate at the apex, pubescent above and tomentose beneath; stipulas and stipules ending in a long acumen each; spikes panicked; flowers in fascicles; bracteae very narrow and very acute, exceeding the calyx; legume sub-ovate, with a few, usually 3-4, compound seeds. card. G. Beautiful flowering species. Native of Mexico, in fields, between Misantla and Colima. The whole plant is of a yellowish-cinereous color. Corolla violaceous. Habit of Hedys. cajenifolium, H. B. et Kunth. Hedys. multiflorum, Fl. W. no. 13797. et Schlecht. et Cham. 1. c.

_Plicate-podded Desmodium._ Shrub 2 feet.

** * * * South American and West Indian species. Hedysarum, Swartz. fi. occid. 3. p. 1263. H. B. et Kunth, nov. gen. amer. 6. p. 517.

54 D. uncinatum (D. C. pro. 2. p. 331.) stem shrubby, climbing, rough from hairs, which are hooked at the apex; leaflets ovate, villous, painted with white above; racemes terminal. card. S. Native of the Caracaces. Hedys. uncinatum, Jacq. hort. schenck. 3. t. 298. Flowers violaceous.

_Hooked-haired Desmodium._ Shrub cl.

55 D. coriicole-violaceum (D. C. pro. 2. p. 331.) stems shrubby, terete, diffuse, and are as well as the leaves clothed with villous pubescence; leaflets elliptic; stipulas lanceolate-subulate, ciliated; racemes terminal, capitulate; legumes scabrous, pilose. card. S. Native of Guiana. Hedys. coriicole-violaceum, Meyer. esseq. 246. Calyx 5-parted, with lanceolate-subulate lobes. Corolla bluish violet.

_Bluish-violet-flowered Desmodium._ Shrub 1 to 2 feet.

56 D. molliculatum (D. C. pro. 2. p. 331.) stems diffuse, clothed with soft pith as well as the petioles and peduncles; leaflets plicate on both surfaces, terminal one rhomboid-oblanceolate, lateral ones roundish-elliptic, mucronate; racemes loose-flowered, young legumes with 2 hispid joints. card. S. Native of South America. Hedys. molliculatum, H. B. et Kunth, nov. gen. amer. 6. p. 519. Heteroloma lanaturn, Desv. ined. Flowers purple. Allied to _D. lanatum_ and _D. rotundifolium._

_Softish Desmodium._ Shrub diffuse.

57 D. arenarium (H. B. et Kunth, nov. gen. amer. 6. p. 527.) stems herbaceous, procumbent; stipulas ovate, acuminate-subulate; leaflets oblong-elliptic, clothed with adpressed pubescence on both surfaces, glaucous beneath; racemes almost terminal or opposite the leaves, solitary; joints of legume few, hairy. card. S. Native on the banks of the Orinoco, near Atures, in sandy places. Flowers violaceous.

_Sand Desmodium._ Pl. procumbent.

58 D. ? multica1e (D. C. pro. 2. p. 331.) stems diffuse, slender, suffrutescence at the base, clothed with hoary-velvety down as well as the leaves; leaflets elliptic; stipulas broad, corydalis, acuminate; racemes opposite the leaves and about the same length; pedicels twin; bracteas tern, acuminate. card. S. Native of Peru. Root thick, woody. Flowers small. Young legume slender and many-jointed, villous. Perhaps this plant does not belong to the present genus.

_Many-stemmed Desmodium._ Shrub diffuse.

59 D. erythrinaceolum (D. C. pro. 2. p. 331.) stems twitty, glabrous, angular; leaflets broad-ovate, acuminate, glabrous, pale beneath; stipulas subulate; racemes terminal, somewhat pinedale; joints of legume very smooth and oblong-oblong, acute at both ends. card. S. Native of South America. Hedys. erythrinaceolum, Juss. in Poir. dict. 6. p. 408.

_Erythrina-leaved Desmodium._ Shrub.

_Caripe Desmodium._ Shrub 2 to 3 feet.

61 D. cacanifolium (D. C. pro. 2. p. 331.) branches densely hairy; leaflets oblong, obtuse, full of parallel veins, somewhat shining above, but covered with soft silky pubescence and glaucous beneath; racemes pinedale; joints of legume 2-6, semi-oblong, and puberulous. card. S. Native on the banks of the river Magdalena, near Honda, and of the island of Trinidad. Hedys. cacanifolium, H. B. et Kunth, nov. gen. amer. 6. p. 525. t. 598. Flowers bluish.

62 D. Wa'de (D. C. pro. 2. p. 331.) stem shrubby; lower leaves simple, the rest trifoliate; leaflets ovate-lanceolate, ciliated; racemes very long, opposite the leaves; pedicels tern; legumes membranous, scabrous, 3-jointed. card. S. Native of Brazil, particularly in Para. Hedys. Wade, Vand. in Roxm. script. 63. Flowers small, white. _Wade_ is the vernacular name of the plant.

_Wade Desmodium._ Shrub 1 to 2 feet.

63 D. racemi-feron (D. C. pro. 2. p. 331.) stem terete, slender, hispid; leaflets oval, obtuse, glabrous above, villous beneath, and somewhat marcescent; stipulas and bracteas oblong, acuminate, villous; racemes terminal; pedicels twin at each bracteae, which is caducous. card. S. Native of Cayenne. Hedys. racemosum, Aubl. guian. 2. p. 774. but not of Thunk. Flowers purple.

_Raceme-bearing Desmodium._ Shrub 1 to 2 feet.

64 D. ancistrocarpum (D. C. pro. 2. p. 331.) stem frutescent, pilosely-pubescent; leaves glaucous beneath; leaflets of the lower leaves orbicular, of the upper ones elliptic; racemes opposite the leaves, elongated; joints of legume numerous, semi-oblong, hispid from stiff hairs, which are hooked at their spines. card. S. Native of Brazil. Hedys. ancistrocarpum, Ledebo. ind. hort. dorp. suppl. 1823. Flowers small, purple.

_Ancistro-carpeted Desmodium._ Shrub 1 to 2 feet.

66 D. supinum (D. C. pro. 2. p. 332.) stems frutescent, de- clinate, pubescent above; leaflets ovate, clothed with hoary villi beneath; stipulas lanceolate, acuminate, puberulous; racemes

Var. b. hirtellum (C. D. prod. 2. p. 332.) stem best with short hooked hairs; leaves rather villous on both surfaces. ʻ. Š. Native of Guadaloupe. Perhaps a proper species.

68 D. molle (C. D. prod. 2. p. 333.) stem erect, terete, glabrous; leaflets ovate, attenuated, clothed with soft villi beneath; racemes terminal; pedicels tern; young legumes puberulous, with rhomboid joints, the ultimate one largest and somewhat orbicular, at length all glabrous. ʻ. S. Native of the islands of Santa Cruz, St. Thomas, and St. Domingo. Hedys. molle, Vahl. symb. 2. p. 83. Flowers purple.

Soft Desmodium. Shrub 1 to 2 feet.

69 D. ascendentens (C. D. prod. 2. p. 332.) stem suffruticescent, ascending, terete, pilose; leaflets rounded, pubescent beneath; stipulas lanceolate, falcate; racemes erect, axillary, simple; pedicels solitary; legumes dectate, pubescent. ʻ. Š. Native of the West Indies. Hedys. ascendentens, Swartz, fl. ind. occid. 1263. but not of Sieb. Flowers small, red. Perhaps many species are confused under this name.

Var. b. Orobrochus (H. B. et Kunth, nov. gen. amer. 6. p. 520. t. 327.) legumes with 1-3 joints.

70 D. cerculatum (stem terete; branches declinate, ascending, pilose; leaflets roundish, pubescent beneath, mucronate, somewhat emarginate; stipulas rather falcate; racemes simple, erect, axillary, many-flowered. ʻ. Š. Native of Brazil. D. ascendentens var. b. cerculatum, Lindl. bot. reg. 815. D. D. prod. 2. p. 333. Flowers large, blue. Stemans monadelphous according to the figure.

71 D. limeense (Hook, bot. misc. 2. p. 215.) stem erect, furrowed, hairy; leaves on long stalks; leaflets smoothish above, and covered with adpressed hairs beneath; racemes long, terminal, and axillary; bracteas ovate, acuminate, silky; legumes flexuous, with 5-8 oval, hairy, scarious joints. ʻ. Š. Native of Peru, near Lima.

Lima Desmodium. Shrub 1 to 2 feet.

73 D. oboviforme (C. D. prod. 2. p. 332.) stems herbaceous, diffuse, terete, and are as well as the petioles clothed with rough villi; stipulas scarious, ovate, acuminate; leaflets ovate-oblong, acuminate, villously pubescent; peduncules almost radical, elongated, loosely racemose at the apex; lower pedicels twin. ʻ. Š. Native of Jamaica, on the higher mountains. Hedys. oboviforme, Berk. ind. Flowers purplish-violet. Ovary puberulous, 2-3-jointed.

Obovate-leaved Desmodium. Pl. diffuse.

74 D. spirale (C. D. prod. 2. p. 332.) stem herbaceous, climbing, rooting at the base, angular, glabrous; leaflets ovate, glabrous; stipulas subulate; racemes terminal, elongated; pedicels twin or tern; legumes pubescent, spirally twisted. ʻ. Š. Native of the south of Jamaica, in shady, arid, bushy places. Hedys. spirale, Swartz, fl. ind. occid. p. 1273. H. procumbens, Mill. dlei. Flowers small, greenish yellow. Leaflets marked with a shining spot above, sometimes obtuse and sometimes acuminate, according to Swartz.

Very small Desmodium. Pl. diffuse.

76 D. tenue (C. D. prod. 2. p. 333.) branches ascending, glabrous; floral leaves simple, the rest trifoliate; leaflets clothed with adpressed pubescence on both surfaces, glaucous beneath, terminal one ovate-oblong, lateral ones elliptic, acute; racemes loose, rather flexuous; legumes with 2-5 joints, spirally twisted, glabrous, the joints rhomboid. ʻ. Š. Native of shady humid places near Caraucaes. Hedys. tenue, H. B. et Kunth, nov. gen. amer. 6. p. 322. Nearly allied to D. tortuosum and D. spirale. Flowers purple.

77 D. axillare (C. D. prod. 2. p. 333.) stem herbaceous, creeping, and rooting at the joints, rather pubescent; leaflets rhomboid-roundish, pubescent beneath, and reticulately veined; racemes axillary, much longer than the leaves; pedicels 1-3-together; legumes dectate, pubescent, with 2-4 semi-ovate joints. ʻ. Š. Native of Jamaica, St. Domingo, and Guadaloupe. Hedys. axillare, Swartz, fl. ind. occ. 1274. Flowers small, of a purplish blood-colour.

Axillary-flowered Desmodium. Pl. creeping.

78 D. reptans (C. D. prod. 2. p. 333.) stems creeping; leaflets obovate-roundish, lateral ones unequal-sided, rounded at both ends, glabrous above, but clothed with cunescent pubescence beneath; racemes ascending, on very long peduncles; joints of legume 2; semi-oreticular, hispid. ʻ. Š. Native of St. Domingo and of New Granada, in very hot places, on the banks of the river Magdalena, near Nares. Hedys. reptans, Poir. dlei. 6. p. 422. H. B. et Kunth, nov. gen. amer. 6. p. 518. Flowers flesh-coloured.

Creeping Desmodium. Shrub creeping.

79 D. scorpiurus (Desv. 1. c.) stems herbaceous, procumbent, rather pilose; stipulas ovate-falcate, apiculate; leaflets obovate-oblong, obtuse, pubescent beneath; racemes opposite the leaves, elongated; joints of legume 4-5, ovate. ʻ. Š. Native of Jamaica and St. Domingo. Hedys. scorpiurus, Swartz, fl. ind. occid. p. 1268. Flowers purple.

Scorpius-tail-like racemose Desmodium. Pl. procumbent.

80 A.asperum (Desv. 1. c.) stems tetragonal, hispid, fistular;
leaflets ovate, obtuse, rough above, but soft and hoary beneath; panicle terminal, diffuse; joints of legume small, ovate-globose, pubescent.—Native country unknown. Hedys. asperum, Poir. dict. 6. p. 408.

† Species natives of the same countries, but are not sufficiently known.

Glabrous Desmodium. Pl. 1 foot.

82 D. PORTORICENSE (Spreng. syst. 3. p. 314. under Hedys.) plant herbaceous, erect; leaflets oblone, obtuse; stipulas subulate, short; panicle terminal, bracteolate; joints of legume reticulated and pubescent. Y. S. Native of Porto Rico.

Porto Rico Desmodium. Pl. 1 to 2 feet.

83 D. TENELLM (Spreng. syst. 3. p. 314. under Hedys.) plant herbaceous, procumbent; branches filiform, smooth, as well as the leaves; leaflets ovate, glabrous; stipulas setaceous; racemes terminal. 2. S. Native of St. Domingo.

Tender Desmodium. Pl. procumbent.

84 D. LEIOCARPUM (Spreng. prod. 2. p. 338.) shrubby; leaflets ovate-oblong, obtuse, pubescent beneath; panicle terminal; legumes glabrous, compressed, moniliform. Y. S. Native of Brazil. Hedys. leiocarpum, Spreng. syst. 3. p. 316.

Smooth-fruited Desmodium. Shrub 1 to 2 feet.

85 D. ? VILLOSUM (D. C. prod. 2. p. 338.) stems herbaceous, diffuse, branched, villous; leaflets ovate, rather hispid; racemes terminal, rather spicate; calyces rather villous; joints of legume numerous, usually somewhat 4-horned. O. S. Native of Vera Cruz. Hedys. villosum, Mill. dict. no. 9. but not of Wild. Flowers small, pale purple.

Villosum Desmodium. Pl. diffuse.

86 D. GUIANENSE (D. C. prod. 2. p. 338.) stem frutescent; leaflets hoary beneath; flowers crowded, racemose; legumes hairy.—Native of French Guiana. Hedys. guianense, Aubl. guian. 774. without a description.

Guiana Desmodium. Pl. 1 to 2 feet.

87 D. EMAROINATUM (D. C. prod. 2. p. 338.) stem herbaceous, angular, and rather villous; leaflets ovate, obtuse, glabrous; stipulas ovate-lanceolate; racemes axillary, simple; legumes glabrous, having only one joint, which is emarginate on one side. Y. S. Native of Martinico. Hedys. emarginatum, Poir. dict. 5. p. 432. Flowers small, yellow.

Emerginate-jointed Desmodium. Pl. 1 to 2 feet.

* * * Species, native of the Cape of Good Hope. Hedysarum, Thunb. fl. cap. 594.

88 D. ? CELIATUM (D. C. prod. 2. p. 333.) stem suffrutescent, erect, villous; leaflets ovate, mucronate, pilose on the margins and midrib; stipulas spreading, lanceolate, glabrous; pedicels axillary, 1-flowered, shorter than the leaves; calyx 5-parted. Y. G. Native of the Cape of Good Hope, in grassy fields. Hedys. ciliatum, Thunb. nov. act. up. 6. p. 43. t. 2. fl. cap. 504. Perhaps the plant belongs to a different genus: the legume is unknown.

Cilated-leaffletted Desmodium. Shrub 1 foot.

89 D. SQUARROSUM (D. C. prod. 2. p. 333.) stem suffrutescent, erect, hairy; leaflets ovate, obtuse, pubescent above, but tomentose and nerved beneath; stipulas lanceolate; flowers disposed in spikes? redlexed; legume 2-jointed, hairy. Y. G. Native of the Cape of Good Hope, among grass. Hedys. squarrosum, Thunb. l. c.

Squarrose Desmodium. Shrub 1 foot.

* * * Species natives of Guiana.

90 D. BULLANCEE; stems creeping and rooting; branches beset with rough villi; leaflets roundish-obovate, pale, and clothed with adpressed pubescence beneath; stipulas subulate; pedicels long, loose-flowered. Y. S. Native of Sierra Leone, on the Bullam shore. Flowers purple (v. s. herb. Lamb.).

Bullam Desmodium. Shrub creeping.

91 D. LINEARIFOLIUM; stem erect, branched; branches very villous; leaflets elliptic-lanceolate, obtuse at both ends, clothed with adpressed villi beneath; pedicels few-flowered, panicled; legumes with 4-6 smooth joints. Y. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.).

Linear-leaffletted Desmodium. Shrub 1 foot.

92 D. SIMPLEX; stem erect, simple, clothed with adpressed villi, as well as the under side of the leaves; leaflets of the lower leaves roundish-obovate, emarginate, of the upper ones obvate, mucronate; raceme terminal, on a long naked pedicel. Y. S. Native of Sierra Leone. Flowers purple (v. s. herb. Lamb.).

Simple-stemmed Desmodium. Shrub 2 to 3 feet.

93 D. OXALIDIFOLIUM; plant suffrutescent, branched, prostrate; leaflets obvate-roundish, membranous, glabrous, mucronate, small; stipulas subulate; pedicels elongated, few-flowered; legume with rough joints. Y. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

Sorrel-leaved Desmodium. Shrub prostrate.

94 D. RAMOSISSIMUM; plant shrubby, erect, much branched; leaflets obvate, glabrous, rounded at the apex and mucronate; racemes spiked, terminal, few-flowered; legumes articulated. Y. S. Native of the Island of St. Thomas. Flowers small, flesh-coloured.

Scattered-flowered Desmodium. Shrub 1 to 3 feet.

96 D. TE'NUE; stems shrubby, ascending, simple, weak; leaflets small, obvate, mucronate; racemes spiked, slender. Y. S. Native of Sierra Leone. Joints of legume hairy. Flowers rose-coloured.

Slender Desmodium. Shrub ascending.

* * * * * Species, natives of the Mauritius, Madagascar, and Arabia.

97 D. CESPIOSUM (D. C. prod. 2. p. 333.) stems creeping, tufted, and smoothish; stipulas lanceolate, acuminate, scarios; leaflets obvate-roundish; racemes erect, terminating the branches; pedicels solitary; legumes pubescent, with 2-5 semi-ovate joints. Y. S. Native of the Mauritius. Hedys. cespiosum, Poir. dict. 6. p. 421.

Tufted Desmodium. Pl. creeping.

98 D. MAURITIUM (D. C. prod. 2. p. 334.) stem erect, tretate, pubescent stipulas lanceolate, acuminate, scarios, clothed with adpressed down, as well as the stems, petioles, and pedicels; leaflets obvate-oblong, obtuse; raceme terminal, simple; legumes drooping, with semi-arboicular joints, when young pubescent. Y. S. Native of the Mauritius. Hedys. mauritianum, Willd. spec. 3. p. 1185. Ethesynóme arbórea, Sieb. pl. maur. exs. no. 155. and perhapes of Lin. Flowers drooping. Roots creeping.

Mauritian Desmodium. Shrub 1 to 1 foot.

99 D. SCALPEE (D. C. prod. 2. p. 334.) stem erect, suffrutescent stipulas lanceolate-linear, acuminate, glabrous; leaflets ovate or rhomboid, acuminate, mucronate, with sinuate-crenated margins; racemes terminal, elongated; pedicels twin, capillary. Y. S. Native of the island of Bourbon, and per-
haps of Madagascar. Hedys. Scalpe, Comm. herb. Hedys. repandum, Poir. dict. 6. p. 408. but not of Vahl. Asclepiadaceae remota, Poir. dict. 4. p. 452. Petioles nodose at the base. Stems pubescent at the apex, as well as the under side of the leaves. Legume unknown. Perhaps this and the following species would constitute a new genus. Scalpe is the vernacular name of the plant.

Scalpe Desmodium. Shrub 1 to 2 feet.

100 D. repandum (D. C. prod. 2. p. 384.) stem shrubby, erect; stipulas lanceolate, ciliated; leaflets ovate-rhomboid, obtuse, with repand-crenated margins; raceme terminal, elongated; pedicels 2-3 together, capillary. \( \varphi \). S. Native of Arabia Felix. Hedys. repandum, Vahl. symb. 2. p. 82.

Repand-leafed Desmodium. Shrub 1 to 3 feet.

101 D. oxynxacteum (D. C. prod. 2. p. 334.) stem frutesc- cent, terete, glabrous; leaflets oblong, acuminate, glabrous; stipulas and bracteas lanceolate, and very much acuminate; racemes axillary and terminal; legumes deflexed, depressed, smoothish, coriaceous. \( \varphi \). S. Native of the Mauritius, spontaneous or cultivated. Flowers purple.

Sharp-bracted Desmodium. Shrub 1 to 2 feet.

102 D. diversifolium (D. C. prod. 2. p. 334.) stem shrubby, terete, glabrous; leaves simple and trifoliate; leaflets oval, glabrous, but puberulous on the middle nerve beneath, the terminal leaflets always twice or thrice the size of the lateral ones; racemes almost terminal; legumes villous, compressed, nearly linear. \( \varphi \). S. Native of Madagascar. Hedys. diversifolium, Poir. dict. 6. p. 493.

Abyssinian Desmodium. Pl. cl.

* * * * * * * Species natives of the East Indies, Nipaul, \&c.

104 D. polycarpum (D. C. prod. 2. p. 334.) stem terete, erect, clothed with adpressed pubescence; leaves trifoliate, with ovate obtuse leaflets, terminal one the largest; racemes terminal and axillary, crowded; legumes with 5-8 semi-ornicular joints. \( \varphi \). S. Native of the East Indies. Lam. ill. t. 638. f. 4. Hedys. polycarpum, Poir. dict. 6. p. 413. Flowers purple. Said to be allied to D. latifolium and D. lassiocarpum.

Many-fruited Desmodium. Shrub 2 to 3 feet.

105 D. Pryot (D. C. prod. 2. p. 334.) stem almost terete, smoothish, erect; leaflets oval, acute, glabrous above, but clothed with silky pubescence beneath, the terminal leaflet thrice the size of the lateral ones; racemes axillary, longer than the leaves; legumes hardly puberulous, with 5-6 semi-ornicular joints. \( \varphi \). S. Native of the East Indies. Hedys. viridiflorum, Bum. ind. 167. exclusive of the synonyms. Hedysarum spicatum foliis acuminatis, Pryot in herb. Bum. Hedys. Pryot, Spreng. syst. append. 292. The legumes are like those of D. Gangicicum.

Pryot's Desmodium. Shrub 1 to 2 feet.

106 D. triflorum (D. C. prod. 2. p. 334.) stems herbeaceous, procumbent, filiform, puberulous; leaflets obcordate, glabrous above, but puberulous on the nerves beneath; pedicels axillary, 1-flowered, 2-3 together; legumes puberulous, with 3-4 semi-ornicular joints. \( \varphi \). S. Native of China, Malabar, the Mauritius, also of the West Indies and Guiana. Hedys. triflorum, Lin. spec. 1057. Swartz, obs. 285. t. 6. f. 1. Hedys. stipulaceaum, Bum. ind. t. 54. f. 2. zeyl. t. 54. f. 2. Hedys. bisflorum, Willem. maur. 49. ? Flowers red.

Three-flowered Desmodium. Shrub procumbent.

107 D. heterophyllum (D. C. prod. 2. p. 334.) stem herbeaceous, ascending, rather pilose; leaflets obovate, obtuse, glabrous above, and clothed with adpressed pubescence beneath; pedicels axillary, 1-flowered, 2-3 together; legumes ciliated, with the joints semi-ornicular. \( \varphi \). S. Native of Ceylon. Bum. zeyl. t. 54. f. 2. Hedys. heterophyllum, Willd. spec. 3. p. 1201. Flowers red.

108 D. farriolium (D. C. in ann. sc. nat. 4. 1825. p. 100.) stems procumbent, herbeaceous, much branched, weak, and glabrous; leaflets small, obovate or roundish, emarginate or mucronate, covered beneath with adpressed hairs, but glabrous above; racemes panicked, axillary, 5-6-flowered, much longer than the leaves; pedicels capillary, diverging; legumes glabrous, with 3-4 semi-ornicular joints. \( \varphi \). G. Native of Nipaul. Hedys. tenallum, D. Don, prod. fl. nep. p. 243. but not of Kunth. Hedys. parviflorum, Spreng. syst. 2. p. 318. Flowers small, purple. Calyxine segments lanceolate, awned.

109 D. duillum (Lindl. bot. reg. 967.) leaflets obovate, rather retuse, mucronate, pubescently-pilose, paler beneath; racemes elongated, many-flowered, terminal; bracteas subulate, equal in length to the pedicels; stems angular, and are as well as the pedicels hairy. \( \varphi \). G. Native of Nipaul. Flowers purple. Perhaps not distinct from the following.

Loose-flowered Desmodium. Shrub 1 to 2 feet.

110 D. diffusum (D. C. l. c.) stem shrubby, nearly erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminate, glabrous above, but clothed with adpressed pubescence beneath; racemes terminal, elongated; pedicels twice the length of the calyx, in fasicules; young legumes villous. \( \varphi \). S. Native of the East Indies. Hedys. diffusum, Roxb. hort. beng. p. 57 but not of Willd. Hedys. Roxbubhi, Sp. diff. syst. append. 292. Flowers purple.

111 D. laflexum (D. C. l. c.) stem fruticose, erect, terete, glabrous; branches pubescent; stipulas lanceolate; leaflets elliptic, acuminate, glabrous above, but clothed with adpressed pubescence beneath; racemes terminal, longed; pedicels hairy, filiform, much longer than the calyx; joints of legume oblong, compressed, hardly puberulous, usually 4-5. \( \varphi \). G. Native of Nipaul. Flowers purple. Perhaps not distinct from the following.

Loose-flowered Desmodium. Shrub 2 feet.

112 D. elegans (D. C. l. c.) stem shrubby, branched, terete; branches angular, pubescent; stipulae linear, acuminate; leaflets roundish-ovate, acuminate, pubescent beneath; racemes terminal, panicled; pedicels hispid, filiform; calyx ob- soletely 5-toothed. \( \varphi \). G. Native of Nipaul, on Shreenagar.

Elegant Desmodium. Shrub 3 to 6 feet.

113 D. nutans (Wall. mus. Graham in edinb. phil. journ. Hook. bot. mag. 2867.) shrubby, branched; racemes compound, terminal, and axillary, and are, as well as the branches, pendulous; flowers twin; bracteas acute; leaves pendulous; leaflets roundish-rhomboid, tormentose on both surfaces; stipulae subulate. \( \varphi \). S. Native of the East Indies. Corolla bluish lilac. Stamens monadelphus.

114 D. pendulum (Wall. pl. rar. asiat. 1. p. 81. t. 94.) erect, twiggly; branches villous; leaflets cuneate-oblong, obtuse, cuspidate, villous and many-nerved beneath; stipulas and bracteas large and dry, membranous, aristately mucronate; racemes solitary, terminal, pendulous; flowers twin; legumes compressed, moniliform on one side; joints 4, reinfert, lower one sti-
pitate. *H.* S. Native of Nipao, on the mountains on the confines of the valley. Flowers purple.

*Pendulous-racemed* Desmodium. Shrub 3-4 feet.

115 D. *multiflorum* (D. C. l. c.) stem shrubby, terete, glabrous; branches hairy, trigonal; stipulas lanceolate, subulate; racemes axillary and terminal, pubescent above, and villous beneath; racemes axillary and terminal, longer than the leaves. *H.* G. Native of Nipao. Hedys. floribundum, D. Don, prod. fl. nep. 244. ? Flowers purple. Calyx nearly smooth. Young legume with 5-0 ovate pubescent joints.

116 D. *angulatum* (D. C. l. c.) stem suffruticos; branches angular, pubescent, but villous along the angles; leaflets ovate, acutish, clothed with adpressed villi on both surfaces; racemes axillary and terminal, almost spicata; bracteas villous, very much acuminate, deciduous, longer than the flowers. *H.* G. Native of Nipao. Hedys. retusum, D. Don, prod. fl. nep. 243? Hedys. Walllichianum, Spreng. syst. append. 293. Flowers purple.

**Angular-stemmed** Desmodium. Shrub 2 feet.

117 D. *pilosusculum* (D. C. prod. 2. p. 325.) stem angular, rather pilose; leaflets ovate-lanceolate, acute, glabrous above, and puberulous beneath; racemes terminal, somewhat spicate; bracteas deciduous, villous, somewhat acuminate; legumes a little incurved, with oval pubescent joints. *H.* S. Native of the Philippine islands.

**Pilose** Desmodium. Shrub 1 to 2 feet.

118 D. *confertum* (D. C. in ann. sc. nat. 4. 1825. p. 100.) stem shrubby, nearly terete, villous; leaflets ovate, acutish, rather coriaceous, glabrous above, and villous beneath; racemes crowded, short, terminal; bracteas ovate, acutish, glabrous, ciliated. *H.* G. Native of Nipao. Flowers purple.

**Crowded** Desmodium. Shrub 1 to 2 feet.

**Suembu** Desmodium. Fl. July. Shrub 1 to 2 feet.

120 D. *reticulatum* (D. C. in ann. sc. nat. 4. 1825. p. 100.) branches and peduncles terete, covered with rufous villi; leaflets ovate-elliptic, obtuse, mucronate, glabrous above, and pubescent beneath; racemes terminal, panicled; bracteas deciduous, villous, very much acuminate. *H.* S. Native of the East Indies. Hedys. reticulatum, Spreng. syst. append. 292. Upper leaves with one leaflet. Stipula broad at the base, but elongated and subulate at the apex.

**Rufescens** Desmodium. Shrub 1 to 2 feet.

121 D. *concinnum* (D. C. l. c.) stem shrubby, branched; branches terete, pubescent; leaflets elliptic-obovate, mucronate, pubescent beneath, with rather prominent nerves; stipulas lanceolate-linear, acuminate; racemes terminal; pedicels twin, hairy; bracteas deciduous, ovate, acuminate, villous. *H.* G. Native of Nipao. Hedys. concinnum, Spreng. syst. append. 292. Allied to the preceding species, but differs in the leaflets being 1½ inch long, not 2-5, and in having fewer flowers. Flowers violaceous.

**Neat** Desmodium. Shrub 1 to 2 feet.

122 D. *fruticosum* (D. C. l. c.) stems procumbent, suffruticos; branches at the base, terete, hairy; leaflets obovate, roundish, obtuse, glabrous above, pubescent beneath; stipulas scarious, lanceolate-linear, acuminate, glabrous; bracteas conforming to the stipulas, ciliated; racemes terminal; pedicels twin. *H.* G. Native of Nipao. Flowers violaceous.

**Hairy-stemmed** Desmodium. Fl. procumbent.

123 D. *viscidum* (D. C. prod. 2. p. 336.) stems suffruticos; branches terete, covered with adpressed villi; leaflets smoothish, terminal one obovate and larger than the lateral ones, which are ovate and acutish; racemes almost terminal, villous; stipulas and bracteas scarious, ovate-lanceolate, acuminate, striated, glabrous. *H.* S. Native of Java. Burm. scyl. t. 84. f. 1. Hedys. viscidum, Burm. ind. 167. Flowers blue.

**Viscid** Desmodium. Shrub 1 to 2 feet.

124 D. *pauciflorum* (D. C. l. c.) stem shrubby, erect, branched, terete, smoothish; leaflets elliptic, obtuse, pubescent and veiny beneath; stipulas membranous, acuminate-awned; bracteas conforming to the stipulas, somewhat ciliated; racemes terminal; pedicels solitary or twin. *H.* S. Native of the East Indies. Very like *D. concinnum*. Flowers violaceous.

**Few-nerved**-leafed Desmodium. Shrub 1 to 2 feet.

125 D. *lescinaulthi* (D. C. l. c.) stem terete, puberulous, suffruticos; leaflets rhomboid, mucronate, puberulous on both surfaces; racemes axillary, slender; stipulas and bracteas deciduous, acuminate, and rather pilose; pedicels 2-3-together, spreading. *H.* S. Native of the East Indies. Flowers purple.

**Capitate**-flowered Desmodium. Fl. July. Clt. ? Sh. 1 to 2 ft.

127 D. *silicidum* (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-ovate, clothed with silky tumentose beneath; stipulas lanceolate, dry; racemes axillary, bracteate before the flowers expand, and of a capitulate conical figure; legumes pedululous. *H.* S. Native of Java. Hedys. silicidum, Burm. fl. ind. 169. t. 55. f. 2. Perhaps a species of *Lespedeza*.

**Siliqueose**-poddDesmodium. Shrub 1 to 2 feet.

128 D. *retroflexum* (D. C. prod. 2. p. 336.) stem shrubby, erect; leaflets roundish-ovate, clothed with silky tumentum beneath; racemes axillary, erect, elongated; legumes reflexed. *H.* S. Native of the East Indies. Hedys. retroflexum, Lin. mant. 103. Allied to *Plemonia lineata*, but the legume is many-jointed. It differs from *D. concinnum* in the leaflets being roundish, not elliptic, and in the racemes being axillary, &c.

**Retroflexum** Desmodium. Shrub 1 to 2 feet.

**Two-flowered**-peduncled Desmodium. Sh. tw.

130 D. *lauxum* (D. C. in ann. sc. nat. 4. p. 126.) stems twining, trigonal, and are either pilose or glabrous, as well as the petioles; stipulas lanceolate, acuminate; leaflets elliptic, acuminate, glabrous, but pubescent on the nerves beneath, middle one acuminate at the base, lateral ones unequally semicordate at the base; petioles terminal, very loose; pedicels twin. *H.* C. G. Native of Nipao. Hedys. lauxum, Spreng. syst. append. 292. Young legume smooth and repand.

**Loose**-flowered Desmodium. Shrub tw.

131 D. *Willdenowii*; stems ascending, triquetrous; stipulas obliquely cordate; leaflets oblone-ovate, obtuse, hairy beneath; racemes erect, panicled; bracteas cordate, deciduous; legumes with 4 roundish, hairy joints. *H.* S. Native of Tranquebar.
LEGUMINOSAE.  

CLV. DESMODIUM.  

297  

Willow-desmodium. Shrub 2 to 3 feet, diffuse.  

122 D. dicotomum (D. C. prod. 2. p. 336.) stem erect, triquetrous; pubescent; stipulas and bracteas ovate; leaflets elliptic, obtuse, pubescent, hoary beneath; racemes elongated; legumes hairy, with 6 joints. \( \mathfrak{s}' \). S. Native of Tranquebar. Hedys. dichotomum, Wildl. spec. 1180. This species is like the preceding.  

*Dictotomous-stemmed Desmodium.* Shrub 2 to 3 feet.  

123 D. oxyphyllum (D. C. in Ann. sc. nat. 4. p. 102.) stem erect, terete, branched, and is rather angular and smooth, as well as the branchlets; stipulas subulate; leaflets elliptic, acuminate, glabrous, pale white beneath; panicule terminal, loose; pedicels 2-3-together, in fascicles. \( \mathfrak{g}' \). G. Native of Nipaul. Hedys. oxyphyllum, Spreng. syst. append. 202.  

*Sharp-leaved Desmodium.* Shrub 1 to 2 feet.  

124 D. podocarpum (D. C. L. c.) stem ascending, terete; branches rather angular, and are as well as the petioles and peduncles pilose; stipulas subulate; leaflets broad-ovate, rather rhomboid, pale beneath, but rather puberulous above; racemes terminal, elongated, slender; pedicels twine; legumes with 1-3 triangular, puberulous, distant joints, lower joint stipitate. \( \mathfrak{s}' \). G. Native of Nipaul. Flowers purple.  

*Foot-fruited Desmodium.* Shrub 1 to 2 feet.  

125 D. heterocarpum (D. C. prod. 2. p. 337.) stem shrubby, erect, and is as well as the petioles scabrous; stipulas setaceous; leaflets elliptic, obtuse, glabrous; racemes axillary and terminal; legumes puberulous, erect, lower ones with only 1 joint, the rest having 5-7 orbicular joints. \( \mathfrak{s}' \). S. Native of Ceylon. Burm. zeyl. 117. t. 55. f. 1. Hedys. heterocarpum, Link. spec. 1054, but not of Thunb. Flowers pale purple.  

*Various-fruited Desmodium.* Shrub 1 to 2 feet.  

126 D. sequex (Wall. pl. asiatic. rar. 2. p. 46. t. 157.) plant shrubbery, erect, twiggy, and branched; branches terete, and are villous, as well as the petioles; leaflets lanceolate, acuminate, clothed with adpressed pili above, and villous beneath, intermediate one double the size of the lateral ones; stipulas linear; racemes axillary, about equal in length to the leaves; flowers usually twin, on villous pedicels; legumes slender, linear, many-jointed, many-toothed on both edges, and covered with hooked pili. \( \mathfrak{s}' \). S. Native of the East Indies, on the mountains of Kamaon. Flowers pale red.  

*Sticking Desmodium.* Shrub 3 feet.  

137 D. laburnifolium (D. C. prod. 2. p. 337.) stem shrubby, branched, terete, smoothish; stipulas setaceous; leaflets ovate, acute, glabrous, shining above, clothed with adpressed pubescence beneath; racemes terminal, loose; legumes pendulous, hispid, with oblong compressed joints. \( \mathfrak{s}' \). S. Native of Java. Hedys. laburnifolium, Poir. dict. 6. p. 422, but not of Sieb. This plant probably belongs to section Eudesmodium.  

*Laburnum-leaved Desmodium.* Shrub 2 to 3 feet.  

138 D. salicifolium (D. C. prod. 2. p. 337.) stem frutescens, branched, terete, glabrous; stipulas and stipels lanceolate-setaceous, elongated; leaflets lanceolate-oblong, acuminate, glabrous; panicule terminal, diffuse; bracteas lanceolate-subulate; legumes arched, hispid. \( \mathfrak{s}' \). S. Native of the East Indies. Hedys. salicifolium, Poir. dict. 6. p. 422.  

*Willow-leaved Desmodium.* Shrub 1 to 2 feet.  

139 D. rotuli (G.) plant herbaceous, erect; leaflets large, obläng-elliptic, acutish, rather stiff and stiff beneath; panicule terminal, elongated, diffuse; legumes linear, arched, glabrous. \( \mathfrak{q}' \). S. Native of the East Indies. Hedys. linearis, Rottl. Hedys. rotuli, Spreng. syst. 3. p. 320.  

Rottler's Desmodium. Pl. 1 foot.  

† Species, natives of Nipaul, which differ from the other species in having a 4-toothed calyx instead of being 5-toothed.  

140 D. rectum; leaflets oblong, retuse, mucronulate, villous, canescent beneath; stipulas lanceolate, acuminate; racemes many-flowered; leaflets ovate, mucronate, villous, imbricated; calyces teeth ovate, cuspidate; keel of corolla truncate at the apex. \( \mathfrak{g}' \). G. Native of Nipaul, at Nara-nhetty. Hedys. retusum, Hamilt. mss. ex D. Don, prod. fl. nep. 243. Leaflets nearly 2 inches long and half an inch broad.  

141 D. floribundum; leaflets ovate, mucronate, and are as well as the branches piously tomentose; stipulas lanceolate, falcate; racemes many-flowered; pedicels capillary, aggregate; calyces segments ovate, acute, upper one broader and emarginate. \( \mathfrak{g}' \). G. Native of Nipaul, at Gosainghat. Hedys. floribundum, D. Don, prod. fl. nep. p. 244. Flowers reddish. Perhaps the same as *D. multiflorum* of D. C.  

*Floribundum Desmodium.* Shrub 2 to 3 feet.  

142 D. tiliaceum; leaflets roundish-ovate, acuminate, pubescent; racemes terminal, panicled; calyx bluntly 4-lobed. \( \mathfrak{g}' \). G. Native of Nipaul, on Shreenagur. Hedys. tiliaceum, D. Don, l. c. Leaflets almost 3 inches long.  

*Lime-tree-leaved Desmodium.* Shrub 2 to 3 feet.  

*Diores Desmodium.* Shrub 3 feet.  

† Doubtful species, natives of the East Indies.  

144 D. grandifolium (D. C. prod. 2. p. 338.) stem frutescent, simple, trigoinal; stipulas ciliated; petioles triquetrous; leaflets oblong-lanceolate, acute, racemes somewhat spicate. \( \mathfrak{s}' \). S. Native of the East Indies. Hedys. grandifolium, Horn. hort. hain. cat. 2. p. 700.  

*Great-leaved Desmodium.* Shrub 2 to 3 feet.  

145 D. punctatum (D. C. prod. 2. p. 338.) stem twining, furrowed, pinnate; leaflets ovate, acute, and are as well as the calyces beset with red dots; racemes axillary, short. \( \mathfrak{q}' \). C. S. Native of the East Indies. Hedys. punctatum, Rottl. berl. mag. p. 231.  

*Dotted Desmodium.* Shrub tw.  

146 D. spicocris (D. C. prod. 2. p. 338.) stem shrubby, erect; leaflets ovate, glabrous, middle one largest; spikes oblong, dense; legumes straight, bearded, joined on the upper suture. \( \mathfrak{g}' \). G. Native of Cochin-china. Hippocris barbata, Lour. fl. coch. p. 453. Flowers purple.  

*Hippocris-like Desmodium.* Shrub 4 feet.  

147 D. malacophyllum (D. C. prod. 2. p. 338.) stem herbaceous, erect, hairy; leaflets oblong, somewhat cordate, pale, and clothed with soft hairs beneath; racemes terminal. \( \mathfrak{s}' \). S. Native of Manilla. Hedys. malacophyllum, Link. enum. 2. p. 247.  

† Species, natives of New Holland and New Ca- 

edonia.  

148 D. spartoides (D. C. prod. 2. p. 337.) stem slender, terete, dichotomous, glabrous; stipulas acute; leaflets oblong-linear, mucronate, glabrous above, but pale, and pubescent beneath; racemes terminal and opposite the leaves; pedicels from Q q
LEGUMINOSÆ. CLV. DESMODIUM. CLVI. DIÆRMA.

1-3. in a fascicle, distant, joints of legume 4, semi-orbicular, hardly puberulous. 帑. G. Native of New Holland. The figure in Burm. ind. t. 51. f. 2. agrees with this plant, but the description does not.

**Broom-like Desmodium.** Shrub 1 to 2 feet.

140. D. varianum; lower leaflets elliptic, upper ones orbic or ; racemes axillary and terminal, flexuous. ¥. G. Native of New Caledonia. Hedys. varianum, Labill. cal. p. 71. t. 71. 

**Varying Desmodium.** Pl. cl.

150. D. TUBERCULATUM; leaves simple and ternate; leaflets obovate, grey beneath; racemes terminal. ¥. G. Native of New Caledonia. Hedys. tuberculatum, Labill. cal. p. 71. t. 72.

**Tubercled Desmodium.** Shrub 1 to 2 feet.

* * * * * * * Species, natives of Japan and China. Hedysarum, with ternate leaves, Thunb. fl. jap. 284.

151. D. Microphyllum (D. C. prod. 2. p. 337.) stem shrubby, erect, glabrous; stipules ovate, subulate, almost covering the branches; leaflets ovate, villous; panicle terminal; legumes scabrous, 3-jointed. ¥. G. Native of Japan, near Nagasaki. Hedys. microphyllum, Thunb. fl. c. i. c. flowers purple. 

**Small-leaved Desmodium.** Shrub 1 to 2 feet.

**Racemose-flowered Desmodium.** Shrub 1 to 2 feet.

**Tailed Desmodium.** Pl. 1 foot.

154. D. Tomentosum (D. C. prod. 2. p. 337.) stem herbaceous, erect, angular, flexuous, tomentose, as well as the pedi- toes, peduncles, and under sides of the leaves; stipulas broadest at the base, setaceous; leaflets ovate-oblong, obtuse, mucronate; racemes axillary. ¥. G. Native of Japan. Hedys. tomentosum, Thunb. fl. jap. 286.

**Tomentose Desmodium.** Pl. 1 foot.

Thunberg's Desmodium. Pl. 2 feet.

**Pilose Desmodium.** Pl. decumbent.

**Striated Desmodium.** Pl. 1 to 2 feet.

† A doubtful species, of which the native country is unknown.

158. D. Violeceum; plant shrubby, erect, branched, pubes- cent; leaves petiolate, ovate-lanceolate, mucronate at the apex, clothed with hoary tomentum beneath; stipulas very villous; bracteas pubescent, lanceolate, acute. ¥. S. Native of Man- ranath. Flowers small, violaceous.

159. D. NEISSI (D. C. prod. 2. p. 338.) branches terete, rather angular at the apex, clothed with silky villi; leaflets ovate- lanceolate, acuminate, puberulous above, but clothed with silky villi beneath; racemes axillary and terminal, somewhat spicate; bracteas longer than the flowers; acuminate, rather villous at the apex. ¥. S. Native country unknown.

**Neiss's Desmodium.** Shrub 1 to 2 feet.

† Species only known by name, from Roxburgh's Hortus Benga- lensis, p. 57. and p. 58, under Hedysarum, many of which may be identical with some of those described above.

Cult. The stove and greenhouse species of this genus grow well in a mixture of loam and peat, and young cuttings will root readily in sand, under a hand-glass in heat. The hardy kinds or those natives of North America succeed well in a light rich soil, and are increased by dividing at the root in spring, or by seeds.

CLVI. DIÆRMA. (from διαέρεα, δίαερυος, ippa, ippua; a prop; in reference to the calyx being propped by 2 bracteas). D. C. legum. mem. vi. prod. 2. p. 339.

**Lin. syst. Diodaphia, Decándria.** Calyx bilabiate, propped by 2 adpressed bracteas at the base; upper lip entire or hardly bidentate at the apex, lower one trifid, with the middle lobe rather longer than the lateral ones. Vexillum obovate. Carina and wings about equal in length. Keel obtuse, not obliquely truncate at the apex. Stamina diadelphous. Legume constantly of 2, rarely of 3 orbicular, regular, flat, 1-seeded joints, which are not echinated, the ultimate one bearing the permanent style.—Shrubs with trifoliate leaves. Pedicels 1-flowered, numerous, aggregate in the axis of the leaves or bracteas. Flowers yellow or purple.

SECT. I. PHYLLODIOUM (from φυλλος, phyllon, a leaf; in reference to the leaflets being stipitate). Desv. journ. bot. p. 3. t. 5. f. 54. D. C. prod. 2. p. 339. Leaves on long petioles, pinately trifoliate; leaflets stipulate. Floral leaves bifoliate, the odd one being abortive, lateral ones orbicular, lined, formed like bracteas, the petiole ending in a bristle. Flowers numerous in the axis of the floral leaves, or very short pedicels. Stipulas distinct and free from the petioles.

1 D. PULCHELLEUM (D. C. prod. 2. p. 339.) stem erect, shrubby; leaves pinately trifoliate; leaflets elliptic-oblong, pubescent beneath, glabrous above, terminal one very large; floral leaves bifoliate, with the petiole ending in a bristle; gle- sume straight, 2-jointed. ¥. S. Native of the East Indies, Java, Mindanao, and China. Hedys. pulchellum, Lin. spec. 1053. Phylloidium pulchellum, Desv. i. c.—Burm. zey. t. 52. —Pluk. alm. t. 433. f. 7. Flowers purple, 2 to each pair of floral leaves.

**Elegant Dicerma.** Fl. July, Aug. Cit. 1819. Sh. 2 to 3 ft.

SECT. II. APHYLLODIUM (from αφυλλος, aphyllon, a leaf; in reference to the leaflets being without stipules.) D. C. legum. mem. vii. prod. 2. p. 339. Leaves trifoliate; leaflets about equal in size, exstipitate, rising from the top of the pe-
tiole; floral leaves reduced to stipules, and therefore the flowers are disposed in an almost naked terminal raceme. Stipules joined, opposite the leaves. The plant in this section is very different in habit from those species contained in the first section, but the character of the fructification is very similar.

3 D. biarticulatum (D. C. prod. 2, p. 339.) leaflets 3, disposed in a palmate manner, obvolute-oblong, obtuse, smoothish; branches and legumes clothed with adpressed pubescence. 

1. Native of the East Indies. Hedys. biarticulatum, Lin. spec. 1054.—Burm. zeyl. 114. t. 50. f. 2.

Cult. This is a genus of elegant shrubs; they will grow in a mixture of loam and peat, and they may be increased by young cuttings, planted in sand, with a hand-glass placed over them, or by seeds.

Lin. syst. Diadelpheia, Decandria. Calyx bibractejate at the base, half 5-cleft, and somewhat bilabiate; the segments lanceolate-linear, and acuminate. Corolla papilionaceous; vexillum nearly obovate. Wings shorter than the calyx. Keel obtuse. Stamens diadelphous, straight, or a little inflexed at the apex. Style fimbriate, long, flexuous, deciduous. Legume constantly of 2 orbicular, compressed, 1-seeded joints.—Shrubs, natives of the Levant, with simple and trifoliate leaves. Stipules joined together at the base. Flowers rose-coloured or white.

1 T. nummulare (D. C. leg. mem. vii. t. 52.) leaves all simple, on short petioles, orbicular, mucronate, glabrous, pubescent; racemes axillary, few-flowered, much longer than the leaves. 

2 T. spartiæ (D. C. prod. 2, p. 339.) leaves simple or trifoliate; leaflets oblong; racemes axillary and terminal; pedicels twin, 1-flowered, very short. G. Native of Persia. Hedys. spartiæ, Burm. fl. ind. 166. t. 51. f. 2. Flowers yellow.

Broom-like Taverniera. Shrub 1 to 2 feet.

CLVIII. HEDYSARUM (γένεσαρος, hedysaron), is the name of a plant of Theophrastus and Dioscorides; said to be from ήδης, hedys, sweet, and αρωμα, aroma, perfume. The present genus, however, has nothing to do with the plant of Theophrastus, further than belonging to the papilionaceous tribe. His plant being Trigonella foenum Graecum, from which an oil was extracted and mixed with ointments by the Hindoos). Jaum. journ. bot. 5. p. 61. exclusive of some species. D. C. legum. mem. vii. prod. 2, p. 340.—Echinolobium, Desv. journ. bot. 3. p. 128. t. 5. f. 20-21.—Hedysarum species of Lin. and others.

Linn. syst. Diadelpheia, Decandria. Calyx 5-cleft; the segments linear-subulate and nearly equal. Corolla with a large vexillum and obliquely truncate keel, which is much longer than the wings. Stamens diadelphous, having the staminodial tube abruptly inflected. Legume constantly of numerous, flat, orbicular or lenticular, regular, 1-seeded joints, which are connected together in the middle, and therefore the sutures are convex on both sides.—Herbs or subshrubs, with impari-pinnate leaves, axillary, simple peduncles, bearing racemose spikes of large, purple, white, or cream-coloured flowers. This genus is nearly allied to Onobrychis, but differs in the legumes being of many joints, not of one joint only as in that genus. All the species are very elegant when in blossom.

* Plants almost stemless. Calyceine segments subulate and elongated.

1 H. grandiflorum (Pall. itin. 2. p. 743. t. Y. ed. gall. append. no. 307. t. 82.) plant nearly stemless; leaflets elliptic, clothed with silky hoary down beneath; wings of flower equal in length to the calyx; keel shorter than the vexillum; legumes joined, clothed with white, wrinkled, having the disks of joints muricated with spinules, which are glomcidate at the apex.

2 H. Native of Iberia, the Ukraine, and South of Podolia, on calcareous hills at the Niecep, and at the Irish. Bibb. cent. pl. ros. 3. t. 63. ex suppl. no. 1445. H. sericeum, Bibb. fl. taur. 2. p. 176. H. argenteum, Lam. in Pall. l. c. Astragalis grandiflorus, Lin. spec. 1071.—Gmel. sib. 4. t. 31. Corolla large, cream-coloured or pale purplish.

2 H. argenteum (Lin. fil. suppl. no. 333.) plant almost stemless; leaflets ovate or ovate, villous above and clothed with shining silky pubescent beneath; petioles and peduncles clothed with adpressed pubescence; calyx shorter than the corolla; keel twice the length of the wings and about equal in length to the vexillum; legumes articulated, tomentose, rough. G. Native of Caucasus and of Siberia, at the river Iaucus. Bibb. fl. taur. 2. p. 175.—Gmel. sib. 4. p. 30. t. 13. Flowers purple.

3 H. caudatum (Bibb. fl. taur. 2. p. 176. and suppl. no. 1444.) plant almost stemless; leaflets roundish, ovate, pubescent above and clothed with silky white down beneath; petioles and peduncles covered with spreading pubescence; calyx length of corolla; carina twice the length of the wings, but about equal in length to the vexillum; legumes tomentose, wrinkled, roughish. G. Native of Tauria, on calcareous hills. H. argenteum, Willd. spec. 3. p. 1205. exclusive of the synonyms. H. creticum, Pall. ined. taur. Flowers pale purplish, but at length changing to a cream colour.

Var. β. hâmile (D. C. prod. 2. p. 40.) scapes thistle; plant more humble than the species. G. Native of Tauria, about Sudak. H. supinum, Pall. ined. taur. H. hâmile, Hablitz, taur. 152.

4 H. splendens (Fisch. in linn. D. C. prod. 2. p. 340.) stems short; leaves with 1-3 pairs of ovate leaflets, which are clothed with adpressed silvery-silky pubescent on both surfaces; peduncles or scapes longer than the calyx; spikes racemose, oblong; wings of flowers shorter than the calyx; vexillum striated, almost the length of the carina; legumes clothed with silky pubescence, having 2 reticulate-reined joints. G. Native of Siberia, at the river Irish. Flowers large, pale red. Leaves sometimes unifoliate. Bracteas longer than the pedicels. Stipulas joined in one, opposite the leaves.
**Plants with stems. Calyceine segments subulate or linear. Legumes prickly.**

5 H. \textit{falcis}um (Desf. fl. atl. 2. p. 177.) stems decumbent; leaves with 6-7 pairs of elliptic-oblanceolate, pubescent leaflets; spikes or racemes of flowers oblong, crowded; wings of flower thrice the length of the calyx; joints of legume orbicular, prickly. \( \textcircled{2} \). Native of Barbary, near Maser. Sims, bot. mag. 1251. Flowers pale rose-coloured, about the size of those of \textit{H. coronarium}.

**Cylindrical-flowered Hedysarum.** Fl. July, Aug. Pl. 1820. Pl. 1 in text; leaves with 3-4 pairs of elliptic oblong leaflets; spikes of flowers ovate; legumes jointed, rather undulated, prickly. \( \textcircled{2} \). Native of Armenia. Flowers yellowish; ex Vilm. It orientem ineunt floribus varis magnis, siliquique aspera, Tourn. cor. 277.

12 H. \textit{angustum} (Willd. spec. 3. p. 1060.) stem ascending; leaves with 7 pairs of elliptic acute leaflets, which are pubescent above, and repentant beneath; legumes articulated, rough. \( \textcircled{2} \). Native of Armenia. Flowers yellowish? ex Vilm. It orientem ineunt floribus varis magnis, siliqui aspera, Tourn. cor. 277.

15 H. \textit{tuberculatum} (D. C. spec. 2. p. 341.) stem suffruticose, diffuse; upper leaves trifoliate, and are, as well as the branchlets, rather villous; leaflets elliptic, mucronate, terminal one much the largest; spikes few-flowered; legumes with 2 prickly joints. \( \textcircled{2} \). Native country unknown. According to the legume this species belongs to section \textit{Echinolobium}, but its habit is very distinct from the other species.

**Anomalous Hedysarum.** Shrub 1 foot.

**Plants caulose. Segments of the calyx subulate. Legumes pilose or pubescent, or crenately wrinkled, but not prickly.**

14 H. \textit{pseudocarum} (Desf. in herb. mus. par. D. C. spec. 2. p. 341.) stem erect, leaflets ovate-lanceolate, rather pubescent; racemes elongated, axillary; bracteae exceeding the pedicels; teeth of calyx lanceolate, about equal in length to the tube; vexillum length of the wings, but shorter than the carina; legumes pendenulous, pilose, with somewhat quadrangular joints. \( \textcircled{2} \). Native of the Altai mountains. Flowers purple.

16 H. \textit{tubuliforme} (D. C. spec. 2. p. 341.) stems ascending; leaves with 8-9 pairs of oblong-cuneate oblong leaflets, which are pubescent beneath; spikes of flowers ovate, pedunculate, crowded; vexillum subulate, a little longer than the keel; wings twice the length of the calyx; legumes reticulately wrinkled, and clothed with hoary pubescence, with 2-3 orbicular joints. \( \textcircled{2} \). Native of Siberia, in the desert between the rivers Obi and Irtisch. H. prostratum, Pall. ex herb. Patrin. Flowers purple.

17 H. \textit{tuberculatum} (Pall. nov. act. petrop. 10. p. 315.) stems erect; leaves with 4-6 pairs of lanceolate-linear leaflets, which are clothed with adpressed pubescence beneath; spikes of flowers...

18 H. Tauricum (Steph. ex Fisch. in litt. D. C. prod. 2. p. 342.) stem erect; leaves with 6-8 pairs of oblong-lanceolate leaflets, which are clothed with adpressed pubescence beneath; peduncles longer than the leaves; spikes of flowers oblong or ovate, pedunculate; vexillum emarginate, shorter than the carina; wings length of the calyx; legumes articulated, pubescent, reticulately veined. 2. H. Native of Siberia, and the Altaian mountains. Flowers rose-coloured. This species is very like *H. Taureicum*, but differs in the wings of the corolla being about equal in length to the calycine segments, not longer. Bracteas longer than the pedicels.

19 H. *Alticum* (Fisch. in litt. D. C. prod. 2. p. 342.) stems erect; leaves with 5-7 pairs of elliptic or oblong leaflets, which are clothed with adpressed pubescence beneath; peduncles longer than the leaves; spikes of flowers oblong or ovate; wings longer than the calyx, but about equal in length to the carina; vexillum a little longer than the keel; ovaries pubescent, 2-jointed. 2. H. Native of Siberia, on the Altaian mountains. Flowers purple. Bracteas and segments of the calyx subulate. Stipulas concrete, opposite the leaves. Leaflets of the lower leaves ovate, of the upper ones oblong, and nearly linear.

20 H. venustum (Fisch. in litt. D. C. prod. 2. p. 342.) stem erect; leaves with 5-7 pairs of elliptic leaflets, concolorous on both surfaces from adpressed down; peduncles a little longer than the leaves; spikes of flowers oblong; vexillum rather longer than the keel, but the wings are shorter than it, and hardly exceeding the segments of the calyx; legumes villous, with 3 joints. 2. H. Native of the Altaian mountains, in the desert of Scythia. Flowers large, purple. Bracteas a little longer than the pedicels. Stipulas concrete, opposite the leaves. *Shiny Hedysarium.* Pl. 3/4 to 1 foot.

21 H. nitidum (Willd. spec. 3. p. 1905.) stems flexuous, clothed with white tumentum; leaflets elliptic, clothed with silky tumentum on both surfaces; wings length of the carina; legumes articulated, smooth. 2. H. Native of Armenia. H. orientale argentum, flore luteo, silvâe glâbrâ, Tourn. cor. 27. The ovary examined in Tournefort's specimen is tomentose, and contains 3 ovula, therefore the legumes must be 3-jointed. Flowers yellow.

*Shining Hedysarium.* Pl. 1/2 to 1 foot.

----- Plants caulescent. Calycine teeth short. Legumes wrinkled or a little crested, pubescent.

22 H. fruticosum (Lin. fil. suppl. 333.) stem erect, shrubby; leaves with 5-7 pairs of alternate, elliptic, obtuse leaflets, which are clothed with adpressed pubescence on both surfaces; flowers disposed in spikes, few, distant; wings hardly longer than the calyx; vexillum length of the keel; joints of legume reticulately wrinkled, with the nerves a little echinated. H. Native of Siberia, beyond the Baikal, and of Dahuria, in sandy places. Pall. litt. 3. p. 763. t. 5. f. 1. ed. gall. append. no. 368. t. 92. f. 2.—Gmel. sib. 4. t. 22. Calyx with 5 short teeth. Corolla pale purple. This is a very handsome plant, very grateful to horses, and extremely useful in fixing sand.

23 H. Ibericum (Bieb. fl. taur. 2. p. 177.) stems erect; leaves with 4-5 pairs of elliptic, mucronate, opposite leaflets, which are pubescent beneath; flowers disposed in spikes, few, rather distant; wings, vexillum, and keel about equal in length; joints of legume hoary, with crenulated margins. 2. H. Native of Iberia. Stamens distinctly and abruptly inflected. Flowers purple.

24 H. Razomovitum (Helm. et Fisch. med. D. C. prod. 2. p. 342.) stems erect; leaves with 6-7 pairs of oblong-linear, rather pubescent leaflets; spikes of flowers pedunculate, longer than the wings; wings of flower twice the length of the calyx, and about one-half shorter than the carina; vexillum a little longer than the keel; legumes rather hoary, reticulately wrinkled, not crested. 2. H. Native of Siberia, in the desert of Scythia in the region of Orenburg. Flowers purple. Habit of *H. fruticosum* and *H. Ibericum*.

*Razomovitum's Hedysarium.* Pl. 1/2 to 3 foot.

25 H. Cretaceum (Fisch. in litt. 1825. D. C. prod. 2. p. 342.) stems erect; leaves with 4-7 pairs of oblong-linear, acute, glabrous leaflets; spikes of flowers elongated, slender; wings of flower shorter than the obcordate vexillum, but twice the length of the calyx; keel exceeding the vexillum; joints of legume 2-3, flat, pubescent. 2. S. Native of Siberia, at the Don and the Volga, near Serotinsk. H. Volgense, Fisch. in litt. 1810. Flowers purple.

** Sect. H. Leiolumbus (from λευκός, λευσ, smooth, and λόβος, lobos, a pod; in reference to the smooth pods). D. C. prod. 2. p. 343. Joints of legume smooth, not echinated, or pilose. Calycine segments shorter than the corolla.

26 H. consanguineum (D. C. prod. 2. p. 343.) stems erect; leaves with 6-8 pairs of elliptic leaflets, which are pubescent beneath; peduncles longer than the leaves; spikes of flowers crowded, ovate; wings longer than the calyx, but a little shorter than the carina; vexillum nearly equal to the corolla; ovary linear, glabrous, 5-6-ovulate. 2. H. Native of Siberia, on the Altai mountains. H. Altica var. or species affinis, Fisch. in litt. Habit of *H. Alticum*, but the ovary is like that of *H. subspinosum*. Stipulas membranous, white, concrete in one, which is bidentate at the apex. Flowers purple.

28 H. brachyserrum; stem erect; leaves with 5-9 pairs of ovate smooth leaflets; stipulas concrete; bracteas longer than the pedicels; vexillum one-half shorter than the keel, but about equal in length to the wings; legumes smooth, pendulous. 2. H. Native of the Altaian mountains, at the metal mines of Riddessk. H. obscurum Alticum, Fisch. in litt. H. obscurum β, brachyserrum, D. C. prod. 2. p. 343.—Gmel. sib. 4. t. 10. Flowers larger than those of *H. obscurum*, purple, seldom white.

29 H. alpinum (Lin. spec. 1057.) stem erect; leaflets oblong or lanceolate, pubescent beneath; upper stipulas distinct; bracteas usually shorter than the pedicels; legumes pendulous, quite glabrous. 2. H. Native of Siberia and Dahuria. Jacq. vind.
LEGUMINOSÆ. CLVIII. HEDYSARUM. CLIX. ONOBRYCHIS.

**Alpine Hedysarum**. Fl. July, Aug. Clt. 1798. Pl. 2 to 3 ft. 30. **H. Cajcicum** (Biéb. fl. taur. 2. p. 178.) stem erect; leaflets ovate, smoothish; upper stipulas concrete, opposite the leaves; racemes on long peduncles; bracteae longer than the pedicels; legumes glabrous, pendulous. **H.** Native of Caucasus and Siberia, on the Alps. Flowers purple. Peduncles almost a foot long.

**Northern Hedysarum**. Pl. 2 to 3 feet.

32. **H. Mackenziei** (Rich. in Frankl. journ. append. p. 745.) stems decumbent; leaflets oblong, clothed on both surfaces with canescent pila; stipulas sheathing; joints of legume wrinkled transversely and pilose. **H.** Native of Arctic America and about the Saskatchewan, on the Eagle and Red deer hills. Flowers large, red. This is the liquorice plant mentioned by Sir Alexander Mackenzie as being indigenous to North-west America.

Mackenzie's Hedysarum. Pl. decumbent.

33. **H. subspinósus** (Fisch. in litt. D. C. prol. 2. p. 343.) stems suffruticosum, much branched, erect, and are as well as the leaves clothed with adpressed canescent down; branches and peduncles permanent, and becoming hardened into spines; petioles flatish; leaves with 5-7 pairs of elliptic leaflets; spikes of flowers pedunculate, longer than the leaves; wings shorter than the calyx; ovary linear, glabrous. **H.** Native of Siberia, at Lake Indesker. This is a very singular species, with the habit of Astragalus gibbosus.

Spinose Hedysarum. Shrub ½ to 1 foot.

34. **H. incarnátum** (Willd. spec. 3. p. 1209.) stem erect, glabrous; leaflets oblong, acute, hoary beneath; stipulas wanting; flowers racemose, drooping.—Native of Japan. **H. incarnánum**, Thom. fl. jap. 289. but not of Swartz. Flowers flesh-coloured. Said to be allied to **H. obsérvarum**, but the plant is without stipulas. Flesh-coloured-flowered Hedysarum. Pl. 1 foot.

† Doubtful species.

35. **H. línæ'aré** (Lour. fl. cochini. 452.) stem suffruticosum, diffuse; leaflets lanceolate-linear, glabrous; spikes terminal; legumes straight, linear, smooth, 6-seeded. **H.** Native of Cochini-china. Flowers pale violet. The root is esteemed to be debauchant, emmenagogue, and to create an appetite.

**Linear-podded Hedysarum**. Shrub 2 feet.

36. **H. unifólérum** (Lapeyr. apr. fl. 436.) stems ascending; leaflets elliptic, rather silky beneath; flowers pedunculate, solitary; wings twice the length of the calyx; legumes 4-paried, villous beneath; lobes 2-horned. **H.** Native of the Pyrenees, among rocks. Flowers yellow.

One-flowered Hedysarum. Pl. ascending.

**Call**. All the species of this genus are very handsome when in flower, being clothed with racemes of elegant pea blossoms; they are therefore well adapted for ornamenting flower borders or rock-work. They succeed well in light rich soil, and the perennial kinds are increased by dividing the plants at the roots in spring or by seeds. The seeds of the annual species only require to be sown in the open border in spring.

CLIX. **ONOBRYCHIS** (from oine, oine, an ass, and ßyoxo, brychoo, to gnaw; the plants are graceful to the ass). Tourn. inst. t. 211. Germ. fruct. 2. t. 148. D. C. fl. fr. 4. p. 511. legum. mem. viii. prod. 2. p. 244. Desv. journ. bot. 2. t. 125. t. 6. f. 33. 34. 1814. I. p. 50. Hedysarum species of Lin. and others.

**Lin. syst. Diadélphia, Decadúria.** Calyx 5-5ef, with nearly equal subulate segments. Corolla papilionaceous, with the carina as if it was truncate, and the wings short. Stamens diadelphous. Legume sessile, of only one compressed, indescendent, rather coriaceous, cuneate, crested or winged, 1-seeded joint, which is thicker and straight on the upper suture, but convex and thinner on the lower suture.—European or Asiatic herbs, with impari-pinnate leaves, axillary elongated peduncles, bearing spikes of red or white flowers at their tops. The ovary when young is perhaps truly bi-ovulate. The legume also is sometimes 2-seeded, but only 1-celled.

**Sect. I. Eucy'bris** (from ev, ev, well or good, ßyoxo, brychoo, to gnaw; this section contains the most useful species in agriculture.) D. C. legum. mem. vii. prod. 2. p. 344. Legume oblique, wrinkled or prickly in the disk, andoothed or interrupted on the crest.

1. **O. sá'tiva** (Lam. fl. fr. 2. p. 652.) stem erect; stipulas usually distinct; leaflets elliptic-oblong, mucronate, glabrous; spikes of flowers elongated; keel of flower shorter than the vexillum; wings shorter than the calyx; legumes pubescent, denticulated on the back, but having the sides wrinkled, and rather prickly. **H.** Native of Europe, on dry calcareous hills. In Britain on all calcareous hills. Hedys. onobrychis, Lin. spec. 1059. Jacq. austr. t. 352. Smith, engl. bot. 96. O. vicéfolia, Scop. O. vulgaris, Jaun. O. spicátà, Mænch. Flowers variegated, crimson.

**Sainfoin** is called L'espuret in France; Esparzetto in German, and Cadragola in Italian. It is a deep-rooting perennial plant, with branching spreading stems. It is a native of England and many parts of Europe, but never found but on dry, warm, chalky soils, where it is of great duration. It has been long cultivated in France and other parts of the continent, and as an agricultural plant was introduced from the latter country into England about the middle of the 17th century. It has since been a good deal cultivated in the chalky districts, and its peculiar value is that it may be grown on soils unfit for being constantly under tillage, and which would yield little under grass, this owing to the long and descending roots of the sainfoin, which will penetrate and thrive in fissures of rocky and chalky substrata. Its herbage is said to be equally suited for pasture or for hay, and that eaten green it is not apt to swell or hove cattle like the chovers or lucern. Arthur Young says, that upon soils proper for this plant no farmer can sow too much of it; and in the code of agriculture it is said to be "one of the most valuable herbage plants we owe to the bounty of Providence." There are no varieties of this plant, but there are numerous other species of the same genus that might be cultivated.

**The best soil for sainfoin** is that which is dry, deep, and calcareous, but it will grow on any soil that has a dry subsoil. Kent thinks that the soils most suited to the culture of this plant are those of the chalky loam, and light sandy or gravelly kinds, or almost any of those of a mixed quality, provided they be not too wet, and have a rocky and hard calcareous bottom to check the roots at the depth of a foot or foot and a half below the surface, which he, notwithstanding the above, conceives necessary, as the plants are apt to exhaust themselves in running down. And for this reason he considers it as improper for being sown
where there is a great depth of soil or mould. Marshal says, that the poorest soils afford a large produce, and such as are more rich and arable abundant crops. Still he conceives that it is only by a small proportion of the dry chalk and limestone, or such as have been well impregnated with that sort of matter, that it succeeds in a perfect manner, or becomes durable. In sandy soils, as in Norfolk, which are unfit for any other purpose, under saintfoin will produce after the first year about two tons per acre of excellent hay, with an after grass extremely valuable for weaving and keeping lambs.

The best preparation which any soil fit for this plant can undergo is deep trenching, but the usual preparatory culture is the same as for clover, ploughing however deeper than ordinary, either by means of the trench plough, or by the common plough going twice in the same tract. (Boys (Communications to the Board of Agriculture, vol. iii.) recommends as a preparation for saintfoin, 1st, year, bare and burn for turnips to be eaten on the land by sheep; 2nd, barley to be sown very early, with clover seed; 3rd, clover eaten off by sheep; 4th, wheat; 5th, turnips, with manure; 6th, barley, with saintfoin. The corn crops must be carefully weeded, and in particular cleared of charlock. Under this system, the produce has been great, and the ground has been laid down in the highest order with saintfoin, or any other grass calculated for this species of soil.

The season of sowing saintfoin; it may be observed, that the earlier it can be put into the soil in spring the better, as from the greater moisture of such soils at that season, there will be a greater probability of their vegetating in a perfect manner; therefore the sowing of saintfoin seed should never be deferred later than the beginning of March, and it is still better if this work is completed in February. Some, however, think it may be deferred to the middle of March without injury.

The manner of sowing saintfoin seed is almost always broadcast, but it may be sown in drills, or even transplanted, though neither of these modes can be recommended. Some advise its being sown with about half the quantity of barley, which is annually sown for a full crop, that it may shade and keep it moist during the first summer, and at the same time not injure it from the crop being lighter, which is sometimes the case. Where the barley is drilled, the saintfoin may be put in afterwards in the same manner, but in a contrary direction. If sown over wheat, it should be harrowed in, and afterwards rolled. In whatever manner it is sown, as the seeds are larger than those of many other herbage plants, the ploughing the seed in with a very thin or shallow furrow is recommended. In most cases, especially in all the more light soils, in which this sort of crop is grown, the use of the roller may be necessary immediately after the seed is put into the ground. It is the practice in some districts to sow a small portion of clover-seed with saintfoin, with the idea of increasing the first year's produce, but it is perhaps better to increase the quantity of saintfoin-seed without mixing it with that of any other, as different kinds of herbage seed do not answer well when sown together, from there being a continual contest in their growth. It is, however, supposed by Marshall that such a practice is beneficial in alternately procuring a fine clean crop of saintfoin upon the land. It is a sort of crop that grows in so perfect a manner in the broad-cast method, that there can seldom be any necessity for having recourse to drills. It may, however, be cultivated in the latter mode with much success. And in Norfolk it is the practice with some cultivators to have it drilled at nine inches apart across the barley field, which has been sown in the same way, but in a contrary direction.

The quantity of seed required in the broad-cast method, which is that mostly employed, is about four bushels the acre, though less is frequently given, but on soils proper for this plant that quantity is always necessary. But when the drill system is adopted a smaller quantity is used, from two to three bushels per acre. In Lincolnshire, where this plant is much grown, the common allowance of seed is five bushels per acre. In that county 4 pounds of clover seed is recommended to be sown with each acre of saintfoin. The reason for which is, that in that exposed country, the young plants suffer more by the sun in summer than by the frost in winter. Of course, the trefoil coming to perfection in the first year, and living only three, will be a shelter for the young plants during the first year or two, and die off when the saintfoin wants its room.

In the choice of saintfoin-seed it is the best practice for the cultivator to select it from the best and most abiding plants in his particular soil, as such as is purchased from the seed-shops can rarely be depended upon. The external signs of good seed are, that the husk is of a bright colour, and the kernel plum, of a light grey or blue colour, and sometimes of a shining black. The seed may be good though the husk is black, which is owing sometimes to the letting it receive wet on the field. If, when the kernel is cut across, it appears greenish and fresh, it is a certain sign that it is good. Seed of the former year's sowing is always the best, as older seeds seldom vegetate in a perfect manner.

The after culture and management of saintfoin consists in occasional dressings with manure, and in the judicious intervention of mowing and pasturing. The first year some farmers do not mow it, while others do; but the second year and the succeeding summer a crop of hay may be taken, and the after grass be fed down with any sort of stock but sheep till towards December, care being taken that they do not eat it in too close a manner, as where that is the case, from the largeness of the roots, there may be danger of injuring the crowns of the plants. In the following autumn there will, however, be less risk in this respect, and sheep as well as cattle stock may be turned in and kept upon the pastures till they are well eaten down, being always careful to shut them up as early as possible in the beginning of the year. This is the opinion of Kent. And it is supposed, that as this sort of herbage is considered to be improved by being nipped by the frost, it may be a proper practice not to turn stock upon these leys too early in the autumnal season. With this intention it may be advisable to defer it till the latter end of, September, when this sort of rouen or after grass will be found to have much effect in promoting the flow of milk in cows, as well as in forwarding the condition of fattening beasts, great store of seed being still left for sheep. But with this sort of stock they should not be too closely fed down, or the sheep remain too long upon them, as much injury may be sustained by it. It has been suggested that all sort of cattle stock should be removed by the beginning of the year from these rouens, as much harm may be done by their continuing longer.

In top dressing saintfoin, peat ashes are the best material that can be made use of, where they can be procured in sufficient quantity. And other sorts of ashes are likewise found beneficial where these cannot be had. This should be applied so as to form a thin, even, regular dressing over the whole surface of the crop. In this view soot has also been found of great utility, when spread evenly over such leys in the beginning of January, in the proportion of 25 to 30 bushels to the acre. Malt dust has also been employed in the same way with considerable success; and it is supposed where these sorts of dressings can be applied every third or fourth year, the saintfoin crops, when well established in the soil, may be preserved in a state of vigorous growth for 10 or 15 years or more, and the land be considerably improved by the roots striking so deeply into it.

In taking and using the saintfoin crop, the same practice may be followed as for taking clover; it may be mown for soil or hay or seed, and eaten on the spot by tethering, hurling, or common pasturing. In making it into hay, it is cut immediately
on its coming into full blossom, and as it remains but a short time in that state, as much expedition as possible should be employed both in mowing it and making the produce into hay. It is the most easy crop to make into hay, when the season is favourable. The haymakers follow the scythe, and having turned over the swath, throw it into wind-rows, when it may be immediately formed into cocks, and the whole crop be fit for cutting in a week after it is mown; and though it may appear green, and the stack acquire a considerable degree of heat, there is no danger to be apprehended, provided the weather has been fair during the hay-ricking, as it is so far from taking harm by heating in the stack, that the contrary state is most to be feared, and for this reason great care is necessary not to suffer the fodder to continue too long either in the swath or in the cocks, lest the air and wind should dry it too fast, and by exalting its juices prevent its heating in the stack, and thereby render it of little value.

In regard to the frequency of cutting saintfoin, it is probable that on the thinner sorts of soils it can seldom be done more than once, but on those of the deeper sorts two crops may sometimes be taken, in the same manner as clover, care being taken in these cases that the future growth of the plants be not injured by this method.

The usual duration of saintfoin, in a profitable state, is from 8 to 10 years. It usually attains its perfect growth in about 3 years, and begins to decline towards the 8th or 10th year on calcareous soils, and about the 7th or 8th on gravels. There are instances, however, of fields of saintfoin which have been neglected and left to run into pasture, in which plants have been found upwards of 50 years from the time of sowing. In general the great enemy to the endurance of saintfoin is the grass, which accumulates and forms a close tuft on the surface, and thus choked up the plant.

The quantity of produce on a medium of soils and cultivation may probably be estimated at from about one and a half to two tons per acre. And on the poorer and thinner staple sorts of land it will perhaps seldom afford less than from a ton to a ton and a half on an acre.

The nutritive products of saintfoin are the same as clover, viz. 3½ being 1¾ per cent. more than those of lucern.

In saving seed from saintfoin, it should remain on the land till the husks become of a somewhat brownish colour, and the seeds are perfectly plump and firm. It requires some experience to know of what degree of ripeness to cut the seeded saintfoin, because all the seeds do not ripen at the same time on the same spike or head, as all the heads begin blossoming at the lower part, and continue to blow gradually upwards for many days, so that before the flowers have gone off the top, the seeds are almost mature at the bottom, therefore if the cutting is deferred till the top seeds are quite ripe, the lower, which are the best, would then all be lost. The best time to cut it is when the greater portion of the lower seeds are ripe, and the last one beginning to be full. The unripe seeds will ripen after cutting, and be in all respects as good as those that were ripe before. It should be mown in the morning and evening, when the plant is most supple, for if mown in the heat of the day the ripe seeds will shed. In fine clear weather saintfoin seed will soon dry. After being dried it may be either threshed out in the house or on the field on a large sheet, it then should be ridded through a large sieve, to separate the seed from the chaff and broken stems. The haumin may be then used as hay.

Culture or Common Saintfoin. Fl. June, July. Britain. Pl. 30. 6 ft.

2. O. Tana'etia (Sprg. neue. entl. 2. p. 168.) stem erectish; stipulas usually distinct; leaflets elliptic-lanceolate, mucronulate, clothed with silky pubescence beneath, the rest of the plant as in O. sativa. 2. H. Native of Siberia, on the banks of the Don. Hedys. onobrychis, Bibl. fl. taur. no. 1431. O. sativa, var. b, subvilloso, D. C. prod. 2. p. 344. O. sativa Tatârica, Fisch. in litt. Flowers flesh-coloured.

3. O. MONTA'NA (D. C. fl. fr. 4. p. 611.) stem rather decumbent; stipulas joined together, opposite the leaves; leaflets curve-lanceolate, mucronulate, glabrous; spikes of flowers short; keel longer than the vexillum; wings shorter than the calyx; legumes on the back, and wrinkled and pubescent on the sides. 2. H. Native of the Alps of Europe and of the Pyrenes, in the higher meadows. Hedys. montanum, Pers. encl. 2. p. 324. According to Wahlenberg this is only a variety of O. sativa. Flowers deep purple or red.

4. O. confe'RTA (Desv. journ. bot. 1814. 1. p. 88.) stems decumbent; stipulas usually distinct; leaflets oblong-elliptic, mucronulate, pubescent beneath; racemes of flowers ovate; wings shorter than the calyx; keel equal in length to the vexillum; legumes rather hairy, furnished with rather long prickles on the back, but wrinkled and furnished with a few short prickles on the sides. 2. H. Native of Caucasus, Iberia, south of Podolion, in grassy places. Hedys. conforontum, Bibl. fl. taur. et suppl. 1452. Flowers deep red.

5. O. Fontan'ëši; procumbent, pubescent; stipulas ovate, acute, dry; leaflets crowded, elliptic, obtuse, pubescent, and nerving beneath; racemes of flowers ovate, crowded. 2. H. Native of Tunis, in sandy places near Shibia. Hedys. confertum, Desf. fl. atl. 2. p. 178. O. conferta b, Fontanëši, D. C. prod. 2. p. 344. Flowers fine red.

6. O. proce' רובנים (Stev. in litt. D. C. prod. 2. p. 844.) stems procumbent; leaflets oblong-linear, mucronate, pubescent beneath; spikes of flowers cylindrical, on long peduncles; wings shorter than the calyx; keel rather exceeding the vexillum; legumes pubescent, dentilulate on the back, with the sides wrinkled, and rather prickly. 2. H. Native of Liberia, about Tiflis. Hedys. onobrychis var. Iberica, Bibl. suppl. 484. Flowers red.

8. O. gla'brane (Desv. journ. bot. 1814. vol. 1. p. 82.) stems ascending; leaflets lanceolate, acuminate, quite glabrous; legumes oblong, chinky, glabrous, crested, with the crest toothed at the apex. 2. H. Native of Tauria. Hedys. onobrychis var. e, Gouan. ill. 48. Flowers red.

9. O. are'naëria (D. C. prod. 2. p. 345.) stem erect, suffrutescent at the base; leaflets oblong-linear, mucronate, glabrous; spikes of flowers cylindrical; wings shorter than the calyx; keel about equal in length to the vexillum; legumes pubescent, almost toothless on the back, but wrinkled on the sides. 2. H. Native of Hungary, and of Siberia, at the Irith about Kroupeanka. Hedys. arenarium, Kit. in litt. Wild. enum. suppl. 51. H. cretes- tium, Patrin. herb. Flowers red.
LEGUMINOSAE

10 O. MAREOTICA (Stevens, in litt. D. C. prod. 2. p. 345.) stems erect; leaflets linear, mucronate, glabrous; racemes cylindrical, very long; wings shorter than the calyx; keel about equal in length to the vexillum; legumes villous, prickly on the back, and with the sides wrinkled and prickly. 2. H. Native of the Mareotic marsh in Egypt. Lobes of calyx long and villous. Prickles on the legumes arranged in two rows on each side. Flowers pale red. Very nearly allied to O. alba, but differs from it in being glabrous.

11 O. LTA (Desv. l. c.) stem erect; leaflets linear, mucronate, with silky-pubescence on the under surface; spikes of flowers cylindrical; wings shorter than the calyx; keel a little longer than the vexillum; legumes pubescent, crested on the back, and furnished with longish prickers, but with the disks wrinkled, and furnished with short prickles. 2. H. Native of Hungary, on calcareous mountains, and of Abbruozo by way sides. Hedys. album, Waldst. et Kit. pl. hung. 2. t. 111. Stem angular. Upper leaves sessile. Flowers white.

12 O. Echinateum; stem nearly erect, velvety; leaves all pinate, petiolate; leaflets linear, mucronate, pilose above, and clothed with silky-pubescence beneath, elegantly nerves; spikes of flowers cylindrical, short; wings falcate, acuminate, not half so long as the calycine teeth; legume 1-seeded, crested, and prickly on the back, with the sides pitted and prickly in front. 2. H. Native of Calabria, on calcareous hills. Hedysarum ciliatum, Guss. pl. rar. p. 301. Flowers flesh-coloured.

13 O. Pterea (Desv. l. c.) stem erect; leaflets linear, mucronate; spikes cylindrical, long peduncles; wings twice the length of the calyx; keel a little shorter than the vexillum; legumes crested, and denticulated on the back, but wrinkled and toothless on the sides. 2. H. Native of Caucasus, among calcareous rocks. Hedys. petrea, Gis. fl. taur. et suppl. 1453. Corolla white, but with the keel tipped with purple. There are two varieties of the species, the one having the legumes and leaves quite smooth, and the other having the under side of the leaves and the legumes pubescent.

14 O. caesalpinia (Bess. enum. pl. volii. p. 74.) stems ascending; leaflets linear-lanceolate, mucronate, with the mid-rib usually beset with adpressed pill above; wings of flower hardly longer than the tube of the calyx; legumes roundish, canescent, toothed with prickers on the back, and with the sides reticulately wrinkled. 2. H. Native of the south of Podolia. O. petrea, Bess. enum. p. 27. Flowers small, pale, the vexillum streaked with pale red and yellow at the base, but having the keel tipped with red.

15 O. saxatile (All. pedem. no. 1191. t. 19. f. 1.) stem ascending; leaflets linear, mucronate; spikes cylindrical, pedunculate; wings longer than the calyx; keel a little shorter than the vexillum; legumes glabrous, crested, and entire on the back, and wrinkled on the sides. 2. H. Native of Provence, Dauphiny, Nice, and Spain, on hills and among rocks. Hedys. saxatile, Lin. spec. 1653. O. tumifolia, Mouch. Hedys. microcarpum, Dufour, in litt. Flowers white. There are varieties of this species with glabrous and silky-villous leaves, and glabrous and pubescent legumes.

16 O. eriophora (Desv. l. c.) stems trailing; leaflets linear, acute, pubescent; legumes clothed with hoary tomentum, crested and prickly on the back, and wrinkled and prickly on the disks, the prickles are hairy, and disposed in 3 rows. 2. H. Native of Spain. Hedys. eriophorum, Pourr. Flowers red.

Wool-bearing Saintfoin. Pl. trailing.
17 O. CRINUMTA (Desv. l. c.) stems trailing; leaflets ovoid, obtuse, pubescent, hoary; legumes prickly on both sides; prickles pubescent. 2. H. Native of the Levant.

Hairy Saintfoin. Pl. trailing.
18 O. nadorida (Desv. l. c. t. 22.) stems decline; leaflets linear, acuminate, pubescent; legumes crowded, large, lunate, bearing spines; spines acute, pubescent, longer than the crest on the back of the legumes. 2. H. Native of Barbary.

Hortid Saintfoin. Pl. decline.
19 O. testiculata (D. C. prod. 2. p. 346.) stem erectish; leaflets oblong-linear, mucronate, 3-4 pairs, clothed with silky-hoary down beneath; legumes crowded, clothed with hoary villi, and beset with prickles on all sides; the prickles pubescent. 2. H. Native of Spain in the kingdom of Valencia, in arid places. Hedys. sternorhiza, Dufour, in litt. Root long, slender, simple. This plant differs from all the other species in the genus in the leaves having only 3 or 4 pairs of leaflets. Flowers unknown.

Slender-rooted Saintfoin. Pl. 1 foot.
20 O. caepa (Lam. fl. fr. 2. p. 651.) stems erect; leaflets oblong or cuneate-ovate, mucronate, pubescent; spikes few-flowered; wings rather longer than the calyx; keel a little shorter than the vexillum; legumes rather pubescent, very prickly on all sides. 2. H. Native of the south of Europe, in rugged exposed places. Hedys. caput-galli, Lin. spec. 1059. Lob. icon. 2. p. 81. f. 1. Flowers flesh-coloured.

21 O. cri-STA-GALLI (Lam. fl. fr. 2. p. 653.) stems trailing; leaflets cuneate, oblong or obovate, obtuse or retuse, pubescent; spikes few-flowered; calyces about equal to the corolla; wings and keel about the same length as the vexillum; legumes glabrous, crested on the back; the crest parted into broad, flat, oval, toothed segments, having the disks wrinkled, and rather prickly. 2. H. Native of the south of Europe, in rugged exposed places. Gaertn. fruct. 2. t. 148. Hedys. cri-sta-galli, Lin. syst. 563. Flowers pale red.

Cock's-comb Saintfoin. Fl. June, Aug. Clt. 1710. Pl. proc. 22 O. FOVEOLATA (D. C. prod. 2. p. 346.) stems trailing; leaflets cuneate-oblong, mucronate, villous; racemes few-flowered, hardly twice the length of the leaves; legumes pubescent, crested on the back; the crest divided into 3 or 4 entire unequal segments; disks reticulated, with prominent, prickly, villous nerves, the hollows between the nerves deep and glabrous. 2. H. Native of Sicily, on arid hills. Flowers pale red?

23 O. quIDUENTATA (D'Urville. enum. pl. archip. p. 90.) stem erect; leaflets oblong, obtuse, mucronate, rather pubescent; peduncles 3 or 4 times longer than the leaves; legumes glabrous, somewhat orbicular, with the disks wrinkled and somewhat arched; the back crested, with the crest divided into equal entire teeth. 2. H. Native of the islands of Candia and Melos on hills. O. Crétique folis vicina, fructu magnó cristato et acutato, Tourn. 26. Hedys. quiduentatum, Smith, fl. grac. prod. 3. p. 1752. O. cristata, Desv. jourm. bot. 1814. vol. 1. p. 83. t. 23. Flowers red, having the vexillum streaked with blood-colour.

Equal-toothed-crested Saintfoin. Pl. 1 foot.
† Species belonging to section Eubrychis, but are not sufficiently known.

24 O. eniISTUS (D. C. prod. 2. p. 346.) stems glabrous; leaflets linear, rather pilose, mucronate; raceme terminal? simple; calyx villous; legumes thick, lanuginous, very prickly on all Rr
LEGUMINOSÆ. CLIX. OSORBYCHIS.

SECT. II. HYMENOBRYCHIS (from ἱμενος, hymen, a membrane, and βρυξα, brýcho, to gnaw; in reference to the species contained in this section being furnished with a membranous crest on the back of the legume). D. C. legum. mem. vii. prodr. 2. p. 346. Legumes falcate or somewhat orbicular, wrinkled, and prickly in the disks, expanded into a membranous, dentipulate, or entire crest the whole length of the back. This section agrees with the genus Hymenocolpus, but differs in the pods being 1-seeded, not many-seeded, and in the disks of the pods being wrinkled, not smooth, as in that genus.

Tournefort’s Saintfort. Pl. 1 foot.

30. O. pallasi (Bieb. pl. ross. 1. t. 35.) stem erect, hairy; leaflets elliptic-oblong, acuminate, tomentose beneath; spikes of flowers cylindrical; wings shorter than the calyx, oblong, and with one tooth at the base of each; calyx villous; legumes pubescent. ♀ ♀. Native of Iberia and Tauria, on calcareous hills. Hedys. Pallasi, Willd. spec. 3. p. 1214. Bieb. fl. taur. et suppl. no. 2. p. 178. O. Buxbaumiana, Desv. journ. bot. l. c.—Buxb. cent. 2. t. 42. Flowers cream-coloured, but the vexillum is painted with purple veins.

31. O. radiata (Bieb. cat. hort. gor. 1812. p. 75.) stem erect, pilose; leaflets ovate, obtuse, macrornate; hairy beneath; spikes of flowers cylindrical; wings sagittate, twice the length of the calyx; calyx and legumes villous. ♀ ♀. Native of Caucasus, Iberia, and Cappadocia, on hills among stones. Hedys. radiatum, Desf. ann. mus. 12. t. 13. Bieb. suppl. no. 1450. Hedys. Buxbaumii, Bieb. fl. taur. no. 1150. exclusive of the synonyme of Buxbaum, Hedys. cinnamitum, Willd. spec. 3. p. 1213. O. cinnamitum, Desv. l. c. Flowers cream-coloured, but the vexillum is lined with red, and with a yellow mark at the base.

32. O. michauxii (D. C. prodr. 2. p. 347.) stem erect, smoothish; leaflets elliptic-oblong, mucronate, glabrous; spikes elongated, low-flowered; wings sagittate, shorter than the calyx, with the anthers diverging; calyces villous; legumes clothed with velvety tomentum. ♀ ♀. Native of the Levant. Hedys. cryptoperum, Lher. herb. O. picta, Desv. in herb. Desf. Flowers pale, with the vexillum striated. The figure in Buxb. cent. 2. t. 42. agrees pretty well with this species.

34. O. venána (Desv. l. c.) stem almost naked; leaflets elliptic, villously-tomentose beneath, outer one a little larger than the rest; peduncles radical, longer than the leaves; flowers spicate, distant; wings shorter than the calyx; legumes very villous. ♀ ♀. Native of Tunis, on the mountains of Sylia, and of Persia, as well as the island of Cyprus. Hedys. venosum, Desf. fl. at. 2. p. 179. t. 201. Corollas pale yellow.

Teiny Saintfort. Pl. 4 foot.

35. O. Ptolemaica (D. C. prodr. 2. p. 347.) stem erect, villous; leaves with 3-6 pairs of elliptic villous leaflets; spikes about the length of the leaves; wings shorter than the calyx; legumes silky, orbicular, 2-seeded. ♀ ♀. Native of Egypt, in the desert of Suez. Hedys. Ptolemaicum, Delil. fl. egyp. 111. t. 39. f. 1. Poir. suppl. 5. p. 18. Flowers yellow, painted with brown lines. Said to be allied to O. venána, but differs in the legumes being luullate, with entire margins, and 2-seeded.

SECT. III. DENDROBRYCHIS (from δενδρον, dendron, a tree, and βρυξα, brýcho, to gnaw; in allusion to the species contained in this section being shrubby). D. C. legum. mem. vii. prodr. 2. p. 347. Legumes smooth, unarmed, and crestless. Stems shrubby.

36. O. cornuata (Desv. journ. bot. 1814. vol. 1. p. 81.) stem erect, shrubby; leaflets linear-lanceolate, pubescent; peduncles divaricate, few-flowered, and at length become spines; wings of flower longer than the calyx; vexillum villous, crenated at the apex. ♀ ♀. Native of the Levant, about Barbout (ex Tourn. voy. 2. p. 299. with a figure), and of Eastern Caucasus, in subalpine situations (ex Bieb. fl. taur. 2. p. 181.) Hedys. cor- nutum, Lin. spec. 1060. O. orientalis, Jaume, fam. nat. 2. p. 239. Flowers purple. Legumes reticulate in the disk. Perhaps the Caucasian plant is the same as the Armeniean one.

Horned Saintfort. Pl. June, Aug. Cl. 1816. Sh. 1/2 to 1 ft.

37. O. tragacanthoides (D. C. prodr. 2. p. 347.) stem erect, shrubby; leaflets oblong-lanceolate; peduncles at length hardening into spines, and divaricate; wings longer than the calyx; vexillum oblique, glabrous. ♀ ♀. Native of the Levant. Stipulas membranous, white, concrete in one, which is bifid at the apex.

Tr. O. Michauxii. Shrub 1/4 to 1 foot.

38. O. ? puëma (Desv. l. c. p. 84.) stem suffrutescent; leaflets oval-oblong; calyces glabrous; wings shorter than the vexillum, and the vexillum shorter than the keel. ♀ ♀. Native of Spain.

Hedys. püëlimum, Lin. mant. 448. Fruit unknown.

Drwarf Saintfort. Shrub 3 foot.

SECT. IV. ECCHINOBRYCHIS (from εκχυς, echinos, a hedge-hog,
and *pýx*, *brycho*, to gnaw; in reference to the legumes being prickly). D. C. legum. mem. vii. prod. 2. p. 348. Legumes trigo-
nal, rather incurved, prickly on the back. Leaves simple. Perhaps a proper genus.

39 O. rotundifolia (Desv. l. c.) stems prostrate, angular, 
glabrous; leaves obovate, on short petioles, quite smooth, and 
bistipulate; racemes few-flowered; legumes somewhat incurved, 
triguetrous, acuminate, prickly on the back.—Native of the 
East Indies. Pluk. aln. t. 483. f. 1. Hedys. rotundifolium, 
Hedys. nummularifolium, Vahl. in herb. mus. par. et Juss.

Round-leaved Saintfond. Pl. prostrate.

40 O. cuneifolia (D. C. prod. 2. p. 348.) stem erect, 
shrubby, glabrous; leaves ovate-cuneated, ending in a very short 
recurved mucrone; flowers solitary, terminal; legumes half-
lunate, prickly. $\gamma$. S. Native of the East Indies. Hedys. 
cuneifolium, Roth. nov. spec. 357. Stipulas scarious, ovate-
subulate, ciliate, half-stem-clasping.

Wedge-leaved Saintfond. Shrub.

Cult. All the species of this genus are very showy when in 
bloom, and are therefore well adapted for ornamenting flower-
borders or rock-work. The best method of increasing them is 
by seeds, which should be sown where the plants are to remain. 
The shrubby kinds do best in pots, filled with a mixture of chalk, 
loam, and sand.

CLXI. ELEOTIS (from ελείος, elios, a dormouse, and ως 
ωρος, ous oto, an ear; in allusion to the shape of the 
leaves, which have some resemblance to the ear of a dormouse.) D. C. 
legum. mem. vii. prod. 2. p. 348.

Lin. syst. Diadelpia, Decandra. Calyx campanulate, 
truncate, hardly, but bluntly 5-toothed. Corolla papilionacea. 
Vexillum ovoboate. Kecel obolute. Stamens diadelphous, 
permanent. Legume compressed, 1-celled, 1-seeded, rather mem-
branous, semi-oval, with the upper suture straight, and the 
lower one curved.—Slender Indian herbs, with triquetrous stems, 
small acute adpressed stipulas, simple or pinnately trilobate petiolate 
leaves, axillary racemes of small flowers much longer than the 
leaves, and twin distant pedicels. The plants are commonly 
called *Dormouse-ears* in India; hence the generic name.

1 E. monophylla (D. C. legum. mem. vii.) leaves simple, 
orbicular, somewhat emarginate at both ends. $\gamma$. S. Native of 
the East Indies. Flowers red.

Var. a, hebecarpa (D. C. prod. 2. p. 348.) legumes puber-
ulous in the disk on both sides. Glycine monophyllos, Burm. fl. 
ind. 161. t. 50. f. 2.

Var. ß, leiocepha (D. C. l. c.) legumes glabrous. Petiv. gaz. 
t. 82. f. 1.

One-leaved Eleotis. Pl. trailing.

2 E. sororia (D. C. legum. mem. vii. prod. 2. p. 348.) leaves 
pinnately-trilobate, 2 lateral leaflets very small, rising beneath the 
middle of the petiole, terminal one very large, and almost orbic-
ular, and emarginate at both ends. $\gamma$. S. Native of the East 
Indies. Hedys. sororium, Lin. nat. 270. exclusive of the synonyme of Burm. 
3. t. 6. f. 31. 1814. vol. 1. p. 60. Flowers red.

 Sister Eleotis. Cit. 1817. Pl. straggling.

Cult. The species of this genus grow well in any light rich 
soil, and cuttings will root under a bell-glass, in heat.

CLX. LESPEDEZA (in honour of — Lespedez, once 
governor of Florida, and a great patron of botany). Michx. fl. 

—Hedyssaceae family of Lin. and others.
LEGUMINOSÆ. CLXI. LESPEDEZA. CLXII. EBENUS.

7 L. frioica'ea (D. C. in ann. mus. sci. nat. 4. p. 102.) erect; petioles short; leaflets ciliate-obovate, retuse, mucronate, reticulated on both surfaces; glabrous above, but clothed with strigose pubescence beneath; racemes in fascicles, almost sessile; calyxes one-half shorter than the corolla and legume, which is obicular, acuminate, and hairy. L. G. Native of Nipantu. Aspâdôthos violaceus, D. Don, prod. fl. nep. 246. Anthîllus cuneatus, Hamilt. miss. Flowers violaceous, calyceal segments lanceolate, acuminate, about equal in length to the corolla. (D. Don, l.c.)

8 L. sru'ivi (Nutt. gen. amer. 2. p. 107.) plant erect, simple, clothed with soft silky villi; petioles very short; leaflets elliptic-ovate, mucronate; racemes corymbose, many-flowered, axillary, on short peduncles, about the length of the leaves; legumes pubescent, longer than the calyx. H. Native of the state of New York, in sandy fields. Flowers purpure.

9 L. longifolia (D. C. prod. 2. p. 649.) stem erect, angular, pubescent; petioles very short; leaflets oblong, glabrous above, but clothed with adpressed, silky-silvery pubescence beneath; racemes fasciculately corymbose, many-flowered, axillary and terminal; legume shorter than the lobes of the calyx. H. Native of Louisiana. Flowers purpure.

Long-leaved Lespedeza. Pl. 2 to 3 feet.

10 L. frutescens (D. C. prod. 2. p. 549.) plant erect; stems simple, villous; petioles short; leaflets elliptic, obtuse, rather mucronate, clothed with silky pubescence beneath; racemes axillary, almost sessile, shorter than the leaves; calyx shorter than the corolla; legumes pilose, shorter than the calyx. F. Native of Carolina. L. fruticosus, Pers. encl. 2. p. 318. Hedys. frutescens, Lin. spec. 1065. Willd. spec. 3. p. 1193. Flowers purpure.

11 L. capitata (Michx. fl. bor. amer. 3. p. 71.) plant erect, simple; petioles very short; leaflets elliptic, clothed with adpressed pubescence beneath; spikes capitate, on short peduncles, axillary, but they are also disposed into globose heads at the tops of the branches; calyxes villous, length of corolla, but much longer than the legume. H. Native from Carolina to New York, in sandy fields and on the edges of woods. Pursh. fl. sept. amer. 2. p. 480. Hedys. conglomeratum, Poir. dict. 6. p. 416. Flowers pale purple.

12 L. angustifolia (Ell. sketch. 2. p. 206.) plant erect, pubescent; petioles very short; leaflets oblong-elliptic, or lanceolate, clothed with canescent pubescence beneath; racemes capitate, longer than the leaves; corolla longer than the calyx. H. Native from Carolina, in arid, sandy places. L. capitata, var. angustifolia, Pursh. fl. amer. sept. 2. p. 480. Flowers pale purple.

13 L. polystachya (Michx. fl. bor. amer. 3. p. 71. t. 40.) plant erect, branched, very villous; petioles very short; leaflets roundish-ovate, obtuse; spikes oblong, axillary, twice the length of the leaves, pedunculate; calyxes about equal in length to the corolla, but hardly longer than the legume. H. Native from Pennsylvania to Carolina, and of Upper Canada, in waste fields. Hedys. hirtum, Willd. spec. 3. p. 1193. Flowers white with a red spot on the vexillum.

14 L. villosa (Pers. encl. 2. p. 318.) plant erect, branched, clothed with villous tomentum; petioles rather elongated; leaflets elliptic, obtuse; spikes axillary, slender, 3 or 4-times longer than the leaves; calyxes shorter than the corolla, but longer than the legumes. H. Native of North America. Hedys. hirtum, Lin. spec. 1065. H. hirta, Horn. cat. 699. H. villosus, Willd. spec. 3. p. 1193. Flowers white and pale yellow, twin, the lower pairs distant, with the flowers sometimes abortive and sometimes in fascicles, mixed with scales in the axil of the leaves.

16 L. prostrata (Pursh, fl. amer. sept. 2. p. 481. Nutt. gen. amer. 2. p. 108.) plant prostrate, slender, glabrous; petioles short; leaflets elliptic, obtuse, mucronate, hardly pubescent beneath; racemes axillary, slender, few-flowered, longer than the leaves; legumes shorter than the corolla; calyxes villous; petioles rather pubescent. H. Native of Pennsylvania (Muhl.), of New Jersey (Nutt.), Upper Canada (Doug.). Hedys. prostratum, Muhl. in Willd. spec. 3. p. 1206. Flowers purplish.

17 L. glomerata (Horn. Hort. hafn. suppl. 81.) stems twining; leaflets oval, obtuse, rather pubescent; spikes of flowers axillary and terminal, sessile, glomerate. C. S. Native of the East Indies. Flowers probably red.

18 L. virgata (D. C. prod. 2. p. 350.) stem herbaceous, erect, branched, angular, pilose; leaflets ovate, mucronate, lined, glabrous, bearing hairs on the nerves beneath and on the margins; stipulas membranous, oblong. G. Native of Japan. Hedys. virgatum, Thumb. fl. japon. 290. Peduncles 3-flowered and pilose, according to Thumberg, l.c. The plant is in habitat like L. eriocarpum, which is seen by a specimen in the herbarium of Agardh, at Copenhagen.

Tweegy Lespedeza. Pl. 1 to 2 feet.

19 L. indoca (Spræg. syst. 3. p. 262.) leaflets roundish-ovate, clothed with rusty tomentum beneath; racemes axillary, crowded, few-flowered; flowers bracteate; calyxes villous; stem shrubby. S. Native of the East Indies. Hâlia trifoliata, Roth.

Indian Lespedeza. Shrub 2 to 3 feet.

Cult. The species are rather showy when in flower, and are therefore worth cultivating for the purpose of decorating flower-borders. The herbaceous perennial kinds grow well in a light rich soil, or in peat borders, and are increased by dividing at the root in spring, or by seeds. The shrubby kinds are also very elegant plants, but they will not live unless protected by a greenhouse or frame during winter; for this purpose they should be grown in pots, in a mixture of sand and peat, and young cuttings of them will strike root readily if planted in a pot of sand, with a bell-glass placed over them. The seeds of the annual kinds should be sown in a peat-border, in as sheltered a situation as possible.

CLXII. EBENUS (from abnous, the Arabic name for ebony, or έβηνος or οβηνος of the Greeks, ebēnon or ebēnum of the Romans, from the Hebrew Hebên). Lin. gen. no. 985. D. C. legum. mem. vii. prod. 2. p. 350. Anthyllis species of Lam. L. Ebenus, Roth. M. brûdii, Desd. Calyx permanent, cleft into 5 beyond the middle; the tube becoming at length rather ventricose; the segments linear-subulate, about equal in length,
Flowers mixture

Corolla reddish, shorter than the calyx.

3 E. Sibiricorh (D. C. legum. mem. viii. t. 53.) plant herbaceous; leaves impari-pinnate, with 4-5 pairs of linear or oblong leaflets, with an odd one; leaflets distinct, acuminate; stem beset with soft hairs; spikes of flowers ovate-cylindrical. q. F. Native of Candia. Anthyllis Cratica, Lam. dict. i. p. 203. Sims, bot. mag. 1092.—Alp. extol. t. 278.—Barrel. icon. t. 377. and 913. Flowers large, reddish, or purple. Staminiferous tube elegantly striated.

2 E. Pinpata (Desf. act. soc. hist. nat. par. 1. p. 21. t. 3. fl. atl. 2. p. 158.) plant herbaceous; leaves pinnate, with 4-5 pairs of linear or oblong leaflets, with an odd one; leaflets distinct, acuminate; stem beset with soft hairs; spikes of flowers ovate. q. F. Native of Barbary, on uncultivated hills. Lher. stirp. nov. t. 38. Hedys. sericeum, Vahl. symb. 2. p. 83. t. 41. Anthyllis sericea, Willd. spec. 2. p. 1014. Onobrychis, &c. Shaw, spec. no. 431. Onobr. sericea, Spreng. syst. 3. p. 205. Bractes ovate, acute, concave, one under each flower. Corolla reddish, shorter than the calyx.

Stibithorp's Ebony. Pl. 1 foot.

Cult. The species of this genus are propagated by seeds, which should be sown in pots in autumn, and placed in a frame or greenhouse, and in the month of May, when the plants will have attained a proper size, they should be planted singly in small pots, filled with a mixture of loam, sand, and peat, and the plants shifted into larger pots as they grow, some of them may be planted out into the open border, in a sheltered situation, where they will probably survive the winter with a little protection, if not too severe.

LIN. SYST. Diadelphia, Decandria. Calyx acutely 5-leaf, 4 of the segments almost equal, but the lowest one is much longer than the rest. Corolla papilionaceus. Vexillum striatum. Stamens diadelphous. Legume sessile, oval, turbid, 2-valved, 1-celled, 2-seeded. Seeds spherical.—Herbs or shrubs, natives of the East Indies. Stipulas lanceolate, acuminate, deciduous. Leaves petiolate. Flowers red or purple, disposed in axillary crowded racemes. This genus is perhaps more nearly allied to Rhynchosia, and therefore perhaps referrible to tribe Phascolaeae, especially in the seeds being spherical.

Sect. I. Flemingiastrum (an alteration from the generic name). Flowers naked, or propped with small deciduous bracteas. Leaves trifoliate; leaflets sessile.

1 F. stri'eta (Roxb. l. c. t. 218.) stem herbaceous, almost simple, straight; leaflets feather-nerved, broad-lanceolate, glabrous; racemes axillary, solitary, length of petiole; bracteas very long, acuminate, deciduous. 2. S. Native of Coromandel. Cratālaria macroadelia, Pesc. herb. Flowers purple.

2 F. semi'ata (Roxb. l. c. t. 249.) stem shrubby, branched; branches silky, erectish; leaflets 3-nerved, elliptic, acuminate, glabrous above, but clothed with silky pubescence beneath; petals winged at the apex; spikes branched, panicled, terminal, and axillary; bracteas ovate, mucronate, villous. 2. S. Native of Nepal. D. Don, prod. fl. nep. 242. F. paniculata, Dietr. ex Steud. Flowers pale red.

3 F. con'formis (Roxb. in hort. kew. 4. p. 639.) stem shrubby, erect; leaflets broad-lanceolate, lateral ones 2-nerved, terminal one 3-nerved; racemes axillary, crowded, shorter than the petals. 2. S. Native of the East Indies. Branchlets, petioles, and racemes villous when young. Flowers purple. Perhaps the same as F. trinervia, Desf.

4 F. na'na (Roxb. in hort. kew. 4. p. 350.) stem shrubby, much branched; leaflets obovate; petals winged; racemes crowded; legumes covered with viscid glands. 2. S. Native of the East Indies.

5 F. line'a (Roxb. l. c.) stem suffruticose, erect, branched; leaflets oblong-cuneate, 3-nerved, linear, clothed with canescent velvety down; racemes axillary, elongated, pedunculate, dichotomous; legumes clothed with glandular pili. 2. S. Native of the islands of Ceylon and Timor, and on the mountains called Nelligery, in India. Hedys. lineatrum, Lin. spec. 1054. Burm. ind. t. 53. f. 1. Lespedeza lineata, Pers. ench. 2. p. 318. Onobrychis lineata, Desv. in journ. bot. 1814. vol. 1. p. 50. Flowers purple.

6 F. Rothta'na (D. C. prod. 2. p. 351.) stem shrubby, erect, rather tomentose; leaflets roundish-ovate, with the nerves rusty on the under side; racemes axillary, crowded, loose, 5-6-flowered; legumes compressed, pubescent, 1-seeded. 2. S. Native of the East Indies. Haliàa trifoliata, Roth. spec. 352.

Roth's Flemingia. Shrub 2 to 3 feet.

Sect. II. Osteopr'ium (from osteos, osteos, a scale, and odous, odous, a tooth; in reference to the large leafy scale-like bracteas). Desv. journ. bot. 3. p. 119. t. 4. f. 2. D. C. prod. 2. p. 351.—Loureia, Jaume, journ. bot. 3. p. 61. Flowers furnished with a large, leafy, concave, permanent bractea each. Leaves simple, feather-nerved.

8 F. Guinkee'se; shrub glabrous; leaves with 5, obovate, obtuse leaflets; stipulas about the size of the lateral leaflets, nerved; peduncles axillary, racemose; bracteas large, round, nerved, crowded, one to each flower. 2. S. Native of Sierra
Leone. This species is remarkable in having pinnate leaves and large stipules. It is perhaps a species of *Dickoma*.

*Guinea Flemingia*. Shrub 2 to 3 feet.

*Cult.* The species of this genus are not worth cultivating, unless in botanical gardens. They will grow well in any light soil, and cuttings will root, if planted in a pot of sand, with a hand-glass placed over them, in heat.

**Subtribe III. ALHA'GAE (plants agreeing with Alhagi in some important characters).** D. C. prod. 2. p. 352. Flowers disposed in racemes (f. 45. k.) or spikes. Legumes almost terete (f. 45. d.).

**CLXIV. ALHA'GAE (Agkth or Aegul is the Arabic name of the first species).** Tourn. cor. 54. t. 489. Desv. journ. bot. 3. p. 120. t. 4. f. 4. D. C. prod. 2. p. 352. - Hedysarum species of Lin.-Manna, D. Don, prod. fl. nep. 246.

**Lin. Syst. Diadéphia, Decândria.** Calyx campanulate, 5-toothed; teeth small, nearly equal. Corolla papilionaceous, with the petals almost equal in length, but the carina is a little shorter than the vexillum, which is obvolute and complicated. Keel straight, obtuse; wings rounded at the apex. Stamens diadelphous. Ovary linear, many ovulate. Style filiform, glabrous, acute. Legume stipitate, rather woody, terete, torulose, few-seeded, not articulated. Seeds reniform. - Oriental shrubs, with simple leaves and minute stipulas, and axillary stipulate peduncles. Flowers few, red, disposed in racemes along the peduncles.

1. *A. Maukour (Tourn. l. c.)* stem shrubby; leaves obovate-oblong; teeth of calyx acute. f. G. Native of the deserts of Egypt, Syria, Mesopotamia, and other eastern countries. Raw. itin. 94, with a figure. Hedys. Alhagi, Lin. spec. 1051. exclusive of some of the synonyms. Alhagi manifera, Desf. l. c. Ononis spinosa, Hasselq. ed gall. l. 1. p. 138. 2. p. 187. but not of Lin. Manna Hebræica, D. Don, prod. fl. nep. 247. Spines strong, and longer than those of the following. Flowers purple in the middle and reddish about the edges. It is on this shrub that manna (Triongibin or Terengibin) is found in Mesopotamia. It is chiefly gathered about Taurus, where the shrub grows plentifully. Sir George Wheeler found it growing in Témen. Tournefort also found it in many places in Armenia and Georgia. The manna is a natural exudation from the leaves and branches of this shrub, which takes place only in very hot weather. The Arabian writers believed that it fell from the clouds upon the plant. At first the manna resembles drops of honey, but soon thickens into solid granules, as big as a coriander seed at most. It is collected with more or less care, and is valued according to its purity, which is evinced by the distinctness of the granulations. The manna of this country is collected from the flowering ash, and has nothing to do with Persian manna.

3. *A. Nipaulénsis* (D. C. prod. 2. p. 352.) plant shrubby; leaves obovate, mucronulate, veinless, clothed with silky-silvery down on both surfaces; calyces longer than the pedicels; teeth

*CLXV. ALYSCARPS (from alvus, alysis, a chain, and καρπος, karpôs, a fruit; in reference to the shape of the legume, which is composed of many 1-seeded joints, giving the whole the appearance of a chain).* Neck. elem. no. 1515. Desv. journ. bot. 3. p. 120. t. 4. f. 8. D. C. prod. 2. p. 352. - Hállica, Jaune, journ. bot. 3. p. 60. but not of Thumb.—Fabricia, Scep. but not of Gærtn.

**Lin. Syst. Diadéphia, Decândria.** Calyx campanulate, permanent, 5-cleft (f. 45. a.); segments equal, lanceolate, acute (f. 45. a.). Corolla small, papilionaceous (f. 45. c.). Stamens diadelphous. Legume (f. 45. d.) constantly composed of many closed, 1-seeded joints (f. 45. c.), which are equal on both sides, terete, or compressed, at length separating from each other. - Indian and African herbs, with scarious stipulas and bracteas, and simple, linear, oval or roundish, entire leaves. Racemes of flowers opposite the leaves and terminal, bearing pedicellate, twin, or solitary, distant flowers, which are either yellow or purple, and hardly longer than the calyx.

*Joints of legume smooth or irregularly nerved.*

Var. β. *hispridis* (Burm. herb. D. C. prod. 2. p. 352.) lower leaves roundish, as in *A. nummularifolius*, but the upper ones are oblong and acutae, as in *A. bupleurifolius*, and the upper stipulas are longer than the pedicels.

3. *A. Nummularifolius* (D. C. prod. 2. p. 353.) plant gla-
Leaves usually dotted with black, from some species of 
Pucinia.

Var. β, Bumánni (D. C. prod. 2 p. 353.) legume with only 5 or 8 joints. θ. S. Native of Ceylon. Ornithopódion, &c. Burm. zeyl. 177. t. 82. Perhaps a proper species.

Cult. See Alysicarpus for culture and propagation.

§ 2. Saròévloboe (from σαρώ, σαρώς, sarz sarco, flesh, and λοβος, lobus, a lobe; in reference to the thick fleshy coryledons). Embryo with thick fleshy coryledons (f. 21. b.), which do not undergo any change at the time of germination. The seeds of all the plants contained in this division of Leguminosae are used as food in different countries, while none of those of the first division, Phylloboe, are so employed.

Tribe IV.

—Vieie, Adans. fam. 2. p. 232. Corolla papilionaceous (f. 46. d.). Stamens diadelphous, 9 jointed, and 1 free (f. 46. g.). Legumes continuous (f. 46. h.). Coryledons thick, fainceous, not changing, even in germination, when above the earth, but remaining inclosed in the spermacde. Radicle curved inwards (f. 21. f. e.). The leaves of all the plants contained in this tribe are abruptly-pinnate (except in some species of the genus Cicer, which are impari-pinnate), with the common petiole ending in a bristle or tendril instead of a leaflet, the petiole not jointed above the stem. This is a very natural tribe, which agrees with 
Phascolor in the twining habit and thick coryledons.

CLXVII. Cicer. Calyx 5-lobed, with the tube more or less gibbose on the upper side; lobes acuminate, with 2 or 4 of the upper ones lying upon the vexillum. Legume turbid, 2-seeded. Seeds gibbosus, mucronate.—Annual herbs, clothed with numerous glandular hairs, with impari or abruptly-pinnate leaves; having the leaflets and stipules much nerved, and the petioles ending in a tendril, and axillary and almost always flowers from abortion. Fruit pilose.

1 C. aráctum (Linn. spec. 1040.) leaves impari-pinnate; leaflets ovate, serrate, equal; stipulas lanceolate, somewhat toothed; calycyshardly gibbose, with the segments equal in length to the wings of the corolla. Q. H. Native of Spain, Italy, and the Levant, among corn. Lam. ill. t. 632. Sims. bot. mag. 2274. The glandular hairs on the plant are full of acid juice. Flowers purple or white. The form of the seed is like that of a ram's head. The seeds are edible, and the plant is cultivated for their sake in the south of Europe and the Levant, where they are frequently eaten both raw and boiled. The seeds should be soon broadcast like tares, or in drills like peas, about 2 feet asunder, that there may be room for the branches to spread, when the plants are fully grown, as also to hoe the ground, to keep it clean from weeds, which is all the culture these plants require. The plant flowers in June, and the seeds ripen in August, but unless the season proves dry and warm the plants decay in this country before the seeds are ripe.

2 C. Sogna`cum (Steph. ex Fisch. in litt. D. C. legum. mem. viii. with a figure) lower leaves impari-pinnate, upper ones abruptly pinnate, bearing simple tendrils at the apex; leaflets obovate-uncinated, serrated, upper ones smallest; stipulas ovate,
toothed; calyx very gibbous at the base, with the segments shorter than the wings of the corolla. 0. H. Native of Sogaria and Persia. The flowers and the fruit are almost twice the size of those of C. arcticum.

Songarian Chick-pea. Pl. 1 foot.

3 C. soloniensis (Schrack. not. pl. dec. Frioul, p. 49.) peduncle elongated, 1-flowered; leaves with 2 pairs of leaflets, lower ones obovate, middle oblong, upper ones linear.

0. H. Native of Europe.

Solon Chick-pea. Pl. 1 foot.

4 C. ? summulafolium (Lam. dict. 2. p. 2.) stem filiform, slender; leaves simple, obovate, entire, hairy; peduncles 2-3-flowered; calycine segments obtuse; legumes cordate.

0. H. Native of the East Indies.—Pluk. aln. t. 389. This plant ought to be perhaps excluded from the present tribe.

The seeds of these plants require only to be sown in the open ground in the spring.

CLXVIII. FABA (from φάβα, phago, to eat; the esculent seeds of the common bean are well known). Tourn. inst. t. 222. D. C. fl. fr. 4. p. 598. prod. 2. p. 354.—Vicia species of Lin. and others.

LIN. SYST. Diádélphia, Decándria. The character of Faba is nearly the same as that of Vicia, but differs principally in the great size of the legume, which is coriaceous, and rather tumid, and in the seeds being oblong, not round, and in the hylium being terminal, not lateral.—Erect plants, with abruptly-pinnate leaves with or without a simple tendril.

1 F. vulgáris (Moench. meth. p. 130.) leaves thick, with 2-6 broad, oval, mucronate leaflets; stipulas semi-sagittate, oval; tendrils of leaves almost wanting; teeth of calyx almost linear.

0. H. Said to be found wild on the confines of Persia, not far from the Caspian Sea, and is now cultivated to a great extent in gardens and fields, for the sake of its seeds. Vicia Faba, Lin. spec. 1039. Flowers white, with a blackish-blue silky spot in the middle of the wings. The legumes almost terete, or flat, green or black. Seeds more or less roundish, or very broad and flat, varying much in size.

Var. a. Horténisús; seeds flat, white, usually large. There are the following varieties of the garden bean.

1 Mazagan-bean. An excellent early bean. It was brought from a Portuguese settlement just without the straits of Gibraltar. The seeds of this are even smaller than the horse-bean. If the seeds of this sort are sown in October under a warm hedge, pale, or wall, and carefully earthened up when the plants are advanced, they will be fit for the table by the middle of May.

2 Early Portugal or Lisbón-bean. This appears to be the Mazagan sort saved in Portugal. It is the kind used by gardeners for their first crop, but it is not so well tasted as the Mazagan; therefore when the Mazagan-bean can be procured no one would think of sowing this sort.

3 Small Spanish-bean. This will come in well for the second crop, soon after the Portugal, and as it is rather a sweeter bean, it should be preferred to it.

4 Broad Spanish-bean. This is a little later than the last sort, and being a good bearer is therefore frequently sown.

5 Sandwich-bean. This comes in soon after the broad-Spanish, and is almost as large as the Windsor-bean, but being hardier is commonly sown a month sooner. It is a plentiful bearer, but tends to be very delicate for the table.

6 Toker-bean. It is ready for use about the same time as the Sandwich, and is a good bearer, but rather a coarse bean.

7 White and black-blossomed beans are by some persons much esteemed; the seeds of the former when boiled are almost as green as peas; and being a tolerably sweet sort renders it more valuable. These two sorts are very apt to degenerate if the seeds are not sown with great care.

8 Windsor-bean. This is allowed to be the best of all the sorts for the table. When sown on a good soil, having plenty of roots, the beans will be very large, and when gathered young they are the sweetest and best tasted of all the sorts. This sort is seldom sown before Christmas, because it is found not to bear the frost so well as many other sorts; so it is generally sown for the principal crop to come in in June and July.

9 Fan or cluster-bean. This sort is chiefly sown for curiosity. It is dwarf 6 or 10 inches high, with branches spreading like a fan, and flowers succeeded by small pods, both in clusters.

10 Long-podded-bean. A very tall kind, and a good bearer; the pods long and narrow, closely filled with oblong middle-sized seeds. Of this there are several subordinate varieties, as the early Turkey, &c.

11 White blossomed-bean. The flowers are pure white, having none of the black marks on the wings. The seeds are semi-transparent, and have less of the peculiar bean flavour when young than any of the others, and are by some persons esteemed on that account. It bears an abundance of smallish, long, narrow pods, and the seeds are almost black when ripe.

12 Red-blossomed-bean. This is a very shewy plant; the blossoms very red, without any mixture of white. It bears smallish pods and seeds, which are not very palatable, and the plant is therefore only grown for curiosity.

There are a number of other varieties of the garden-bean, such as the green-nomparel, Munford, &c., but they are hardly worth notice.

The following varieties of the field or horse-bean are worth cultivating.

Var. β. equina; the common horse-bean, from which perhaps all the varieties have originated.

1 Common field or horse-bean. This is the kind most commonly sown for agricultural purposes.

2 Tick-bean. This is lower in stature than the former, but is a more plentiful bearer, and succeeds better on light land. There are several subordinate varieties of this kind, such as the Flat-Ticks or May-beans, Small or Essez Ticks, and French Ticks. Some of the garden-beans are taken into field culture in Kent, as the Toker, Windsor, Long-podded, Spanish or Lisbon, and the Mazagan-bean; besides others cultivated only in small quantities for supplying the London seedsmen.

* Garden beans, their culture and uses.

Estimate of sorts. The Mazagan is one of the hardiest and best flavoured of the small and early sorts. The Lisbon is next in point of earliness and fruitfulness. The dwarf-fan or cluster-bean is likewise an early variety, but it is planted chiefly for curiosity. The Sandwich-bean has been long noted for its fruitfulness. The Toker and the broad-Spanish are also great bearers. Of all the large kinds, however, the Windsor-bean is preferred for the table. When gathered young, the seeds are sweet and very agreeable. There are several sub-varieties of the Windsor-bean, such as the Kentish-Windsor and Taylor's-Windsor. The long-podded-bean rises about 3 feet, and is a great bearer. This sort is now very much cultivated, and there are several sub-varieties of it, as the early, the large, and the sword-long-pod. The white-blossomed-bean, so called because it is destitute of the black mark on the wings of the blossom so conspicuous in other kinds. The seed is transparent, and when young has a very delicate bean flavour, and it is on this account much esteemed; it is at the same time a great bearer, and proper for a late crop. De launay, in Le Bon Jardinier, describes as excellent a new variety cultivated about Paris, which he calls the green-bean from China. It is a late sort, but very
productive, and the pods remain green even when ripe and dried.

**Times of sowing for early and successive crops.** For the earliest crop plant some *Mazagons* in October, November, or December, in a warm border, under an exposure to the full sun. Set them in rows, 2 or 2½ feet asunder, about 1½ inch deep, and 2 or 3 inches apart in the rows. The most successful plan for nurturing a crop over the winter, is to sow the beans thickly together in a bed of light earth, under a warm aspect, for the intermediate object of protecting the infant plants the better from rigorous weather, and with the view of transplanting them at the approach of spring or when the size of the plants (2 or 3 inches in height) require it, into warm borders, at the distances at which the plants are in fruit. For this object, the size of a garden frame is a convenient width for the bed, which should slope a little to the south; plant at the depth of 2 inches, and an inch apart each way. At the approach of frost, protect the young plants with a frame, or matting or other shelter. In February or March, as soon as the mild weather or a warm southern border, placing one row close under a protecting fence, as far as that advantage can be given. Take them from the seed bed with balls of earth, and pull off the old beans. Then plant them at final distances, closing the earth rather high about the stems. Beans are accelerated in their growth by transplanting. If severe frosts kill the early advanced plants, or if it were omitted to sow an early crop at the general season, a quantity may be sown thick in a moderate hot-bed in January or February, or in large pots placed therein, or in a stove, to raise some plants quickly for transplanting as above. In all cases, as the young plants come up give occasional protection in the severity of winter, and hoe up a little earth to the stems. Plants which can have no other shelter should be covered lightly with the launum of plants or straw, but such a covering must be carefully removed as often as the weather turns mild. To succeed the above, plant more of the same sort, or some of the early-long-pod or small-Lisbon in December or January, when mild weather, for larger supplies, in more open exposures. And in order to obtain either, a more full succession, or a first general crop, plant some early and long-podded and broad-Spanish at the end of January, if open weather, in some warm quarter of mellow ground. Some of the larger Sword long-pod, Sandwich, and Toker-beans may also be planted in fuller crops in February, if the weather permit, both for succession and principal supplies. You may likewise plant any of the preceding kinds, as well as *Windoors* and other sorts, in full and succession crops in February, March, and April. For the main summer crops adopt principally the *Windoors*, *Sandwich*, *Toker*, long-long-pod, and broad-Spanish. The *Windoors* rank first in regard to flavour, but prove on common soils not so plentiful a bearer as other late kinds. Plant also all succession crops in March and April, and smaller portion in May and June for late production, especially the long-pod, broad-Spanish, and Toker; also some early sorts, which are more successful in late planting than the larger broad varieties. The white-blossomed bean, though the smallest of the middle-sized sorts is very desirable to plant as secondary crops, both in the general and late planting seasons, from March till June and July, being a great bearer and a tender and sweet eating bean, if gathered young. Any of the other sorts named may also be planted to increase the variety. For sowing in June and July, the smaller and early kinds again become the most proper, as their constitution fits them for standing late as well as early. Thus the regular supplies may be provided for, in succession from June till September. (Abercrombie)

**Quantity of seed.** For early crops one pint of seed will be requisite for every 80 feet of row; for late crops nearly the same quantity as for the early. For the main crops the quantity cultivated, in proportion to that for early or late crops, is generally triple or quadruple, as to the extent of ground; but a less quantity of seed is requisite for the same space.

**Method of sowing.** Plant all the sorts in rows, 2½ feet apart for the smaller, or very early, or very late kinds; and 3 feet for the larger; the smaller beans 2 inches deep, and 3 inches distant in the row; the larger beans 3 inches deep, and 4 inches apart in the row.

**Transplanting.** Speechly constantly transplants his early bean crops, and considers this plant may be as easily transplanted as cabbage or any other vegetable. He plants them alternately with potatoes in the same row, the rows 3 feet apart, and the potatoes 18 inches apart in the row. The beans are transplanted, by which means they have the start and advantage of the potatoes, and weeds, and as they come in early may be gathered before they can possibly incommode or injure the potatoes. (Speechly's Practical Hints, &c. p. 17.)

**Manual process.** The work of sowing is most generally effected by a dibble, having a thick blunt end to make a wide aperture for each bean, to admit it clean to the bottom without any narrow hollow parts below, strike the earth fully and regularly into the holes over the inserted beans. Or the planting may be performed occasionally in drills, drawn with a hoe the proper depth and distance, placing the beans at proper intervals along the bottom of each drill, and earth them over evenly, which method, though suitable to any kinds, may be more particularly adopted in sowing the early and other small sorts.

**Soaking seed in summer.** In planting late crops in June and July, if the weather be dry, it is eligible to give the beans a previous soaking for several hours in soft water, or if they are to be sown in drills, water the drills beforehand, then directly put in the beans, and earth them in while the ground remains moist.

**Subsequent culture.** As the plants come up, and advance from 2 to 4 and 6 inches high, hoe up some earth to the stems on both sides of each row, cutting down all weeds. Repeat the hoeing as future weeds arise, both to keep the ground about the plants clean, and to loosen the earth to encourage their growth. In earthing up, great care must be taken that the earth does not fall on the centre of the plants so as to bury them, for this occasions them to rot or fail. After earthing up, stir between the rows with a three-pronged fork. As the different crops come up into full blossom, pinch or cut off the tops, in order to promote their fruiting sooner in a more plentiful production, or well-filled pods. (Abercrombie). Nicol says, "Topping is unnecessary for any but the early crops." Most gardeners are, however, of opinion, that topping improves the crop both in quantity and quality. To forward an early crop, see *Pisum*.

**To produce a very late crop.** Neil mentions an expedient sometimes resorted to to produce a late crop. A quarter of beans is fixed on, and when the flowers appear, the plants are entirely cut down, a few inches from the surface of the ground. Next comes spring from the stools, and these produce a very late crop of beans.

**Gathering.** For table use, gather only such as are tender, the seed decreasing in delicacy after they obtain about half their proper size. When they become black eyed, they are tough and strong tasted, and much inferior for eating.

**To save seed.** Either plant some of the approved sorts in February or March wholly for that purpose, or leave some rows of the different crops ungathered, in preference to the gleanings of gathered crops. The pods will ripen in August, and the beans become dry and hard; then pulling up the stalks, place them in the sun to harden the seed thoroughly, after which thresh out each sort separately. (Abercrombie).

**Use.** The seeds are the only part used in cookery, and are either put in soups, or sent up in dishes apart.
The time of sowing beans, is as early as possible after the severity of winter, in the south sometimes in January, but never later than the end of March, as the ripening of the crop and its safe harvesting otherwise would be very precarious in this climate.

The mode of sowing is almost always in rows; they are sometimes nibbled, but for the most part drilled by judicious cultivators, or deposited after the plough in every furrow, or only in every second or third furrow. In the latter method the crop rises in rows at regular intervals of 9, 18, or 27 inches, and the hand hoe ought to be invariably employed, but it is only where the widest intervals are adopted that the horse-hoe can be used with much effect in their subsequent culture. The seed may either be deposited by the drill machine or by the hand.

The dibbling of beans is considered by some as an excellent method, if well performed; the rows are marked out one foot asunder, and the seed deposited in holes made by the dibbler 2 inches apart; this method is greatly to be preferred to sowing the beans at random.

The quantity of seed is very different in the southern and northern parts of Britain, in the former, even when in rows, only 2 or 3 bushels are allowed per acre, but in Scotland seldom less than 4 bushels to an English statute acre, even when sown in rows 27 inches distant, and a bushel more when sown broadcast. Thin sown crops of beans seldom turn out well, unless upon very rich lands, for unless the rows are close weeds get the better after the clearing process is finished. Both in the broad-east and drill husbandry it is common to mix a small quantity of peas along with beans. This mixture improves both the quality and quantity of the straw for fodder, and the peas-straw is useful for binding up the bean-straw in harvest.

The after-culture of the bean crop commences with harrowing just before the young plants reach the surface. When sown in rows, in either of the modes already described, the harrows are employed about 10 or 12 days after, and being driven across the ridges, the land is laid completely level for the subsequent operations, and the annual weeds destroyed.

After the beans have made some growth, sooner or later, according as the soil may happen to be incumbered with or free from weeds, the horse-hoe is employed in the intervals between the rows, and followed by the hand-hoe, for the purpose of cutting down such weeds as the horse-hoe cannot reach, and the weeds among the beans beyond the reach of either hoe should be pulled up by the hand. The operation may be repeated as often as the land requires it. Before the introduction of the horse-hoe, a common small plough, drawn by one horse, was used in working between the rows, and is still necessary where root-weeds abound. The plough goes down the intervals, turning the earth from the beans, and forming a ridgelet in the centre, then hand-hoes are immediately employed. The same plough with an additional mould-board, finally splits open the intermediate ridgelet, and lays up the earth to the beans on each side.

Before reaping beans the grain ought to be tolerably well ripened, otherwise the quality is impaired, whilst a long time is required to put the straw in such a condition as to be preserved in the stack. In an early harvest, or where the crop is not weighty, it is an easy matter to get beans sufficiently ripened; but in a late harvest, and in every one where the crop takes on a second growth, it is hardly practicable to get them thoroughly ripened for the sickle. Under these circumstances, it is unnecessary to let beans stand uncult after the end of September or the first of October, because any benefit that can be derived afterwards is not to be compared with the disadvantages that accompany a late wheat-seed time. Beans are usually cut with the sickle and tied in sheaves, either with straw ropes or with ropes...
made from peas sown along with them. It is proper to let the
sheaves lie untied several days, so that the winning process may be
hastened, and when tied to set them up on end, in order that the
full benefit from the air may be obtained, and the grain kept off
the ground. Beans are sometimes mown, and in a few instances
pulled up by the roots. In all cases they should be cut as near
to the ground as possible, for the sake of the straw, which is
of considerable value as fodder, and because the best pods are
often placed on the stems near the roots (Brown).

Beans are stacked either in the round or oblong manner, and
it is always proper, if the stack be large, to construct one or more
fumels, to allow a free circulation of air.

The threshing of beans is nearly as easy as that of peas.
The produce of beans, when proper management is exercised,
and where diseases have not occurred, is generally from 25 to
35 bushels per acre. Donaldson says that a crop of beans,
taking the island at large, is from 10 to 40 bushels, but that a
good average crop cannot be reckoned to exceed 20. In
Middlesex, Middleton says that bean crops vary from 10 to 80
bushels per acre. The produce in haulm is very bulky in moist
seasons.

In the application of beans. The grain in Scotland is sometimes
made into meal, the finer for bread and the coarser for
swine; but beans are for the most part applied for feeding horses,
swine, and other domestic animals. In Middlesex, all are given
to horses, except such as are preserved for seed, and such as
are gathered while green and sent to the London markets. When
pigs are fed on beans, it is observed that the meat becomes so
hard, as to make very ordinary pork, but excellent bacon.

The flour of beans is more nutritious than that of oats, as
appears in the fattening of hogs; whence, according to the respec
tive prices of these two articles. Dr. Darwin suspects that peas
and beans generally supply a cheaper provender for horses
than oats, as well as for other domestic animals. But beans are
more difficult of digestion than oats, although of more nutrition.
Some advise cut straw or bran to be mixed with beans to
accelerate their digestion.

Bean-straw, when mixed with peas, Brown considers as affording
almost as much nourishment, when properly harvested, as is
gained from hay of ordinary quality, when it is well got
horses are fonder of it than of pea-straw. It should either be
given when newly threshed, or else stacked up and compressed
by treading or covering, as the air is found to affect materially
both its flavour and nutritious quality.

The produce of beans in meal is like that of peas, more is
proportion to the grain than in any of the cereal grasses. A
bushel of beans is supposed to yield 14 pounds more of flour
than a bushel of oats, and a bushel of peas 18 pounds more, or
according to some, 20 pounds. In 1000 parts of bean-flour, were
found by Sir Humphrey Davy, 570 parts of nutritious matter, of
which 428 were mucilage, 103 gluten, and 41 extract, or matter
rendered insoluble during the process.

The diseases of beans are the rust, the honey-dew, mildew,
and black-fly or aphides, which the lady-birds are supposed to
feed upon, as they are observed to be plentiful wherever the
black-fly is found. The fly almost always succeeds the honey-
dew, both are most prevalent on the summits of the plants, and
some have attempted to mitigate the evil by cutting them off.
In general, however, these diseases are without remedy, either
preventive or positive; therefore the best thing that can be
done when the plants are attacked is to plough them down.

Common Garden-bean and Horse-bean. Fl. year. Ctt. 2
Pl. 2 to 3 feet.

CLXIX. VICIA (said to be from vino, to bind together,
because the species have tendrils by which they bind other
pl. 559. prod. 2, p. 354.—Vicia species of Lin.
LIN. SYST. DIADIPHYLLUM, Decandria. Calyx tubular, 5-dent
or 5-toothed (f. 46. a.), the 2 superior teeth shortest (f. 46. a).
Corolla papilionaceous (f. 46. d.). Stamens diadelphous (f. 46.
g.). Style filiform, almost forming a straight angle with the
ovary, villous on the upper side (f. 46. g.), and on the under
side beneath the apex. Legume oblong (f. 46. h.), 1-celled,
many-seeded (f. 46. h.); seeds with a lateral, oval, or linear
hyhum.—Usually planting herbs, with abruptly pinnate leaves,
having many pairs of leaflets; the common petiole drawn out
into a tendril at the apex (f. 46. i.), which is usually branched.
Peduncles usually semi-sagittate. Peduncles axillary, elongated,
much-flowered, or short and I-flowered. The species of the
genus are not well defined.

§ 1. Peduncules elongated, many-flowered; flowers secund.
1 V. pisiformis (Lin. spec. 1034.) plant smooth; leaves
mucronate, with 3-8 pairs of ovate, cordate, obtuse, reticulately
veined, distinct leaflets; stipulas ovate, semi-sagittate, toothed;
peduncle many-flowered, length of leaves; calyce teeth nearly
equal, shorter than the tube; legumes oblong, compressed, reticulately
veined; seeds globose, with the hylum linear. 2. H.
H. Native of the south of Europe, in woods. Sturm, deutsch.
fl. 1. fasc. 31. Jacq. auct. 4. p. 33. t. 348.—Tet. triv. t. 3.
The lowest leaflets approximating the stem and sessile.
Flowers cream-coloured, about the size of those of V. clystis-
edens.

2 V. AMERICAN (Fisch. in litt. Ser. in D. C. prod. 2, p. 555.)
stem erect, tetrangular, firm, and smoothish; leaves distant on
the stem, tendrilled at the apex; leaflets numerous, dense,
opposite and alternate, elliptic-lanceolate, rather mucronate,
reticulated with numerous diverging fine nerves; stipulas
semi-sagittate, toothed; peduncle many-flowered, rather longer
than the leaves; the superior teeth of the calyx broadish, short,
and acute, lower ones elongated and subulate; style hardy pilsse
at the apex; legumes unknown. 2. H. Native of Siberia,
about Trucetsk.—Gmel. sib. 4. p. 11. no. 11. t. 3. Flowers
purple, about the size of those of V. onobrychioides. Leaflets
large, like those of the first species.

3 V. CAROLINA'NA (Walt. fl. Carol. p. 182.) plant smoothish;
leaves with 8-10 or more elliptic-lanceolate, obtuse, mucronate,
alternate leaflets; stipulas ovate-lanceolate, entire, small; peduncle
many-flowered; flowers rather distant; calyce teeth short;
style villous at the apex; legumes lanceolate, glabrous,
obliquely reticulated. 2. H. Native of Carolina. V.
pavilloba, Michx. fl. car. 2. p. 69. V. cecidoides, Rafin. in
litt. V. Cracea, Pursh, ex Rafin. Corolla white, smaller and
rarer in V. Cracea, having the vexillum tipped with black.

4 V. PONTICA (Willd. spec. 3. p. 1094.) plant pubescent;
leaflets numerous, elliptic-lanceolate, obtuse, mucronate;
stipula lanceolate, quite entire, nerved; peduncle very long,
many-flowered; flowers crowded; legumes unknown. 2. H.
H. Native of the country near the Euxine sea. Flowers secund,
nodding, about the size of those of V. Cracea, white. Leaves with a few,
scattered, adpressd pill on the under side. Vicia multiflora,
florus albus, calyce purpureo, Tourn. cor. 27.

Ponie Vetch. Fl. cl.
5 V. vetchiformis (Lin. spec. 1085.) plant smoothish; leaflets
reflexed, ovate-lanceolate, mucronate, alternate, very finely
and reticulately veined; stipulas lunate and setaciously toothed;
peduncle many-flowered, about the length of the leaves; caly-
cine teeth very short, equal among themselves; style bearded
at the apex; legumes oblone, compressed, reticulately and finely
s s 2
veined; seeds roundish, with the hylum linear. 2H. Native of America and Europe, in bushy and shady places, particularly in Austria, Switzerland, Piedmont, France, and Germany. Sturm, deutschl. fl. 1, fasc. 31, with a figure. Oxypogon elegans, Rafi, in litt. V. tetragna, Hort. par. in litt. This species differs from V. pisiformis in the flowers being purplish-blue, and in the deep-green and longer leaflets, with the lower pairs not approaching the stem.

6 V. _menziesii_ (Fisch. in litt.) this plant differs from _V. dactylium_ in the smaller approximate leaflets, which are ovate-obtuse, the lower ones roundish and acutely toothed towards the apex in the more loose flowers, and in the semi-sagittate serrated stipulas. 2H. Native of the south of Russia. V. dactylorum, var. β, dentata, _Ser. in_. D. C. _prod._ 2, p. 355. —Gmel. sib. 4, p. 9. _tub._ p. 221. Flowers violaceous.

8 V. _svylicia_ (Linn. spec. 1035.) plant smooth; leaflets numerous, alternate or opposite, elliptic-oblong, mucronulate, finely and reticulately veined; stipules between semi-sagittate and reniform, setaceous-toothed; peduncles longer than the leaves, many-flowered; calyces segments hardly the length of the tube; style villous at the apex; legumes oblong-linear, compressed, finely reticulately, incurred at the apex; seeds globose, with a linear hylum. 2H. Native of Europe, in mountain woods. Plentiful in mountainous parts of the north of England and Scotland, in woods. Sturm, deutschl. fl. 1, fasc. 31, with a figure. Smith, engl. bot. 79. Oed. fl. dem. 277. Hall. helv. no. 426, t. 12, f. 2. Stipulas fringed. Style with the beard at the apex hardly discernible. Flowers rising from the peduncle by two or three, with interruptions, rather large, having the vexillum and wings whitish, and beautifully variegated with blue, and keel pale blue. This is an elegant plant when in flower.

9 V. _americana_ (Muhlenb. ex Willd. spec. 3, p. 1096.) leaflets numerous, elliptic-lanceolate, obtuse, glabrous, mucronate; stipulas semi-sagittate, deeply toothed; peduncles many-flowered, shorter than the leaves; legumes unknown. 2H. Native of Pennsylvania. This plant differs from _V. svylicia_, in the longer leaflets, in the teeth of the stipulus not being awned, and lastly in the racemes being fewer-flowered and never longer than the leaves. Leaflets 8-12 in number.

10 V. _variegata_ (Willd. spec. 3, p. 1096.) plant villous; leaflets numerous, elliptic, obtuse, villous, alternate, lower ones emarginate mucronate; tendrils trifid; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with second flowers; calyces teeth about equal, shorter than the tube; style bearded; legumes rather pubescent. 2H. Native of Eastern Caucasus, on the cliffs. Desl. cor. p. 86, ann. mus. 12, p. 111. t. 12. Leaflets 14-26. Stipulas ovate-lanceolate, bipartite at the base. Flowers with a rose-coloured standard, white wings, and purplish keel, and variegated.

11 V. _purpurea_ (Stev. in mem. soc. mosq. 4, p. 53, et Bieberl. fl. taur. suppl. 468.) plant hardly escent; leaflets numerous, oval, mucronate, villous; stipulas semi-sagittate, quite entire; peduncles many-flowered, rather longer than the leaves; racemes crowded with second flowers; calyces teeth much shorter than the tube, the superior ones almost obsolete. 2H. Native of Tauria. Flowers purple.

_Var. β, minor_ (Stev. l. c.) leaves small; flowers paler. 2H. Native of Tauria, near the region of perpetual snow.

_Purple-flowered Vetch_. Pl. cl.

12 V. _alpestris_ (Stev. in mem. soc. mosq. 4, p. 53, and Bieberl. fl. taur. suppl. 469.) plant hardly escent; leaflets elliptic-oblative, mucronulate, villous; stipulas semi-sagittate, almost quite entire; tendrils usually trifid; peduncles usually 6-flowered, longer than the leaves; racemes crowded; calyx villous, having the teeth much shorter than the tube, but with the superior ones almost obsolete; legumes unknown. 2H. Native of Tauria. Flowers purple.

_Alg Vetch_. Pl. cl.

13 V. _casabica_ (Linn. spec. 1035.) leaflets numerous, opposite or alternate, ovate-elliptic, mucronate, nearly glabrous, firm, reticulated with numerous diverging nerves; lower stipulas lanceolate and semi-sagittate at the base, upper ones linear and almost entire; peduncles many-flowered, about equal in length to the leaves; racemes crowded with second flowers; calyces teeth unequal, shorter than the tube; style villous at the apex; legumes conic, hardly reticulated, oblong, short, compressed, smooth; seeds globose. 2H. Native of the south of Europe. _Oed. fl._ dan. 98.—Pluck. _phyt._ t. 79, f. 2. Root creeping. Flowers pale blue. Leaves impari-pinnate.

14 V. _abreviata_ (Fisch. in litt. ex Spreng. _pl._ _cogn._ 1, p. 50.) leaflets oblong, rounded at both ends and mucronulate, rather pubescent; stipulas almost obsolete; peduncles many-flowered, shorter than the leaves, which are impari-pinnate. 2H. Native of Caucasus, on the margins of woods. Very like _V. cassabica_, but differs in the stem being quite smooth and not fleshy, in the stipules being very minute, and lastly in the calyces being villous. Leaves impari-pinnate, as in _V. cassabica_. Perhaps only a variety of _V. cassabica_, according to _Ser._. Flowers pale blue.

15 V. _galloprovincialis_ (Poir. _suppl._ 5, p. 471.) leaflets opposite or alternate, very numerous, elliptic-lanceolate, mucronate, villous; stipulas semi-sagittate; tendrils almost simple; peduncles shorter than the leaves; flowers small, very numerous; vexillum broad, length of wings; legumes unknown. 2H. Native of the south of Provence, on the mountains. Ger. _Galпров._ p. 497, _n._ 5, _t._ 19. Flowers blue or purple.

_Provence Vetch_. Pl. cl.

16 V. _cineza_ (Biebr. _fl._ _taur._ suppl. 470.) leaves with very short tendrils; leaflets linear-elliptic, oblong, clothed with hoary villi; stipulas bipartite, with elongated teeth; peduncles usually 2-flowered, shorter than the leaves; calyces teeth triangular, acute, superior ones very small. 2H. Native of Tauria, about Tiflis. Flowers pale blue, about the size of those of _V._ _cracea_. Calyx clothed with silky villi.
LEGUMINOSÆ. CLXIX. Vicia.

Cinetias Vetch. Pl. cl.

17 V. setidifolia (H. B. et Kunth, nov. gen. amer. 6. p. 500.) stems weak, smoothish; leaflets 8-9, very narrow-linear, mucronate, puberulous on both surfaces, as well as the rachis or petiole; stipulas lanceolate, semi-sagittate; calyx turbinate at the base, with the superior teeth ascending; peduncles 3-4-flowered, a little longer than the leaves, and are, as well as the calyces, pubescent; legumes lanceolate, glabrous. 2. H. Native near the city of Mexico, Quito, and Santa-Fe de Bogota, at the height of 3500 or 4500 feet above the level of the sea. Flowers flesh-coloured.

Bristle-leaved Vetch. Pl. cl.

18 V. Broteria na (Ser. miss. in D. C. prod. 2. p. 537.) leaflets nearly oval, villous; lower stipulas semi-sagittate, and somewhat dentate; flowers imbricate; peduncles very villous; calyce teeth setaceous, and villous; legumes rather villous, pendulous. O. H. Native of Portugal, in cultivated fields about Coimbra. V. villosa, Brot. fl. lus. 2. p. 150, but not of Roth. Corolla deep purple at the apex.

19 V. acutifolia (Ell. sketch. car. et geogr. 2. p. 223.) stem glabrous; leaflets few, linear, acute at both ends; stipulas lanceolate, entire; peduncles few-flowered, longer than the leaves. —Native of Georgia.

Acute-leafletted Vetch. Pl. cl.

20 V. pulchella (H. B. et Kunth, nov. gen. amer. 6. p. 499. t. 583.) stems weak, puberulous; leaflets 8-12, linear, acute, pubescent beneath, as well as the calyces; stipulas linear, semi-sagittate; calyce teeth very unequal, superior ones much the smallest; peduncles 16-20-flowered, longer than the leaves, pubescent; legumes unknown. 2. H. Native of Mexico, on the westem declivities of mountains, especially near Meseca at the height of 705 feet above the level of the sea. Flowers white.

Neat Vetch. Pl. cl.

21 V. cracca (Lin. spec. 1095.) stems branched; leaves cirrhous at the apex; leaflets numerous, oblong-lanceolate, alternate or opposite, pubescent, mucronate, with rather parallel simple nerves; stipulas linear, semi-sagittate; peduncles angular, hairy, bearing numerous second flowers, equal in length to or exceeding the leaves; calyce teeth unequal, upper ones very short, lower ones shorter than the tube; style pilose at the apex; legumes oblong-lanceolate, coriaceous, reticulated, compressed, glabrous; seeds globose, black. 2. H. Native of Europe, in fields and hedges; plentiful in all parts of Britain. Sturm, deutschl. fl. fase. 31. with a figure. Smith, engl. bot. t. 1168. Curt. lond. 5. t. 54. Mart. fl. rust. 117. Cracca, Riv. tetr. t. 50. Root creeping. Flowers blue and purple, or blue and violet mixed, marked with veins of a deeper colour. Leaves clothed with canescent down, giving them a manifest whiteness; this is most apparent in plants growing in exposed dry situations, for in moist soils the leaves are almost green. Dr. Plot, in his history of Staffordshire, says, that this and the Wood-Vetch advance starved or weak cattle above any thing yet known. These perennial vetches yield such abundance of food, that they seem to deserve the notice of agriculturists. But it is well observed in English history, that to gather them from their native situations would be impracticable, so firmly do they cling by their tendrils to their neighbours; and if cultivated, they would probably choke themselves for want of support.

FIG. 46.

Var. a. violacea; flowers bluish violet.
Var. b. purpurea; flowers purple.
Var. γ. albiflora; flowers pure white.

22 V. bipunctata (Rafn. prec. 37. Desv. journ. bot. 1814. p. 260.) plant pubescent; stems tetragonal; tendrils simple; leaflets 10-14, oblong-linear, mucronate; stipulas lanceolate, semi-sagittate, rather toothed at the base; peduncles few-flowered, equally long as to the length of the plant; flowers scented, rather distant; calyce teeth setaceous, length of tube; style bearded at the apex; legumes oblong-lanceolate, compressed, finely reticulated. 2. H. Native of Sicily, and of Coroa. V. lanceantha, Bertol. stip. sic. fase. V. litoralis, Salzm. exsic. Flowers pale, purplish blue, with the carina tipped with black. Perhaps the same as V. pseudocracea.

Bicot's Vetch. Pl. cl.

23 V. Gerardiana (Jacq. fl. astr. t. 229. D. C. fl. fr. 4. p. 591.) exclusive of the synonmys, stems simple; leaves cirrhous at the apex; leaflets numerous, oblong-lanceolate, alternate or opposite, mucronate, rather woolly, having parallel simple nerves; stipulas linear, semi-sagittate; peduncles many-flowered, rather shorter than the leaves; style pilose at the apex; legume oblong, coriaceous, finely reticulated, glabrous. 2. H. Native of the south of Europe, particularly in Austria and France. V. mutilans, Crantz. Flowers violaceous. Root creeping? Calyce teeth unequal, pilose.

24 V. pseudocracea (Bertol. pl. rar. p. 58.) plant pubescent; stems branched at the base, diffuse; leaflets 8-12, oblong-obtuse; stipulas linear, semi-sagittate; peduncles usually 6-flowered, longer than the leaves; flowers scented, loose; decresc.; calyce teeth unequal, linear, acute, shorter than the tube; style pilose at the apex; legumes elliptic, short, smooth, finely reticulated. O. H. Native of Italy near Pisa. V. tenuifolia, Tenore, prod. p. 42. Very like V. Cracca, but differs in the annual roots, in the broader legumes, and in the longer calyce teeth. Flowers blue.

25 V. arboecula (H. B. et Kunth, nov. gen. amer. 6. p. 498. t. 582.) plant pubescent; stems weak; leaflets 7-12, linear-lanceolate, obtuse, mucronate; stipulas linear, semi-sagittate, acute; tendrils bifurcate; peduncles 2-4-flowered, hardly exceeding the leaves; calyx bilabiate, the superior teeth the smallest; legumes somewhat cultriform, smoothish. 2. F. Native of the Andes of Quito on mount Antisana, at the height of 6300 feet above the level of the sea. Flowers violaceous.

Aedes Vetch. Pl. cl.

26 V. microphylla (D'Urv. enum. pl. arch. p. 87.) stems weak, branched at the base, and diffuse; leaflets 8-10, ovate on short petioles, small, mucronate; stipulas very small, and semi-sagittate; peduncles straight, twice or thrice longer than the leaves, 4-6-flowered; flowers pale; legumes compressed, glabrous, 5-7-seeded. 2. H. Native of the island of Melos, on hills. Corolla very pale violet or white, double the length of the calyx, and sometimes longer. Perhaps the same as V. pseudocracea of Bertol.

Small-leafletted Vetch. Pl. cl.

27 V. polyphylla (Desf. fl. atl. 2. p. 162.) leaflets numerous, linear-lanceolate, mucronate, villous; stipulas linear, semi-sagittate; peduncles many-flowered, longer than the leaves; flowers scented, crowded. 2. H. Native about Algiers. The flowers are like those of V. Cracca, but they are larger and paler. The vexillum is blue, and wings and keel white.

28 V. tenuifolia (Roth. fl. germ. 2. p. 183.) stem branched; leaves cirrhous at the apex; leaflets numerous, linear-lanceolate, smoothish, mucronate, alternate or opposite, full of parallel sim-
ple veins; lower stipules semi-sagittate, linear, upper ones linear-setaceous; peduncles longer than the leaves; flowers crowded, secund; calyceal teeth unequal, lower one longer than the tube; style pilose at the apex; legumes lanceolate. 2. H. Native of France, in the mountainous parts. Sturm, deutschl. fl. 1. fasc. 31. with a figure. All. pedem. t. 42. no. 1198. Sims, bot. mag. 2206. Flowers purplish blue.

*Var. β, angustissima* (Ser. miss. in D. C. prod. 2. p. 55.) leglets setaceous, and shorter. 0. H. Native about Montpelier.

37 V. atropurpurea (Desf. fl. atl. 2. p. 164.) plant villous; stems tetragonal; tendrils very trifid; leaflets oblong, mucronate, numerous, opposite, and alternate; stipules lanceolate, semi-sagittate, usually toothed at the base; peduncles many-flowered, hardly the length of the leaves; flowers secund, approximate; calyceal teeth setaceous, pilose, longer than the tube; style elongated, somewhat clavate, bearded at the apex; legumes oblong, compressed, very hairy; seeds globose, black, rather velvety. 0. H. Native of Algiers. Vent. hort. cels. t. 84. Lindl. bot. reg. 751. Flowers dark purple.

38 V. gigantea (Hook. fl. bor. amer. p. 157.) plant pubescent, black when dried; stems furrowed; leaflets 20-26, oblong, pilose, obtuse; stipules large, semi-sagittate, profoundly toothed at the base; peduncles 5-10-flowered, much shorter than the leaves; flowers crowded; style hardly bearded; legume broad, oblong, glabrous, obscurely reticulated. 2. H. Native of North America, in open woods on the Columbia. Flowers purple, about the size of those of *V. Americana*. Stems hardly one-third of an inch broad, hollowed, and herbaceous. Stipulas an inch and a half in length. The plant turns black on drying.

**Giant Vetch.** Pl. trailing.

39 V. nigericans (Hook. in Beech. bot. p. 20.) plant pubescent; stems tetragonal; leaflets oblong-elliptic, obtuse, alternate; tendrils divided; stipules semi-sagittate; peduncles twice the length of the leaves, many-flowered; flowers crowded, the 2 superior teeth of the calyx almost wanting, lower ones subulate, middle one elongated, and exceeding the tube; stigma bearded. 2. H. Native of Chili about Concepcion. Leaflets more than an inch long. Plant becoming very black on drying.

**Blackish Vetch.** Pl. cl.

40 V. bengalensis (Lin. spec. 1036.) leaflets elliptic, obtuse, stipules entire; peduncles usually bearing only 5 flowers, length of leaves; legumes turgid, hairy. 0. H. Native of the Stochades Islands.—Herm. ludg. 624. t. 625. Flowers deep purple, having the keel tipped with black. Plant downy.

41 V. fere'nsis (D. C. cat. hort. monsp. 155. and fl. fr. 5. p. 578.) plant villous; stems tetragonal; tendrils simple; leaflets oblong-linear, mucronate, villous, opposite or alternate; stipules lanceolate, semi-sagittate, and usually toothed at the base; peduncles few-flowered, length of leaves; flowers secund, rather lax; calyceal teeth setaceous, pilose, length of tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, pubescent, reticulated; seeds orbicular, compressed, bay-coloured. 2. H. Native of France, about Perpignan. Flowers purple.

*Var. β, sulphurifóssa* (Ser. miss. in D. C. prod. 2. p. 539.) stems smaller, diffuse, sulphurifusse at the base; leaves and leaflets smaller.

42 V. longifolia (Poir. dict. 8. p. 567.) stems tetragonal; tendrils branched; leaflets numerous, narrow, very long, glabrous; stipules semi-sagittate, entire; peduncles many-flowered, longer than the leaves; flowers drooping; calyceal teeth unequal, acute, superior ones very small. 0. H. Native of Syria. Flowers cream-coloured.

43 V. aoe'ntea (Lapeyr. abr. 417.) plant canescent; stems
tetragonal, never climbing; tendrils wanting; leaves clothed with silvery-grey down; leaflets oblong-linear, mucronate; stipulas lanceolate, semi-sagittate; peduncles many-flowered, about the length of the leaves; flowers secund, loose; calyce segments almost equal, length of the tube; style elongated, rather clavate, bearded at the apex; legumes oblong, compressed, tomentose. 2. H. Native of the Pyrenees, on the Spanish side. D. C. fl. fr. suppl. no. 4011. Hook. bot. mag. 2946. Calyx reddish with green teeth. Flowers with the vexillum and wings yellowish-white, streaked with purple, but the keel is white. Root fusiiform.

44 V. TRIUNCALYX (Moris, elench. sard. ex Schlecht. Linnaea. 5. p. 96.) plant pubescent; leaflets elliptic-oblong, mucronulate; tendrils branched; stipulas lanceolate, semi-sagittate, toothed; peduncles many-flowered, about equal in length to the leaves; flowers secund, crowded; calyx very villous, with setaceous teeth, which are much longer than the tube; legumes hairy. O. H. Native of Sardinia, in corn-fields. This plant is very like V. atropurpurea of Desf. but differs in flowering later, and in every part being much larger, in the calyx being more villous, and, lastly, in the corolla being white, and only rose-coloured at the apex.

Hair-calyx Vetch. Pl. cl. 45 V. VILLATA (Roth. fl. Germ. 2. p. 182. but not of Brot.) plant clothed with villi; stems tetragonal; tendrils almost simple; leaflets oblong, mucronulate, opposite or alternate; stipulas lanceolate, entire, semi-sagittate; peduncles many-flowered, length of the leaves; flowers secund, rather loose; calyce teeth setaceous, pilose, longer than the tube; style villous at the apex; legumes oblong, compressed, glabrous; seeds globose, variegated. O. H. Native of Germany. Sturm. deutschfl. i. fasc. 31. with a figure. Flowers purple. Like V. atropurpurea, but differs in the stipula being entire, and in the legumes being smooth.

46 V. DISPERMA (D. C. cot. hort. monsp. 154. and fl. fr. 5. p. 578.) plant rather pilose; stems tetragonal; tendrils simple; leaves with 8-10 pairs of linear-oblong mucronate leaflets; stipulas semi-sagittate, entire; peduncles 2-3-flowered, shorter than the leaves; flowers small, calyce teeth nearly equal, lanceolate-subulate, length of the tube, and about equal in length to the corolla; style villous at the apex; legumes oblong, compressed, glabrous, reticulated, transversely 2-seeded; seeds globose, black. O. H. Native of the south of France. V. parviflora, Lois. fl. gall. 466. but not of Michx. Flowers and fruit like those of V. ruvm. lens.

47 V. ALTRISIMA (Desf. fl. atl. 2. p. 163.) leaflets elliptic, quite smooth, truncate at the apex; petioles usually bearing 10 leaflets; stipulas dentate; peduncles many-flowered, longer than the leaves; flowers nodding; calyce teeth unequal, superior ones minute, lower ones acute and longer; style bearded; legumes lanceolate, compressed, many-seeded. 2. H. Native of Barbary. Flowers pale blue, about the size of those of V. sepium.

48 V. POLYSPE'RA (Tenore, prod. append. 5. 1826. ex Schlecht. Linnaea. 3. p. 102.) stem branched; leaves ciliiform; leaflets ovate-oblong, obtuse, entire, mucronate, glabrous; tendrils branched; stipulas toothed; peduncles 8-10-flowered, longer than the leaves; flowers erect, loosely racemose; calyce teeth unequal, upper ones shorter, lower ones setaceous, longer; legumes linear-lanceolate, 3 inches long, flat, glabrous, 14-20-seeded. 2. H. Native of Naples, in hedges. Flowers the size of those of V. sativa, pale blue. Very nearly allied to V. alissina, but it in the legume does not exceed an inch in length, the leaflets are also elliptic and truncate at the apex, 4 lines long and 3 broad, but in the present plant they are 8 lines long and 5 broad. Flowers densely racemose.

Many-seeded Vetch. Pl. cl. 8 feet.

49 V. BIE'NNIS (Lin. spec. 1036.) leaflets about 12, lanceolate, glabrous; petioles furrowed, cirrhous; stipulas semi-sagittate, acute; peduncles many-flowered, hardly longer than the leaves; calyce teeth unequal; legumes ascending, compressed, glabrous, short. 2. H. Native of Siberia. Poir. dict. 5. p. 538.—Omel. sib. 4. p. 10. t. 2. Leaves involute. Flowers pale blue. Seeds globular, dirty yellow, spotted with black. This promises to become an useful plant for fodder, the stalks growing to a great length, and being well furnished with leaves, which do not decay in autumn, but continue green through the winter, in defiance of the most severe frost; so that in February and March, when there is often a scarcity of green food for ewes and lambs, this may be of great service.

50 V. NISSOLIANA (Lin. spec. 1036.) plant downy; petioles cirrhous; leaflets oblong, hardly retuse, rather downy; stipulas lanceolate, entire, very narrow; peduncles many-flowered; flowers small, dark purple; legumes ovate-oblong, villous, nodding, 5-seeded. O. H. Native of the Levant. Stem angular. The plant in the gardens under this name is a very shelly species, with dark-purplish, elegant, crowded, second flowers, and is the plant figured in bot. reg. t. 871. under the name of V. atropurpurea.

51 V. PELLUCIDA (Jacq. hort. schenbr. 2. p. 222. t. 222.) stems branched; leaflets obovate, emarginate; stipulas oblong; peduncles usually 4-flowered, shorter than the leaves, which are without tendrils; calyce teeth equal, spreading; style bearded at the apex; legumes oblong, compressed, falcate, membranous, rather villous; seeds kidney-shaped, compressed. 2. F. Native of the Cape of Good Hope. Flowers purple, but with the vexillum variegated. Leaves impari-pinnate.

52 V. HOOKER'I; plant sparingly pilose; leaves with 3-4 pairs of narrow, linear, acuminate leaflets; tendrils almost simple; stipulas semi-sagittate, linear, entire; peduncles shorter than the leaves, few-flowered; calyx short, campanulate; the teeth lanceolate and equalizing the tube; corolla glabrous; legumes lanceolate, 6-seeded, compressed, with pilose suture. 2. F. Native of Chili; about Conception. V. parviflora, Hook, in Beech. bot. p. 20. but not of Cav. Habit of E'rum tetraspermum.

Hooker's Vetch. Pl. cl.

53 V. MITCHE'LLI (Rafin. prec. 37. and in Desv. journl. bot. 1814. p. 269.) plant glabrous; stems weak, striated; leaves for the most part with 7 pairs of leaflets; leaflets oblong, cuneiform, retuse, mucronate; stipulas entire or multifid; small; peduncles many-flowered; vexillum pubescent; legumes 2-seeded, pilose. O. H. Native of North America, in Long Island. Ell. sketch. car. et geogr. 2. p. 224. Seeds edible. Mitchell's Vetch. Pl. cl.

54 V. PARVIFLORA (Cav. annal. sci. nat. 4. p. 73. but not of Michx. nor Lois.) stems filiform; leaves cirrhous; leaflets linear, mucronate; stipulas normal; peduncles elongated, 2-4-flowered. O. H. Native about Mogodor.

Small-flowered Vetch. Pl. cl.

55 V. BIDENTATA (Hook, bot. misc. 2. p. 215.) plant quite smooth; leaves with 2-3 pairs of opposite and alternate, cuneate leaflets, which are bidentate at the apex, and with a mucrone in the centre; tendrils simple; stipulas broad, semi-sagittate, a little toothed; peduncles 3-4-flowered, equal in length to the leaves; legumes oblong, glabrous. O. H. Native of Peru, near Lima.

Bidentate-leaved Vetch. Pl. 1 foot.
56. *V. diplora* (Desf. fl. at. 2. p. 166. t. 197.) leaves tendrilled; leaflets numerous, linear-lanceolate; stipulas semi-sagittate, entire; peduncles 2-flowered, shorter than the leaves; calyceous teeth nearly equal, small. O. H. Native of Algiers. Flowers blue.

57. *V. graminea* (Smith, in Rees' cyc. vol. 37.) plant almost smooth; leaflets 3 pairs, linear, pointed; stipules ovate, entire, slightly sagittate; peduncles 4-flowered, shorter than the leaves; tendrils simple or divided; legumes smooth, compressed, not an inch in length, elliptic-oblong, with an oblique, incurved point; seeds 6-7, small, round. 2. H. Native of Buenos Ayres. Flowers very small, pale, apparently tinged with purple. Calyx rather downy, with the teeth shorter than the tube.

**Grassy-leaved Vetch.** Pl. cl.

§ 2. **Flowers pedunculate, solitary.**

58. *V. calcarata* (Desf. fl. at. 2. p. 166.) stems rather tetragonal, decumbent; leaflets linear-lanceolate, obtuse; stipulas fuscate; peduncles 1-flowered, bracteolate at the apex, much shorter than the leaves; calyceous teeth small, acute; legumes compressed, glabrous. O. H. Native of Algiers. V. monantha, Retz. obs. 3. p. 39. Willd. spec. 3. p. 1109. and enum. p. 764. Flowers blue and veined.

59. *V. bigyna* (Lin. spec. 1038.) stems weak, leafy, angular, slightly branched; leaves with 2 pairs of lanceolate, mucronate leaflets, hairy beneath; stipulas semi-sagittate, with deep fringed teeth; peduncles axillary, 1-flowered; calyx hairy, with very long rather unequal fringed teeth; legumes erect, broad, slightly tumid, clothed with rigid tawny hairs. 2. H. Native of the south of Europe. In Britain in bushy places, on a gravelly soil, often near the sea, near Doncaster, Yorkshire; in woods, near Clifton-upon-Teme, Worcestershire; between Rockenhall and Sandbury, in the same county; in a field half way between Weymouth and Portland Ferry, near the sea, and on the coasts of Dorsetshire and Hampshire. Smith, engl. bot. 1842. Jacq. hort. vind. 2. p. 69. t. 147. Flowers with a purplish vixillum, and the keel and wings white, the former tipped with violet.

60. *V. syriaca* (Weinn. hort. dorp. 162.) plant glabrous; stems decumbent; leaves with 4-5 pairs of ovate-oblong, mucronate leaflets; stipulas linear, entire, small; legumes pedunculate, solitary, reflexed, 4-5-seeded. O. H. Native of Syria. Flowers violaceous. Very like *V. calcarata*.

**Syrian Vetch.** Fl. June, July. Cit. 1816. Pl. cl.

61. *V. numilia* (H. B. et Kuhn. nov. gen. amer. 6. p. 498. t. 581.) stems weak; leaves with 2-3 pairs of linear-lanceolate, obtuse, mucronate, glabrous leaflets; tendrils simple; stipulas linear, acute, semi-sagittate; peduncles 1-flowered, shorter than the leaves; calyceous segments long; legumes lanceolate; calyx and rachis clothed with adpressed down. O. H. Native of Mexico, near Moran, at the height of 3990 feet above the level of the sea. Flowers rose-coloured.

**Humble Vetch.** Pl. cl.

§ 3. **Flowers nearly sessile, solitary.**

63. *V. intermedia* (Viv. fl. lyb. p. 42. t. 19. f. 1.) leaves with 3-4 pairs of leaflets, lower ones obcordate, cutuated, superior ones linear, emarginate and mucronulate; tendrils oblate; stipulas semi-sagittate; flowers solitary; calyx 10-nerved, gibbous at the base; legumes hairy, rather compressed. O. H. Native of Cyrenica, in meadows. Allied to *V. lathyroides* and *V. sativa*, according to Viviani. Flowers purple.

**Intermediate Vetch.** Fl. June, July. Pl. ½ foot.

65. *V. pimpinelloides* (Mauri, pl. rom. cent. 13. p. 35.) leaflets deeply crenated, superior ones quite entire; stipulas spotted, a little toothed, semi-sagittate; flowers usually solitary and almost sessile; calyceous teeth elongated, ciliated; legumes erect, oblong, gibbous; seeds roundish, compressed. O. H. Native of Italy, about Rome. Flowers purple.

**Pomperial-like Vetch.** Fl. June, July, Pl. 1 foot.

64. *V. reflexa* (D'Ur. fl. 8. p. 88.) stems diffuse, branched at the base, trailing; leaflets usually 6, alternate, very narrow and acute; stipules small; flowers axillary, solitary, almost sessile; legumes compressed, glabrous, 4-seeded. 2. H. Native of the island of Melos, in dry places. Flowers pale purple, twice or thrice the length of the calyx. Root creeping.

**Creeping Vetch.** Pl. trailing.

65. *V. globosa* (Roth. obs. 3. p. 39.) leaves tendrilled; leaflets 4-8, pubescent, each ending in a reflexed bristle; stipulas spotted, 4-toothed; flowers solitary, erect, almost sessile; calyceous teeth linear-lanceolate, ciliated; legumes terete, spreading, glabrous; seeds globose. O. H. Native country unknown. Very like *V. sativa*, but differs from it in the stipulas, in the longer calyx, in the form of the legume, and lastly in the fewer leaflets. Flowers blue.

66. *V. pilosa* (Bieb. fl. tur. 2. p. 161.) plant hairy; leaves hardly ciliiferous, upper leaflets linear-lanceolate, acute, or truncate and mucronulate, hairy; stipulas semi-sagittate, a little toothed; flowers solitary, sessile; calyces cylindrical, with linear, parallel, nearly equal segments, length of the tube; style bearded at the apex. O. H. Native of Tauria. Flowers purple. Seeds globose, black.

67. *V. peregrina* (Lin. spec. 1038.) leaves tendrilled; leaflets 10-12, linear, truncate, and mucronate; stipulas semi-sagittate, linear, entire; flowers solitary, pedunculate; calyces campanulate, with lanceolate-linear, nearly equal, diverging segments, which are about the length of the tube; style bearded at the apex; legumes compressed, lanceolate, reticulated, inclined, broad, puberulous; seeds nearly globose. O. H. Native of the south of Europe. Hoppe in Sturm, deutschl. fl. 1. fasc. 32. with a figure. Flowers of a dusky violet colour.

68. *V. melosorum* (Bieb. fl. tur. 2. p. 161. and suppl. 471.) leaves ciliiferous, leaflets linear, retuse, mucronate; stipulas semi-sagittate, entire, small; flowers solitary, almost sessile; style bearded at the apex; legumes pubescent, reflexed; seeds large, globose, brown, with more obscure confluent spots. O. H. Native of Tauria. Flowers purple.

**Large-seeded Vetch.** Fl. June, July. Cit. 1798. Pl. cl.

69. *V. michauxii* (Spreng. cat. hort. hal. cx Willd. enum. 764.) leaflets linear, truncate, mucronate; stipulas lanceolate, undivided; peduncles very short, tufted; calyceous teeth unequal, upper ones very short, lower ones length of the tube; legumes finely pubescent, 3-4-seeded. O. H. Native country unknown. Corolla white. Nearly allied to *V. peregrina*, but the calyces are very distinct.

70. *V. linearifolia* (Hook. in Beech. bot. p. 20.) plant pilose; stems angular; leaves with 5 pairs of linear retuse leaflets; tendrils usually simple, or almost so; stipulas broad, semi-sagittate, toothed at the base, dotless; flowers almost sessile, solitary; calyx campanulate, villous; teeth subulate, about equal; corolla glabrous; legumes hairy. O. H. Native of Chili, about Concepcion. Flowers not half the size of those of *V. sativa*. Like *V. michauxii*.

**Linear-leaffletted Vetch.** Pl. cl.

71. *V. amphiaca* (Dorothy journ. phys. 55. p. 131.) leaves tendrilled; lower leaflets obcordate, mucronate, upper ones linear, retuse, and mucronate; stipulas semi-sagittate, entire or
toothed; flowers solitary, almost sessile; calyxes cylindrical, with equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes reticulated, puberulous, stem ones linear-oblong, inclined, under-ground or root ones ovate, compressed, and short.  O. H. Native of the south of France, in gravelly places. Ger. mag. enc. ann. 6 vol. 3 p. 344. with a figure. D. C. fl. fr. no. 1021. Flowers crimson, hardly the size of those of V. sativa.

72 V. Pyrenaica (Poir. act. toul. 3 p. 333.) leaves tendrilled; leaflets obcordate, mucronate; stipulas semi-sagittate, entire or denticulated; flowers solitary, almost sessile; calyxes somewhat campanulate, with unequal, lanceolate, somewhat spreading segments, which are shorter than the tube; style bearded at the apex; legumes oblong-linear, reticulated, smoothish, and inclined.  2. H. Native of the Pyrenees, in meadows. D. C. fl. fr. no. 4022. icon. rar. 1 p. 10. t. 33. Flowers purplish. Root creeping.

73 V. Lathyrus (Lin. spec. 1037.) plant downy; stems branched; leaves ciliated; leaflets 4-6, elliptic-oblong; lower ones obcordate, tendril simple; stipules semi-sagittate, entire; flowers solitary, sessile; calyx cylindrical, with nearly equal, linear, parallel segments, which are shorter than the tube; style bearded at the apex; legumes compressed, reticulated, glabrous or wrinkled, inclined; seeds globose, dotted with warts.  O. H. Native of the south of Corsica, and in Britain, in fallow fields on a gravelly soil, in chalky pastures, or on banks; about Norwich, and in Hyde-park, also in the King's-park, and various other places round Edinburgh. Sturm, deutschl. fl. 1. fasc. 31. Smith, engl. bot. 50. Oed. fl. 98. Jacc. misc. 2. p. 299. t. 18. E'rvum Solon.sinse, Lin. spec. 1040. Flowers small, bluish, occasionally white.

74 V. L. nigra (Smith, engl. bot. 433. fl. brit. 2 p. 773.) plant quite smooth; stems nearly erect, quadrangular, branched; leaves ciliated; leaflets 6, elliptic-lanceolate, rounded, and mucronate; stipulas green or brownish, cleft; calyx segments linear, equal, about the length of the tube; legumes compressed, short, lanceolate-oblong, quite smooth.  2. H. Native of the south of England, among pebbles by the sea-side, at Weymouth, Dorsetshire. V. hybrida, Huds. fl. angl. 319. Flowers of a whitish or pale blue, seldom yellowish.

75 V. L. leuca (Lin. spec. 1037.) plant pilose; stems branched; leaves ciliated; leaflets elliptic-lanceolate, sometimes retuse, hairy beneath; flowers solitary, almost sessile; calyx segments unequal, diverging, superior ones short, lower ones shorter than the tube; vexillum emarginate, glabrous; style bearded at the apex; legumes compressed, ovate-oblong, finely reticulated, pilose, bent down as it ripens; seeds oval, smooth.  O. H. Native of the south of Europe; in Britain on stony ground, chiefly near the sea; upon the pebble beach at Orford, Suffolk; at Aldburgh; near Weymouth; Shoreham, Sussex; in a chalk pit on the side of Glastonbury Torhill; in Scotland, in Mearnsshire. Sturm, fl. germ. 1 fasc. 31. with a figure. Smith, engl. bot. 481. Corolla pale yellow, rarely white.

Var. B. muricata (Ser. mss. in D. C. prod. 2 p. 363.) fruit muriated.  O. H. Native about Tangers.

76 V. B. sitia (Balb. misc. alt. Pers. ench. 2 p. 508.) stems hairy; leaves ciliated; leaflets linear, mucronate; vexillum glabrous; legumes sessile, solitary, pilose, reflexed.  O. H. Native about Nice, in fields. This plant comes very near V. sitia, but differs in being more hairy, in the leaflets being nar-

VOL. II.

LEGUMINOS.E. CLXIX. Vicia.

flower, and in the flowers being white or very pale cream-coloured.

77 V. hybrida (Lin. spec. 1037) plant pilose; stems branched; leaves ciliated; leaflets obcordate, mucronate; stipulas semi-sagittate, a little toothed; flowers solitary, almost sessile, somewhat deflexed; calyx segments narrow, nearly equal, length of the tube; vexillum emarginate, pilose; style bearded at the apex; legumes lanceolate-oblong, compressed, finely reticulated, pilose, reflexed.  O. H. Native of Europe; in the south of England but very rare; on Glastonbury Torhill. Sturm, fl. germ. 1. fasc. 32. with a figure. Smith, engl. bot. 482. Jacc. hort. vind. 2. t. 146. Flowers pale yellow, streaked a little with red.

78 V. spuria (Rafin. car. p. 73.) stems procumbent, rather angular; leaves with 5-6 pairs of obovate, retuse, mucronate, pilose leaflets; stipulas ovate-lanceolate, spotless; flowers axillary, solitary, pedunculate, drooping; vexillum villous; legumes linear, compressed, 2-4-seeded.  O. H. Native of Sicily, near Palermo, and on mount Etna. Flowers yellowish.

Spurious Vetch. Pl. procumbent.

79 V. pusilla (Muhl. in Willd. spec. 3 p. 1106) upper leaves furnished with long tendril; leaflets usually 6, lanceolate, mucronate; stipulas quite entire, semi-sagittate; peduncule long, solitary, 1-flowered; legumes oblong, small, glabrous.  O. H. Native of Pennsylvania. Perhaps the same as E'rvum te-traspermum. Flowers small, white with a tinge of red.

Small Vetch. Pl. cl.

80 V. ciliaris (Smith, fl. grasc. t. 700. ex prod. 2. p. 71.) leaflets about 7 pairs, emarginate; stipulas setaceous-multifid; peduncules 1-flowered, awned, length of the leaves. 2. H. Native of Asia Minor. Tendril many- parted. End of pedicels drawn out beyond the flower. Flowers pale blue, streaked with purple. Legumes 1 inch long, compressed, 2-seeded.

Ciliated-stipled Vetch. Pl. cl.

81 V. melanops (Smith, fl. grasc. t. 701. ex prod. 2. p. 72.) stems diffuse; stipulas marked with black; wings depressed, incumbent; legumes solitary, reflexed, linear, glabrous. 2. H. Native of Laconia. Flowers of a dull greenish-yellow; their wings, which converge horizontally, tipped with very dark brown. Very like V. hibrida.

Black-marked Vetch. Pl. cl.

82 V. Bactra (Zucc. obs. bot. cent. 1. no. 83. A.) stem 2-edged, striated; leaflets wedge-shaped, retuse; stipulas toothed, upper segments dotted; legumes solitary, almost sessile.  O. H. Native country unknown.

Bactra Vetch. Pl. cl.

§ 5. Flowers almost sessile, twin.

83 V. inceba (Bieb. fl. taur. suppl. p. 471.) leaflets obovate, retuse, mucronate, deeply serrated; stipulas toothed, semi-sagittate; legumes sessile, usually twin, pubescent.  O. H. Native of Tauria. Very like V. sitia, but differs in the leaflets being very deeply cut into 4 opposite serratures on each side. Flowers purple.

84 V. cornut'era (Chaub. in Saint Amans fl. agen. p. 204.) leaflets linear, very narrow, villous; stipulas entire, lower ones semi-sagittate, superior ones lanceolate; flowers almost sessile, twin; vexillum subulate, convolute, spiral.  O. H. Native of sandy places, near Agen. Flowers purple. It is perhaps only a narrow leafletted variety of V. sativa.

Horn-bearing Vetch. Pl. 1 foot.
85 V. canadiensis (Zucc. obs. bot. cent. 1. no. 83.) leaves with 7 pairs of retuse mucronate leaflets; upper stipulas simple, marked above, lower ones ciliately 4-toothed; superior legumes solitary, lower ones twin, and horizontal; seeds globose, lenticiform, yellowish. O. H. Native of Canada. Flowers purple?

Canada Vetch. Pl. cl.

87 V. cordata (Wulf. ex Hoppe in Sturm, deutschl. fl. 1. fasc. 32.) leaves cirrhiferous; leaflets 10-12, oblong-obcordate, mucronate; stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal, somewhat parallel segments, which are about the length of the tube; legumes oblong, rather torulose, puberulous; seeds globose, variegated. O. H. Native of Germany. Flowerspurple. This plant grows very near V. sativa, but still it is very distinct.

87 V. dubania (Schultes, obs. 149.) leaves with 6 pairs of linear-truncate or linear-lanceolate, mucronate, ciliate leaflets; stipulas marked, profusely toothed; flowers usually twin; calyx striated, curved, pubescent, with subulate teeth; legumes glabrous, terete, erect; seeds round, cream-coloured. O. H. Native country unknown.

Dolichof Vetch. Pl. cl.

87 V. sativa (Lin. spec. 1057.) leaves cirrhiferous: leaflets 6-10, obovate, or elliptic-oblong, retuse, mucronate, pilose or smooth: stipulas semi-sagittately-toothed; flowers usually twin, sessile; calyx cylindrical, with lanceolate-linear, nearly equal parallel segments, which are about the length of the tube; style bearded at the apex; legumes compressed, somewhat torulose, oblong, reticulated, erectist; seeds nearly globose, smooth, variable in colour. O. H. Native of Europe, in corn or cultivated fields; plentiful in Britain; also of North America about Fort Vancouver. Flowers purple. This is a very variable plant in the form of the leaflets, in the size of the stems, and in the colour and size of the seeds.

The tare, vetche or fitch, is called in French cece; in German wicke; and in Italian loggio. It has been cultivated for its stems and leaves from time immemorial. Ray, in 1685, informs us that the common tare or vetche was then sown almost all over Europe; that it was chiefly used in England mixed with peas and oats to feed horses, but that it was sometimes sown separately for soiling cattle, and was reputed to cause milch cows to yield much milk. The tare, Brown observes, is of hardy growth, and when sown upon rich land will return a large supply of green fodder, for the consumption of horses or for fattening cattle.

The varieties of the tare are chiefly two, the winter and spring-tare; both have local names, as gore-vetche, rath-ripe-vetche, &c. Professor Martin observes, that there appears a material difference in the constitution of the two plants in question. Not to say any thing of a trifling difference in the colour and size of their seeds, the only visible mark of distinction seems to be a disparity in the first leaves of the upright stalks, which in the spring-tare are elliptical and rounded, or notched at the end, but in the winter-tare linear, and drawn to a point. The leaves of the branches, which afterwards issue below, and in time form the bulk of the plants, are the same in both the varieties. But whatever the difference may be, it is evident that the seeds of the two sorts ought to be kept separate, since each sown out of its proper season is found not to prosper. Numerous other species of Vicia might be cultivated with advantage, as the V. Narbonensis and V. serratifolia, which are cultivated in Germany. Dr. Anderson has recommended the V. sepium, and a writer in the Bath Agricultural Transactions the V. cracca.

In choosing between the spring and winter tare every thing must depend on the intention of the crop. If the object is to have early food, the winter variety is undoubtedly to be preferred; but where the land is poor, and requires to be two or three times ploughed in spring, or where a late crop is desired, or a crop for seed, then the spring variety will generally deserve the preference. The soil preferred by the tare is clay; but it will grow in any rich soil, not over dry. In a moist climate, the haulm grows so luxuriant as to rot at the bottom, and in one over dry it is deficient of strength. A dry season is upon the whole more favourable than a moist one, as the crop soon covers the surface.

The preparation of the soil seldom consists of more than one ploughing if for autumn sowing, and of a winter and spring ploughing when to be sown in spring. If in the latter case the land is very foul, several ploughings are given. In general tares succeed some of the corn crops. In England, manure is sometimes given, either with a view to eating them off early, and following with a crop of turnips, or to the enriching the soil for a crop of wheat.

The time of sowing depends on the kind of tare, and the purpose in view. The winter variety is sown in September and October, and the first sowing in spring ought to be as early as the season will permit. If they are to be cut green for soiling throughout the summer and autumn, which is the most advantageous method of consuming them; successive sowings should follow till the end of May. Summer tares, when meant for seed, ought to be sown early, otherwise the return will be imperfect, but when for green food any time between the first of April and the end of May will answer, provided crops in succession from the first to the last mentioned period be regularly cultivated. In Middlesex, the winter sowing is commenced about the beginning of August; in the northern counties no winter sowings are made, as the tare there will not endure the severity of that season.

The mode of sowing tares is mostly broad-cast, which should be performed as early as possible over well prepared land, the seeds being afterwards covered in by proper harrowing. It has been suggested, that in rich soil it is probable the row method would succeed well with this sort of crop, as Marshal states is the practice in some of the southern districts of the island. After the seed is sown, and the land carefully harrowed, a light roller ought to be drawn across, so that the surface may be smooth, and the seythe permitted to work without interruption. It is proper also to guard the field for several days against the deprivations of pigeons, who are remarkably fond of tares, and will pick up a great part of the seed unless constantly watched.

The quantity of seed to an acre is from $\frac{3}{4}$ to $\frac{3}{4}$ bushels, according to the time of sowing, and as they are to be consumed green or left to stand for a crop. When tares are intended for seed less seed is required. A writer in the Farmer’s magazine, vol. 1. has suggested that the most productive manner of sowing this crop when intended for seed, is to mix them amongst beans when drilled, at the rate of one flit of tares to one bushel of beans, and by this means the quality of tares is vastly improved, as by clinging to the beans they are kept from the ground, and enjoy the full benefit of the sun in ripening them in the most perfect
manner. The beans at the same time answer for bands to tie the principal crop, and the produce in this way on an average of seasons is considered at least double. A little rye sown with the winter-tares, and a few oats with the spring-tares, not only serves to support the weak climbing stems, but adds to the bulk of the crop, by growing up through the interstices.

In the choice of the seed. It is hardly possible to distinguish the grain of the winter from that of the spring variety; the former is said to be rather smaller and lighter coloured, but the only reliance must be on the honesty of the vendor.

The after culture given to tares, consists merely in pulling out the larger weeds, unless they are in rows, in which case the horse or hand-hoe is applied; or intended for seed, in which case the weeding must be more particularly executed.

In reaping tares for soiling, they ought always to be cut with the scythe, as the sickle by breaking asunder the stalks, and tearing up a number of the roots, renders the second crop of little value. When sown early, they will sometimes produce three mowings, but generally two. In reaping tares for seed, they may be either mown or cut down with the sickle, and treated like peas in drying, stalking, and threshing.

Tares are eaten off the ground in some places by different kinds of live stock, particularly by sheep; and as the winter-sown variety comes very early in spring, the value of this rich food is then very considerable. The waste, however, in this way must be very great, even though the sheep be confined by hurdles, and must be still greater when consumed by horses or cattle.

Tare crops are sometimes made into hay, in which case great attention is necessary in drying it properly. The best time for cutting tares for hay is when the blossoms have begun to decline and the tares begin to fall and lie flat. When well made the hay is of the best and most nutritious properties.

The produce of tares cut green is, according to Middleton, 10 to 12 tons the acre, which is a large crop, and when made into hay about 3 tons the acre, which shows the disadvantage of making these crops into hay. And it is found that the spring-tare crops are lighter and more likely to be injured by a dry season.

The produce in seed is likewise found to be considerable, being by some stated to be at from 3 to 6 sacks, but in other instances 40 bushels or more have been obtained from the acre.

In the application of tares they are found to be a most nourishing food for all sorts of cattle. Cows give more butter when fed with this plant than with any other food whatsoever. Horses thrive better upon tares than they do upon clover or rye-grass; and the same remark is applicable to the fattening of cattle, who feed faster upon this article of green fodder than upon any kind of grass or esculent plant whatever. Danger often arises from their eating too much, especially when the tare is podded, as colics and other stomach disorders are apt to be produced by the excessive loads which they devour, in consequence perhaps of the great quantity of fixed air contained in the plant. When the tares are over succulent, fewer dangers would follow if the tares were mixed with oat-straw in the stalls. If the plants are cut green and given to live stock, either on the field or in the fold-yards, there is perhaps no green crop of greater value, nor any better calculated to give a succession of herbage from May to November. The winter-sown tare, in a favorable situation, is ready for cutting before clover. The first spring crop comes in after the clover must be all consumed or made into hay, and the successive spring sowings give a produce more nourishing for the larger animals than the after math of clover, and may afford green food at least a month longer. In the county of Sussex, Young observes, "tare crops are of such use and importance, that not one-tenth of the stock could be maintained without them; horses, cows, sheep, hogs, all feed upon them; hogs are soiled upon without any other food. This plant maintains more stock than any other plant whatsoever. Upon an acre, Davies maintained 4 horses in much better condition than upon 5 acres of grass. Upon 8 acres he has kept 12 horses and 5 cows for three months without any other food whatever. No artificial food is equal to this excellent plant." This statement must be coupled with the usual produce of turnips in Sussex, 10 or 15 tons per acre, hence the superiority of tares to every other green crop. Tares cut green, Professor Thayer observes, draw no nourishment from the soil whatever, while made into hay they afford a fodder preferred by cattle to pea-straw, and more nutritive than hay or any other herbage.

The use of the grain of tares, is usually for sowing; but they are also given to pigeons, by whom they are highly relished, and it is thought they would form a very good food for poultry. In Germany they are given to horses, cows, sheep, and swine.

The diseases of tares are so few as to be of no consequence. A crop is sometimes, but rarely, lost by the mildew.

Common or Cultivated Vetch or Tare. Fl. May, July, Britain. Cl. XVII. P. 260. CLXIX.

Narrow-seeded Vetch. Fl. May, June, Britain. Cl. 90 V. GLabra (Schleisch. ex pl. exsic.) leaflets oblong-ovate, rather truncate and mucronate, glabrous, as well as the legumes and calyxes; the rest as in V. sativa. o. H. Native of Switzerland, in fields. V. sativa, var. ε, glabra, Ser. in D. C. prod. 2. p. 261. Flowers purple.

Glabrous Vetch. Fl. May, July. Clt. 1819. Pl. cl. 91 V. BOBARTI (Forst. in Lin. trans, vol. 16. p. 442.) leaves cirrhiferous, rather hairy; leaflets 6-7 linear, lower ones obcordate; stipulas small, narrow, toothed, with a pale depression beneath; flowers solitary, nearly sessile; legume nearly upright, narrow, downy; finally blackish; seed globose, smooth. o. H. Native of England, in grassy pastures, on a chalky or gravelly soil; in Essex; on Shotover-hill, Oxfordshire; in Stow wood; in Hyde-park; among the grass in Richmond Gardens; also in Scotland. V. angustifolia, Smith, engl. fl. 3. p. 382. V. angustifolia, β, Pers. V. lathyroides, Dicks. V. lathyroides, β, Huds. V. sativa, γ, Smith, fl. brit. 770. Flowers crimson, white at the keel and lower edge of the wings.

Bobart's Vetch. Fl. May, July, Britain. Cl. 92 V. LEUCOSPERMA (Moench. meth. 148.) leaves cirrhiferous; leaflets 10-12, obcordate, pilose or glabrous; stipulas semi-sagittately toothed; flowers usually twin, sessile; calyx cylindrical, with linear-lanceolate, nearly equal segments; legumes somewhat torulose; seeds globose, white, or yellow. o. H. Native of Europe. V. alba, Moench. meth. 148. Flowers white or purple.

White-seeded Vetch. Fl. May, July. Clt. 1810. Pl. cl. 93 V. GRANDIFLORA (Scop. fl. carn. 2. p. 65. t. 42.) leaves cirrhiferous; leaflets obcordate, mucronate, 10-12, approximate; stipulas ovate; flowers usually twin, inclined; calycine segments nearly equal, length of tube; vexillum obovate, mucronulate; style bearded at the apex; legumes oblong, com-
pressed, glabrous, brown; seeds globose, blackish red. H. Native of Carniola, and other parts of Europe. Flowers large, yellow. The vexillum edged with red.

Great-flowered Vetch. Fl. June, July. Cl. 1818. Pl. cl. 94 V. so'bridea (Walld. et Kt. pl. rar. hung. 2. p. 133. t. 153.) stems branched; leaves ciliatious; leaflets 10-12, obovate, retuse, mucronate; stipulas semi-sagittate, entire, spotted; flowers usually two, inclined; calyx cylindric; the segments hardly unequal, linear, a little shorter than the tube, parallel; vexillum large, somewhat obcordate and mucronulate; style bearded at the apex; legumes lanceolate, compressed, declinate, smoothish, reticulate; seeds somewhat globose. H. Native of Hungary. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers large, yellow tinged with green, pedicellate.

Var. β, rotundata (Ser. ms. in D. C. prod. 2. p. 363.) leaflets roundish-obcordate.

Sordid-flowered Vetch. Fl. June, July. Cl. 1802. Pl. cl. 95 V. Biebrerstenchi (Besser, in Bieb. fl. taur. suppl. 492.) leaves ciliatious; leaflets 8-10, linear, rather truncate and mucronulate; stipulas semi-sagittate, lanceolate, spotted; flowers usually two; calyx cylindrical, with hardly unequal, linear segments, which are a little shorter than the tube; legumes nearly sessile, usually solitary and spreading, glabrous. H. Native of Podolia. V. sórdida, Bieb. fl. taur. 2. p. 161. exclusive of the synonymes. Flowers yellow.

Biebrersten's Vetch. Fl. June, July. Cl. 1829. Pl. cl. 96 V. línea'ýta (Bieb. fl. taur. suppl. 478.) leaflets linear-elliptic, pilose; stipulas spotted, lower ones deeply toothed; flowers usually two, almost sessile; calyce teeth broadish, shorter than the tube, glabrous; style bearded at the apex; vexillum glabrous, linear; legumes very pilose. H. Native of Tauria. Flowers pale yellow?

Lined-flowered Vetch. Pl. cl. 13 foot.

97 V. biparti'ta (Moench. meth. p. 149.) leaves ciliatious; leaflets 5-7, linear, obtuse, acuminate; stipulas lanceolate, bipartite; peduncle two, linear, longish; calyce teeth lanceolate; legumes terete, glabrous, 6-8-seeded. H. Native country unknown.

Bipartite-stipled Vetch. Pl. cl.

98 V. Bál'ca (Moench. meth. p. 148.) leaflets oblong, obtuse, and mucronulate; stipulas semi-lunate, toothed; flowers two; leaflets erect, smooth; calyx glabrous; seeds somewhat compressed, olive-coloured. H. Native country unknown.

Baica Vetch. Pl. cl.

99 V. Be'color (Wild. enum. suppl. p. 51. ex Horn. hort. hafn. suppl. p. 81.) leaflets oblong, obtuse; stipulas subulate, with one tooth at the base; peduncles naked, usually two or shorter than the leaves. H. Native country unknown. Flowers mixed with purple and white.

Two-coloured-flowered Vetch. Fl. Ja. Aug. Cl. 1820. Pl. cl. 98. 6. Flowers almost sessile, 2-4-together, on very short pedicels, or few flowers on very short pedicelles.

100 V. tre'icolor (Sebast. et Mauri, prod. fl. rom. p. 245. t. 4.) stems simple; leaves ciliatious; leaflets numerous, oblong, retuse, and mucronulate, villous; stipulas semi-sagittate, lanceolate, spatulate; flowers 2-together, inclinate; calyx obliquely-compressed, with unequal, diverging teeth, which are shorter than the tube; vexillum dotted with rust colour; style bearded at the apex; legumes lanceolate, glabrous, ciliated, reflexed. H. Native about Naples. Vexillum yellowish. Wings purplish.

Var. ω, obcordáta (Ser. in D. C. prod. 2. p. 364.) leaflets obcordate, truncate, clothed with silky villi beneath.

Var. β, oblongá (Ser. 1. c.) leaflets oblong, somewhat truncate, and mucronulate.

CLXIX. Vicia.

Three-coloured-flowered Vetch. Fl. Ju. Aug. Cl. 1818. Pl. cl. 101 V. sé'pium (Lin. spec. 1038.) stems branched; leaves ciliatious; leaflets 10-12, ovate, retuse, and somewhat mucronulate, hairy, ciliatious; stipulas semi-sagittate, lower ones toothed, each marked with a brown spot; flowers 3-4-together, leaning one way; calyx hairy, tubular, with unequal teeth, which are deflexed at the apex and shorter than the tube; style bearded at the apex; legumes smooth, lanceolate-oblong, inclinate, a little ciliated, reticulate; seeds globose, smooth. H. Native of Europe, in shady places. In Britain in thickets and under hedges, common. Sturm, fl. germ. 1. fasc. 31. with a figure. Smith, engl. bot. 1515. Oed. fl. dan. 699. Riv. tetr. irr. t. 56. Flowers dull bluish purple. This plant shoots earlier in spring than any other plant eaten by cattle, vegetables in the autumn, and continues green all the winter. A patch sown in drills in a garden was cut five times in the course of the second year, and produced at the rate of 24 tons an acre of green food, which when dry would weigh near four tons and a half. Though palatable to all kinds of cattle, it would be difficult to cultivate on a large scale, the seeds being generally devoured by the larvae of a species of Atellatus, which larvae are the prey of a species of ichneumon.

Var. α, ochroleuca (Bast. suppl. no. 8. D. C. fl. fr. 5. p. 58.) flowers cream-coloured.

Var. γ, subrötulá (Ser. ms. in D. C. prod. 2. p. 364.) leaflets ovate-rounded; flowers violaceous.

Var. ε, capóll嗣a (Ser. 1. c.) leaflets obcordate, similar in shape of the pods to Capáll嗣a; flowers 1-3-together, white? Native of the Levant.

102 V. Panuño'ica (Jacq. fl. aust. t. 34.) plant pilose; stems simple; leaves ciliatious; leaflets oblong, mucronate; stipulas lanceolate, marked; flowers from 2-4-together, inclinate, almost sessile; calyce segments setaceous, nearly equal, length of the tube or longer; vexillum pilose and emarginate; style bearded at the apex; legumes oblong-lanceolate, compressed, pilose, deflexed. H. Native of Hungary and Austria. Sturm, fl. germ. 1. fasc. 31. with a figure. Flowers dirty white.

103 V. stria'ta (Bieb. fl. taur. 2. p. 162.) plant beset with hairs; leaves ciliatious; leaflets elliptic, oblong, acute, clothed with silky pili beneath; stipulas lanceolate, marked; vexillum clothed with silky pili; legumes pedunculate, 2 or 3-together, reflexed, clothed with silky pili. H. Native of Tauria. Viscidoltes hirsuta, Moench. meth. 137. V. Panuño'ica β, Wild. spec. 3. p. 1107. V. purpureácesa, D. C. hort. monsp. 155. V. Panuño'ica β, purpureácesa, Ser. in D. C. prod. 2. p. 364. Flowers violaceous and streaked, wings and keel paler.

Var. β, lineári'folia; flowers purple; leaflets linear-oblong, mucronulate. V. Panuño'ica γ, lineári'folia, Ser. 1. c.

104 V. trúncal'tula (Fisch. cat. hort. gornik. 1812. p. 72. ex Bieb. fl. taur. suppl. p. 473.) stems almost simple, striated, glabrous; leaflets elliptic, truncate, and mucronulate at the apex, puberulous, with numerous diverging nerves; tendrils almost obsolete; stipulas semi-sagittate, ovate, small, acuminate; peduncles almost sessile, few-flowered; calyx pilose, black, with nearly equal teeth, which are shorter than the tube; style bearded; legumes lanceolate. H. Native of Caucasus. Flowers cream-coloured. This plant is nearly allied to V. sé'pium, but with the leaves impari-pinnate, as in V. Cassióbica.

Var. ω, glabrísēcula (Ser. in D. C. prod. 2. p. 364.) plant less pubescent, teeth of calyx short and rather spatulate. Native of Iberia.

§ 7. Annual plants, with broad leaflets, resembling the common bean.

105 V. Narbonensis (Lin. spec. 1038.) stem tetragonal, striated, quadrilaterally pilose; leaves ciphriforous; leaflets ovate, entire; stipulas semissagittately toothed, ciliated, lower ones entire; flowers 2-3-2-together, on short pedicels; calyx campanulate, with ovate, 3-nerved segments, having the sides reflexed above; style bearded at the apex; legumes oblong, compressed, obliquely reticulated, glabrous, with ciliately- serrated sutures; seeds nearly globose. ☞ H. Native of the south of Europe. Flowers dark purple. Knor. del. 2, t. L. 1. Riv. tetr. t. 40. This plant might be cultivated with advantage as tares. Leaflets 4.

106 V. serratifolliola (Jacq. fl. aust. append. t. 8.) stem tetragonal, striated, pilose; leaves ciphriforous; leaflets ovate, serrated; peduncles short, 2-3-flowered; stipulas toothed; calyx campanulate, with ovate, 3-nerved segments, which are inflexed at the sides above; style bearded at the apex; legumes lanceolate, compressed, with ciliately-serrated sutures; seeds nearly globose. ☞ H. Native of Austria and Hungary. Sturm, fl. germ. 1. fasc. 23, with a figure. Flowers deep purple. V. Narbonensis var. a, serratifolliola, Ser. in D. C. prod. 2, p. 365. Very like V. Narbonensis, but differs in the serrated leaflets.

107 V. pratcycanos (Roth. abendl. t. 1.) leaflets ovate, toothed at the apex; stipulas ciliately toothed; style bearded at the apex; legumes almost sessile, solitary, compressed, a little inflated; seeds with scabrous margins. ☞ H. Native country unknown. Flowers deep purple. J. Bauh. hist. 2, p. 286. with a figure. Perhaps only a variety of V. Narbonensis. Leaflets 2 or 4.

108 V. monadelphus (Roth. cat. bot. part 2, p. 27, ex Poir. dict. 8, p. 568.) leaves ciphriforous; leaflets oval, repand-toothed; stipulas semi-lunate, lanceately-toothed, upper ones entire at the apex; peduncles 1-flowered; calyx segments unequal, 2 superior ones lanceolate, and rather falcate, lower one very long and linear, and ciliated at the apex; legumes terete. ☞ H. Native of America. Flowers deep purple.

† The names of species mentioned in various garden catalogues, but not described. Most of them are probably synonymous with those described above.

1 V. Baticca, Fisch. 2 V. Coris, Thouin. 3 V. ferruginea, Bess. 4 V. gracillimus, Russell. 5 V. hirsuta, Fisch. 6 V. hirsutissima, Cyrril. 7 V. Maspina, Boeae. 8 V. nodosa, Fisch. 9 V. Thibaudi, Martius. 10 V. terulosa, Desf. 11 V. Virginica, Martius.

 Cult. The species grow in any common soil. The perennial ones are increased by dividing the roots or by seeds. The seed of the annual kinds only require to be sown in the open border in spring. All those belonging to the first division of the genus are worth cultivating for the beauty of their blossoms.

LIN. SYST. Didelphin, Decandria. Calyx 5-leaf, with linear acute segments, about equal in length to the corolla. Stigma glabrous. Legume oblong, 2-3-seeded.

E. Le's (Lin. spec. 1039.) stems branched; leaflets oblong, usually 8, nearly glabrous; stipulas lanceolate, ciliated; tendrils nearly simple; peduncles 2-3-flowered, about equal in length to the leaves; legumes broad, short, somewhat truncate, finely reticulated, glabrous, 2-seeded; seeds compressed. ☞ H. Native of Europe, in corn-fields. Sturm, fl. germ. 1. fasc. 32, with a figure. Riv. tetr. irr. t. 35. L'ens esculet, Mouch. Meth. p. 131. Cicer punctulatum, Hortul. Flowers small, pale blue, with the vexillum veined. There are varieties of this plant with fulvous, bay-coloured, and black seeds, varying in size. The lentil is called Les lentils in French, Lentzen in German, and Lenticeca in Italian. It is a legume of great antiquity, being in esteem in Eavan's time, and much prized in eastern countries ever since. In Egypt and Syria the seeds are parched in a frying-pan and sold in the shops, and considered by the natives as the best food for those who undertake long journeys. The lentil is considered a native of France, but has been known in England from the earliest agricultural records. In Hampshire's time they were sown for the same their baulm given to cattle, and the grain to pigeons, and used in meagre soups.

There are three varieties of lentil cultivated in France and Germany; the small brown, which is highest flavoured, and the best for haricots and soups; the yellowish, which is the largest and the next best; and the Lentil of Provence, which is almost as large as a pea, with luxuriant straw, and more fit to be cultivated as a tare, than for the grains as human food. A dry warm sandy soil is requisite for the lentil; it is sown rather later than the pea, at the rate of a bushel or a bushel and a half per acre, in lands, in which the other sorts of cereals and vegetables are the same, and it ripens sooner. The lentil, Young observes, is a crop not uncommon about Chesterford, in Essex, where they sow a bushel an acre on one ploughing in the beginning or middle of March. It is there the custom to make hay of them, or seed them for cutting into chaff for rough-meal for sheep and horses, and they sow them on both heavy and dry soils. It is, however, added, that the whole county is of a calcareous nature. It is likewise stated, that attention should be paid not to water horses soon after eating this sort of food, as it is apt to have them. They are likewise asserted to be cultivated for the same purposes in Oxfordshire, and probably in other districts. The produce of the lentil in grain is about one-fourth less than that of the tang, and in straw it is not a third as much, the plants seldom growing above 1 or 1½ foot in length. The straw is, however, very delicate and nourishing, and preferred for lambs and calves, and the grain on the Continent sells at nearly double the price of peas. Einhoff obtained from 3840 parts of lentils, 1260 parts of stalk, and 1455 of matter analogous to animal matter.

The use of the lentil on the Continent is very general, and particularly by Roman Catholics in time of Lent, both in soups and dressed in butter sauce as haricots. They are imported from Hungary and sold in London for the same purposes.

2 E. nigricans (Bieb. fl. taur. 2, p. 164.) plant pubescent; leaflets oblong; stipulas semi-sagittate, denticulated at the base; tendrils nearly obolate; peduncles usually 2-flowered, longer than the leaves; calyx segments rather diverging, subulate, longer than the corolla; tube of calyx very short; legumes black, glabrous, 2-seeded; seeds black. ☞ H. Native of the south of Tauria and of Lucania. E. lentoides, Tenor. prod. suppl. 2, p. 68, and cat. 1819, p. 56. Flowers pale blue.

3 E. Lentcula (Schreb. herb. ex Sturm, fl. germ. 1. fasc. 32, with a figure) leaflets oblong-linear; stipulas small, lanceolate, acute; tendrils almost wanting; peduncles 1-flowered, longer than the leaves; calyx segments lanceolate-linear, equal, ciliated; legumes somewhat ovate, compressed, rather

4 E. victorideae (Desf. fl. atl. 2. p. 108. t. 198.) plant hairy; leaves ciliiforous, with many leaflets; leaflets oval-oblong, obtuse, and mucronate; stipulas subulate; peduncles few-flowered; calyx very pilose, with the segments longer than the tube; legumes hairy, rhomboid, reticulated, 2-seeded; seeds roundish, black. ○ H. Native of Algiers, in hedges. E. viciciforme, Spreng. syst. 3. p. 270. Corolla pale blue, twice the length of the calyx.

Fetch-like Lentil. Pl. cl.

5 E. insignis (Lin. spec. 1039.) leaves ciliiforous; leaflets linear, retuse, mucronulate; stipulas semi-sagittate, narrow; peduncles 3-4-flowered, shorter than the leaves; calycine segments lanceolate-linear, equal, longer than the tube; legumes oblong, compressed, rather truncate, hairy, finely reticulated, nodding, 2-seeded; seeds globose, variegated. ○ H. Native of Europe, in cultivated fields; plentiful in Britain: also of North America, at Fort Vancouver. Sturm, fl. germ. 1. fasc. 32, with a figure. Smith, engl. bot. 971. Curt. fl. florid. 54. Oed., pl. cl. 639. V. Michelli, Rafin. ex E. Prow. 2. p. 224.

D. C. pro. 2. p. 360? Flowers small, pale blue, or almost white. This is a very troublesome weed in corn-fields; in wet seasons whole crops are overpowered by it. All sorts of cattle will eat it. In some parts of England it is known by the name of Tine-tare.

Cochin-china Lentil. Pl. 2 feet.

7 E. terrosus (Tenore, fl. cap. prod. append. 5. 1826.) leaves ciliiforous, with 8 pairs of linear-lanceolate, truncate, rather mucronate, glabrous leaflets; peduncles awned, 4-8-flowered, much shorter than the leaves; calycine segments lanceolate-linear, equal, pubescent, and about the length of the corolla; legumes glabrous, ovate, truncate, inflated, reticulated; seeds bay-coloured. ○ H. Native of Naples, in hedges. This plant differs from E. dispersum in being smooth, and in the peduncles being many-flowered.

Terrone's Lentil. Pl. cl.

8 E. dispersum (Roxb. in Willd. enum. p. 766.) leaflets linear-lanceolate, pubescent; peduncles 2-flowered, awned; legumes glabrous, 2-seeded. ○ H. Native of the East Indies. Peduncles and calyces pubescent.

9 E. camelorum (Spreng. syst. 3. p. 270.) peduncles 1-flowered, nodding, awned; legumes 2-seeded, glabrous; leaves pubescent, upper ones ciliiforous, with 6-8 pairs of leaflets, lower ones oblong, upper ones linear, mucronate. ○ H. Native country unknown.

Camel's Lentil. Pl. cl.

Sect. 11. ERVILLA (an alteration from the generic name). Ser. miss. in D. C. prod. 2. p. 366.—Ervilia, Link. enum. vol. 2. Legumes somewhat inflated, oblong-linear, 4-6-seeded.

10 E. ervilia (Lin. spec. 1040.) plant glabrous; leaves ciliiforous; leaflets numerous, oblong, mucronulate; flowers usually twin, pedunculate; stipulas sub-lanceolate, toothed; calycine segments equal, very narrow, much longer than the tube; legumes torulose, 4-seeded, glabrous, transversely and finely reticulated; seeds roundish, angular. ○ H. Native of the south of Europe, in cultivated fields. Sturm, fl. germ. 1. fasc. 32, with a figure. Riv. tetr. irr. t. 6. Blackw. icon. t. 205. v. 3. Eria Ervilia, Willd. spec. 3. p. 1103. Ervilia sativa, Link. enum. 2. p. 240. Flowers pale purple. The seeds of this plant ground into flour are sometimes used in medicines abroad, and the green herb is employed for feeding cattle in some countries, but the plant is not worth cultivating for that purpose in England.

11 E. monanthos (Lin. spec. 1040.) stems tufted, simple; leaflets numerous, linear, truncate, and mucronulate; tendrils almost simple; stipulas unequal, one of which is linear-lanceolate, and entire; the other very narrow, and fringed; peduncles 1-flowered, about equal in length to the leaves; calycine segments linear, equal, longer than the tube; legumes oval, compressed, glabrous, with transverse reticulated veins, torulose, 3-4-seeded. ○ H. Native of the south of Europe. Sturm, fl. germ. 1. fasc. 32, with a good figure. Vicia articulata, Wild. spec. 3. p. 1109. Lathyrus monanthis, Wild. enum. 750. but not of his spec. pl. Vicia multifida, Wallr. fl. hal. suppl. 3. p. 85. Flowers purple, with blue veins.

12 E. tetragamos (Lin. spec. 1039.) stems tufted, branched; leaves ciliiforous; leaflets 4-6 pairs, oblong, bluntish; stipulas linear, mucronulate; stipulas lanceolate, semi-sagittate; peduncles 1-flowered, but usually 2-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, glabrous, nerveless, rather torulose; seeds nearly globose, black. ○ H. Native of Europe, in cultivated fields; also of North America, in grassy meadows. Sturm, fl. germ. 1. fasc. 32, with a good figure. Curt. florid. 1. t. 55. abr. 15. Smith, engl. bot. 1223. Oed. fl. dan. t. 95. Flowers very pale grey. The keel tipped with deep blue.

Var. b. phyllocarpum (Ser. miss. in D. C. prod. 2. p. 367.) leaflets numerous, transformed into legumes.

13 E. gracile (D. c. hort. monsp. 109. et fl. fr. 5. p. 581.) stems ascending, angular, with the angles pubescent above; tendrils simple; leaflets 6-8, linear-lanceolate, acuminate, rather pubescent; stipulas semi-sagittate, entire, narrow; peduncles 3-flowered; flowers second, pendulous; calycine teeth unequal, 2-superior ones short, broad, and a little recurved, the lower 3 equal, awl-shaped, and acute; corolla one-half longer than the calyx; legumes pendulous, compressed, torulose, glabrous; seeds of a testaceous colour, nearly globose. ○ H. Native of France and Spain, in corn-fields. Vicia gracilis, Lois. fl. gall. p. 460. f. 15. E. tenuiflorum, Lagase. nov. gen. p. 22. E. tenuissimum, Pers. ench. 2. p. 309. E. longiflorum, Tenor. prod. 59. Vicia laxiflora, Brot. phyt. 123. E. tetraspermum b. gracile, Ser. Flowers white, having the vexillum streaked with purple or red.

14 E. pubescens (D. c. hort. monsp. 109. et fl. fr. 5. p. 582.) stems tufted, branched; leaves ciliiforous; tendrils forked; leaflets 4-6, elliptic, mucronulate; stipulas linear; peduncles 1-flowered, filiform; calycine segments unequal, broadish, shorter than the tube; legumes oblong, compressed, rather villous, nerveless, and a little torulose. ○ H. Native of Provence, and about Naples. Flowers purplish.

Var. b. leiodorum (Moricand, herb.) legumes glabrous; stems smaller. Native about Naples.

15 E. losleevii (Bieb. fl. tanr. suppl. p. 475. exclusive of the synonyme of Lois.) leaflets oblong-linear; lower stipulas semi-hastate, upper ones subulate; peduncles usually 2-flou.
ered, shorter than the leaves; teeth of calyx setaceous, longer than the tube; legumes glabrous, 4-seeded; seeds globose.  

H. Native of Tauris. This is perhaps nothing else but E. transpernum.

Loiseleur's Lentil. Pl. cl.

16 E. arista'tum (Rafin. prec. p. 38. and in Desv. journ. bot. 1814. p. 270.) stems weak, angular; leaves with 3 pairs of linear acute leaflets; tendrils simple; peduncles axillary, very long, awned, and for the most part bearing 2 flowers each; legumes 2-6-seeded.  

H. Native of Sicily, on mount Etnea, and near Messina.  

Awned-peduncled Lentil. Pl. cl.

17 E. diaphyllum (Besser in Balb. cat. hort. 1813. append. p. 11.) leaflets unknown; stipulas lanceolate; tendrils obsolete, having 2, rarely 4 leaflets; peduncles 1-flowered, longer than the leaves; legumes finely pubescent.  

Two-leaved Lentil. Pl. cl.

18 E. vari'um (Brot. ii. l. 2. p. 152.) leaflets linear, atehish, pubescent beneath; peduncles 3-4-flowered; legumes glabrous; seeds 4-5, globose.  

H. Native of Portugal, about Coimbra. Flowers purplish?  

Variable Lentil. Pl. cl.  

Cult. None of the species of this genus are worth cultivating unless in botanical gardens. The seeds of them only require to be sown in the open border in spring.

Linn. syst. Diadēphila, Decândria. Calyx with foliaceous segments, the 2 superior ones shorter. Vexillum ample, reflexed. Style compressed, carinated, villous above. Legume oblong, rather compressed, but not winged. Seeds globose, numerous, with a roundish hylum.—Annual herbs, with abruptly-pinnate ciliiform leaves, having 3 pairs of leaflets, and large foliaceous stipulas.

1 P. sati'um (Lin. spec. 1026.) petioles terete, bearing 3 pairs of ovate, entire, glaucescent leaflets, with undulated margins, usually opposite and mucronulate; stipulas ovate, somewhat cordate, crenated at the base; peduncles 2 or many-flowered; legumes rather fleshy.  

H. Native of the south of Europe, and now cultivated in fields and gardens throughout the world. Lam. ill. 633. Flowers white or red.

Var. a, se'charatum (Ser. mss. in D. C. prod. 2. p. 368.) stem tall; legumes rather coriaceous, between terete and compressed; seeds globose, distant. Lam. ill. 633. Tourn. inst. t. 215. Called in France Petits-pois and Pois-sucre, and in England sugar-pea.

Var. b, macrocarpum (Ser. l. c.) stems large; legumes large, falcate, very much compressed, not coriaceous, every part edible; seeds large, distant. Pism sine cortice duriore, C. Bahn. pin. 343. Called in France Pois-gouius, Pois-sans-parchemin, and Pois-mange-tout.

Var. ε, latifolii (Poir. dict. 5. p. 436.) stem weak, dwarf; legumes smaller, rather coriaceous; seeds approximate; roundish. P. humile, Mill. dict. no. 2. Called in French Pois-nains, and dwarf-pea in English.

The varieties of the pea are variously numerous, but the following are the names of the principal sorts cultivated in gardens.

1 Early Charlot; an excellent early sort, nearly equal to the genuine frame.

2 Nimble-tailor; an excellent early kind.

3 Early golden-Charlot.

4 Early Nickel's golden-Charlot.

5 Common-Charlot.

6 Early single-blossomed.

7 Reading Hotspur; long pods.

8 Dwarf marrowfat; large long pods.

9 Tall marrowfat; large long pods.

10 Green marrowfat or Patagonian.

11 Knight's wrinkled or marrow; a white-blossomed, tall luxuriant grower; the seeds of excellent flavour, cream-coloured and shrivelled when ripe and dried.

12 Spanish moratto; rather large.

13 Prussian blue; a great bearer.

14 Egg; rather large.

15 White rouncewell; large fine pods.

16 Green rouncewell; large fine pods.

17 Grey rouncewell; large fine pods.

18 Tall sugar; large crooked pods.

19 Dwarf sugar.

20 Bishop's dwarf; a very excellent early prolific kind.

21 Crown or rose; a tall strong grower, producing its blossoms and fruit in an umbel at the top of each peduncle.

22 Leadman's dwarf; a great bearer, but small in the pods; good for a late crop, or as required for succession.

23 Spanish moratto; of low growth and small pods.

24 Early dwarf-frame; the best kind for forcing.

The pea has been cultivated in this country time immemorial. It was not, however, very common in Elizabeth's time, when, as Fuller informs us, peas were brought from Holland, and were "fit dainties for ladies, they came so far, and cost so dear." The use of the pea in cookery is familiar to every one. In one variety, called the sugar-pea, the inner tough film of the pods is wanting, and such pods when young are frequently boiled with the seeds or peas within them, and eaten in the manner of kidney-beans. This variety is comparatively new, having been introduced about the middle of the 17th century.

Estimate of sorts. The varieties, besides differing in the colour of the blossoms, height of stalks, and mode of growth, are found to have some material differences in hardiness to stand the winter, time of coming in, and flavour of the seeds. The Charlton is not only very early, but great bearers, and excellent peas for the table, and are therefore equally well fitted for the early crop, and forward succession crops, and inferior to few even for the main summer crops. The frame-pea may, indeed, be raised without the assistance of heat for a forward crop, and if a genuine sort will fruit a few days sooner than the Charlton, but it grows low and bears scantily. The Hotspur is hardy and prolific, and makes returns nearly as quick as the Charlton, and about a fortnight before the marrowfat. Bishop's dwarf-pea is an early kind and a great bearer. The sorts already specified, therefore, embrace the best for sowings made from the end of October till the middle of January, and for late crops raised between the middle of June and the beginning of August.

The fine flavour of the marrowfat is well known. A few dwarf marrowfats may be sown in December and January, as mild weather may occur; but the time for sowing full crops of the larger kinds of peas, is from the beginning of February till the end of April. Knight's pea and Bishop's dwarf; two of the hardest varieties, are very prolific, and retain their fine sweet flavour when full grown. The egg, the maratto, the Prussian blue, and the round-clove, the large sugar, and the crown, are
all very fine eating peas in a young growth, and like the narrow-fat may be sown freely according to the demand, from the third week of February to the close of April, and in smaller crops, until the middle of June. For late crops, in addition to the early sorts already mentioned, the dwarf sugar, Leadman's dwarf, Bishop's dwarf, and Spanish dwarf are very suitable. The Leadman's as well as Bishop's dwarf, are small, delicious peas, great bearers, and in high request at genteel tables, but as the fruit of Leadman's dwarf is long of coming in, it is not advisable to sow it after the third week in June; rather sow it in March, April, and May, and then it will be later than the Charltons raised five weeks afterwards. The Charltons and Hotspur may be sown in May, for late full crops, in June for a smaller supply, and in July, along with the frame, for the last returns.

*Times of sowing.* Much that relates to this has been incidentally mentioned in the estimate of sorts. To try for a crop as early as possible, sow of the sort preferred as early and forward, a small portion on a sheltered south border, or other favourable situation, at the close of October, or rather in the course of November. Follow with another sowing in December, that if the former should be casually cut off in winter, this, coming up later, may have a better chance to stand; and if both survive the frost, they will succeed each other in fruit in May and June. For more considerable and less uncertain returns, either in succession to the above, or as first early and intermediate crops, sow larger portions in December or January, if open temperate weather. To provide for main crops, make successive sowings of the suitable sorts from February till the end of May. It frequently proves that the fruit from a sowing at the beginning of February is not a week later than that from a crop sown in November; nay, the February-sown crop sometimes surpasses all that have stood the winter, in forward returns as well as quantity. From the middle of February, make successive sowings every three weeks in the course of March, April, and May, or twice a month in summer, when a continued succession is to be provided till the latest period. At the close of the sowing season, July and the first week of August, sow a reduced quantity each time, because the returns will depend on a fine mild autumn following, and whatever fruit is attained will be small and scanty.

*Quantity of seed.* Of the small early kinds, one pint will sow a row of 20 yards; for the larger sorts for main crops, the same measure will sow a row of 33 yards.

*Process of sowing.* For early sorts make the drills 1/2 inch deep; and let parallel drills be 2 1/2 or 3 or 4 feet asunder. Peas that are to grow without sticks require the least room. For summer crops and large sorts, make the drills 2 inches deep and 4, 5, or 6 feet asunder. As to the distances along the drill, distribute the peas according to their size and the season; the frame 3 in the space of an inch; the Charltons, Hotspur, and dwarf narrow-fat, 2 in an inch; the Persian-blue and the middle-sized sorts 2 to 3 inches; the large narrow-fats and Knight's a full inch apart; the marrowfat and Knight's narrow-pea 3/4 inch apart; and the Petrovogian 2 inches.

*Soil and situation.* The soil should be moderately rich, and deeper and stronger for the lofty growers. Peas are not assisted but hurt by unreduced dung, recently turned in. A fresh sandy loam or road-stuff, and a little decomposed vegetable matter, is the best manure. The soil for early crops should be very dry, and rendered so where the ground is moist, by mixing sand with the earth of the drills. For early crops, put in from October till the end of January, let the situation be sheltered, and the aspect sunny. Before the end of December, every one or two rows should stand close under a south or south-eastern fence. In January, several parallel rows may be extended, under a good aspect, further from the fence. After January till the end of May, sow in an open situation. For the late crops, return again to a sheltered sunny border.

*Subsequent culture.* As the plants rise from half an inch high to 2 or 3 inches, begin to draw earth to the stems, doing this when the ground is in a dry state, and earthing gradually higher as the stems ascend. At the same time with the hoe loosen the ground between the young plants, and cut down rising weeds. Early crops should be protected during hard frosts by dry straw or other light litter, laid upon sticks or brushwood, but remove this covering as soon as the weather turns mild. If in April, May, and the course of summer, continued dry weather occurs, watering will be necessary, especially to plants in blossom and swelling the fruit, and this trouble will be repaid in the produce. Rows partly cut off may be made up by transplanting. This is best done in March. In dry weather water, and in hot days shade until the plants strike. All peas fruit better for sticking, and continue longer productive, especially the larger sorts. Stick the plants when from 6 to 12 inches high, as soon as they begin to vine. Provide branching sticks, of such a height as the sort will require; for the Frame and Leadman's dwarf 3 feet high; for the Charltons and middle-sized sorts 4 or 5 feet; for the narrow-fat and larger kinds 6 or 8 feet; for the marrowfat and Knight's narrow-fat 9 or 10 feet. Place a row of sticks to each line of the plants on the sunny side, that the attraction of the sun may incline the plants towards the sticks. Place about half the number on the opposite side, and let both rows stand rather wider at top than at the ground. Some gardeners stop the leading shoots of the most early crop when in blossom, a device which accelerates the setting and maturing of the fruit.—Abereromic.

*Rotation of crops of garden peas.*—In January sow on an early border or other warm situation, if the weather be open and the ground sufficiently dry. The true-early-frame, nimble-tailor, and Charlton are the best for this sowing. In February a full crop of Charltons may be sown about the beginning of the month, and of narrow-fat and other larger sorts towards the end in the open quarters of a garden. It frequently happens that the fruit of a sowing made the beginning of this month is not a week later than that of a crop sown in November, and often surpasses all that have stood the winter, both in forward returns, as well as quantity. From the middle of this month make successive sowings every three weeks during the months of March and April, and twice in each of the months of June, July, and August, reducing the quantity each time from the end of June till the middle of August. In February sow peas of the early sorts in pots and flat boxes, and place them in a hot-house, and if for extensive crops sow on a light hot-bed. This has been practised by Mr. Bishop, an experienced gardener, and is the most rational plan of transplanting peas ever practised. In March sow peas as before directed, and transplant those that were sown in boxes or pots, or on hot-beds last month. In October, peas for the early crop next season may be sown, about the end of the month, in a warm south border, fully exposed to the sun. For this sowing the early-frame, Charlton, nimble-tailor, and Hotspur are the best sorts. If the ground is cold and wet, it is best to draw the mould up in ridges 2 feet high, both this and the three following months. In November and December sow the same kind of peas as are recommended for last month.

*To forward an early crop,* "sow or plant in lines from east to west, and stick a row of spruce-fir branches along the north side of every row, and sloping so as to bend over the plants, at 1 foot or 18 inches from the ground. As the plants advance in height, vary the position of the branches, so as they may always protect them from perpendicular colds or rain, and yet leave them open to the full influence of the winter and spring sun. Some cover during nights and in severe weather, with two
boards nailed together lengthwise at right angles, which form a very secure and easy-managed covering, but excludes light. A better plan would be to glaze one of the sides, to be kept to the south, and to manage such rows-glassesses, as they might be called, when over peas, beans, spinach, &c., as hand-glasses are managed when over cauliflowers, that is, to take them off in fine weather, or raise them constantly or occasionally, by brick-hats or other props, as the weather and the nature of the crop might require.”

Management of a late crop. The best variety for this purpose is Knight’s narrow-pea, which may be sown at intervals of 10 days from the beginning to the end of June. “The ground is dug over in the usual way, and the spaces to be occupied by the future rows of peas are well soaked with water. The mould upon each side is then collected so as to form ridges 7 or 8 inches above the previous level of the ground, and these ridges are well watered. The seeds are now sown in single rows along the tops of the ridges. The plants grow vigorously, owing to the depth of soil and abundant moisture. If dry weather at any time set in, water is supplied profusely once a week. In this way the plants continue green and vigorous, resisting mildew, and yielding fruit till subjected by the frost.”—Hort. trans. vol. 2.

Taking the crop. “The early crops are generally gathered in very young growth, often too young, when the pods are thin and the peas small, for the sake of presenting some at table as soon as possible. In the main crops there is no cause for precipitation; take them as they become pretty plump, while the peas are yet green and tender. Leave none on to grow old, the young pods will then fill in greater perfection, and the plants will continue longer in bearing.”

To save seed. “Either sow approved sorts in the spring, for plants to stand wholly for seed, to have the pods ripen in full perfection; or occasionally leave some rows of any main crop; let all the early pods ripen, and gather the later formed ones for the table, as the last gleanings of a crop seldom afford good full seed. For public supply extensive crops are commonly raised in fields. Let the seed attain full maturity, indicated by the pods turning brown and the peas hardening; then to be hooked up and prepared for threshing out, in due time cleansed and housed.”—Abercrombie.

Forcing peas. “Peas,” Nicol observes, “are often raised in forcing-houses, and are brought to perfection very early.”

For forcing peas in a pit, sow as directed for French beans, Phascolus vulgaris, in pots or boxes, and transplant when 1½ or 2 inches high into the pit in rows 15 inches asunder, and 6 inches from each other in the rows.

Temperature may be progressive, beginning at 40° or 50° and rising to 52° or 66° from the origin of the plant to the state of flowering, and after flowering increase from 55° to 70°, or in a regular heat between the latter limits. For hot-hells the temperature may be 50°, or 55° for the nursery-bed, and 55° to 65° for fruiting.

The best sort of pea to force, is the genuine early-frame. Forcing peas in a peach or cherry-house. For the earliest crop some of the true early-frame sort may be sown in October, in the borders of a cherry-house, peach-house, or vineyard, intended to be forced from the beginning of the year. By the time the forcing commences they will be fit for transplanting, which is to be done in the same borders, either in a single row, or in more rows, according to the room. The distance between the rows may be 15 or 18 inches, and 2 inches in the line.

In forcing peas,” Nicol observes “they should always be transplanted. They become more prolific, and run less to straw by that management than when they are sown where they are to remain. Indeed, it would be worth while to transplant the earliest crops in the open ground.”—Nicol, kal. p. 29.

Beans may be forced in a similar manner, though this is seldom attempted.

Field peas, their culture and uses.

The pea is the most esteemed legume in field cultivation, both for its seed and haulm, and was cultivated by the Greeks and Romans, and in this country from time immemorial, though its culture appears to have diminished since the more general introduction of herbage plants and roots; and, excepting near large towns for gathering green, and in a few places for boiling, the pea has given way to the bean, or to a mixture of peas and beans. There are various inducements, however, to the cultivation of peas in dry warm soils near large towns. When the crop is good and gathered green, few pay better. The ground, after the peas have been removed, is readily prepared for turnips, which also pay well as a retail crop near towns, and the haulm is good fodder.

The varieties of peas cultivated in fields are numerous, but they may be divided into two classes, those grown for the ripened seed, and those grown for gathering in a green state. The culture of the latter is chiefly near large towns, and may be considered as in part belonging to horticulture rather than agriculture. The grey varieties are, the early-grey, the late-grey, the purple-grey, Marlborough-grey, and the horn-grey. The white varieties grown in fields are, the pearl, early Charlton, golden Hotspar, the common white or Suffolk, and other Suffolk varieties. New varieties are readily procured by selection or impregnation.

In the choice of sorts, where it is desired to grow grey peas for the sake of the seeds, the early variety is to be preferred in late situations, and the late variety in early ones; but when it is intended to grow them chiefly for covering the ground, and for haulm, then the late varieties claim the preference, and especially the purple-grey. Of white peas to be grown for gathering green, the Charlton is the earliest, and the pearl or common Suffolk the most prolific. When white peas are grown for boilers, that is, for splitting, the pearl and Suffolk are also the best sorts. It is supposed by some to be of considerable importance to the economy of a farm, when the nature of the soil is suitable, to have recourse to the early sorts, as by such means the crops may be in many cases cut, and secured while there is leisure, before the commencement of the wheat harvest. And where the nature of the soil is dry and warm, and the pea crop of a sufficiently forward kind, it may be easy to obtain a crop of turnips from the same land in the same year, as has already been suggested. But with this view it is the best practice to sow the crops in the row method, and keep them perfectly clean by means of attentive hand or horse-hoeing, in which way the land will be in such a state of preparation for a crop of turnips, as only to require a slight ploughing, which may be done as soon as the pea crop is removed, and the turnip-seed drilled in as quickly as possible upon the newly turned up earth. In some particular districts a third crop is even put into the same land, the turnips being cleared off in the autumn, and replaced by cole-worts, for the purpose of greens in the following spring. This, according to Middleton, is the practice in some places in Middlesex. But it is obviously a method of cultivation that can only be attempted on the warm and fertile kinds of turnip soil, and where the pea crops are early; on the cold, heavy, and wet descriptions of land it is obviously impracticable, and wholly improper. Loudon, encyl. agr. p. 766.

The soil best suited for peas is a dry calcareous sand; it should be in good till, not very rich, nor dunged along with the crop. In North and Suffolk, peas are often sown after clover-leys, after one furrow, or after corn crops on two furrows, one given in autumn, and the other early in spring.
The climate required by the pea is dry and not very warm, for which reason as the seasons in this country are very often moist, and sometimes exceedingly dry and hot in June and July, the pea is one of the most uncertain of field crops.

The season of sowing must differ considerably, according to the intention of the cultivator. When they are grown for podding early for sale green, they should be sown at different times from January to the end of March, beginning with the driest and most reduced soils, and with this intention they are sown in the autumn in some southern counties. For the general crops, from February to April, as soon as the lands can be brought into proper order; the grey sorts being employed in the early sowings, and the white in the later. It is always best to sow early, in order to get the crop off in time for a crop of turnips to follow, being a profitable kind of husbandry which should never be neglected.

The quantity of seed must be different in different cases and circumstances, and according to the time and manner in which the crop is sown; but in general it may be from 2½ to 3 bushels, the early sowings having the largest proportion of seed.

The most common method of sowing field peas is broadcast, but the advantages of the row culture in the case of a crop so early committed to the soil must be obvious. The best farmers, therefore, always sow peas in drills, either after the plough, the seed being deposited in every second or third furrow, or if the land is in a pulverized state, by drawing drills with a machine, or by ribbing. In Norfolk and Suffolk peas are generally dibbled on the back of the furrow, sometimes one, and sometimes 2 rows on each, but this method has no particular advantage. In Kent, where immense quantities of peas are grown, both for gathering green, and for selling ripe to the seedsmen, they are generally sown in rows, from 18 inches to 3 feet asunder according to the kind, and well cultivated between; 4 to 6 inches is a proper depth for peas to be sown, but they will vegetate if sown at 1 foot in depth.

The after culture given to field peas is that of hoeing, either by the hand-hoe or the horse-hoe. Where the hand culture prevails, it is the general custom to give two hoeings; the first when the plants are about 2 or 3 inches in height, and again just before the period of their flowering. At the last of these operations, the rows should be laid down, and the earth well placed up to them. In Kent it is the custom, where this sort of crop is much grown, when the distance of the rows is sufficiently great to prevent the vegetation of weeds, to forward the growth of the pea crops by occasional horse-hoeing and the use of the brake-harrow, the mould being laid up to the roots of the plants at the last operation, by fixing a piece of wood to the harrow. This should, however, only be laid up on one side, the peas being always placed up to that which is the most fully exposed to the sun.

In harvesting the pea considerable care is requisite, both on account of the seed and haulm. When pea crops become ripe they wither and turn brown in the haulm, and the pods begin to open. In this state they should be cut as soon as possible, in order to prevent loss from shedding. In early crops the haulm is generally laid up into loose open heaps, which when dry are removed and stacked. In the general crops they are generally put into small heaps, called wads, which are formed by setting small parcels against each other, in order that they may be more perfectly dried both in seed and stem; these wads or bundles should be turned as often as possible. When wet weather happens whilst the peas lie in wads, it occasions a considerable loss, many of them being shed in the field, and of those that remain a great part will be so considerably impaired, as to render the sample of little value. This inability of peas to resist a wet harvest, together with the great uncertainty throughout their growth, and the frequent inadequate return in proportion to the length of the haulm, has discouraged many farmers from sowing so large a portion of this pulse as of other grain, though in light lands which are in tolerable heart the profit in a good year is far from inconsiderable.

In gathering green peas for the market, it is frequently a practice with the large cultivators of early green pea crops in the neighbourhood of London, to dispose of them to the acre to inferior persons, who procure the podders; but the smaller farmers, for the most part, provide this description of persons themselves. It is sometimes the custom to pick the crops over twice, after which the rest are suffered to stand till they become ripe, for the purpose of seed; but being the worst part of the crop are very improper for seed. This sort of crop affords the most profit in those pea seasons which are inclined to be cool, as under such circumstances the peas are most retarded in their ripening, and of course the markets kept from being over abundantly supplied, but in some warm dry seasons when their ripening is hastened they scarcely repay the expences.

The threshing of peas requires less labour than that of any other crop. Where the haulm is wished to be preserved entire it is best done by hand, as the threshing machine is apt to reduce it to chaff. But where the fodder of peas is to be given immediately to horses on the spot, the breaking it is of no disadvantage.

The produce of the pea in ripened seed is supposed by some to be from 3½ to 4 quarters an acre; others, however, as Donaldson, imagine the average of any two following crops not to be more than about 1 bushel, and therefore may be considered as a less profitable crop than most others. But as a means of ameliorating, and improving the soil at the same time, it is esteemed as of great value. With respect to the produce of green peas in the husk, the average of the early crops in Middlesex is supposed to be from about 25 to 30 sacks the acre, which selling at from 8 to 10 shillings per sack, affords 18l. the acre. The author of the "Synopsis of Husbandry," however, states the produce about Dartford in Kent at about 40 sacks per acre, though he says 50 sacks have been gathered from that space of land.

The produce of peas in straw is very uncertain, depending so much on the sort and the season, in general it is more bulky than that of grasses, but may be compressed into less room.

The produce of peas in flour is as 3 to 2 of the bulk of grain, and husked and split for soups as 4 to 2. A thousand parts of pea-flour afforded Sir H. Davy 574 parts of nutritive matter, viz. 501 of mucilage, 32 of sugar, 25 of gluten, and 16 of extract or matter rendered insoluble during the operation.

The use of peas for soups, puddings, and other culinary purposes is well known. In some places porridge, brose, and bread are made of pea-flour, and reckoned very wholesome and substantial. In Stirlingshire it is customary to give peas or bean biscuits to horses while in the yoke as a refreshment. The portion of peas that is not consumed as human food is mostly appropriated to the purposes of fattening hogs and other sorts of domestic animals, and in particular instances they are given to laboring horses in place of beans, but care should be taken when used in this way that they be sufficiently dry, as they are otherwise apt to occasion bowel complaints in those animals. For feeding swine the pea is much better adapted than the bean, it having been demonstrated by experience that hogs fatten more kindly when fed with this grain than on beans; and what is not easy to be accounted for, the flesh of swine which have been fed on peas, it is said, will swell on boiling, and be well tasted, whilst the flesh of the bean-fed hog will shrink on boiling, the fat will boil out, and the meat be less delicate in taste.

Peas straw cut green and dried is reckoned as nourishing as hay, and is considered as excellent for sheep.

In the sowing of any particular sorts for seed, they should be carefully looked over while in flower, in order to draw out all
such plants as are not of the right sort, which if left to mix will
degenerate the kind. As many rows as may be thought sufficient
to furnish the desired quantity of seed should be marked out,
and left till their pods turn brown and begin to split, when
they should immediately be gathered up with the tallow; they
may then be either stacked or threshed out as soon as they are
dry; but care should be taken not to let them remain too long
abroad after they are ripe, as wet would rot them, and heat after
a shower of rain making their pods burst in such a manner, that
the greater part of their seeds would be lost.

The diseases of peas are few, and chiefly the worm in the pod,
and the fly on the leaves and flowers. They are also liable to
be mildewed or blighted. None of these evils, however, are very
common, and there is no known method of preventing them but
by judicious culture.

2 P. ELATIUS (Bieb. taur. 2. p. 151.) stems erect; petioles
terete, bearing 6 lanceolate-oblong leaflets; stipulas rounded and
crenated below; peduncles 2-flowered, longer than the leaves.
2. H. Native of Hebrews. Internodes naked, striated. Stipulas
nearly like those of P. sativum, but the leaflets are more oblong.
Peduncles very long, erect. Flowers pale red, with the lamina of
the wings dark purple. Legume unknown.

3 P. ARVENSE (Lin. spec. 1027.) petioles terete? bearing 2-
pairs of ovate, roundish, crenulated, mucronate leaflets; stipulas
ovate, semi-cordate, denticulated; peduncles usually 1-
flowered, very short. 2. H. Native country unknown. P.
sativum arvense, Poir. dict. 5. p. 456.—Moris. hist. 2. p. 47.
sect. 2. t. 1. f. 4. Bram. icon. chin. t. 15. Called in French
Bistaille and Pois de Pigeon. In English field-pea or grey-pea.
Flowers red, the vexillum darkest. Seeds grey. For the culture
and uses of Pisum arvense, see field-peas, and their culture under
Pisum sativum, of which all the grey varieties belong to this
species.

4 P. MARITIMUM (Lin. spec. 1027.) stem angular; petioles
flattish above; leaflets 5-8, elliptical, mucronate, smooth, alter-
nate; stipulas triangular, semi-sagittate, toothed towards the
base; peduncles many-flowered, length of leaves; legumes ob-
long, small, obliquely-recurved; seeds small, 6-8, approximate,
roundish, rather bitter. 2. H. Native of France, Denmark,
and other parts of Europe, and Kamtschatka. In Britain
on the stony sea beach; on the pebbly beach between Aldburgh
and Orford, Suffolk; also near Hastings, Sussex; on the west
side of Dungeness near Lydd, in Kent; on the sharp ridge
running from Portland island to Bridport. Oed. fl. dan. 388.
Smith, spic. t. 9. engl. bot. t. 1046.—Moris. hist. 2. p. 47.
sect. 2. t. 1. f. 5. Flowers large, purple, variegated with crimson
veins. The seeds are very bitter. We learn from the epistles
of Caius that the sea-pea was first observed in the year
1555, in a great scarcity the poor people on the coast of
Suffolk, about Orford and Aldburgh, supported themselves with it
for some time. This legend is related by Stow and Camden,
with the addition, that they supposed it to spring up opportunely
in that year of dearth, from a ship-wrecked vessel loaded with
peas, whereas the sea-pea is a very different species from all
other peas. The legend of the miraculous arrival of these peas
in a time of scarcity is still believed among the country people.
Cattle are very fond of the herb.

Var. p. glabrum (Ser. in D. C. prod. 2. p. 388.) leaves gla-
brous. Native of Canada.

5 P. AMERICANUM (Mill. dict. no. 51.) stem angular, procu-
renchent; leaves with one pair of leaflets; lower leaflets lanceolate,
acutely-toothed, upper ones sagittate. 2. H. Native of South
America, at Cape Horn. Peduncles 4-5-flowered. Flowers
blue. Legumes tapering, near 3 inches long. Seed about
the size of those of tares. Miller calls this the Cape Horn pea,
its having been brought by Lord Anson's cook when he
passed that Cape, where this pea was a great relief to the sailors,
but it is not so good for eating as the worst sort cultivated in
England.

6 P. JOMARDI (Schracn. in flora, p. 309.) plant quite smooth
and glaucous; stem angular; petioles terete; stipulas toothed
at the base, as well as the leaflets, which are ovate. 2. H.
Native of Egypt. Flowers white.

7 P. fulvum (Smith, fl. grec. t. 688.) petioles terete; stipulas
rounded below, and acutely-toothed; peduncles 2-flowered;
legumes short. 2. H. Native of Asia Minor. Flowers of a
beautiful fulvous colour, marked with deep or almost scarlet
veins. Legume semi-elliptic, an inch long. Peduncles 2 or 4.

Purpureus-flowered Pea. Pl. cl.
8 P. THEBAEUM (Willd. enum. suppl. p. 51. ex Link. enum.
2. p. 236.) peduncles shorter than the leaves. 2. H. Native of
Upper Egypt.

Cult. The seeds of all kinds of peas only require to be sown
in the open ground in spring for common purposes, and the
plants stuck to support them.

CLXXII. LATHYRUS (from λαθρός of Theophrastus,
which is said to be from λαθρ., augmentative, and σπόρος, thom-
eros, any thing exciting; in reference to the qualities of the seeds).
Lin. gen. no. 1186. D. C. prod. 2. p. 369.—Lathyrus, Clyme-
num, and Alp'haea, Tourn. inst. p. 394. 396. t. 216, 217, 218,
219, and 220.—Cicerella, Monch. meth. 163.

Lin. syst. Diadophidia, Decandria. Calyx campanulate, 5-
cleft, the 2 superior lobes shortest. Corolla papilionaceous.
 Stamens diadelphous. Style complanate, dilated at the apex,
villos or pubescent in front. Legumes oblong, many-seeded,
2-valved, 1-celled. Seeds globose or angular.—Usually climbing
herbs, with semi-sagittate stipulas, and having the petioles
terminating in branched tendrils, and furnished with 1 to 3 pairs
of leaflets. Peduncles axillary.

Sect. 1. EULATHYRUS (from eu, well, and lathyrus; genuine
species). Ser. mss. in D. C. prod. 2. p. 369. Vexillum tooth-
less at the base. Leaflets opposite or wanting from abortion.
Petioles furnished with a narrow wing.

§ 1. Perennial plants, with many-flowered peduncles.

* Leaves with only one pair of leaflets.

1 L. TOMENTOSUS (Lam. dict. 2. p. 709.) plant clothed with
rufescent tomentum; stems tetragonal, striated; leaves with one
pair of linear-lanceolate leaflets; stipulas semi-sagittate, much
shorter than the leaves; peduncles many-flowered, approximate,
longer than the leaves; calyce teeth nearly equal, lanceolate,
acute, length of the tube; legumes linear, clothed with silky
tomentum; style very long, twisted at the base, linear-
spatulate. 2. G. Native of Buenos Ayres. Flowers large, purple?

Tomentose Lathyrus. Pl. cl.
2 L. SERICUS (Lam. dict. 2. p. 708.) plant clothed with silky
rufescent down; stems tufted, simple; leaves with one pair of
linear leaflets; stipulas narrow, semi-sagittate, length of leaflets;
tendrils very short; peduncles many-flowered. 2. G. Na-
tive of Monte Video.

Silky Lathyrus. Pl. cl.
3 L. SYLVESTRUS (Lin. spec. 1083.) plant quite glabrous;
stems winged; leaves with one pair of lanceolate, attenuated,
coriaceous leaflets; stipulas very narrow, semi-sagittate, shorter

u u 2
than the leaves; peduncles 3-5-flowered, length of leaves; legumes compressed, reticulated lengthwise; seeds roundish, covered with wart-like dots.  2. H. Native of Europe, in woods and hedges. In England in moist hedges and groves in chalky counties, but rare in Scotland. Corolla red, variegated with pale crimson, violet, and tints of green; the wings violet. Smith, engl. bot. 805. Curt. lond. 6 t. 52. Root creeping. 

Far. α, ensifolius (Ser. miss. in D. C. prod. 2. p. 368.) leaflets very narrow, and very much elongated. L. ensifolius, Bidare in dair. phys. chem. papiers. an. 1821.

Far. β, oblongus (Ser. l. c.) leaflets shorter, elliptic-oblong. Oed. fl. dan. 325.

Wood Lathyrus or Narrow-leaved Everlasting-pea. Fl. July, Sept. Britain. Pl. cl. 4 L. Purescens (Hook. in Beech. voy. p. 21.) plant clothed with soft pubescence above; stems winged; leaves ciliatiflorous, having one pair of oblong-lanceolate leaflets, which are twice the length of the petiole; stipulæ ovate, semi-sagittate, nearly one-half shorter than the petiole; peduncles many-flowered, longer than the leaves; calyx tubular, pubescent, with lanceolate teeth.  2. H. Native of Chili, about Conception and Valparaiso. This species has many points in common with L. sylvestris.

Pubescent Everlasting-pea. Pl. cl. 5. INTERMEDIATE Everlasting-pea. Fl. Ju. Sept. Clt. 1820. Pl. cl. 6 L. Magellanicus (Lam. dict. 2. p. 708.) plant glabrous and blackish; stems a little branched, tetragonal, but not winged; leaves with one pair of ovate or ovate-oblong leaflets; stipulæ broad, cordately-sagittate, broader than the leaves; tendrils trifid; peduncles long, 3-4-flowered; legumes unknown.  2. H. Native of the Straits of Magellan. Flowers bluish purple.

Magellan Everlasting-pea. Fl. Ju. Sept. Clt. 1744. Pl. cl. 7 L. Hookeri; plant glabrous, blackish; stems angular, hardly winged; leaves with one pair of linear-lanceolate leaflets; petioles furnished with a short tendril each; stipulæ semi-sagittate, ovate, much shorter than the leaflets; peduncles twice the length of the leaves, usually 5-flowered; calyx campanulate, nerved, with nearly equal teeth.  2. H. Native of Chili, about Conception. L. sessilifolius, Hook. in Beech. voy. p. 20. but not of Tenore. Closely allied to L. pratensis and L. sylvestris. From L. Magellanicus it seems to differ principally in the shape of the leaflets.

Hooker's Everlasting-pea. Pl. cl.

8 L. Latifolius (Lin. spec. 1083.) plant quite glabrous; stems winged; leaves with one pair of elliptic, rather glaucous, 3-5-nerved, obtuse, and mucronate leaflets; stipulæ broad, ovate, semi-sagittate; peduncles many-flowered, longer than the leaves; legumes long compressed, reticulated lengthwise.  2. H. Native of Europe, in woods. In England, in Madingley, and other woods near Cambridge; on the rock by Red Neese, near White-haven, Cumberland; in Severn Stoke Copse, Worcestershire; and at Hawnes and Bromham, Bedfordshire. Smith, engl. bot. 1108. Mart. fl. rust. t. 8. Garid. prov. t. 108. Mill. fig. 52. Oed. fl. dan. 708. exclusive of the synonyms. Flowers large, rose-coloured. This is a shewy plant for shrubberies, arbours, wilderness quarters, and trellis-work. Bees resort much to it, and the flowers afford them abundance of honey.

Far. β, monstruosus (D. C. mem. legum. 1. t. 2.) calyx of 5 sepals; sepals linear; petals and stamens abortive; legumes foliaceous; seeds abortive.

Broad-leaved Everlasting-pea. Fl. Ju. July. Britain. Pl. cl. 9 L. Peduncularis (Poir. suppl. 2. p. 775.) stems thick, cylindrical, striated, winged, branched; leaves with one pair of oval, nerv’d, mucronate leaflets; stipulæ semi-sagittate, lanceolate, cuneate at the apex; peduncles stiff, many-flowered, striated, very long; bracteæ cuneate.  2. H. Native country unknown. Flowers pale rose-coloured.

Peduncularis Everlasting-pea. Pl. cl. 10 L. Nervosus (Lam. dict. 2. p. 708.) plant quite smooth; stems almost simple, striated; leaves with 1 pair of ovate, acute, nerv’d leaflets, which are longer than the internodes; petioles very short; tendrils trifid; stipulæ sagittate, nerv’d; peduncles many-flowered; legumes long, linear, glabrous.  2. G. Native of Monte Video. Flowers purple.

Nerved-leaved Everlasting-pea. Pl. cl. 11 L. Rotundifolius (Willd. spec. 3. p. 988.) plant quite glabrous; stems winged, branched; leaves with 1 pair of ovate, 3-5-nerved leaflets; stipulæ semi-sagittate, a little toothed; peduncles many-flowered, longer than the leaves; calyces teeth broad and short; legumes compressed, reticulated lengthwise, dotted; seeds globose, obscurely dotted.  2. H. Native of Tauria. Bibl. fl. taur. 2. p. 156. cent. pl. rar. rass. 1. t. 22. Flowers rose-coloured, very shewy, like those of L. latifolius.

Far. β, ellipticus (Ser. miss. in D. C. prod. 2. p. 370.) stem with broader wings; stipulæ larger; leaflets elliptic; corolla vermilion-coloured.  2. H. Native in woods, on Mount Beschtau. Bibl. fl. taur. suppl. 466.

Round-leaffletted Everlasting-pea. Fl. May, July. Clt. 1822. Pl. cl. 12 L. Pratensis (Lin. spec. 1033.) plant smooth-stemmed; stems tetragonal; leaves with 1 pair of oblong-linear or lanceolate, 3-5-nerved leaflets; tendrils usually simple; stipulæ sagittate, ovate, shorter than the leaflets; peduncles many-flowered, twice the length of the leaves; calyces nerved, with nearly equal teeth, which are about the length of the tube; legumes compressed, obliquely reticulated; seeds globose, smooth.  2. H. Native of Europe, in humid meadows. In England, in meadows, pastures, and thickets, very common. Curt. locl. fasc. 5. t. 44. Smith, engl. bot. 570. Mart. fl. rust. 52. Oed. fl. dan. 527. Flowers yellow. The plant is called in England Tare everlasting, Meadow vetchling, or Common yellow vetchling. In old English it seems to be used as a vile weed, which spreads much by means of its creeping roots. Many later writers, however, recommend it as an excellent food for cattle, and not without reason, since its quality is good and it bears a large burden of succulent leafy stalks. Among its patrons we may reckon Linnæus, Haller, Schreber, Curtis, and Young.

Meadow Lathyrus. Fl. June, Aug. Brit. Pl. cl. 1 to 2 ft. 13 L. Tuberosus (Lin. spec. 1033.) stems tetragonal; leaves with 1 pair of oblong-elliptic, rather mucronate leaflets; stipulæ semi-sagittate, narrow, acute, about equal in length to the petioles; peduncles 3-5-flowered, 2 or 3-times the length of the leaves; calyces veinless, with almost equal, broad teeth, which are about equal in length to the tube; style arched; legumes compressed, reticulated lengthwise; seeds roundish, smooth.  2. H. Native of Europe, on the margins of fields. Curt. bot. mag. 111. L. arvensis, Riv. tetr. 42. L. attenuatus, Viv. fragm. t. 19. ex Poir. suppl. 2. p. 776.—Lob. icon. 2. p. 70. f. 2.—Moris. hist. sect. 2. t. 2. f. 1. Root creeping, putting out irregular, brown tubers. Flowers large, rose-coloured. The plant is cultivated in Holland for its roots, which are eaten there. Gerarde calls it Pens-earth-nut.

14 L. sessilifolius (Tenes, fl. neap. prod. append. 5. 1826.) root tuberous and fibrous; stems ascending, simple; leaves with 1 pair of leaflets, without a petiole; leaflets lanceolate-linear, mucronate; peduncles usually 2-flowered, longer than the leaves; calyx about equal in length to the tube of the corolla; the segments lanceolate and equal; legumes flat, many-seeded. 2 H. Native of Naples, in Lucania, in hedges. L. attenuatus, Tenere, prod. but not of Viv. Plant glabrous. Corolla blue, with the wings longer than the keel. Style flat, dilated in front, and rather villous. It differs from L. tuberosus, in the leaflets being sessile and linear-lanceolate.

Sessile-leaffletted Lathyrus. Pl. ascending.

15 L. roseus (Stev. in mem. soc. mosc. 4. p. 51. and Bieb. fl. tur. suppl. p. 466.) plant quite smooth; stem slender, not winged; leaves with 1 pair of ovate-rounded leaflets; tendrils very short; stipulas small, subulate; peduncles filiform, longer than the leaves; calycine teeth acute, superior ones shortest. 2 H. Native of Iberia. Flowers beautiful rose-coloured, rather smaller than those of L. tuberosus.

16 L. grandiflorus (Sims, bot. mag. 1838.) hairy; stems tetragonal, winged; leaves with 1 pair of large, ovate, obtuse, waved leaflets; stipulas small, semi-sagittate, lanceolate; peduncles 2-3-flowered, longer than the leaves; teeth of calyx acute, longer than the tube; legumes long, linear, puberulous. 2 H. Native of the south of Europe, in hedges and among bushes. In Sicily, about Palermo and on Mount Etna. Pismum biflorum, Rafin. car. di piant. p. 71. Perhaps L. grandiflorus, Smith, fl. grac. t. 698. Flowers very large, rose-coloured, with an emarginate vexillum.

17 L. vulgates (Ell sketch, car. geogr. 2. p. 223.) tendrils simple; leaflets 2, linear-lanceolate; stipulas falcate; peduncles 1-flowered, elongated. Native of Carolina, at Cooper's River.

Small Lathyrus. Pl. cl.

** Leaves with 2-3-4 or more pairs of leaflets.

18 L. pisiformis (Lin. spec. 1034. but not of Houtt.) plant smooth; leaves with 3-4 pairs of oval leaflets; stipulas unequally cordate, hastate, with the angles acute, equal in length to the leaflets; peduncles many-flowered, rather shorter than the leaves; the 2 upper segments of the calyx short; legumes linear-oblong, compressed, rather falcate, acute at the apex on the upper suture. 2 H. Native of Europe, Siberia, and throughout North America, in the plains. L. maritimus, Begel. fl. host. ed. 2. p. 262. L. Californicus, Dough. in bot. reg. 1144. L. vendens, Sweet, fl. gard. 2. ser. t. 37. but not of Wild. Begel. fl. host. ed. 1. p. 167. but not of ed. 2. Pismum maritimum, Rich. in Frankl. 1. journ. ed. 2. append. p. 28.—Gmel. fl. sib. 4. p. 7. t. 1. Astrágalus Chinensis, Buch. cent. 10. dec. 2. t. 5. Flowers purple. We have followed Dr. Hooker, in his recent publication, in adding the numerous synonyms, but we have some reason to believe that he is perfectly wrong with regard to some of the species.

19 L. Califonicus (Doughl. in bot. reg. 1144.) stems tetragonal, glabrous; leaves glaucous, with 4-5 pairs of ovate-oblong, glabrous, mucronulate leaflets; tendrils 3-parted; stipulas semi-sagittate, about the size of the leaflets; peduncles many-flowered, about equal in length to the leaves; root creeping. 2 H. Native of California and the north-west coast of America. Flowers purple, elegantly veined, twice the size of those of V. pisiformis or V. mutabilis. Legumes oblong, rather falcate, inflated.

20 L. mutabilis (Sweet, fl. gard. 194.) stems flexuous; winged; leaves with 3-4 pairs of ovate, obtuse, glaucespent leaflets; stipulas semi-sagittate, ovate, acute, angularly toothed at the base; peduncles many-flowered, shorter than the leaves; calycine segments ovate-lanceolate, ciliated, unequal, length of tube; legumes convex, narrow, dotted, pubescent. 2 H. Native of Siberia. Flowers changeable in colour, at first purplish pink, striped with numerous dark purple branching lines, but at length changing to a brownish green. Very like L. pisiformis.

21 L. ochroleucus (Hook, in fl. bor. amer. p. 159.) plant quite glabrous; leaves with 3-4 pairs of broad, oval, or ovate leaflets; stipulas toothed, broad, semi-cordate, rather hastate, hardly smaller than the leaves, with the angles sometimes acute, and sometimes obtuse; peduncles many-flowered, about equal in length to the leaves; the 2 upper calycine segments short; legumes in an immature state, linear-elongated, acuminate, compressed, quite smooth. 2 H. Native of North America, Hudson's Bay, and from the Red River, in lat. 49° through the whole woody country to Bear Lake, in lat. 66°. L. pisiformis, Richards. in Frankl. 1st jour. edit. 20 append. p. 28. Flowers cream-coloured.

Cream-coloured-flowered Lathyrus. Pl. cl.

22 L. decapthyllus (Pursh, fl. amer. sept. 2. p. 471.) plant glabrous or pubescent; leaves with 4-6 pairs of elliptic, rarely ovate or oblong leaflets; stipulas small, semi-sagittate, lanceolate, with the lobe deflexed and about equal in length to the stipulas; peduncles many-flowered, about equal in length to the leaves; calyx pubescent, with the superior teeth very short. 2 H. Native of North America, on the banks of the Saskatchewan, abundant in bushy places in north-west America. Hook. bot. mag. 3193. Flowers purple.

23 L. speciosus; plant glabrous; leaves with 4 pairs of broad, elliptic, mucronate leaflets; stipulas as large as the leaflets; tendrils simple; peduncles many-flowered, longer than the leaves; segments of the calyx ovate-lanceolate, upper ones broadest and shortest, all mucronate. 2 H. Native of Mexico. Flowers purplish-blue. (v. s. herb. Lamb.)

Shelly Lathyrus. Pl. cl.

24 L. japonicus (Willd. spec. 3. p. 1092.) stems acutangular; leaves with 4 pairs of elliptic, acute leaflets; stipulas sagittate, stem-clasping, breadth of the leaflets, but shorter; peduncles many-flowered. 2 H. Native of Japan. L. pisiformis, Houtt. fl. syst. 8. t. 63. f. 11. but not of Lin. Flowers purple, or rose-coloured.

Japan Lathyrus. Pl. cl.

25 L. vexosus (Muhl. in Willd. spec. 3. p. 1092.) stems tetragonal, not winged; leaves with many pairs of ovate, obtuse, nearly opposite, mucronulate, glabrous leaflets; tendrils trifid; stipulas semi-sagittate, ovate; peduncles many-flowered, shorter than the leaves. 2 H. Native of Pennsylvania, and common throughout the great chain of lakes in Upper Canada; plentiful on the Red River and the river Winpeg. Oxypogon eleanus, Rafin. in journ. phys. aug. 1819. p. 98, but the legume is said to be falciform and the ovary stipitate. Said to be like L. pisiformis, but the stipules are much smaller, and the leaflets are broader, ovate, and the corolla is larger. Flowers purple, veined.

Veiny Lathyrus. Fl. cl.

26 L. stipulaceus (Leconte, in cat. pl. new york, p. 92.) plant quite smooth; stems acutely tetragonal, hardly winged; leaves with 3 pairs of elliptic, mucronate leaflets; stipulas ovate, semi-sagittate, acuminate, large; peduncles 4-6-flowered, rather
longer than the leaves; legumes, when immature, linear, acuminate, compressed, glabrous. 2. H. Native of North America, in meadows about New York, also of Upper Canada and about Lake Huron. Flowers large, purple.

27 L. MYRTIFOLIUS (Muhl. in Wildig, spec. 3. p. 1091.) stems weak, flexuous, tetragonal, not winged; leaves with 2-3 pairs of oblong-lanceolate, bluish, stiffish, glabrous, mucronate leaflets, which are striated with veins; tendrils trifid; stipulas semi-sagittate, lanceolate, acuminate, with scabrous margins; peduncles 3-4-flowered, longer than the leaves. 2. H. Native of the grassy plains of the Missouri. Vieja stipulacea, Pursh, fl. amer. sept. p. 471. Allied to L. palustris. Flowers purple, streaked with deeper veins.

29 L. MACRÆUM (Hook, in Beech. voy. p. 21.) plant rather pilose; stems angular; leaves with 6 pairs of elliptic, retuse, feather-nerved leaflets, which are reticulately veined, white beneath, also full of pellucid dots; stipulas small, semi-sagittate, entire; peduncles many-flowered, longer than the leaves; lower segments of calyx very long and subulate, upper ones very short; style linear, pilose at the apex on all sides, but more conspicuous on the upper side. 2. H. Native of Chili, about Valparaiso and Concepcion.

Mac Rate's Lathyrus. Pl. cl.

30 L. PALÆSTRIS (Lin. spec. 1034.) plant quite glabrous; stems winged, erectish; leaves with 2-3 pairs of oblong, mucronulate leaflets; petioles subulate; tendrils bifid or trid; stipulas semi-sagittate, acute, small; peduncles 3-5-flowered, hardly longer than the leaves; calyx segments unequal, nearly linear, length of tube; legumes compressed. 2. H. Native of the north of Europe, in meadows and marshes; plentiful in Britain. Smith, engl. bot. t. 109. Oed. fl. dan. t. 399. Mart. fl. rust. t. 8. Gard. prov. t. 108. L. Narbonensis, Riv. tetr. t. 40. Flowers variegated with blue and purple.

Var. β, lineari-folius (Ser. miss. in D. C. prod. 2. p. 371.) leaflets and stipulas very narrow. Native of Denmark and Switzerland.

Var. γ, subezstrylatis (Ser. miss. in D. C. prod. 2. p. 371.) leaves with 2 pairs of linear-oblong leaflets; stipulas small, sessile. L. palæstris, Næstl. ex herb. D. C.

31 L. HETEROHYLLUS (Lin. spec. 1034.) stems erect, rigid, winged; leaves with 1 or 2 pairs of lanceolate, mucronulate leaflets; petioles winged at the base; tendrils branched; stipulas lanceolate, semi-sagittate; peduncles 6-8-flowered; legumes compressed, glabrous. 2. H. Native of Europe, at the bottom of mountains.—J. Bauh. hist. 2. p. 304. f. 1. Flowers large, with the standard and wings flesh-coloured and the keel white. By the leaves, the wings of the stem, and the size of the flowers, it appears to be intermediate between L. latifolius and L. sylléstris.

32 L. VIGLIÆRUM (Wallr. schr. crit. p. 388.) stems simple, and as well as the petioles winged; leaves with 6 pairs of linear-lanceolate, acuminate, mucronate leaflets; stipulas semi-sagittate, lanceolate; peduncles many-flowered, longer than the leaves. 2. H. Native of Germany, in bushy places. Flowers violaceous, about the size of those of O’robus vernus.

Vetch-formed Lathyrus. Pl. cl.

§ 2. Annual plants, having the peduncles bearing 1-3 flowers.

*S. Petioles leafless.

33 L. APHACA (Lin. spec. 1029.) stems erect; tendrils cylindrical, filiform, leafless (rarely with 2 leaflets); stipulas ovate, sagittate, large; peduncles 1-flowered (rarely 2-flowered), articulated at the apex, furnished with a pair of small, narrow bracteas; calyx segments twice the length of the tube; legumes much compressed, broad, few-seeded; seeds compressed. 2. H. Native of Europe, in cultivated fields. In Britain, on the borders of sandy or gravelly fields, but rare; in Cambridgeshire and Oxfordshire; about Tottenham and Enfield; in a gravel-pit between Norwich and Brooke; and near Fornet, Norfolk. Smith, engl. bot. no. 1107. Curt. fl. lond. 5. t. 51.—Mill. fig. t. 43. Flowers small, yellow, with a paler keel. A smooth, glaucous herb.

34 L. NISSOILÁ (Lin. spec. 1029.) stem erect; petioles dilated, foliaceous, grass-like, 3-5-nerved; stipulas small, subulate, usually wanting; flowers solitary, on long peduncles; peduncles articulated at the apex, and downy on the upper part, where they bear 2 little awl-shaped bracteas; legumes compressed, narrow, nerved, reflexed. 2. H. Native of Europe, in corn-fields. In Britain, in bushy places and grassy borders of fields. Smith, engl. bot. t. 112.—Magn. hort. t. 112. Curt. lond. fasc. 6. t. 51. Buxb. cent. 3. p. 84. t. 45. f. 1.—Moris. hist. sect. 2. t. 3. f. 7. Flowers beautiful crimson, variegated with purple and white. The plant, when young, very much resembles a grass.

Nissail's Lathyrus or Crimson Grass-vetch. Fl. May, June. Britain. Pl. ½ to 1 foot.

**Leaves with 1 pair of leaflets.

35 L. SUBULÁTUS (Lam. dict. 2. p. 707.) plant pilose; stems tufted, filiform, tetragonal; leaves on short pedicles; tendrils very short; leaflets linear, acute; stipulas linear, semi-sagittate, nearly the length of the leaflets; peduncles 1-3-flowered; calyx segments narrow, acute, nearly equal, length of tube. 2. H. Native of Monte Video. Flowers purple, like those of L. tomentósus, but much smaller.

Subulate-leaffletted Lathyrus. Pl. 1 foot.

36 L. INCONSPICUUS (Lin. spec. 1030.) stems obsoletely triquetrous; leaflets lanceolate, striated beneath, acuminate; stipulas semi-sagittate, lanceolate; tendrils on the lower leaves almost wanting; on the upper ones filiform and elongated; peduncles very short, 1-flowered. 2. H. Native of the Levant. Jacq. hort. vind. 1. t. 86. Corolla small, red, very little longer than the calyx. Legumes glabrous, straight, about the length of the leaflets, but broader.

37 L. Sphéricus (Retz. obs. 3. p. 80.) plant smoothish; stems erect, tetragonal, subulate at the apex; leaflets cusiiform, mucronate, nerved; stipulas semi-sagittate, linear, length of peduncles and petioles; peduncles 1-flowered, thickish; calyx-teeth narrow, longer than the tube; legumes somewhat torulose, nerved lengthwise; the nerves numerous and thick; seeds spherical. 2. H. Native of the south of Europe, in cultivated fields. D. C. icon. rar. 1. p. 10. t. 33. L. coccinus, All. pedem. no. 1222. L. axillàris, Lam. dict. 2. p. 706.
Flowers beautiful crimson, about the size of those of *L. Nas- svilia*.

38. L. MERAΣΤHUS (Gerard. in Lois. not. 106.) stems tetragonal; tendrils simple, very short; leaflets linear-lanceolate; peduncles very short, 1-flowered?; stipulas?; calycine segments about equal in length to the corolla; legumes almost sessile, straight, spreading, cylindrical, rather villous. 〇. H. Native of Provence, in corn-fields. Flowers purplish. Perhaps only a variety of *L. inconspicuous*.

39. L. ANGULATUS (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, acuminate; tendrils trifid; stipulas semi-sagittate, linear, acute, hardly longer than the petiole; peduncles filiform, 1-flowered, hardly equal in length to the leaves, somewhat ciliate; bracteae ovate, very short; calycine teeth acute, length of tube; legumes narrow, compressed, veinless; seeds angular. 〇. H. Native of the south of Europe, in cultivated fields.—Buxb. cent. 3. p. 23. t. 42. f. 2. Flowers small, red, or purple.

**Angular-seeded Lathyrus.** Fl. June, July. Cent. 1863. Pl. ½ to 1 ft.

40. L. LONGIPEDICELLATUS (Ledeb. hort. dorp. suppl. 1824. p. 5.) leaflets linear; tendrils trifid; peduncles 1-flowered, awned, exceeding the leaves; legumes cylindrical, nerveless; seeds angular. 〇. H. Native country unknown. Perhaps *A. angustatus*, Roth. cat. 3. p. 68. Flowers red.

41. L. LEPTOCYHUS (Bieb. h. taur. 2. p. 155. suppl. p. 465.) stems erect; leaflets linear-lanceolate; tendrils branched; stipulas narrow, subulate, semi-sagittate; peduncles short, 1-flowered; calycine teeth lanceolate; legumes lanceolate, glabrous; seeds globose, tubercled. 〇. H. Native of eastern Caucasus. Flowers purple but with the keel white.

42. L. SETIFOLIUS (Lin. spec. 1031.) plant glabrous; stems erect, tetragonal; leaflets linear, very narrow; stipulas very narrow, semi-sagittate, length of petiole; tendrils trifid; peduncles 1-flowered, filiform, shorter than the leaves, jointed at the apex, furnished each with a small bract; calycine teeth acute, length of tube; tendrils trifid; legumes ovate-oblong, short, reticulated; seeds globose, warty, purple. 〇. H. Native of the south of Europe; Italy, and France.  *L. prostratus*, Brigg. pl. foro-julius. 1. p. 28.—J. Bauh. hist. 2. p. 308. with a figure. Flowers small, rose-coloured, or scarlet.

43. L. AMUCNTRUS (Lin. spec. 1029.) stems winged, diffuse; leaflets lanceolate; tendrils simple, stipulas semi-sagittate, 1-toothed, longer than the pediole; peduncles 1-flowered, longer than the leaves; caluine as well as subterranneous legumes ovate, 2-winged in front, and a little compressed on the sides, 2-seeded. 〇. H. Native of Syria. Brot. fl. lus. 162. t. 66. Sweert. fl. gard. 236.—Moris. hist. 2. p. 61. sect. 2. t. 25. f. 1. Flowers pink, tinged with blue. In this singular plant there are under-ground stems, which are whitish, and bear flowers and legumes absolutely perfect, and resembling those on the stems above-ground, except that the flowers are smaller and do not expand.

**Both-sides-fruited Lathyrus, or Under-ground or Earth-peak.** Fl. June, July. Cent. 1860. Pl. ½ to 1 ft.

44. L. SATIVUS (Lin. spec. 1030.) plant smoothish; stems winged; leaflets linear-oblong; tendrils trifid; stipulas semi-sagittate, ovate, ciliated, hardly the length of the pediole; peduncles 1-flowered, longer than the pedioles, bracteolate and articulated at the apex; calycine segments lanceolate, foliaceous, almost 3-times the length of the tube; legumes ovate, broad, short, irregularly reticulated, winged on the back; seeds trigonal, smooth, rather truncate. 〇. H. Native of Spain, France, and Italy. Jacq. fil. ecol. t. 115. Curt. bot. mag. t. 115.

—Riv. tetr. irr. t. 47. Cicérula alâta, Mænc. meth. p. 163. Flowers white.

**Var. β. angustatus** (Ser. mas. in D. C. prod. 2. p. 373.) leaflets and stipulas linear, and very narrow.

**Var. γ, coloritus** (Ser. mas. l. c.) corolla white, having the vexillum violaceous on the under side in front, and with deeper veins, and with the wings having each a large blue spot. 〇. H. Native of Tenerife.  *L. sativus* β, Hoffm. verz. fl. 1824. p. 235.

The seeds of *L. sativus* are commonly sown in Switzerland for soiling horses, under the name of *Geese*. In several parts of the continent a white, light, pleasant bread is made from the flour of the pulse, but it produced such dreadful effects in the seventeenth century, that the use of it was forbidden by an edict of George, duke of Wirtemberg, in 1671, and was enforced by other edicts under his successor Leopold, in 1705 and 1714. Mixed with wheat-flour in half the quantity makes a very good bread, and appears to be harmless. But bread made with this flour exclusively has brought on a most surprising rigidity of the limbs in those who have used it for a continuance, insomuch that the exterior muscles could not by any means be reduced, or have their natural action restored. These symptoms usually appeared on a sudden without any previous pain. The disease was regarded as incurable, and being neither very painful nor fatal, those who were seized with it usually submitted to it with patience.

"Swine fattened with this meal lost the use of their limbs, but grew very fat lying on the ground. A horse fed some months on the dried herb was said to have his legs perfectly rigid. Kine are reported to grow lean on it, but sheep not to be affected. Pigeons, especially young ones, lose the power of walking by feeding on the seeds. Poultry will not readily touch it, but geese eat it without any apparent damage. In some parts of Switzerland cattle feed on the herb without any apparent harm."

Duvernay Fabbroni, of Florence, says, that the government there had cautioned the peasants against the use of *Lathyrus sativus*, in 1786, swine having lost the use of their limbs, and become pitiable monsters, by being fed on this pulse exclusively. The peasants, however, eat it boiled or mixed with wheat flour, in the quantity of one-fourth, without any harm.

**Cultivated Lathyrus or Chickling-vetch.** Fl. June, July. Cent. 1860. Pl. el.

45. L. CICEREA (Lin. spec. 1030.) plant smoothish; stems diffuse, winged; leaflets linear-oblong; tendrils trifid or quadriflid; stipulas semi-sagittate, lanceolate, a little toothed, ciliated, length of the petiole; peduncles 1-flowered, longer than the stipulas; bracteoles small; calycine segments lanceolate, foliaceous, nearly 3 times the length of the tube; legumes oblong, irregularly-reticulated, channelled on the back, not winged; seeds trigonal, somewhat truncate, bay-coloured, smooth. 〇. H. Native of Spain. Jacq. fil. ecol. t. 115. *L. sativus* β, Lam. dict. 2. p. 705. Cicérula ânceps, Mænc. meth. 163. Flowers purple or red, rather variable.

**Cicer-like or Flat-podded Lathyrus or Dwarf Chickling-vetch.** Fl. June, July. Cent. 1833. Pl. el. 1 to 2 feet.

46. L. ANXNUS (Lin. spec. 1032.) plant glabrous; stems diffuse, winged; leaflets linear, elongated; tendrils trifid; stipulas semi-sagittate, very narrow, much shorter than the pedioles; peduncles 1-2-flowered, length of the leaves; bracteoles small; calycine segments lanceolate, hardly longer than the tube; legumes oblong-linear, densely-reticulated, not winged; seeds roundish. 〇. H. Native of Spain.—Buxb. cent. 3. t. 42. f. 1.

—Riv. tetr. irr. t. 42. Flowers small, yellow.

LEGUMINOSÆ.  

**Leguminosae.**

47 L. hirsutus (Lin. spec. 1032.) stems winged; leaflets linear-lanceolate, 3-nerved; stipulas semi-sagittate, linear, about equal in length to the petiole; peduncles usually 2-flowered, hardly longer than the leaves; calyx hairy; segments ovate, acuminate, length of the tube; legumes oblong; hairy; seeds globose, warted. O. H. Native of the south of Europe, in corn-fields. In Britain, but rare, in various places, at Rochford, Hundred, Essex; at Southend, Essex; between Bath and Bristol. Sims, bot. mag. 1255. Smith, engl. bot. 1255. J. Bauh. hist. 2. p. 305. with a figure.—Riv. tetr. Irr. t. 41. Corolla with a bright crimson standard, pale blue wings, and white keel.

48 L. hirsutus (Lam. dict. 2. p. 706.) stems tetragonot, not winged; leaflets oblong or obovate; stipulas semi-sagittate, linear, about equal in length to the petioles, or sometimes shorter; peduncles 1-flowered, hardly longer than the leaves; calycine segments ovate, length of the tube; legumes oblong-obovate, hairy; seeds globose, warted with dots. O. H. Native of the Mauritian Islands. Bring Gardeners much. The seeds grow in the cotyledons, and are very hard. The plant is called Hairy Lathyrus.

49 L. odoratus (Lin. spec. 1032.) plant hairy; stems winged; leaflets ovate, mucronate; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 2-3-flowered, much longer than the leaves; calycine teeth broad, longer than the tube; legumes oblong-linear, compressed, hairy; seeds roundish. O. H. Native of Sicily. Flowers sweet-scented.

**Var. a. purpureus;** vexillum purple. Native of Sicily. Curt. bot. mag. t. 60.

**Var. g. albans;** flowers white. White Sweet-pea.

**Var. e. pietus;** wings and keel white; vexillum flesh-coloured. Old Painted Lady-pea.

**Var. e. ecreuloidis;** wings and keel pale blue; vexillum dark purple.

**Sweet-peas** are a great ornament to flower-borders in autumn. The seeds only require to be sown in drills or in clumps in April. Gardeners who raise Sweet-peas for the London markets, sow them in the autumn in pots, and secure them from severe weather by placing them in hot-bed frames, by which means they can bring them early to market. They may be continued in flower the whole summer by repeated sowings in the spring. When sown in pots they require to be frequently refreshed with water.

50 L. tingitana (Lin. spec. 1032.) plant quite smooth; stems winged; leaflets ovate, obtuse, mucronate; stipulas ovate, semi-sagittate, much shorter than the petioles; peduncles 2-flowered, longer than the leaves; calycine teeth nearly equal, shorter than the tube; legumes oblong-linear, much reticulated, compressed, tomentose, with the sutures thick; seeds hardly angular, variegated with black and brown. O. H. Native of the north of Africa, at Tangiers. Curt. bot. mag. t. 100. Jacq. hort. vind. t. 46. Flowers with a large purple vexillum, and with the wings and keel bright red. This species of Lathyrus is usually sown in gardens with other annuuals, but the flowers have not the agreeable scent or variety of colours of the sweet-pea.

51 L. brutus (Tinere, ex Spreng. syst. append.) leaflets 2, elliptic-oblong; stipulas semi-sagittate, setaceous; stem angular, smooth; legumes glabrous. O. H. Native of Calabria.

**Brutian Lathyrus.** Pl. cl.

**Clymenum-like Lathyrus.** Pl. cl.

52 L. clymenoides (D. C. prod. 2. p. 374.) plant smoothish; stems winged; leaves with 2 pairs of linear-lanceolate mucronate leaflets; stipulas semi-sagittate, lanceolate, much shorter than the petioles; peduncles 1-flowered, filiform, shorter than the leaves; calycine segments lanceolate, twice the length of the tube; legumes lanceolate. O. H. Native of the Mauritian Islands. Flowers purple.

**Clymenum-like Lathyrus.** Pl. cl.

53 L. clymenoides (Ser. miss. in D. C. prod. 2. p. 374.) plant quite smooth; stems tetragonal, winged; petioles winged, bearing 5 or 6 leaflets; tendrils much branched; leaflets alternate, elliptic, mucronulate, reticulately veined; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calycine segments unequal, narrow, shorter than the tube; legumes oblong, finely reticulated; style arched. O. H. Native of the Pyrenees, about Olette.

**Tendrilled Lathyrus.** Pl. cl.

54 L. vicinus (Lam. dict. 2. p. 706.) plant pilose; stems tetragonal; leaves with one pair of ovate-oblong mucronate leaflets, upper ones with 2 pairs of linear-lanceolate leaflets; stipulas semi-sagittate, toothed; peduncles short or elongated, 1-2-flowered; calycine segments linear, length of tube or longer; style bearded; legumes oblong, compressed, villous, reticulated, turgid; seeds roundish. O. H. Native of the Levant, and the south of France. L. tenuis, Willd. spec. 3. p. 1082. Flowers with a purple vexillum, and white wings.

**Tendrilled Lathyrus.** Pl. cl.

55 L. purpureus (Presl. del. prng. p. 29. Guss. pl. rar. 297.) leaves with 2 pairs of linear leaflets; stipulas semi-sagittate; peduncles 1-flowered, bracteate, articulated beyond the middle, longer than the stipulas; legumes lanceolate. O. H. Native of Calabria, in corn-fields. Flowers purplish.

**Purple-flowered Lathyrus.** Fl. May. Pl. cl.

56 L. ciliatus (Guss. pl. rar. p. 296.) leaves with 2, rarely with 3, pairs of leaflets; leaflets cuneiform-obovate, retuse, mucronate, ciliated, superior ones linear, elongated, acute; petioles ending in a bristle; peduncles 1-flowered, articulated beyond the middle, shorter than the petioles; legumes linear, compressed, 4-5-seeded; seeds small, globose, smooth. O. H. Native of Calabria, on hills. Corolla small, with a greenish vexillum marked with purple veins; the keel and wings greenish-yellow.

**Ciliated-leaved Lathyrus.** Fl. May. Pl. dec. or cl.

**Clymenum (the Latin name for Water Betony, or from εὐκέμονος, clymenos, clear).** D. C. prod. 2. p. 375. Vexillum furnished with a conical gibbosity on each side at the base. Lower petioles leafless, upper ones bearing 2-6, usually alternate leaves. Petioles usually winged.

**Clymenum** (the Latin name for Water Betony, or from εὐκέμονος, clymenos, clear). D. C. prod. 2. p. 375. Vexillum furnished with a conical gibbosity on each side at the base. Lower petioles leafless, upper ones bearing 2-6, usually alternate leaves. Petioles usually winged.

57 L. difforme; plant glabrous; stems furrowed; leaves with numerous alternate leaflets, which are lanceolate or elliptic-lanceolate, retuse, and mucronate; stipulas small, semi-sagittate, bidentate on one side; racemes shorter than the leaves; flowers secund; calycine segments short and broad, lower one elongated; calyx pubescent. O. H. Native of North America, on the Missouri. O'robus diffusus, Nutt. in Fraser. cat. Flowers large, bluish-purple.

**Diffuse Lathyrus.** Pl. cl.

58 L. nevrians (Roth. abh. 13. t. 4.) stems tetragonal, subulate; leaflets elliptic-lanceolate, mucronulate, glabrous, rugged from dots; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calycine teeth unequal, much shorter.
than the tube; legumes curved. 2. H. Native of Siberia. Wildl. spec. 3. p. 1091.—Buxb. cent. 4. p. 27. t. 46. This plant is said to have the habit of and flowers of *Orobus tuberosus*. Two of the angles of the stem are more winged than the other two, but all ciliated.

*Increased-podded Lathyrus.* Fl. Ju. Jul. Cit. 1808. Pl. cl. 59 L. *alatus* (Tenore, prod. 42, but not of Smith,) stems tetragonal, winged; leaflets 6-8, oblong-lanceolate, mucronulate, alterate; pedicels winged; stipulas lanceolate, unequal, somewhat sagittate; peduncles 2-3-flowered, longer than the leaves; calyceine teeth unequal, shorter than the tube; legumes compressed, flat, many-seeded. O. H. Native of Italy. Flowers large, purple. This plant comes very near *L. Clymenum*.

*Winged-stemmed Lathyrus.* Fl. Ju. Aug. Clt. 1823. Pl. cl. 60 L. *clymenum* (Lin. spec. 1052.) stems tetragonal, winged; lower pedicels dilated, leafless, linear-lanceolate, upper ones bearing 5-6 linear leaflets; stipulas semi-sagittate, linear; peduncles 1-6-flowered, about equal in length to the leaves; calyceine teeth unequal, longer than the tube; legumes oblong, compressed, finely reticulated, with the semi-fusiform suture tumid; seeds compressed, variegated. O. H. Native of the south of Europe. Clymenum uncinatum, Mœnch. meth. 150. Flowers blue. There is also a variety having the vexillum red and the wings blue.

*Clear Vetchling.* Fl. June, July. Clt. 1713. Pl. cl. 61 L. *articulatus* (Lin. spec. 1051.) stems tetragonal, winged; lower pedicels leafless, linear, acuminate, upper ones bearing 5-6 linear leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-3-flowered, about equal in length to the leaves; calyceine teeth nearly equal, shorter than the tube; legumes rather turgid, finely reticulated and nodose at the seeds, having the semi-fusiform suture tumid; seeds compressed, dark purple, rather velvety. O. H. Native of the south of Europe. Gerurt. fruct. 2. p. 293. t. 152. f. 2. Curt. bot. mag. 255. Tourn. inst. t. 218. Mill. fig. t. 96. Clymenum bicolor, Mœnch. meth. 150.—Riv. tetr. irr. t. 48. Corolla with a bright red standard, and white wings and keel.

*Spurious Lathyrus.* Fl. June, July. Clt. 1815. Pl. cl. 64 L. *tenuefolius* (Desf. fl. atl. 2. p. 100,) stems simple, tetragonal, winged; lower pedicels leafless, linear, acuminate, upper ones bearing 4 or 6 linear leaflets; lower stipulas small or wanting, upper ones large, semi-sagittate; peduncles usually 2-flowered, longer than the leaves; calyceine teeth unequal, shorter than the tube; legumes oblong, compressed, glabrous. O. H. Native of Algiers. Corolla blue, about the size of those of *L. sativus*.

*Fine-leaved Lathyrus.* Fl. June, Aug. Clt. 1820. Pl. cl. 65 L. *purpureus* (Desf. cor. p. 81. t. 61.) stems and petioles winged; lower pedicels leafless, lanceolate; upper ones bearing 4-6 ovate-lanceolate leaflets; stipulas lanceolate, semi-sagittate; peduncles 1-flowered, shorter than the leaves. O. H. Native of Greece and Candia. L. alatus, Smith, fl. græc. t. 697. prod. 2. p. 66.? but not of Tenore. Flowers purple, about the size of those of *L. odoratus*.

*American Lathyrus.*

68 L. *Parisianus* (Mill. dict. no. 4,) leaves with many pairs of leaflets; stipulas lanceolate; peduncles 1-flowered. O. H. Native country unknown.

*Parisian Lathyrus.* Fl. July. Clt. ? Pl. cl. 69 L. *magniflorus* (Mill. dict. no. 14,) stems winged; leaves with one pair of ovate-lanceolate leaflets; peduncles many-flowered. O. H. Perhaps only a variety of *L. latifolius*.

*Erect Lathyrus.* Pl. 1 foot.

† *Species only known by name from the catalogues of gardens, which are probably identical with some of those described above.*

*Cult.* The greater part of the species of *Lathyrum* are very handsome when in bloom, the larger kinds are very fit for arbours or shrubberies, and being mostly climbing plants, should be supported by branches stuck in round their roots, or other supports. They all grow in any common soil, and are increased by seeds, and some of the perennial kinds by dividing at the root.

*CLXXIII. OCHRUS* (from ωχρας, oehras, yellow; in reference to the colour of the flowers, which are of a pale yellow). Pers. ench. 2. p. 305.

*Lin. syst. Diadephia, Decandria.* Calyx campanulate, 5-cleft, the 2 superior lobes the shortest and convoluted. Stamina diadephous. Vexillum furnished with a tooth on each side. Style flattened, villous in front at the apex. Legumes with a longitudinal membranous wing on each side of semi-fusiform suture, few-seeded. Seeds globular.—A herb, with bifoliate tendrillic leaves, and axillary, solitary, cream-coloured flowers and ovate stipulas.

*CLXXIV. OROBUS* (οροβος of Theophrastus and Dioscorides, from ωρο, oro, to excite, and βος, bous, an ox; the present genus, however, has nothing to do with the plant of Theophrastus and Dioscorides, which whatever it was, was used X x

§ 1. Leaves with only one pair of leaflets, which are either ovate, lanceolate, or linear.

1. O. lactuca (L.) Ped. (Saxifraga pedunculata) leaves ovate, acute, with parallel nerves; stipules unequally ovate-sagittate, rather larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.

2. O. vulgana (L.) Ped. (Saxifraga cernua) leaves ovate, obtuse, with parallel nerves; stipules unequal, ovate-sagittate, larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.

3. O. hybridus (L.) Ped. (Saxifraga hybrid) leaves ovate, obtuse, with parallel nerves; stipules unequal, ovate-sagittate, larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.

§ 2. Leaves with many pairs of broad leaflets. Stipules much smaller than the leaflets.

8. O. veris (L.) Ped. (Saxifraga veris) leaves ovate, obtuse, with parallel nerves; stipules unequal, ovate-sagittate, larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.

Leguminosae.

CLXXIV. OROSUS.

Fischer's Bitter-Vetch. Fl. May, Jul. Clt. 1857. Pl. 1 ft. 7 O. quadrangularis (Spreng. syst. 2. p. 258.) stem simple, quadrangular; leaves with 1 pair of linear, glabrous leaflets; stipulas semi-sagittate, acute, peduncles many-flowered; flowers secund. 2. H. Native of Sicily.

Quadrangular-stemmed Bitter-Vetch. Pl. 1 ft.

§ 2. Leaves with many pairs of broad leaflets. Stipulas much smaller than the leaflets.

8. O. veris (L.) Ped. (Saxifraga veris) leaves ovate, obtuse, with parallel nerves; stipules unequal, ovate-sagittate, larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.

Leguminosae.

CLXXIV. OROSUS.

Fischer's Bitter-Vetch. Fl. May, Jul. Clt. 1857. Pl. 1 ft. 7 O. quadrangularis (Spreng. syst. 2. p. 258.) stem simple, quadrangular; leaves with 1 pair of linear, glabrous leaflets; stipulas semi-sagittate, acute, peduncles many-flowered; flowers secund. 2. H. Native of Sicily.

Quadrangular-stemmed Bitter-Vetch. Pl. 1 ft.

§ 2. Leaves with many pairs of broad leaflets. Stipulas much smaller than the leaflets.

8. O. veris (L.) Ped. (Saxifraga veris) leaves ovate, obtuse, with parallel nerves; stipules unequal, ovate-sagittate, larger than the leaflets; racemes axillary, shortly pedunculate; flowers small, white, with a large yellow tube; style filiform, very short, about equal to the calyx tube.
acuminated leaflets, with diverging nerves; stipulas ovate-lanceolate, small; peduncles few-flowered, axillary, shorter than the leaves; calyces segments narrow, acute, deflexed, length of tube; legumes compressed, almost semi-sagittate, single toothed; peduncles many-flowered, about equal in length to the leaves; calyceal teeth unequal, short; legumes ovate-oblong, glabrous, pedicellate; style jointed. 2. H. Native of several parts of Europe. In Britain, in mountainous woods and thickets, at Gambleby, Cumberland, about 6 miles from Penrith, on the way to Newcastle; plentiful in several parts of Wales and the lowlands of Scotland; also of Ireland. Smith, Engl. bot. 518. Lightf. fl. scot. t. 16. Petaioes ending in tufts of hairs. Three lower teeth of calyx fringed. Flowers crowded, cream-coloured, streaked and tipped with purple on the outside, white and veined within.

Cream-coloured-flowered Bitter-Vetch. Fl. May, July. Clt. 1816. Pl. 2 to 3 feet. 22. O. Niger (Lin. spec. 1023.) plant smooth; stem branched, angular, flexuous, leaves with 3-6 pairs of elliptic, mucronulate leaflets, with parallel nerves; stipulas linear-lanceolate, acute; peduncles many-flowered, longer than the leaves; calyceal teeth unequal, shorter than the tube; legumes compressed, obliquely and reticulately veined; style jointed; seeds globose. 2. H. Native of many parts of Europe in sub-alpine places. In Scotland in the den of Arly, Forfarshire, and on Craigain near Moy-house, Inverness-shire. Oed. fl. dan. t. 1170. Sims, Bot. mag. 2261.—Riv. tetr. irr. t. 60. Flowers purple, easily changing colour. Herb turning black on drying.

Black Bitter-Vetch. Fl. June, July. Britain. Pl. 2 feet. 23. O. Jordani (Tenore, fl. neap. prod. append. 5.) root tuberously fasciculate; leaves with 3-4 pairs of oblong-lanceolate, cuspidate leaflets; stipulas semi-sagittate, obtuse; peduncles 4-6-flowered, twice the length of the leaves; style jointed. 2. H. Native of Lucania, in humid meadows. Flowers blue.

Jordan's Bitter-Vetch. Fl. May, June. Clt. 1830. Pl. pr. 24. O. humilis (Ser. mss. in D. C. prod. 2. p. 378.) plant quite smooth; stem simple, striated; leaves with 3 pairs of ovate, mucronulate leaflets, with diverging nerves; stipulas semi-bastate; peduncles few-flowered, about equal in length to the leaves; calyceal teeth unequal, shorter than the tube. 2. H. Native of Daluria. Lathyrus humilis, Fisch, in litt.

Humble Bitter-Vetch. Fl. July, Aug. Clt. 1825. Pl. 2 3/4. 25. O. tuberosus (Lin. spec. 1028.) plant quite smooth; stem winged, erect, or prostrate, tuberculate at the base; leaves with 2-3 pairs of elliptic-lanceolate, mucronulate, dotted leaflets, with rather parallel nerves; stipulas semi-sagittate, jagged at the base; peduncles few-flowered, hardly exceeding the leaves; calyceal teeth unequal, ovate, bluntish, shorter than the tube; legumes terete, obliquely and reticulately veined; style jointed, seeds globose. 2. H. Native of almost every part of Europe, in woods and among bushes; plentiful in Britain. Sturm, deutschl. fl. fasc. 21. Oed. fl. dan. 781. Smith, Engl. bot. 1155.—Riv. tetr. irr. t. 59. Roots creeping, swelling into tubers at irregular intervals. Calyx purple. Corolla elegant, variegated, and veined in light purple crimson, and shades of blue and flesh-colour, changing to blue as it fades. The highlanders of Scotland have a great esteem for the tubercles of the roots; they dry and chew them to give a better relish to their whisky; x x 2
they also affirm that they are good against most diseases of the thorax, and that by the use of them, they are enabled to repel hunger and thirst for a long time. In Breadalbane and Ross-shire, they sometimes bruise and steep them in water, and make an agreeable fermented liquor with them. They have a sweet taste, something like the roots of liquorice, and when boiled are well flavoured and nutritive, and in times of scarcity have served as a substitute for bread. Boiled well a fork will pass through the tubers, and dried slightly and roasted they are served up in Holland and Flanders, in the manner of chestnuts. The plant is called Wood-pea or Heathi-pea in England, and Knapperts in the lowlands of Scotland. In Gaelic it is called Cor-neill.

26 O. tetuviolius (Roth. fl. ger. 1. p. 305.) plant quite smooth; leaves with 2-3 pairs of very narrow, linear leaflets; stem winged, erect; stipulas narrow, semi-sagittate, ciliated, indented behind; peduncles few-flowered, hardly longer than the leaves; calyceae teeth unequal; legumina terete; roots swelling in tubers at intervals.

27 O. Pyrenaicus (Lin. spec. 1029.) stem simple, terete; leaves with 2-3 pairs of ovate, nervet, mucronate leaflets, which are glaucous beneath; stipulas semi-sagittate, linear, awned on both sides; peduncles 1-2-flowered; teeth of calyx triangular, the lowest one the longest; style jointed. 2. H. Native of the Pyrenees. O. Plukkenetii, Lapeyr. mem. mus. 2. p. 299.—O. tuberosus var. β, Pyrenaicus, Ser. in D. C. prod. 2. p. 376.—Pluck. phyt. t. 200. Flowers pure purple.

28 O. divaricatus (Lapeyr. in mem. mus. 2. p. 302. t. 2.) stem branched, divaricate, winged in the middle, but naked at both extremities; leaves with 2-3 pairs of elliptic-lanceolate, obtuse, mucronate leaflets; stipulas of the lower leaves acute, entire, of the upper ones sharply and deeply toothed at the base; peduncles few-flowered; calyceae segments triangular, acute, lower one longest. 2. H. Native of the Pyrenees. O. tuberosus γ, divaricatus, Ser. in D. C. prod. 2. p. 376. Flowers purple.

Divaricate Bitter-Vetch. Fl. May, July. Cl. 1816. Pl. 2 ft.

29 O. erectus (Poir. in Lam. dict. 4. p. 627.) stem branched; leaves with 4-6 pairs of elliptic, glabrous, mucronate leaflets; stipulas semi-sagittate, acute; peduncles villous, 4-6-flowered. 2. H. Native country unknown.

30 O. vicetorius (Lag. gen. et spec. p. 22.) leaves pinnate; leaflets oblong, bluish; stipulas bifid, somewhat stipitate; peduncles 1-flowered; legumina lanceolate, glabrous. 2. H. Native of Spain. Flowers pale blue.

Var. a. calcarius; peduncles 1-flowered, furnished with a short awn. Vicia calcaria, Desf. fl. atl. 2. p. 166. Lagasc. l.c.

Var. b. multiflorus; peduncles 2-7-flowered. Lagasc. 1.c.

Vicia-flowered Bitter-Vetch. Pl. decemnunt.

31 O. ? Pisaidia (Sprøe. pl. min. cogn. 1. p. 47.) stem unknown; leaves impari-pinnate; leaflets cuneate, retuse; stipulas subulate; peduncles racemose, few-flowered, longer than the leaves.—Native of New Caledonia. Vicia Pisidica, Forst. mss. The plant from the name appears to be used in New Caledonia for intoxicating fish.

Fish-poison Bitter-Vetch. Pl.

§ 3. Leaves with many pairs of very narrow leaflets.

32 O. varius (Soland. in Sims’s bot. mag. t. 675.) stems simple, angular; leaves with 3-4 pairs of linear-lanceolate, mucronulate leaflets; stipulas semi-sagittate; peduncles many-flowered, longer than the leaves; calyceae teeth lanceolate, unequal, shorter than the tube; style almost filiform. 2. H. Native of Italy. O. versicolor, Gmel. syst. 2. p. 1108. Flowers having the vexillum rose-coloured, and the keel and wings yellow.

33 O. canescens (Lin. fl. suppl. p. 327.) stem tetragonal; leaves with usually 2-3 pairs of linear, bluish, pubescent, or dotted leaflets, with parallel nerves; stipulas semi-sagittate, linear, acute; peduncles many-flowered, longer than the leaves; calyceae teeth lanceolate, unequal, shorter than the tube; legumina straight, compressed, glabrous, reticulately veined lengthwise; style jointed, rhomboid. 2. H. Native of the south of Europe. O. filiformis, Lam. fl. fr. 2. p. 568. Flowers white, with a tinge of blue.

Var. β. tenuis (Ser. l. c.) leaflet linear; flowers dark-purple.

2. H. Native of the Pyrenees. O. atropurpureus, Lapeyr. abr. 413.

34 O. palleseens (Biebl. fl. taur. 2. p. 152. suppl. p. 465.) stem simple, pubescent, tetragonal; leaves with 2-3 pairs of linear, subulate, pubescent leaflets; stipulas semi-sagittate, subulate, almost entire; peduncles many-flowered, longer than the leaves; style very thick at the apex. 2. H. Native of Tauria. O. canescens β palliisens, Ser. in D. C. prod. 2. p. 376. Flowers white. Perhaps a species of Platystylis.

Flowerless Bitter-Vetch. Fl. May, Ju. Cl. 1823. Pl. 1 ft.

35 O. ensifolius (Lapeyr. in mem. mus. 2. p. 303. t. 12.) stem terete, striated; leaves with 2-3 pairs of ensiform, acute, erect, nervet, crowded leaflets; stipulas semi-sagittate, acute; peduncles many-flowered, twice the length of the leaves; calyceae teeth ovate, acute, lower ones longer; wings and keel coalescent. 2. H. Native of the Pyrenees. O. canescens var. γ, ensifolius, Ser. in D. C. prod. 2. p. 376. Flowers white.

Sword-leaved Bitter-Vetch. Fl. May, June. Pl. 1 foot.

36 O. Alius (Lin. fl. suppl. 327.) stem simple; leaves with 2-3 pairs of linear mucronate leaflets, with parallel nerves; stipulas broadish, semi-sagittate, shorter than the petiole, which is winged; peduncles many-flowered, longer than the leaves; calyceae teeth lanceolate, very unequal, lower ones much the longest; legumina compressed, glabrous, rather flexuous; style linear. 2. H. Native of the south of Europe, Austria, Hungary, &c. Sweet, fl. gar. t. 22. O. Pannonicus, Jacq. austr. 1. t. 33. O. lactus, Biebl. fl. taur. 2. p. 152.—J. Bauh. hist. 2. p. 326. f. 2. Flowers white, tinged with rose-colour.

Var. β, asphodeloides (Ser. in D. C. prod. 2. p. 376.) leaflets shorter and broader, tubers of root oblong. O. asphodeloides, Gouan. ill. 48. Perhaps a distinct species.

37 O. angustifolius (Lin. spec. 1028.) stem simple; leaves with 2 pairs of narrow, ensiform, acute leaflets; stipulas subulate, semi-hastate; peduncles many-flowered, longer than the leaves. 2. H. Native of Siberia.—Gmel. fl. sib. 4. p. 14. t. 5. Flowers yellow. The leaflets are remarkably narrow.

38 O. atropurpureus (Desf. fl. atl. 2. p. 157. t. 196. but not of Lapeyr.) stem simple or branched, striated or angular; leaves with 5 pairs of linear acute leaflets; stipulas semi-sagittate, very narrow, awned; peduncles many-flowered, longer than the leaves; flowers secund, drooping; teeth of calyx almost equal, obtuse, and very short; style filiform, crowned by a glo-

DARK-PURPLE-FLOWERED BITTER-VETCH. Pl. 1 to 2 feet.

39 O. saxatilis (Vent. Hort. cels. t. 94.) stems simple, weak; leaves with 2 pairs of linear leaflets; stipulas small, semi-sagittate; peduncles 1-flowered, much shorter than the leaves, articulated, and bracteolate; calyce segments lanceolate, nearly equal, shorter than the tube; legumes nearly cylindrical, grey. O. H. Native of Provence, on arid hills. D. C. fl. fr. 4. p. 589. Flowers blue and white mixed.

40 O. longifolius (Nutt. gen. amer. 2. p. 95.) plant clothed with silky villi; leaves ternate, and with 2 pairs of leaflets, uppermost ones simple; leaflets very long, filiform-linear; stipulas undivided, ovate-lanceolate, acuminate; racemes pedunculate, filiform, shorter than the leaves; 2 upper teeth of calyx shortest. 2. H. Native of North America, on the plains of the Missouri. Psoralea longifolia, Pursh. Fl. sept. amer. 2. p. 741. Racemes usually solitary. Flowers pale-red. Roots creeping.

Long-leafletted Bitter-Vetch. Pl. 1 foot.

41 O. darpurr (Nutt. gen. amer. 2. p. 95.) leaves unequally pinnate, with 6-8 pairs of linear obtuse leaflets; stipulas simple, ovate; racemes sessile, twin or tern; segments of the calyx equal, the superior indented, however, more profound and wider than the rest; legumes, glabrous. 2. H. Native of North America, on arid hills about Fort Mandan. Flowers cream-coloured, having the wings longer than the keel. Habit of a species of Astragalus.

Unlike Bitter-Vetch. Pl. decumbent.

† Species not sufficiently known.

42 O. procumbens (Mill. dict. no. 11.) stems procumbent; leaves impari-pinnate, tomentose; outer leaflets largest; leaflets 5 pairs. Native of Mexico, about Vera Cruz. Flowers bright purple, disposed in short axillary racemes. Legumes compressed. Seeds 6, roundish.

Procumbent Bitter-Vetch. Pl. procumbent.

43 O. vivens (Mill. dict. no. 8. fig. t. 193. f. 2.) stems simple; leaves with 4 pairs of ovate acute leaflets; legumes umid, containing 3-4 roundish seeds; peduncles 4-flowered. 2. H. Native of Germany and Italy. Flowers purple. Perhaps a variety of O. vernalis.

44 O. montanus (Scop. fl. cern. 2. p. 80. t. 41.) stem simple, striated; leaves with 3-4 pairs of ovate leaflets; racemes 5-6-flowered, a little longer than the leaves; legumes glabrous, purplish. 2. H. Native of Carniola. Flowers yellowish-white. Perhaps a variety of O. vernalis.

Mountain Bitter-Vetch. Pl. 1 foot.

45 O. coccineus (Mill. dict. no. 12.) stems procumbent; flowers axillary and terminal; leaves abruptly-pinnate, with 3-4 pairs of linear villous leaflets. 2. S. Native of Mexico, about Vera Cruz. Peduncles short, 3-4-flowered. Flowers small, scarlet, succeeded by short taper pods, containing 3-4 small roundish seeds each.

Var. 1. unijugus (Ser. in D. C. prod. 2. p. 380.) stipula semi-hastate; leaves with one pair of linear-lanceolate leaflets; flowers solitary, length of the pedicel. Longh. bot. cab. 583.

46 O. argenteus (Mill. dict. no. 10.) stems erect, tomentose; leaves pinnate; leaflets oblong-ovate, silky beneath; flowers disposed in terminal spikes. 2. S. Native of Mexico, about Vera Cruz. Leaves with 4-8 pairs of leaflets, hairy on the upper surface. Flowers deep purple, succeeded by long, woolly, compressed pods, each containing 4-5 seeds.

Silvery Bitter-Vetch. Shrub 5 to 6 feet.

47 O. americana (Mill. dict. no. 9.) stem much branched, frutescent; leaves pinnate, with 5-6 pairs of linear-lanceolate leaflets, which are tomentose beneath; legumes compressed, glabrous. 7. G. Native of Jamaica. Flowers pale purple, disposed in loose terminal spikes.

Cult. O'robus is a genus of very elegant pea-flowering plants, and being all hardy, deserve to be cultivated in every flower border. They thrive best in light soil, and are easily propagated by seeds, or by dividing the plants at the roots in spring.

CLXXV. PLATYSTYLI S (from πατρίς, platys, broad, and στύλος, a style; in reference to the dilated style, which separates the genus from O'robus). Sweet. fl. gard. 239.

L. SYN. Diadelphia, Decandria. Calyx campanulate, 5-6-lobed, the 2 upper lobes shortest. Corolla papilionaceous. Stamens diadelphous. Style broad, spatulate, villous at the apex. Legumes oblong, many-seeded; seeds nearly globose.—Erect herbs, with semi-sagittate stipulas. Leaves abruptly-pinnate, with few pairs of leaflets. Petioles ending in a bristle.

1 P. cyanescens (Sweet, fl. gard. 239.) stem simple, striated; leaves with 2-3 pairs of approxicate, linear-lanceolate, acute leaflets; stipulas about equal in length to the petioles; peduncles few-flowered, longer than the leaves; calyce segments lanceolate, hardly the length of the tube. 2. H. Native of Eastern Caucasus, in subalpine places. O'robus cyanescens, Stev. in mem. soc. cur. moisq. 4. p. 51. Bieb. fl. taur. suppl. p. 464. Flowers large, bluish-purple.

Blue-flowered Platystylis. Fl. May, June. Cl. 1832. Pl. 1 foot.

2 P. sessillifolia (Sweet. l. c. in a note,) stems simple, striated; leaves with 1 pair of linear-subulate approximate leaflets; stipulas semi-sagittate, subulate, much longer than the petioles; peduncles few-flowered, longer than the leaves; calyce segments linear, hardly the length of the tube; style jointed, spatulate; legumes narrow. 2. H. Native of Tauria, in woods, and about Athens in Greece. O'robus sessillifolius, Smith, fl. grac. t. 692. ex prod. 3. p. 64. O. digitatus, Bieb. fl. taur. 2. p. 153. et suppl. 462.—Buxb. cent. 2. p. 36. t. 38. Flowers large, bluish-purple.

Sessile-leafletted Platystylis. Fl. May, Ju. Cl. 1832. Pl. 1 foot.

3 P. stipulacea (Stev. c. 3. p. 239.) stem erect, angular, branched above; leaves with 2-3 pairs of linear, attenuated, very long leaflets, which are obscurely 3-nerved, and glabrous; stipulas large, semi-sagittate; peduncles axillary and terminal, few-flowered, shorter than the leaves; calyce teeth unequal, lower ones the longest. 2. H. Native of Sicily? O'robus stipulaceus, Hook. bot. mag. 2937. Flowers with a purple vexillum, blue wings, and purple keel.

Large-stipled Platystylis. Fl. May. Pl. 1 foot.

Cult. Elegant plants, well adapted for the front of flower borders. A light sandy soil suits them best, and they are easily increased by seeds, or by dividing the plants at the roots in spring.

Tribe V.

PHASEOLEÆ (plants agreeing with Phaseolus in some important characters). Brom. diss. p. 133. D. C. legum. mem. ir. prod. 2. p. 381.—Phaseolus, Adans. fam. 2. p. 325. exclusive of numerous genera. Corolla papilionaceous (C. 47. c. f. 48. b.), Stamens monadelphous (f. 49. a.), but usually diadelphous (C. 48. e. f. 47. g.), 9 joined together, and 1 free. Legume many-seeded, dehiscent, continuous, usually subdivided internally into
1-seeded cells by cellular transverse membranes, never truly articulated. Radicle curved back upon the fissure formed by the cotyledons (f. 21. e. f.). Cotyledons thick, filled with fecula, and destitute of cortical pores, and do not undergo any change at the time of germination, but nourish the young plant by means then supply of food they already contain; they rise above the earth, and are usually protruded from the spermmaderm. Primordial leaves opposite, all the rest of the leaves are furnished with an odd leaflet; the leaflets always pinnately disposed, rarely disposed palmately. This tribe of plants is more natural than the preceding; it is allied to Hedysarea, from the pods being divided into transverse cells by cellular membranes, and to Viciae in the cotyledons being thick, and protruding from the spermmaderm.

Lin. syst. Mondelphia, Enneandra. Calyx bluntly 4-lobed, upper lobe broadest. Corolla papilionaceous, with an acute vexillum. Stamens 9, monadelphous at the base, leaving the tube or sheath gaping in front. Stigma obtuse. Legume oblong, compressed, 4-6-seeded. Seed roundish, separated by cellular membranes.—A delicate twining shrub, with abruptly-pinnate leaves, bearing many pairs of leaflets. This genus differs from the rest of the present tribe in the leaves being abruptly-pinnate.

1 **A. FRACTATUS** (Lin. syst. 583). L. S. Native of the East Indies, from whence it has probably migrated to the tropical parts of Africa and America.—Rumph. amb. 3. t. 32.—Rheed. mal. 8. t. 59. Flowers pale purple, disposed in axillary bunches. There are different varieties of this plant, varying in the colour of the seeds, which are probably as many distinct species; some are red, with a black spot, some blood-coloured, others white, rufous, and black. The leaves and roots of this plant taste like liquorice, whence the inhabitants of the West Indies call it *wild liquorice*, and they use the roots for the same purposes as we do liquorice. The seeds of the commonest variety are of a glossy scarlet-colour, with a black spot or eye at the hylum, or that part which is fixed to the pod; they are commonly strung, and used as ornaments by the inhabitants of those countries where the herb grows wild; they are frequently brought to Europe from Guinea, and the West and East Indies, bored, and used as beads, with other hard seeds and shells; they are also used as beads for rosaries, hence the trivial name, and in Egypt as pulse, but they are the hardest and most indigestible of the whole pea tribe.

*Prayer Wild-liquorice.* Fl. March, May. Clt. 1686. Sh. tw. Cult. This plant requires a strong heat to keep it in a growing healthy condition. A mixture of sand and loam is the best soil for it, and it is increased by cuttings under a glass-house in sand, or by seeds, which should be raised on a hot-bed.

*Filiform Sweetia.* Fl. July, Aug. Clt. 1820. Shrub tw. 3 **S. VELUTINA**; leaflets oblong, obtuse, villous on both surfaces; racemes few-flowered; legumes lanceolate, pubescent. L. S. Native of St. Domingo. Tephròsia velutina, Spreng.*Febvleveyia.* Shrub tw. 2 **F. Sweetia**. Shrub tw. 3 **S. f. LIGNOSA** (D. C. prod. 2. p. 383.) leaflets cuneate-obovate, emarginate, rather coriaceous, glabrous; racemes longer than the leaves; bracteas setaceous; legumes rather falcate. L. S. Native of St. Domingo. Glycine lignosa, Turp. in Pers. ench. 2. p. 301. Calyces segments 4, acute, of these the two lateral ones are the shortest. Vexillum very broad, green at the base.

Lin. syst. Diadelphia, Decandria. Calyx tubular, coloured, permanent, 4-cleft; lobes acute, the 2 lateral ones the shortest. Corolla papilionaceous, with an ovate, concave, emarginate vexillum, which is not half the length of the oblong wings. Stamens 10, diadelphous, of these 4 are thicker than the rest, bearing ovate anthers, and the other 6 slender, bearing oblong anthers. Style filiform, crowned by an obtuse stigma. Legume straight, nearly terete, thick, acuminate, many-seeded.—Twining herbs, with trifoliate leaves, ovate-oblomoid pilose leaflets, filiform stipulas, axillary peduncles, bearing many white flowers, and ciliate legumes.

1 **A. COCHINCHINENSIS** (Lour. 1. c.) L. G. Native of Cochinchina, and where also it is cultivated for the legumes, which are dressed and eaten by the inhabitants, as we do French beans.

*Cochin-china Long-flowered Bean.* Fl. July, Aug. Pl. tw. Cult. A mixture of loam and peat will suit this plant. It is increased by seeds, which should be raised on a hot-bed.

Lin. syst. Monadelphia, Decandria. Calyx 5-cleft, the 2 superior segments arched, falcate, and coadunate, pressing down upon the vexillum, which is deflexed. Corolla papilionaceous, with a 2-edged keel. Stamens monadelphous, with the tube or sheath gaping on the back. Legume linear-ensiform, many-seeded. Seeds smooth.

1 **R. TRIFOLIATA** (Pers. 1. c.) L. H. Native country unknown. Dilwynia trifoliata, Roth, l. c. Glycine humifusa, Willd. enum. 756. ex Roth, nov. spec. 349. Cleome prostrata,

Cult. The seeds of this plant only require to be sown in a warm border, in the front of a stove or green-house.

_Lin. Syst._ Monadelphia, Decandra. Calyx biliate, upper lip the longest, and bifid, lower lip 3-parted, with all the lobes acute. Corolla papilionaceous, with a small keel, which is hidden by the calyx. Stamens 10, monadelphous, the 5 alternate ones sterile. Stigma capitate, sessile on the top of the ovary. Legume linear, compressed, 2-valved, many-seeded.—Twining sub-shrubs, natives of the West Indies, with angular branches, pinnately-trifoliate leaves, stipulate leaflets, axillary racemes, which are longer than the leaves, and small remote reddish flowers.

1 T. uncinatus (Swartz, l. c.) branches clothed with retrograde silky down; leaves clothed with silky down beneath, and pubescence above; leaflets ovate or oblong. η. C. S. Native of Jamaica, in arid bushy places. Délitons unciniatus, Lin. spec. 1019.—Plum. ed. Burm. t. 221.

**Hooked Teramnus.** Clt. 1822. Shrub tw.

2 T. volubilibis (Swartz, l. c.) branches clothed with fine retrograde hairs; leaves pubescent beneath; leaflets lanceolate. η. C. S. Native of Jamaica, in humid bushy places on the mountains, and of New Granada, near Mompox, on the banks of the river Magdalena. All the synonyms cited under this plant by Willkewow are referrible to the first species.

**Twining Teramnus.** Clt. 1824. Shrub tw.

Cult. See _Abras_ p. 342 for culture and propagation.

_Lin. Syst._ Diadelphia, Decandra. Calyx campanulate, 4-toothed, bracteate at the base, the teeth equal, and rather bluntish. Corolla papilionaceous. Petals oblong. Vexillum broad, incumbent, and nearly sessile. Stamens diadelphous. Style filiform. Stigma capitate. Stipe of ovary covered by a cylindrical sheath. Legume compressed, stipitate, 2-4-seeded.—Plants, with herbaceous twining stems, pinnately-trifoliate leaves, ovate glabrous leaflets, and axillary racemes, bearing 2 flowers to each bractea. Flowers usually apetalous, those on the stems or bearing legumes dissimile to those on the root; those on the roots usually fertile.

Cult. The seeds of these plants only require to be sown in the open border in spring, in a warm sheltered situation.

_Lin. Syst._ Diadelphia, Decandra. Calyx biliate, upper lip bidentate, lower one trifid, equal (f. 47. a.). Corolla papilionaceous (f. 47. c.), with the vexillum emarginate, recurved (f. 47. b.), but not bent back from the carina. Stamens diadelphous (f. 47. g.). Stigma obtuse (f. 47. f.). Legume linear (f. 47. e.), compressed, transversely many-celled from cellular membranous disseminations. Seeds strophiolate.—Twining shrubs, native of New Holland, with axillary peduncles, and scarlet or violaceous flowers, having the vexillum imbricate at the base.

§ 1. Leaves trifoliate. Keel straight, rather longer than the vexillum.

1 K. rebicun'da (Vent. malm. t. 104.) leaves 3, ovate; stipulas ovate-lanceolate, spreadingly reflexed; peduncles usually 3-flowered; legumes hairy. η. C. G. Native of the eastern and southern coasts of New Holland. Glynice rubicunda, Curt. bot. mag. 248. Caulinia rubicunda, Mœch. Keel about equal in length to the wings, 15 lines long, acute. Flowers dark red.

§ 2. Leaves trifoliate. Keel shorter than the vexillum and wings.

3 K. bractea'ta (Gaud. in Freycinet, voy. part. bot. p. 486. t. 113.) leaves elliptic, obtuse, somewhat emarginate, with indately curved margins, clothed with silky pubescence beneath; stipulas broad, ovate, acute; peduncles few-flowered, bracteate; bracteas connate, funnel-shaped. η. G. Native of the western coast of New Holland. Shrub apparently erect.

**Bracteate Kennedya.** Shrub cl?.

4 K. sericea; leaflets obovate, emarginate, mucronate, clothed with silky hairs, particularly when young; peduncles elong-
gated, many-flowered; calyx very villous. ½, C. G. Native of New Holland. Flowers scarlet. Keel shorter than the vexillum.

6 K. cocci nea (Vent. malm. t. 105. exclusive of the synonymes,) leaflets 3; ovate-oblong, acuminate, rather pilose; racemes many-flowered, longer than the leaves. ½, C. G. Native of New Holland. Glýcine Compontiána, Ker. bot. reg. 298. Flowers bluish purple.

7 K. tabac cea (Labill. cal. p. 70. t. 70.) leaflets 3, ovate-oblong, acuminate, rather pilose; racemes racemose; stems, pedi- toles, and peduncules beset with retrograde hairs; legume hairy. ½, C. G. Native of New Caledonia.

Tabac Ceá Kennedy. Shrub twining.

8 K. iox ey lla (Cunningh. Fl. Mar. Lindl. bot. reg. t. 1421.) leaflets 3, cuneate, mucronate, attenuated at the base, rather pilose above, and silky beneath; stipulas oblong, acute; peduncles longer than the leaves; flowers 12-20, disposed in dense um- bellate heads at the apexes of the peduncles; calyx clothed with black hairs. ½, C. G. Native of New Holland. K. dila tata, Cunningh. mss. Flowers beautiful scarlet; the vexillum with a greenish yellow mark at the base.

§ 8. Leaves simple. Keel of flowers shorter than the wings and vexillum.

9 K. monophylla (Vent. malm. t. 106.) leaves ovate, glau- brous, rather cordate at the base; stipules lanceolate, erect; racemes many-flowered, much longer than the pedi- toles. ½, C. G. Native of New Holland, on the eastern coast. Glýcine bimaculata, Curt. bot. mag. 263. Flowers bluish-purple or viola- ceous. There are varieties of this species with narrow oblong leaves, and cordate lanceolate leaflets.

Var. ½, longiracemosa (Lindl. bot. reg. t. 1336.) racemes slender, longer than the leaves; flowers smaller.

Cult. Kennedy is an elegant genus of shrubs, well fitted for the climbers of a conservatory or greenhouse. A mixture of sandy loam and peat is the best soil for them, and young cuttings root freely if planted in a pot of sand, in a little bottom heat, with a bell-glass placed over them.

Lin. syst. Diadelpheia, Decadæria. Calyx 5-cren, somewhat bilabiate. Corolla papilionaceous, usually shorter than the calyx. Stamens diadelpheous, having the free filament jointed at the base. Style filiform, usually very bent. Legume sessile, compressed, 2-valved, 1-celled, rather falcate, 2-seeded.—Climbing shrubs or herbs, with simple, but usually trifo- lite leaves, having the terminal leaflet petiolate. Flowers yellow, axillary, racemose or solitary.

§ 1. Leaves all, or for the most part, simple, roundish, standing on long pedicels.

1 R. menispermoides (D.C. in ann. sc. nat. 4. p. 102. legumm. mem. ix. t. 55.) stems trailing, covered with spreading pubes- cence; stipulas ovate; leaves reniform, very obtuse; racemes few-flowered, almost sessile; calyces segments lanceolate, acutish, 3-nerved. ½, C. S. Native of Mexico, near Aca- pulco and Vera Cruz, on sandy hills. Legume oval-lanceolate, compressed, acute, 1-2-seeded, hardly pubescent.

Moon-seed-like Rhynchosia. Pl. cl.

3 R. difformis (D.C. prod. 2. p. 384.) stem twining, vel- vety; stipulas oblong-lanceolate, lower leaves simple, upper ones trifoliate; racemes on long peduncles; flowers crowded, spicate; segments of the calyx lanceolate, acuminate. ½, C. H. Native of Carolina, in dry and cultivated places. Glýcine tomentosa, var. volúbilis, Michx. fl. bor. amer. 2. p. 63. This appears an intermediate species between this and the following division.

§ 2. Leaves all on long pedicels, trifoliate. Phaseoloideae.

5 R. Caribae (D.C. prod. 2. p. 384.) twining, pubes- cent; leaflets ovate-rhomboid, acute, covered with resinous dots beneath; racemes longer than the leaves; legumes acinaeiform, hispid. ½, C. S. Native of the West Indies and on the banks of the river Orinoco, according to Kuntb, nov. gen. amer. 6. p. 125, as well as of Western Florida. Glýcine Caribae, Jacq. neera bounty. t. 146. coll. 1. p. 66. Glýcine réflexa, Nutt. gen. amer. 2. p. 115. ex Nutt. in Sill. journ. Flowers yellow, with the vexillum striated. Legume 12-16 lines long, tapering at the base.

6 R. punctáta (D.C. mem. leg. ix. t. 56.) stem twining, angular, beset with retrograde pubescence; leaflets ovate-rhom- boid, acute, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. ½, C. S. Na- tive of Cayenne. Glýcine litorális, Vahl. ined. in herb. Puer. Legumes 6 lines long. Style filiform, inflexed. Flowers 3 lines long; vexillum not striated. This species comes very near R. minima, but the down on the stems is turned backwards, and the flowers are larger.
Dotted-leaved Rhynchosia. Pl. cl. 

8 R. nudata (D. C. legum. mem. ix.) stems twining, angular, having the angles beset with retrograde pubescence; leaflets roundish, mucronulate, glabrous, dotted beneath; racemes filiform, longer than the leaves; flowers deflexed; legumes pubescent. 7. C. S. Native of the East Indies, at Nándaránd. Hédsýarrum náðum, Rott. in herb. Puer. Legumes 9 lines long.

Naked Rhynchosia. Pl. tw.
9 R. volvularia (Lour. exch. p. 460.) stems herbaceous, twining, terete; leaflets roundish-ovate, reticulated, clothed with velvety down; racemes longer than the leaves; legumes ovate, rather velvety. 7. C. G. Native of China, in the suburbs of Canton. Peduncles twin (Lour.). Flowers yellow. Legumes black. Seeds 2, black, shining.

Twining Rhynchosia. Pl. tw.

11 R. precatoria (D. C. prod. 2. p. 383.) stems twining, villous; leaflets rhomboid-ovate, acuminate, obtuse at the base, and 3-nerved, clothed with soft pubescence; racemes axillary, many-flowered, about equal in length to the leaves; legumes oblong. 7. C. S. Native of Mexico, near Acapulco. Glýcine precatoria, Humb. in Willd. enum. 755. H. B. et Kuntb, nov. gen. amer. 6. p. 425. Indígëfera volubilis, Wendl. obs. 55. ex Willd. The hairs on the plant are tipped with glands, but the legumes are articulated, according to Wendland; according to Kunt the seeds are scarlet, and are strong for rosaries, whence the specific name.

12 R. macrophylla (D. C. prod. 2. p. 383.) branches twining, triangular, clothed with soft villi; leaflets rhomboid-ovate, acuminate, somewhat cordate, 3-nerved, clothed with soft pubescence on both surfaces, canescent and beset with glandular dots beneath; racemes many-flowered, on short peduncles; calyces silky. 7. C. S. Native of Cuba, near Havana. Glýcine macrophylla, H. B. et Kuntb, nov. gen. amer. 6. p. 426. Allied to R. reticulata, but the terminal leaflet is 4 inches long and about 2 inches broad.

Large-leafletted Rhynchosia. Shrub. tw.
13 R. erythrinaoides (Schlecht. et Cham. in Linnaea, vol. 5. p. 587.) shrubby, climbing, smoothish; leaflets ovate-rhomboid, acuminate, acute, 3-nerved, beset with resinous dots on both surfaces; racemes axillary, when in fruit about equal in length to the leaves; calyx 5-cref; legume sessile, 2-seeded, torulose; seeds nearly globose, a little compressed, girded at the hyalum vol. II.

by a scarlet arillus. 7. C. S. Native of Mexico, between Masantia and Nantla, in woods. Plant pubescent in its parts when young.

Coral-tree-like Rhynchosia. Shrub tw.
14 R. reticulata (D. C. prod. 2. p. 382.) stems twining, angular; leaflets ovate-rhomboid, acuminate, velvety, reticulately veined beneath; racemes axillary, shorter than the leaves; legumes rather pubescent. 7. C. S. Native of Jamaica, Santa Cruz, and Guadaloupe, on the mountains among bushes, and of Mexico, near Jalapa. Glýcine reticulata, Vahl. symb. 3. p. 88. Swartz, prod. 105. Corolla brownish yellow, shorter than the calyx.

15 R. paniculata (D. C. legum. mem. ix. prod. 2. p. 383.) stems twining; branches angular, and are as well as the leaves clothed with soft, short, velvety down; leaflets elliptic, very blunt, reticulately veined beneath; peduncles 2-flowered; legumes clothed with short down, alternated with a few stiff hairs. 7. C. S. Native of St. Domingo. Leaflets hardly 4-5 lines long. Legumes 2-seeded, hardly half an inch long.

Small-flowered Rhynchosia. Shrub tw.

Pubescent Rhynchosia. Shrub tw.
17 R. Mennónia (D. C. prod. 2. p. 386.) stems twining, terete, and are as well as the leaves clothed with soft, hoary, velvety down; leaflets ovate-obtuse, obtuse, reticulately veined beneath; racemes axillary, longer than the leaves; flowers nodding; legumes compressed, constricted in the middle, villously tomentose. 7. C. G. Native of Egypt, about Thebes. Glýcine Mennónia, Delil. fl. aegypt. 100. t. 38. f. 3. Vexillum rather pubescent, yellow, lined with black veins.

Mennónia's Rhynchosia. Pl. tw.
18 R. densiflora (D. C. prod. 2. p. 386.) stems twining, clothed with short hoary down; leaflets ovate-roundish, acuminate, pubescent on both surfaces, and full of resinous dots; racemes axillary, ovate, dense-flowered, on short peduncles; corolla smaller than the calyx. 7. C. S. Native of the East Indies. Glýcine densiflora, Roth. nov. spec. 348. Corolla glabrous. Legume unknown.

Dense-flowered Rhynchosia. Pl. tw.
19 R. capitata (D. C. prod. 2. p. 386.) stems twining, angular, hairy; leaflets roundish, puberulous on the nerves and margins; peduncles axillary, length of leaves, bearing branches under the capititate raceme; corolla length of calyx; legumes sessile within the calyx, almost orbicular, compressed, 2-seeded, pilose. 7. C. S. Native of the East Indies. Glýcine capitata, Roth. nov. spec. 348. Allied to R. wumuldária.

Elon gated Rhynchosia. Shrub tw.
20 R. elongata (D. C. prod. 2. p. 386.) stems twining; leaflets roundish, somewhat acuminate; racemes axillary, somewhat capititate, shorter than the petioles; lower tooth of calyx elongated, longer than the corolla; legumes pedicellate within the calyx, nearly orbicular, compressed, 2-seeded, pilose. 7. C. S. Native of the East Indies. Glýcine elongata, Roth. nov. spec. 347. Allied to R. wumuldária.

Wumuldária. Shrub tw.
21 R. wumuldária (D. C. prod. 2. p. 386.) stems twining, Y y
38 R. de' blis: plant twining, villous; leaflets roundish, almost glabrous; petiole long; racemes axillary, sessile, crowded with small flowers; legumes short, villous. \( \text{R.} = \text{S.} \) Native of Guinea and of the Island of St. Thomas. Flowers small, yellow.

Weaker Rhyncosia. Pl. tw.

39 R. strait'ra; plant twining; leaflets ovate, acuminate, entire, glabrous, 3-nerved at the base; racemes lateral, sessile; calyx 4-crested, and is as well as the pedicels hairy; corolla about equal in length to the calyx. \( \text{R.} \text{C. S.} \) Native of Sierra Leone. Flowers yellow and striped with red.

Striated-flowered Rhyncosia. Pl. tw.

40 R. diflora (D. C. L. C.) stems twining, clothed with velvety villi; leaflets oval, acutish at both ends, reticulated above, but clothed with soft velvety villi beneath; racemes 2-flowered, shorter than the petioles; legumes ovate, mucronate, villous, constricted between the seeds; seed furnished with a thick bidental silillus. \( \text{R.} \text{C. S.} \) Native of the East Indies. Diclios scarabeoides, Roxb. hort. Beng. 57. Legume 3-5 lines long and 3 lines broad, 2-seeded. Seed ovate, blackish brown, separated by cellular transverse membranes.

41 R. Garin'i (D. C. prod. 2, p. 388.) stems twining, clothed with velvety villi; leaflets roundish-obovate, very blunt, clothed with soft villi on both surfaces; racemes shorter than the leaves; legumes oblong, covered with fine velvety down, mucronate, 2-seeded, not constricted between the seeds. \( \text{R.} \text{C. G.} \) Native of the Cape of Good Hope. Glycine angustifolia, Jacq. hort.sched. 2. t. 331. Flowers yellow. Author's pilose.

42 R. glandulosa (D. C. prod. 2, p. 388.) stems twining, rather angular, smoothish; leaflets oblong, glabrous, but full of resinous dots beneath as well as the calyx; peduncles axillary, 1-3-flowered, longer than the leaves. \( \text{R.} \text{C. G.} \) Native of the Cape of Good Hope. Phascolus Capensis, Burm. cap. p. 81. but not of Thunb. Glycine glandulosa, Thunb. cap. prod. 131. fl. cap. 591. Pedicels nearly an inch long, according to Thunb.

Glandulár Rhyncosia. Shrub tw.

43 R. Totta (D. C. L. C.) stems twining, terete, glabrous; branches clothed with adpressed silky down; leaflets ovate or oblong, mucronate, rather puberulous; fringed a little at the base, dotted beneath; pedicels axillary, jointed in the middle, 1-flowered, length of petioles; segments of the calyx and stipules subulate. \( \text{R.} \text{C. S.} \) Native of the Cape of Good Hope. Burch. clt. pl. afr. aust. no. 2040. Glycine Totta, Thunb. fl. cap. 591. Flowers yellow.

Hottentot Rhyncosia. Shrub tw.

45 R. mollissima; plant twining, very soft and hoary from down; leaflets oval-roundish, mucronate, 3-nerved at the base; racemes axillary, spike-formed. \( \text{R.} \text{C. S.} \) Native of Guinea, very common among grass. Flowers small, brown.

Very-soft Rhyncosia. Pl. tw.

46 R. Hooker'i; plant pubescent; stems twining; leaflets ovate, acute, somewhat rhomboidal, dotted; racemes shorter than the leaves; legumes seminatural, swollen, 2-seeded. \( \text{R.} \text{C. S.} \) Native of the West Indies. Glycine mollis, Hook. exot. fl. t. 201. Flowers yellow.

47 R. mollis (D. C. prod. 2, p. 388.) stems twining; leaflets elliptic, obtuse at both ends, pubescent above but tomentose and reticulately veined beneath; pedicels 1-flowered, one-half shorter than the petioles; legumes 3-seeded, clothed with rufous villi. \( \text{R.} \text{C. S.} \) Native of Guinea. Glycine mollis, Wildk. spec. 3. p. 1063. Lateral leaflets about an inch long, and the middle one about an inch and a half long. Flowers yellow.

48 R. reidula (D. C. L. C.) stems erect, clothed with retrograde, hoary pubescent; leaflets linear, mucronate, pubescent, and beset with resinous dots beneath; pedicels axillary, 1-flowered, bent in the middle, length of petioles; legumes rather villous, oblong, 1-seeded. \( \eta \). G. Native of the Cape of Good Hope. Burch. cat. afr. aust. no. 2387.

Stiffish Rhyncosia. Shrub 1 to 2 feet.

Culti. This genus is composed of plants of no beauty. For the culture and propagation of the species see Erioséma, p. 348.

CLXXXIV. ERIOSÉMA (from epo, erion, wool, and amy, suva, a standard; in reference to the vexillum, which is clothed with silky hairs). Desv. in Schlecht. Linnaea, vol. 2. p. 512.

LAN. SYST. Diadélphia, Decandria. Calyx 5-cleft, somewhat bilabiate, usually inclosing the corolla. Stamens diadelpheous. Style filiform. Vexillum clothed with silky villi. Legume straight, 1-celled, 1 or few-seeded.—Erect subshrubs, with digitately trioliate leaves, with the 3 leaflets rising from the same root or centre from the tip of the petiole, rarely solitary. Racemes or fascicles of flowers axillary. Flowers yellow.

1 E. grandiflora (Schlecht. et Cham. in Linnaea, 5. p. 388.) subshrub, erect; branches angular, somewhat trigonal; petioles very short, and are as well as the nerves and veins on the under surface of the leaves clothed with silky rufous down, but the calyces and legumes are clothed with silky rufous villi; leaves and corollas covered with soft pubescence on both surfaces; leaflets oblong-elliptic, mucronate; bracteas roundish-ovate; acute, rather silky; eliased and bearded; racemes terminal and axillary, panicled; legumes ovate, compressed, obliquely beaked. \( \eta \). S. Native of Mexico, near La Hacienda de la Laguna. Very like E. rufa.

2 E. rufa; plant suffruticose, erect; branches somewhat tetragonal, clothed with rufous velvety down as well as the petioles, which are very short; leaflets 3, elliptic-oblong, clothed with soft velvety down on both surfaces, but with rufous down on the nerves on the under surface, which are rather prominent, the odd leaflet remote from the lateral ones; racemes many-flowered, shorter than the leaves; legumes oval, compressed, mucronate, clothed with rufous villi. \( \eta \). S. Native of New Andalusia, in humid places near Carpe, and on Cerro del Collar. Glycine rufa, H. B. et Kunth, nov. gen. amer. 6. p. 423. t. 574. Rhynchosia rufa, D. C. prod. 2. p. 388.

3 E. viola'cea; plant suffruticose, erect; branches and leaves clothed with very short ferruginous villi; leaflets 3, oblong-linear, acute, greenish above and velvety, but clothed with rusty villi beneath, the odd leaflet rather remote from the lateral ones; racemes axillary and terminal, many-flowered; legumes villous, 2-seeded. \( \eta \). S. Native of Guiana, in meadows. Cytisus violaceus, Aubl. guian. 2. p. 766. t. 306. Crotalaria lineata, Lam. 1. t. 2. p. 200. Glycine picta, Vahl. symb. 2. p. 814.

4 E. difu'usa; branches diffusely procumbent, tetragonal,
when young clothed with hoary appressed villi; leaflets 3, lanceolate, somewhat mucronate, pubescent above and glabrous beneath, and a little dotted, but having the nerves clothed with hoary villi; the terminal leaflet hardly remote from the lateral ones; racemes very short, crowded, axillary; legumes ovate, mucronate, beset with rufous villi. P. S. Native of South America, on the mountains of Popayan, near the river Putes, and of Mexico. Glycine diffusa, H. B. et Kunth, nov. gen. amer. 6. p. 420. t. 572. Rhynchosia diffusa, D. C. prod. 2. p. 388. Flowers yellow.

_{Var. β, oblongifolia (D. C. prod. 2. p. 389.) leaflets oblong and a little broader.}_

_Diffusa Eriosema._ Shrub 3 to 4 feet.

_Hairy Eriosema._ Shrub 2 to 3 feet.

_Neck Eriosema._ Shrub 2 feet.

7 E. _psoraloides_; stem flexuous, angular, velutinous at the apex; leaflets 3, oblong, obtuse, clothed with silky tomentum beneath; stipules lanceolate, length of the petiole, which is very short; spikes axillary, slender, longer than the leaves; legumes ovate-rhomboid, villous. Æ. Native of Madagascar. Corollaria psoraloidea, Lam. dict. 2. p. 201. H. B. et Kunth, nov. gen. amer. 6. p. 418. in a note. Rhynchosia psoraloidea, D. C. prod. 2. p. 389. Flowers yellow.

_Psoralo-like Eriosema._ Shrub 2 to 3 feet.

8 E. _sessiliflora_; plant suffruticoso, erect; branches terete, clothed with silky villi as well as the under side of the leaflets; petioles almost wanting; leaflets 3, oblong-linear, obtuse, quite smooth above; flowers 2-3, axillary, almost sessile. P. S. Native of Porto Rico. Cycitus sessiliflorus, Poir. suppl. 2. p. 430. Rhynchosia sessiliflora, D. C. l.c. Flowers yellow.

_Sessile-flowered Eriosema._ Shrub 1 to 2 feet.

9 E. _simpliciflora_; stems diffuse, angular, clothed with adpressed pilly; petioles very short; leaves linear-lanceolate, rather mucronate, cordate, glabrous; peduncles short, 3-4-flowered; calyx clothed with adpressed pilly. Æ. Native near Atures, at the catacarts of the Orinoco. Glycine simpliciflora, H. B. et Kunth, nov. gen. amer. 6. p. 419. Rhynchosia simpliciflora, D. C. l.c. Flowers yellow.

_Simple-flowered Eriosema._ Shrub diffuse.

_Cult._ None of the species of this genus are worth cultivating except in botanical gardens; they grow well in any light rich soil, and are easily increased by cuttings or seeds.

**CLXXXV. FAGELIA** (evidently the name of some botanist or naturalist). Neck. clm. no. 1257. D. C. legum. mem. ix. prod. 2. p. 389. but not of Schwenk.

_Lin. syst. Dianédpheia, Decadria._ Calyx cleft into 5 parts beyond the middle, with the segments linear, acute, and straight, the two superior ones joined together a little higher up than the others. Corolla with a reflexed vexillum, and a very blunt keel, which is longer than the wings. Stamens diadelphous. Legume ovate-cylindrical, turgid, 6-seeded, 1-celled, 2-valved. Seeds ovate, with a lateral hylum.—A decumbent twining subshrub, clothed with glandular clammy hairs, and rather hairy on the stems, leaves, calyxes, and legumes. Stipulas ovate, acuminate. Leaves petiolate, pinnately-trilobate; leaflets rhomboid, the terminal one remote from the lateral ones. Racemes axillary, longer than the leaves. Flowers yellow, but with the carina tipped with violet, on long distant pedicels, which are at length deflexed.

_Lin. syst. Dianédpheia, Decadria._ Calyx campanulate, somewhat bilobate (f. 48. a.), upper lip with 2 short teeth, lower one with 3 subulate teeth (f. 48. a.). Corolla papilomaceous (f. 48. b.). Vexillum bicarinate. Wings conforming to the keel, which is 2-edged. Stamens diadelphous (f. 48. c.). Necatariferous tube girding the stipe of the ovary. Legume standing on a short stipe, coriaceous, 2-valved, 1-celled, rather turulose at the seeds.—Shewy climbing shrubs, with impari-pinnate exstipulate leaves, and terminal and axillary racemes of bluish lilac flowers, which when in a young state appear like aments from bracteas, which fall off before the flowers expand.

2 W. _cheniiensis_ (D. C. l.c.) wings of flower with one auricle each; ovary villous. Æ. H. Native of China. Sweet, fl. gard. 211. Glycine Chennieii, Sims, bot. mag. 2085. G. Sinensis, Ker. bot. reg. t. 650. Loud. bot. cab. 773. Wistaria Chenii, Loudon, bot. brit. p. 315. Flowers larger than those of the preceding species, of a bluish purple-colour. This is a most elegant climber when in flower.

FIG. 48.
Bundle-flowered Wisteria. Shrub cl.

Cult. All the species of Wisteria are very elegant when in flower, and being all hardy climbers, deserve to be cultivated in every collection of plants. They grow best in light rich earth, and they should be nailed against a south wall, where they will flower in great profusion. The China species being an early flowerer, has a beautiful appearance when planted in a border in the green-house, and the shoots trained to the rafters. They are all easily increased by cuttings planted either in sand or mould, but they are generally propagated by layers.

Lin. syst. Dietelliph. Decandria. Calyx campanulate, with 4 almost obsolete teeth, and one acute elongated one under the keel. Corolla papilionaceous, with a falcate linear carina, bent back upon the top of the vexillum. Stamens diadelphous. Styles of ovary sheathed by a little tube. Stigma emarginate. Legume many-seeded, and 2-celled; the seeds intercepted by dissociations. — Climbing smooth herbs, with tuberous edible roots, impari-pinnate leaves, and axillary racemes of brownish-purple sweet-scented flowers. Bracteoles closely adpressed to the calyx, but very soon falling off.

1 A. Tuberosa (Meech. l. c.) Ψ. O. H. Native from Pennsylvania to Carolina, on the mountains, in hedges, and among bushes. Gléinece A'pios, Lin. spec. 1067. Sims. bot. magn. 1198. Schkuhr. handb. 198. — Morris. hist. 2. t. 9. f. 1. Flowers brown, sweet-scented. Tubers of the roots edible, and farinaceous, much like those of Lathyrus tuberosus sold in some of the German markets, and seldom larger, though more numerous; growing, however, sometimes to a large size.

Cult. A'pios is an elegant climbing plant, which grows freely in common garden soil, and is easily increased by the tubers from the roots. Its branches require to be supported by stakes like peas.

Lin. syst. Diadelph. Decandria. Calyx campanulate, bilabiata; upper lip bidentate, lower one 3-parted. Corolla papilionaceous. Keel, style, and stamens spirally twisted together, rarely incurved. Stamens diadelphous. Style of ovary sheathed by the tubular torm. Legume compressed or cylindrical, 2-valved, many-seeded; the seeds separated by a kind of cellular substance, and furnished with an oval-oblong hyurn. — Herbs or subshrubs, with usually twining stems. Leaves pinnately-trifoliate, with the leaflets stipulate at the base. Racemes axillary. Pedicles usually twin, always 1-flowered. The most part of the species are not well defined.

Sect. I. Euphorbeus (from eu, well, and phasclus; this section contains the genuine species). D. C. prod. 2. p. 390. Legumes compressed.

§ 1. Caracalla (from the Celtic words car, a head, and call, a covering; was the name of a hooded dress worn by the Gauls). Stems fruticoses. Roots fasciculately-tuberous. Legumes entire. Vexillum twisted.

1 P. Caracalla (Lin. spec. 1017.) plant twining, hardly pubescent; leaflets ovate-robust, acuminate; racemes longer than the leaves; teeth of calyx nearly equal; vexillum and carina spirally twisted; legumes straight, torulose, pendulous. Ψ. O. S.

Native of the East Indies. Andr. bot. rep. t. 311. Delaun. herb. amat. t. 51. Savii. mem. p. 11. — Triumph. obs. t. 94. — Trew. pl. rar. p. 14. t. 10. Flowers large, purple and yelowish mixed. This plant is cultivated in many parts of the south of Europe and north of Africa. It is a very curious plant, and will grow and flower freely, if kept free of the red spider. It was named caracalla by the Portuguese, who first brought it from South America, in consequence of its hooded flower.

2 P. Tuberous (Lour. coch. p. 434.) plant twining, shrubby; leaflets unknown; stipulas 2-horned; racemes almost terminal; upper lip of calyx emarginate, lower one 3-parted, nearly equal; vexillum revolute; legume compressed. Ψ. O. G. Native of Cochinchina. Roots tuberous; tubers large, in fascicules, eatable. Flowers yellow.

Tuberous-rooted Kidney-bean. Shrub tw.

3 P. Kostratus (Wall. pl. asiat. rar. 1. p. 50. t. 63.) plant perennial, pilose; leaflets ovate, acute; racemes axillary, few-flowered, on long peduncles; wings variously twisted; keel with a very long spiral beak; legume flat, linear, archeed. Ψ. O. S. Native of the mountains contiguous to Bengal, and of the Burman empire on mountains near the banks of the Irawaddy, at Paghamew and Frome. Flowers pale violet; wings ornamented with white veins.

Beaked-flowered Kidney-bean. Pl. tw.

4 P. Perennis (Wall. fl. car. 182.) plant twining, pubescent; leaflets ovate, acuminate, tri-nerved; racemes 1-3 together, axillary, panicled, longer than the leaves; bracteoles small; legumes broad, puberlous, falcate, mucronate. Ψ. O. H. Native of Carolina and Georgia. Ell. sketch. 2. p. 228. P. paniculatus, Milh. fl. bor. amer. 2. p. 60. Dolichos polysyllabicus, Link. spec. 1023. Flowers purplish-violet. Vexillum bicallous.

§ 3. Macrosyce (from macros, makros, long, and νοδος, nodos, a knot; in reference to the peduncles being longer than the leaves). Roots annual. Legumes entire. Peduncles longer than the leaves.

6 P. Bracteatus (Sprang. syst. 3. p. 250.) branches angular, pubescent; leaflets obovate-oblong, glabrous, rather coriaceous, reticulately-veined; pedicels axillary, few-flowered; bracteas lanceolate, few-nerved; legumes linear. Ψ. O. S. Native of Brazil. Flowers purple.

Bracteate-flowered Kidney-bean. Pl. tw.

7 P. Alatus (Lin. spec. 1017.) plant twining, rather pilose; leaflets ovate, acuminate; peduncles very long, spicate; flowers twin, sessile; upper lip of calyx broad, entire; wings of corolla equal to the vexillum in length; legume linear, compressed, deflexed. Ψ. O. H. Native country unknown. — Dill. hort. olth. p. 314. t. 235. f. 303. Flowers at first purple, but at length becoming violaceous. Seeds compressed, of a brownish red-colour, with a white eye.

8 P. Bracteolatus (Nees et Mart. in nov. act. bonn. 12. p.
27.) plant twining, hairy; leaflets ovate-trapezoid, mucronate; peduncles spicate, longer than the leaves, bearing a fascicle of sterile bracteas on both sides at the base; legumes linear, hairy, many-seeded. ♂. ♀. S. Native of Brazil. Flowers dark purple.

**Bracteolate Kidney-bean.** Pl. tw.

9 P. leucopephalus (Lag. nov. gen. 28.) plant twining, hairy, much branched; leaflets deltoid, obtuse; spikes axillary, and terminal; peduncles many-flowered. ♂. ♀. S. Native of New Spain.

**Stem-peduncled Kidney-bean.** Pl. tw.

10 P. linensis (H. B. et Kunth, nov. gen. amer. 6. p. 415.) plant twining a little; branches and petioles beset with retrograde stiff hairs; leaflets linear, obtuse, mucronate, somewhat cordate at the base; the old leaflet 3-toothed and acuminate; peduncles very long, few-flowered; bracteoles oblong, 5-nerved. ♂. ♀. S. Native of South America, on the banks of the Oronoco. Pedicels alternate. Flowers purplish, about the size of those of *Lathyrus odoratus*. Peduncles 6-8 inches long.

**Linear-leafflet Kidney-bean.** Pl. tw.

11 P. leptomystum; plant twining; stems smooth; leaflets linear, obtuse, mucronate, with revolute margins; peduncles long, hispid, few-flowered; stipulae small, ovate; bracteas small, agglutinate from 2 descending auricles at the base; pedicels opposite; legume linear, pubescent. ♂. ♀. S. Native of Mexico.

P. linensis, Sesse et Moc. in herb. Lamb. Flowers about the size of those of *Vicia sativa*, apparently purplish.

**Slender-leafflet Kidney-bean.** Pl. tw.

12 P. truxilloensis (H. B. et Kunth, nov. gen. amer. 6. p. 451.) plant twining; branches and petioles beset with retrograde pili; leaflets ovate, ending in a narrow acumen, obliquely cordate at the base, and clothed with adpressed pubescence; racemes on long peduncles, upper lip of calyx broad, emarginate, lower lip 3-lobed, acute, lateral lobes falcate. ♂. ♀. S. Native of Peru, near Truxillo. Flowers about the size of those of *Lathyrus odoratus*, of a pale rose-colour or yellowish violet.

**Truxillo Kidney-bean.** Pl. tw.

13 P. pilosus (H. B. et Kunth, nov. gen. amer. 6. p. 453.) plant twining; branches and petioles beset with retrograde pili; leaflets rhomboidal-ovate, obtuse, cuneate at the base, and clothed with adpressed pili on both surfaces; racemes pedunculate, many-flowered, longer than the leaves; bracteoles linear, and are, as well as the calyxes, hairy; upper lip of calyx broad, emarginate, lower one 3-lobed, acute; legumes villous. ♂. ♀. S. Native of South America, on the banks of the river Magdalena near Morales. Corolla yellow.

**Filose Kidney-bean.** Pl. tw.

14 P. portoricanensis (Spreng. syst. 3. p. 352.) plant climbing, smooth; racemes rather compound, elongated; pedicels somewhat verticillate, villous; calyxes bractless, truncate; wings about equal in length to the vexillum. ♂. ♀. S. Native of Porto-Rico.

**Porto-Rico Kidney-bean.** Pl. cl.

15 P. speciosus (H. B. et Kunth, nov. gen. amer. 6. p. 452.) plant twining; branches and petioles pubescent; leaflets ovate, somewhat acuminate-mucronate, puberulous above, and tomento-vestuously pubescent beneath; peduncles long, few-flowered; lobes of calyx ciliate, superior one broad, emarginate, lower ones acute, lateral ones falcate. ♂. ♀. S. Native on the banks of the Oriente, and of Mexico near Mission P. grandiflorus, Sesee et Moc. Flowers large, shewy. Legumes unknown.

16 P. peduncularis (H. B. et Kunth, nov. gen. amer. 6. p. 447.) plant twining; branches scabrous from retrograde stiff hairs; leaflets ovate, acuminate; racemes on very long, ascending peduncles; upper lip of calyx short, emarginate, lower one 3-lobed, acute; legume elongated, erect, linear, pubescent, mucronate. ♂. ♀. S. Native of New Granada. Allied to *P. semi-erecta*.

**Long-peduncled Kidney-bean.** Pl. tw.

17 P. cirrhosus (H. B. et Kunth, nov. gen. amer. 6. p. 448.) plant twining, cirrhiferous, glabrous; leaflets ovate, obtuse, roughish, rounded at the base; racemes on long peduncles; two upper lobes of calyx rounded and short, lateral ones falcate, and the one under the keel straight. ♂. ♀. S. Native of Mexico, near Vera-Cruz. Legume unknown.

**Teunville Kidney-bean.** Pl. tw.

18 P. sylvaticus (H. B. et Kunth, nov. gen. amer. 6. p. 450.) plant twining; branches beset with retrograde pili; leaflets deltoid-ovate, acuminate-mucronate; racemes on long peduncles; bracteoles large, elliptic; upper lip of calyx broad, entire, lower one 3-parted, obtuse. ♂. ♀. S. Native of Mexico, in woods between Valladolid and Ario. Flowers scarlet. Legumes unknown. Very like *P. multiflorus*.

19 P. coccocephalus (Sesse et Moc. in herb. Lamb.) plant twining; leaves and peduncles pubescent; leaflets broad-ovate, oblique, acuminate, strongly 3-nerved; stipulas lanceolate; peduncles length of leaves; flowers umbellate; bracteoles forming an involucre to the umbel of flowers; upper segment of the calyx very broad, and much nerved. ♂. ♀. S. Native of Mexico.

Flowers about the same size and colour as those of the scarlet-runner.

**Scarlet-flowered Kidney-bean.** Pl. tw.

20 P. formosus (H. B. et Kunth, nov. gen. amer. 6. p. 449.) plant twining; branches beset with retrograde hairs; leaflets deltoid-ovate, acutish, mucronate; racemes on long peduncles; bracteoles ovate-ornicular; upper lip of calyx broad, entire, lower one 3-parted, acute; young legumes hairy. ♂. ♀. S. Native of New Spain, in frigid places near Toluca. Flowers scarlet. Very nearly allied to *P. multiflorus*.

**Beautiful Kidney-bean.** Pl. tw.

21 P. multiflorus (Willd. spec. 3. p. 1030.) plant twining, smoothish; leaflets ovate, acuminate; racemes pedunculate, longer than the leaves; pedicels twine; bracteoles rather shorter than the calyx, and adpressed to it; legumes pendulous, rather falcate, torulose, scabrous. ♂. ♀. S. Native of South America. Savi, diss. 2. p. 11. The *scarlet-bean* was only regarded as a variety of the kidney or French-bean by Linneus, but now found to be specifically distinct. The seeds are large, purple, marked with black, and sometimes pure white. The culture and use of the *scarlet-bean* are the same as that of *P. vulgaris* or French-bean, which see, no. 22.

**Var. a. cocciennis; corolla deep scarlet. P. vulgaris cocciennis, Lin. P. cocciennis, Kniph. cent. 12. no. 71. Lam. dict. 3. p. 70.—Moris. hist. 52. t. 5. f. 4.—Corn. can. t. 185. Ger. emac. 1215. This variety is called the scarlet-runner.**

**Var. ß. albisflorus; flowers white. To this variety belong the white-runner, white-Dutch-runner, and perhaps the variable-runner.**

19. 4. Brachyphytldii (from brachy phyto, short, and rre of podos, a foot; in reference to the peduncles being shorter than the leaves). *Roots annual. Legumes entire. Peduncles shorter than the leaves.* Most of the species of this division are cultivated in the gardens under the name of French-beans or kid-ney-beans.

22 P. vulgaris (Savi, mem. 3. p. 14.) plant twining, smoothish; leaflets ovate, acuminate; racemes pedunculate, shorter than the leaves; pedicels two; legumes pendulous, straight,
rather turlose, ending in a long mucrone; seeds ovate, a little compressed. O. O. H. Native of the East Indies, but has been cultivated in the gardens from time immemorial. It is a very variable plant, either twining or dwarf, with white or lilac flowers, and the seeds are variable both in colour and shape. P. vulgaris and P. cana, Lin.-Lob. icon. t. 59. Moris. oxon. sect. 2. t. 5. f. 1. Riv. tetr. irr. t. 30 and 29. f. 1, 2, and 3.-Park. par. t. 525. f. 2.-Savi. mem. 3. p. 14. where he distributes the varieties into the three following series, marked A. B. C.

A. unicolor; seeds of one colour only, black, blue, white, cream-coloured, lilac, yellow, pale red, greenish yellow, or reddish, but never with the colours mixed. P. Nigerimus and P. lilacínus of Zucc. obs. no. 81. To this series belong the early-yellow, dwarf, early-black or negro, early-white, Battéria-white, Canterbury-white, dun-coloured, tawny, large white-dwarf, Canterbury and Battéria small-white runners, &c.

B. fasciátus; seed lined with different colours, the lines broad and curved. The ground-colour of the seeds is either bluish, cream-coloured, blue, grey or liver-coloured, &c. To this series belong the Zebra, streaked or striped, and the variable runner, &c.

C. variegátus; seeds variegated, white spotted with rust colour, lead colour, or violet, blue spotted with olive colour, or yellow spotted with brown. To this series belong early-red-speckled, black-speckled, and brown-speckled, &c.

The common dwarf kidney-bean or French-bean, Haricot of the French, Schminkbohné of the Germans, and Fagüina of the Italians, is a rather tender annual plant, flowering from June to September. The scarlet and white runners, P. multífórlus, are rather tenderer than the varieties of P. vulgaris or kidney-bean; they produce flowers from July to September. The stems of both species twine more or less, though little of this propensity is shown by the dwarfer kinds. The flowers are white, red, or purple. The pods swelling slightly over the seeds, which are generally kidney-shaped, smooth, and shining; when ripe varying much in colour and shape, according to the variety, and either white, black, blue, or spotted; some of the most distinct of these have been considered by Savi as distinct species, which we have described as such. The pods of both the kidney-beans and runners may be had in perfection from June to October. Specieby suggests (Practical Hints on Domestic Economy, p. 16.) that the culture of the kidney-bean might become an object of national or field culture in this country, and be particularly useful in times of scarcity, more especially as on good land it will flourish and grow luxuriantly even in a dry parching season; in which respect it differs from most other culinary vegetables. It is an article of field culture in most warm countries, especially France and America.

Use. The unripe pods are chiefly used in Britain as a legume, for which they are in great estimation throughout the year, being produced by forcing when they cannot be grown in the natural ground. They are also used as a pickle. On the continent, the ripe seeds are much used in cookery, forming what are called Haricots, of different kinds, and entering into some sorts of soups. In the end of the season, when frost is expected, the haulm of the kidney-bean crop is gathered and dried like that of the pea in this country, and the ripe beans afterwards threshed out, and preserved for use through the winter.

Constitution and habit. The varieties of both species, P. vulgaris and P. multífórlus, and all those belonging to the present division of the genus, are tender in their nature, unable to grow freely in the open garden before April or May, the seeds being liable to rot in the ground from the effects of wet and cold, if planted before the beginning of the former month, even in a dry soil. The plants make but little progress till settled warm weather. However, when sown in the proper season from April or May through the course of summer till the beginning of August, they succeed well, making liberal returns of fruit from June or July to October. The dwarf kinds require no support; but the runners, rising with twining stems 8 or 10 or more feet, require tall sticks or poles to climb upon, or lines suspended from a contiguous building or fence, or from poles. They produce pods their whole length. It deserves notice, that the tendrils of the twining stems turn to the right, or in a direction contrary to the apparent diurnal course of the sun, a circumstance, however, not uncommon among papilionaceous twiners.

Estimate of sorts. The dwarf kinds, or the varieties of P. vulgaris, bear sowing a little sooner than the runners, or varieties of P. multífórlus, and make quicker returns. They are besides more convenient to cultivate on a large scale, and the smaller pods which they produce are esteemed by many to have more delicacy of flavour. On this account it is usual to raise the larger supply from the varieties of P. vulgaris, or dwarf kinds. The early-yellow, early-black, and early-red-speckled are among the most hardy and most forward: the early-white comes in a few days later, but it is of superior flavour. The Canterbury, Battéria, black-speckled, brown-speckled, dun-coloured, striped, and tawny are plentiful lasting bearers. Growers for sale in general depend on the Canterbury and Battéria for main crops; but the others just named are also profitable sorts, and acceptable to the consumer. The dwarf kidney-bean continues to produce young pods in abundance and in perfection only about 3 weeks or a month. The runners, or varieties of P. multífórlus, yield a succession of fruit from the same sowing a much longer time than the dwarfs. The scarlet-runner ranks first for its prolific property and long continuance in fruit; the pods are thick, fleshy, tender, and good, if gathered while moderately young. The white variety is equally eligible for the principal crop. The Dutch-runner is also a great bearer, in line long pods, but not so lasting as the former. As to the smaller runner kinds, they are rather degenerate varieties of the Canterbury and Battéria white-beans, casually shooting into runners; they bear in tolerable abundance slender neat pods, which are very good and tender eating, though not so eligible for the principal crop of runners as the scarlets.

Quantity of seed. Half a pint will sow a row 80 feet in length, the beans being placed from 2½ to 3 inches apart.

Soil. The soil for all the kinds should be light and mellow, inclining to a dry sand for the early sowings, and to a moist loam for the sowing in summer.

Culture of dwarf kidney-beans, or varieties of P. vulgaris. About the beginning of April, if the weather be temperate, fair, and settled, make the first sowing, in a dry south border, or other sheltered compartment with a good aspect, or sow in a single row close under a south fence, beginning with a small proportion of the most hardy early sorts. It is a good method to follow in a week with a second sowing, in case the former should fail. You may sow for a larger crop about the middle or 20th of April. For the early crops make the drills 2 feet asunder. The common depth is an inch or inch and a half for the smaller sized beans. Drop in the beans in each row at this season pretty close together, as many may fail, from 1 to 2 inches apart. Cover them in evenly the full depth of the drill. For the main crops you may sow more fully towards the end of April; and in full crops in May and June, a portion once every fortnight or three weeks of the Canterbury or other sorts approved, for a main supply. Draw drills 2 or 2½ feet asunder, an inch and a half or 2 inches deep. Drop the beans 3 inches apart, and cover them with earth the full depth of the drills. For supplies in succession, sow in July once or twice, and make a moderate sowing at the beginning of August for a late and last crop.
the drought of summer it is advisable to accelerate the germination of the seed, by laying it in damp mould till it begins to sprout, or by soaking it in soft water for 6 or 8 hours previous to sowing, and by watering the drills to receive them. Crops sown after the middle of July should be favoured in situation, or the time of their bearing will be much shortened by the decline of summer. From this course of sowings, a regular succession of young green pods will be produced from June and July till October. As the plants may the different crops advance in growth, occasionally hoe and stir the ground between the rows. Cut down all weeds as they spring. Draw some earth to the stems of the plants as they rise in height, which will strengthen and forward them considerably. When advanced to full bearing, it is advisable to gather the pods in moderate, young, or medium growth.

**Culture of runners, or varieties of P. multiflorus.** The runners may be sown in a small portion towards the end of April, if the weather is tolerably warm and dry; but as the seeds of the runners are rather more tender than those of the dwarf kidney-beans, they are more liable to rot in the ground by wet or cold, especially those of the scarlet and white runners, therefore the beginning or middle of May will be time enough to sow a considerable crop, and you may sow a full crop about the beginning of June. Allot principally the scarlet and large white runners. Some Dutch-runners are very eligible as a secondary crop. The first crops should have the assistance of a south wall. Intermediate crops may be sown in any open compartment, or against any fence, not looking north. The latest sown will continue bearing the longer under a good aspect and shelter. In sowing, draw drills about 1 or 2 inches deep. Let parallel rows be at least 4 feet asunder, to admit in the intervals tall sticks or poles for the plants to climb upon. Place the beans in the drills 4 inches apart, and earth them in evenly, the depth of the drills. A row contiguous to a fence or building may ascend upon lines. Some may be sown in a single row along a border, or on each side of a walk; and have the support of a slight trellis of laths and lines, or poles may be placed at certain distances, having a rope drawn along their tops, having lines suspended from it, or they might be arched over with similar materials, so as to form a shady walk or bower. In cold wet seasons, or when requisite to have a few plants more forward than the general crop, some scarlet-runners may be sown in April, either in a slight hot-bed, or in pots under frames or hand-glasses, to raise and forward the plants till 2 or 3 inches high, then, at the end of May, transplant them into a garden. As the plants in the open ground advance from 3 to 6 inches in growth, hoew some earth to the stems, cutting down all weeds at the same time, and when they begin to send forth runners, place suitable supports to each, such as are mentioned above, and conduct the tendrils to the sticks or lines, turning the stems in a contrary direction to the sun. The ascending stems will soon come into flower, podding at the joints in long succession. They are so prolific that the returns, from 3 sowings made in May, June, and July, will last from July till October.

**Taking the crop.** Gather the pods, both from the dwarfs and runners, while they are young, fleshy, brittle, and tender, for then are they in highest perfection for the table; and the plants will bear more fully, and last longer in fruit, under a course of clean gathering, not leaving any superabundant pods to grow old.

To save seed. Either sow a portion for that object, or leave rows wholly ungathered of the main crops, or preserve a sufficiency of good pods promiscuously. The beans saved should be the first fruits of a crop sown at a period which throws the entire course of growth into the finest part of summer. Let them hang upon the stalks till they are fully ripe, till August or September; then let the haulm be pulled up and placed in the sun to dry and harden the seed, which should be afterwards cleared out of the husks, bagged up, and housed.

**Forcing the kidney-bean.** It is often partially forced in hot-houses or frames, with a view to its fruiting in the open garden; and supplies of green pods are also kept up throughout the winter and spring months, by forcing in hot-houses and pits. The kidney-bean may be successfully forced in pits, hot-houses or forcing-houses, and hot-beds. The more general mode is to force in pine-stoves; the same heat which suits the pine-apple suits the kidney-bean, which is a native of India. Nicol prefers a flued pit, such as that used for nursing pine-apple plants; and Abercrombie says, "Where there are not hot-houses, or where kidney-beans are to be raised in quantities for the market, the most economical and successful mode will be found a flued pit, with rather a strong bottom heat, and covering the bed with light vegetable mould."

**Sorts.** Abercrombie recommends the Early-speckled, Early-negro, and Dun-coloured dwarfs. Nicol says the Speckled-dwarf is the best sort.

**Sowing.** Sow in flat boxes or pans filled with fine light earth, and cover the seed the depth of an inch. Let them be placed in a stove or hot-bed, and have moderate supplies of water, and they will be fit to transplant when about 3 inches in height. Plant them in rows across the bed of the pit, 15 inches apart and 3 inches distant in the line.

**Culture.** Water after planting, and afterwards as required; give abundance of air every fine day, and earth up the plants as they advance in growth, in order to give them strength.

**Time of beginning to force.** M'Phail says, "If you wish to endeavour to have kidney-beans green all the year, you should sow the seeds and begin to force in August." Abercrombie observes, "some forcers, quite in opposition to the season, raise kidney-beans in August, and thence to the 21st of December, which day may be regarded as the boundary between late and early forcing."

**Temperature.** The heat by fire at night need not exceed 50°, according to Nicol, but Abercrombie recommends 60° for the minimum, and 75° for the maximum.

**Successional supplies,** are to be obtained by sowing every month or 6 weeks, for which purpose the pits may be divided, in a temporary way, by fitting a board neatly under the middle rafter. By this means the one half of the pit may be kept cooler by matting or not matting, or by the admission of more or less air; this will protract the growth of the beans more in one part than the other.

**Forcing kidney-beans in a hot-house.** "The most early fruit in perfection is obtained by culture in a stove, sowing from mid-winter till the end of March. Sow in pots or oblong boxes, containing a mixture of light fresh earth and vegetable mould, depositing the seeds either in a triangular or quincuncx order, and full an inch deep. If the plants are to fruit where sown, the cradles should be 10 inches deep; but if they are to be transplanted, which admits a greater number in the same space, the seed-pots or boxes may be shallow. Do not fill the cradles with mould at first, to allow of gradually earthing up. When the beans have germinated, sprinkle the earth with water; after the plants have risen, give moderate waterings every other day; the last crops may want water every day. Sprinkle also the leaves with water, warmed by standing some time in the house. Those plants raised in shallow pans should be transplanted for fruiting when 2 or 3 inches high. It is sometimes proper to stop luxuriant runners. These incidental crops may stand in rows on the floors, or on shelves; but take care that they do not shade the pines and other principal plants. For successsion sow every fortnight or 3 weeks."—Abercrombie.

**Insects.** Nicol observes "that the thrips often attack French
Forcing kidney-beans in a peach or cherry house. French-beans, Nicol observes, "may be successfully planted out in the borders of an early cherry-house or peach-house, so as that they may not be overmuch shaded by the trees; but they seldom do much good in a vineyard, where they are shaded by the foliage of the vines."

Forcing kidney-beans in a common hot-bed. "Under the deficiency of a house, you may have recourse to a hot-bed and frame, but the culture will be attended with more trouble, the course will be longer, and the fruit rarely so fine or so plentiful; nor without fire-heat can the difficulties of late or very early forcing be so well contended with. From the middle of February to the beginning of April, is the most successful period for forcing the kidney-bean in a hot-bed. The Early-white-dwarf, from its low growth, is to be sown in preference to the kinds recommended for the stove, unless it be intended to fruit the plants in a deeper frame than ordinary. The Early-yellow and Early-black are next, as not growing very high. The temperature for the kidney-bean is 60° for the minimum and 75° for the maximum of the fruiting-bed. In forcing soon in the spring, raise the plants on a smaller bed, earthen over with light rich compost, 6 inches deep. Sow the beans thickly, covering them to the depth of an inch. The second hot-bed should be earthen over to the depth of 8 or 9 inches. Into this transplant the seedlings, as soon as they are 2 or 3 inches high, setting them in cross rows 12 or 15 inches asunder, and 2 or 3 inches in the line, or when the season is so far advanced that one bed, with the help of linings, will bring the plants well into fruit, you may sow at once, at the full distance, in a similar hot-bed, to continue for podding. Cover the glasses every night with garden-mats, also particularly in severe weather. Admit fresh air moderately every mild day, and give occasional gentle waterings. The plants raised in February will come into bearing in April and May, making moderate returns; a new crop every three weeks will keep up the succession; those sown at the beginning of April will last till the middle or end of June, when they will be succeeded by the early half-sheltered crops in the open garden." Abercrombie.

Crop raised under glass, to fruit in the open garden. At the end of March you may sow a small portion under glasses, for transplanting into the open ground in the first or second week of May. It is not so well to sow in patches on the surface of the ground, as in small pots, because the plants can be turned from the latter with less check to their growth, when transplanted. Sow 3 beans in each pot, and when the seedlings are 2 or 3 inches high, harden them by degrees to the full air, and plant them on a good open border as soon in May as the season will suit. They will yield about a fortnight sooner than the earliest raised under exposure to the weather.

Crop raised on slight heat. A crop to fruit early in the open garden may be accelerated with more certainty by plunging the pots containing the seed beans in a gentle hot-bed, or some sown in shallow pans or boxes may be set on the shelves of a stove. Just at the opening of April will be early enough to begin, as the plants will otherwise get too forward for the weather to proceed well without a continuance of artificial heat. Having nursed them to the proper stage, plant out under a south fence, either 3 inches apart, if in a single line, or 18 inches by 3 if in 2 lines; or it may be better to set the plants in patches of 7 or 8, to receive the temporary shelter of a handglass, lest the transition from a hot-bed all at once to the fluctuating air of spring be too violent. Abercrombie.

Field culture of the kidney-bean. In this country the culture of the kidney-bean has been confined to gardens, but it might be grown equally well in dry, warm, rich, and sheltered soils, being grown in the fields of Germany, Switzerland, and similar climates. The sort generally used for this purpose is the small Dwarf-white. The ground is prepared by several turnings, and the seed is sowed in rows 18 inches or 2 feet asunder, in the beginning of May. The ground is hoed and weeded during the summer, and the crop is ripe in August. It is usually harvested by pulling up the plants, which being dried are stacked or threshed. The haulm is of little bulk or use, but the grain is used in making the esteemed French dish called haricot, which it were desirable the cottagers of this country were made acquainted with. There is perhaps no dish so easily cooked, and at the same time so agreeable and nourishing. The beans are boiled and then mixed with a little salt and butter, or other fat, and a little milk or water and flour. From 3840 parts of kidney-beans, Einhorn obtained 1665 parts of matter analogous to starch, 851 of vege-to-animal matter, and 799 parts of mucilage. Haricots and lentils are much used in all Catholic countries during Lent and maigre days, as they, from their peculiar constituents, form so excellent a substitute for animal food. During the prevalence of the Roman religion in this country they were probably much more generally used than at present.

23 P. compn'xus (D. C. prod. 2. p. 392.) plant twining a little, smoothish; leaflets ovate, acuminate; racemes pedunculate, shorter than the leaves; pedicels thin; legumes compressed, somewhat torulose, mucronate; seeds compressed. C. H. Native country unknown. Legume 5-6 inches long. Flowers white. Seeds white, ovate, obtuse, straight, or concave on the side of the hyllum. P. Romannus, Savi, mem. 3. p. 17. t. 10. f. 20. This plant is called Haricot de Soissons, and Haricot d'Hollande, in French.

Var. a. hümilis (D. C. l. c.) stem humble, erect; seeds smaller. Called in French Le Soissons nain.

Var. b. major (D. C. l. c.) stems taller; legumes twisted a little.

24 P. oblongus (Savi, mem. 3. p. 17. t. 10. f. 14.) plant twining a little, smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straight, rather cylindrical, ending in a long acumen; seeds rather cylindrical, obtuse, or truncatulate. C. H. Native country unknown. Flowers usually of a pale violet colour. Seeds of one colour or variegated, twice the length of the breadth, purple, white, or chestnut-coloured.

25 P. sapona'ceus (Savi, mem. 3. p. 19. t. 10. f. 15.) plant humble, glabrous; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straightish, mucronate, more or less torulose; seeds oblong, obtuse, compressed, spotted on the side next the hyllum. C. H. Native country unknown. Seeds convex on the back, and rather concave in front, marbled, or clouded with black, red, and bay-coloured marks. Flowers white. Legume 5-6 inches long.

26 P. tu'nisus (Savi, mem. 3. p. 19. f. 16.) plant dwarf, climbing a little, and smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes straightish, more or less torulose; seeds convallate, or ovate, turgid, white, spotted.

C. H. Native country unknown. Flowers white. Legumes 3 inches long. To this species belong the garden French-beans called Princess, Nain flaggetet, Nain d'Amérique.

27 P. hlematocarpus (Savi, mem. 3. p. 26. f. 17.) plant twining, tall; smoothish; leaflets ovate, acuminate; racemes Z z
shorter than the leaves; legume straight, torose, mucronate, when in an immature state it is spotted with blood colour; seeds ovate, tumid, variegated. ○. △. H. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Called the Cape kidney-bean by gardeners.

Bloody-fruited Kidney-bean. Fl. July, Sept. Clt.? Pl. tw. 28 P. spuria-acuta (Savi, mem. 3. p. 20. f. 17.) plant tall, twining, smoothish; leaflets ovate, acuminate; racemes shorter than the leaves; legumes torulose, nearly straight, mucronate; seeds compressed, irregularly angled. ○. △. H. Native country unknown. Flowers pale violet. Legume 4-5 inches long. Seeds red, brown, flesh-coloured, or violaceous, zonate, with an areola round the margin. To this species belong the garden kidney-beans called Haricot d’Orléans, Haricot de Prague, &c.

Atropurpureus Kidney-bean. Fl. July, Aug. Clt.? Pl. tw. 30 P. decaera (Schrank, hort. mon. 1. t. 89.) plant twining, smoothish; leaflets ovate; peduncle 2-4-flowered, shorter than the leaves; bracteoles small; vexillum concave, roundish, shorter than the wings; legumes linear-oblong. ○. △. H. Native of Brazil. Corolla greenish white. * Seeds black, with a white hylum.

Scaped-off or Black-seeded Kidney-bean. Fl. June, Aug. Clt. 1819. Pl. tw. 31 P. lunatus (Lin. spec. 1016.) plant twining, smoothish; leaflets ovate, acuminate; peduncle pubescent, shorter than the pedicels; pedicels 2-4-flowered, shorter than the leaves; bracteoles small; vexillum concave, roundish; legume aequinaciform, rather lunate, smooth, 2-4-seeded. ○. △. S. Native of Bengal. Houtt. pl. syst. 8. t. 63. P. rufas, Jacq. hort. vind. 1. t. 34. P. lunatus, of Lour. probably distinct from the plant of Linnaeus. Flowers small, white. Seeds dark purple, streaked with white, large. The seeds are cooked and eaten in Cochinchina as well as in the East Indies, but the plant is grown more for the beauty of the seeds than for their flavour.

Puberulous Kidney-bean. Pl. tw. 35 P. adenanthus (Meyer, prim. esseq. 239.) plant twining, glabrous; leaflets ovate, acuminate cuspidate, middle one lanceolate-oblong; racemes rather longer than the leaves; pedicels twin, rising from the base of the glands; bracteoles ovoid-roundish; legumes incurved, with sebaceous margins. ○. △. S. Native of Guiana, in shady humid places. Flowers large, white painted with blue.

Gland-flowered Kidney-bean. Pl. tw. 36 P. Tunkinsis (Lour. coch. 425.) plant twining, branched, glabrous; leaflets small, thick; racemes axillary; legume somewhat lunate, compressed, smooth, pendulous, 8-seeded. ○. △. H. Native of Cochinchina. Flowers white, but the vexillum is revolute and greenish. Seeds ovate, pale, variegated with red. The plant is cultivated in Cochinchina for the sake of the seeds, which are dressed and eaten by the inhabitants.

Tunquin Kidney-bean. Fl. June, July. Pl. tw. 37 P. macrosperma (Poir. suppl. 3. p. 6.) plant twining, smoothish; leaflets ovate-roundish, or acuminate; peduncles axillary, short, few-flowered; legume very long, glabrous, ending in a hooked mucrone. ○. △. H. Native country unknown. Flowers and seeds white.

Long-fruited Kidney-bean. Pl. tw. 38 P. multiflora (Wall. pl. asiat. rarr. 1. p. 6. t. 6.) plant annual, clothed with hoary pubescence and pilis, twining, much branched; root fibrous; branches filiform, furrowed; leaflets ovate, acute, entire; racemes pedunculate, shorter than the leaves; flowers lurid on the outside; calyx beset with resinous dots, 4-toothed, lower tooth elongated; keel a little beaked, incurved; legume hairy, flat, linear. ○. △. S. Native of the Burman Empire, at Prome. Flowers crowded; the vexillum dark brown beneath and shining, but opaque above and yellowish, with brown lines. Keel and wings yellow.

§ 5. Heterophylli (from ἵππος, hêptos, and φύλλον, phyllon, a leaf; in reference to the variable shape of the leaflets, some being lobed and others entire). Leaflets all or some of them lobed.

39 P. microsperma (Ort. dec. 130.) stem erect, angular, and is as well as the leaves glabrous; leaflets rhomboid-ovate, 3-lobed; peduncles axillary, very long, racemose; bracteoles subulate; wings of corolla orbicular, legumes linear, compressed, pendulous. ○. S. Native of Cuba. Flowers of a dirty purple colour. Seeds grey, lined with black.

41 P. heterophyllus (Willd. enum. 755.) H. et Kunth, nov. gen. amer. 6. p. 446.) plant twining; branches beset with retrograde pilis; leaflets hispid beneath and on the margins, middle one oblong and repand, lateral ones oblong-oblong, having one lobe each above the base; peduncles longer than the pedicels; flowers somewhat spicate; bracteoles small; lobes of calyx 5, acute, nearly equal; legumes linear-falcate. ○. △. H. Native of Mexico, near Valladolid. Flowers small, red.

Clothed Kidney-bean. Pl. tw.

43 P. acuminatissima (Jacq. obs. 3. p. 2. t. 52.) plant twining a little, hairy; leaflets palmatifid beyond the middle, lateral ones 3-4-lobed, terminal one 5-lobed; peduncles usually 3-flowered, shorter than the leaves. O. S. Native of Tran-quebar. Dölichos disssectus, Lam. dict. 3. p. 300. Dölichos palmatus, Forsk. ex Steud. nom.—Pluk. alm. t. 120. f. 7. Legume unknown. Perhaps belonging to the following section.

Sect. III. Strophostyles (from στρωφος, strophos, a twist, and στυλος, stylus, a style; in reference to the style, which is twisted). Ell. sketch. 2. p. 229.—Phasolus and Phasélus, M. nekh. math. 240. Legume terete.

§ 1. Lobátifólii (from lobatus, lobed, and folium, a leaf; leaflets lobed). Leaflets all or some of them lobed.

45 P. trilóbis (Roth. nov. spec. 344.) stem almost erect; branches prostrate, glabrous; lateral leaflets 2-lobed, terminal one 3-lobed; peduncles usually 3-flowered, longer than the leaves: legume declinate, cylindrical; stipula ovate. O. S. Native of the East Indies. Dölichos trilóbus, LIN. spec. 1056. Bumr. 1. 2. t. 50. f. 1. Dölichos stipuláris, Lam. dict. 2. p. 300. Glycine trilóba, LIN. mant. 516.—Pluk. alm. t. 214. f. 3. Flowers green? The leaves are considered by the native practitioners of India to be cooling, sedative, antiseptic, and tonic, and useful as an application to weak eyes.

46 P. anguláus (Ort. dec. p. 24.) plant twining, hairy; leaflets ovate, lateral ones gibbose or 2-lobed on the outside, middle one 3-lobed; peduncles angular, rather longer than the leaves; flowers capitate; bracteoles ovate, wings shorter than the carina; legumes linear, terete, drooping a little, glabrous; seeds tetraquètrus. O. H. Native of North America. Flowers pale flesh-coloured and white. Savi, diss. 2. p. 1.

47 P. farínósus (LIN. spec. 1017.) stems twining; leaflets rhomboid-ovate, acute, somewhat 3-lobed; peduncles axillary, rather longer than the petiole; flowers subcapitate; legumes terete, smooth; seeds cylindrical, truncate at both ends, covered with farinose tomentum. O. S. Native of the East Indies. Niss. act. acad. par. 1730. p. 557. t. 42. Savi, diss. 3. p. 3. P. lunátus, M. nekh. math. 140. Flowers rose-coloured, but the vexillum is deep red.

48 P. stipuláris (LAM. dict. 3. p. 74.) stem erect, glabrous; leaflets oval, obtuse, lateral ones sinuated, terminal one 3-lobed; peduncles spicate, longer than the leaves; stipulas ovate; legumes terete, horizontal, smoothish. O. H. Native of Peru. Flowers with a brown vexillum, yellow wings, and a white keel. Like P. trilóbus.

49 P. atroperuense (MOE. et Sesse, fl. mex. icon. med. D. C. prod. 2. p. 395.) stem twining, clothed with adpressed pu-besence; leaflets ovate-lanceolate, acuminate, mucronate, lateral ones 2-lobed; peduncles bearing something like spikes of flowers, longer than the leaves; wings of corolla stipitate, orbicular, longer than the vexillum; legumes terete, pendulous. O. H. Native of New Spain, on the mountains of Chihupa. Flowers rose-coloured, but the wings are dark purple.

Dark-purple-flowered Kidney-bean. Pl. tw.

§ 2. Integrífoli (from integer, entire, and folium, a leaf; in allusion to the leaflets being entire). Leaflets entire.

51 P. vexillátus (LIN. spec. 1017. Jacq. hort. vind. t. 109.) stems prostrate or twining, rather pilose; leaflets oblong-ovate; peduncles very long; flowers 5-7 in a head; vexillum large, emarginate; wings small; legumes terete, rather pilose; seeds woolly. O. H. Native of Carolina and about Havana, on the sea coast. P. hélvolus, Michx. fl. bor. amer. 2. p. 60. P. vexillátus, Pursh, fl. amer. spec. 2. p. 470. Strophostyles pécularius, Ell. sketch. 2. p. 230. Glycine pécularius, Muhl. et. 64.—Dill. Hort. clth. 313. f. 392. Perhaps the Carolina plant is the same as that from Havana. Flowers green before expansion, afterwards very pale purple; as they fade the purple changes to pale violet, and finally to a dusky lilac-colour or yellowish brown.

52 P. tuberósus (Sesse et Moc. in herb. Lamb.) plant canescent; stems beset with retrograde villi; petioles, and under side of leaves strigose; leaflets small, elliptic, entire, sometimes the lateral ones are slightly 2-lobed; peduncles longer than the leaves; stipulas ovate-lanceolate; stipels and bracteas subulate; teeth of calyx setaceous; root tuberous. O. S. Native of Mexico.

Tuberous-rooted Kidney-bean. Pl. tw.

53 P. muñgo (LIN. mant. 101.) stem flexuous, terete, hispid; leaflets ovate, acute, rather repand; peduncles a little longer than the leaves; flowers 6-7 in a head; carina putting forth a little horn from the left side; legume terete, hairy, rather torulose; seeds cylindrical, truncate. O. H. Native of the East Indies. Savi, diss. 1. p. 9. P. hirtus, RETZ. obs. 3. p. 38. —Mungo, garc. arom. l. 2. c. 21. Yellow seeds. Flowers eelatable. Loc. Muñug-an is the vernacular name of the plant.

54 P. glycíneiformis (Weinm. in flora, 1821. p. 29.) stem decumbent, twining, pilose, rather scabrous; leaflets oblong, obtuse; peduncles axillary, 1-2-flowered, longer than the leaves; legumes terete, pilose. O. S. Native of Chili and Peru. Flowers with a bluish violet vexillum, marked with yellow at the base. Said to be allied to P. Muñgo.

Glycine-formed Kidney-bean. Pl. tw.

55 P. hernándezii (Savi, diss. 1. p. 11.) stem flexuous, hispid; leaflets ovate-rhomboid, somewhat repand; peduncles shorter than the petioles, 4-6-flowered; legumes rather torulose, pilose, beaked, straightish; seeds oblong, cylindrical. O. H. Native of Mexico. Herr. Mex. 887. with a figure.
illium yellow on the inside, and the wings are yellow. Seeds chestnut-coloured.

Hernandez’s Kidney-bean. Pl. 1/4 foot.

56 P. fauciflorus (Sesse, et Moc. in herb. Lamb.) plant twining; stems villous; leaflets ovate, mucronate, pubescent, entire; stipulas broad-cordate, dilated, as well as the bracteas; peduncles more than twice the length of the leaves, 2-flowered; segments of the calyx lancelolate, ciliated, upper one emarginate; vexillum obovate, emarginate; stigma broad, spiral. ♀. C. S. Native of Mexico. Flowers large, with the wings and keel blue, and the vexillum pale.

Few-flowered Kidney-bean. Pl. tw.

57 P. chrysanthis (Savi, diss. 1. p. 15.) stem flexuous, glabrous; leaflets rhomboid-ovate; peduncles a little longer than the leaves, many-flowered; legumes terete, glabrous, rather torulose, horizontal, acuminated by a beak; seeds almost cylindrical. ♀. H. Native country unknown. Flowers yellow. Seeds rust-coloured.

58 P. radiatus (Lin. spec. 1017.) stem erect, terete, beset with retrograde pil.; leaflets ovate, acute; peduncles hardly longer than the leaves; flowers 7-8 in a head; legumes terete, hairy, horizontal. ♂. S. Native of China and Ceylon.—Dill. hort. eitl. 315. f. 304. Flowers pale purple, but changing to ochraceous as they fade.—Reich. act. stockh. 1742. p. 202. t. 7. f. 2. Seeds greenish yellow, ovate, small.

59 P. scarber (Steud. nom. 610.) stem erect, hispid; leaflets broad-ovate; peduncles very short, hispid; flowers somewhat spikeate; legumes erect, terete, scabrous; seeds cylindrical. ♀. H. Native country unknown.—Moris. oxon. sect. 2. t. 5. f. 8. Phasellus scarber, Meech. meth. 140. Flowers greenish yellow. Seeds rusty.

Scabrous Kidney-bean. Pl. 1 to 2 feet.

60 P. lathyroides (Lin. spec. 1018.) stem erect, glabrous; leaflets oblong, acuminate; peduncles longer than the leaves; flowers somewhat spikeate; vexillum concave, much shorter than the wings; legumes terete, subulate. ♂. H. Native of Jamaica, in humid sandy places.—Sloan. hist. 1. t. 116. f. 1. Phasellus lathyroides, Meech. meth. 140. Flowers red; the keel white.

61 P. semierectus (Lin. spec. 1016.) stems twining at the apex, terete, pubescent; leaflets ovate-lanceolate, acute, glabrous; peduncles elongated; flowers twin, disposed in a kind of spike; keel of flower awnless, hooked, turned to the right; legumes rather spreading, straight, subulate, compressed, acuminate by a beak; seeds oblong. ♀. C. H. Native of South America. Savi. diss. 2. p. 6. Jacq. icon. rar. t. 558.—Dill. hort. eitl. t. 233. f. 301. Ker, bot. reg. 1743. Phasellus semi-erectus, Meech. meth. 141. Flowers with a greenish vexillum, tinged with purple, and with the keel purple in the middle, but white on the sides, but the wings are deep purple. Seeds brown, spotted with black.

62 P. violaceus (Steud. nom. 610.) stem erect, flexuous, glabrous; leaflets ovate-lanceolate, acute; peduncles 2-3-flowered, length of the petioles; legumes erect, linear, terete. ♀. H. Native of Africa. Phasellus violaceus, Meech. meth. 141. P. Abyssinicus, Hortul. Flowers sessile, white, but with the vexillum and wings violaceous on the outside.

† Species not sufficiently known.

63 P. max (Lin. spec. 1017. exclusive of the synonym of Hern.) stem erect, angular, hispid; leaflets ovate, acute; legumes torulose, pendulous, hairy, 3-4-seeded, beaked. ♂. H. Native of Moluccas.—Trumph. 11. p. 388. t. 140? Flowers greenish yellow. Seeds black, about the size of coriander-seeds. Max is the Spanish name of the plant.

64 P. cape-sans (Thunb. fl. cap. 589, but not of Burm.) plant filiform, decumbent, flexuous, villous; leaflets ovate or lanceolate; peduncles 1-flowered, flexuous, axillary, longer than the petioles.—Native of the Cape of Good Hope. Corolla large, flesh-coloured. Legume unknown.

Cape Kidney-bean. Pl. decumbent.

65 P. pallas (Mol. chil. ed. gall. p. 355.) stem twining, very pilose; leaflets obliquely-oblong, villous; peduncles racemose, very long; flowers small, remote; legumes pendulous, cylindrical, torulose, villous.—Native of Chili.

Pallas Kidney-bean. Pl. tw.

66 P. aseffus (Mol. l. c.) stem twining; leaflets sagittate; seeds globose.—Native of Chili.

Ass’s Kidney-bean. Pl. tw.

Cult. The species of this genus are not worth cultivating for ornament. They all grow well in light rich soil, and the perennial, herbaceous, and shrubby kinds are easily increased by cuttings.

CLXXXIX. CYRTOTROPIS (from κυρτός, kyrtos, curved, and τρόπις, tropis, a carina; in allusion to the carina of the flower, which is much curved). Wall. pl. asiatic. rar. 1. p. 49. t. 62.

Linn. syst. Diodelphia, Decandria. Calyx bilabiata; upper lip unidentate, lower one tridentate. Corolla papilionaceous. Vexillum reflexed, bicallos at the base; keel linear, faliciform, very long, ascending, 2-petalled; wings cuneiform, short, divaricate. Stamens diadelphous. Legume sessile, linear, compressed, covered on the inside by a spongy membrane, which afterwards separates from it, the seeds intercepted by cellular spongy disseminations.—A tall climbing herb, with perennial roots, imparipinnate leaves, loose axillary racemes of flesh-coloured flowers, and long, pendulous, many-seeded legumes.

1 C. carnea (Wall. pl. asiatic. rar. 1. p. 50. t. 62.) ♀. G. Native of Nipaul, on the high mountains of Sheepore and Chundaghy. Shrub quite smooth. Leaflets 5. Flowers large, pale red, showy; the vexillum ornamented with dark feathered lines.

Flesh-coloured-flowered Cyrtotropis. shrub tw.

Cult. An elegant twining plant, very proper for a greenhouse conservatory. It will grow in rich light soil, and cuttings will strike root in sand under a hand-glass.

Linn. syst. Diodelphia, Decandria. Calyx bilacrateolate at the base, 5-cleft, the 5 lower segments straight and acute, but the 2 upper ones are joined together beyond the middle. Corolla with an ovate vexillum, which stands on a short stipe, and with an oblong straight keel. Stamens diadelphous, the tenth one approximate, but certainly distinct. Stipe of ovary not surrounded by a sheath at the base. Style short. Legume oblong, 2-5-seeded, membranous; the seeds intercepted by cellular disseminations. Seeds ovate, compressed.—A hispid erect herb, with pinnately-trifoliate leaves, and with the flowers either aggregate in the axils of the leaves on short pedicles, or disposed in short pedunculate racemes.

1 S. hispida (Meech. l. c.) ♀. H. Native of Japan, East Indies, and the Moluccas. Dolichos Soja, Lin. spec. 1621. Jacq. icon. rar. t. 145. Soja Japónica. Savi. diss. l. c. Kompfl. amoen. 837 and 838, with a figure. Corolla violaceous, hardly longer than the calyx. The seeds, which are usually called
LEGUMINOSÆ. CXCI. Dolichos.

Miso in Japan, are put into soups, and are the most common dish there, insomuch that the Japanese frequently eat them three times a day. The Soja of the Japanese, which is preferred to the Kitjap of the Chinese, is prepared from the seeds, and is used in almost all their dishes instead of common salt. The Chinese also have a favourite dish made of these seeds, called ten-hu or tan-hu, which looks like curd, and though insipid in itself, yet with proper seasoning is a treasurable and wholesome.

CXC. DO'LICHOS (from Dolichos, dolichos, long; in reference to the length of the twining stems, which in some species extend to the tops of the lowest trees). D. C. prod. 2. p. 597. Legume compressed, apiculated by the short permanent style.

2 D. Curtissi; stem woody; branches twining, rather vil-

3 D. Jacquinii (D. C. prod. 2. p. 397.) stem woody; branches twining, hispid; leaflets ovate, acute; peduncles shorter than the leaves; flowers umbellate; legumes linear, straight, very pilose. β. ☉ S. Native of the West Indies, in woods. D. lignosus, Jacq. amer. 205. pict. 100. exclusive of the syno-
ymnes. Flowers white. Seeds 18, black, with a white hynum.

4 D. galáactus (Gaud. in Freycinet, et voy. part. bot. p. 486. t. 15.) plant procumbent or twining; branches and petioles puberulous; leaflets ovate-elliptic, acuminate, rounded at the base, reticulately-veined, membranous, smooth; peduncles axillary, 3-flowered; the 2 superior lobes of the calyx large and roundish, lower ones lanceolate, acute; legumes 3-keeled. 2. ☉ S. Native of the Sandwich Islands. Perhaps a species of Canaralia.

Helmetted Dolichos. Pl. tw.

5 D. |i? recalescens (Mey. prim. esser. 242.) stem shrubby, climbing; branches tomentose; leaflets ovate, obtuse at both ends, tomentose beneath; peduncles 2-flowered, length of the petioles; legumes linear, ending in a long acumen, tomen-
tose. β. ☉ S. Native of Guiana, in the island of Arowash. Flowers large, purplish-violet. Vexillum without any callosity, having the uunguis thickened with the calyx. Seeds imbedded in dry pulp.

Sparious Dolichos. Shrub tw.

6 D. subræcoræns (Jacq. amer. 205.) stems permanent, twining, and are, as well as the leaves, glabrous; leaflets ovate-
lanceolate; peduncles racemose, 3-4-flowered; legumes linear, acuminate, rather torose, glabrous. β. ☉ S. Native of the West Indies, among bushes. Flowers bluish-purple. Style spatulate at the apex. Stigma ciliately bearded.

Sowerward-racemose-flowered Dolichos. Shrub tw.

7 D. undulatus (Sesse et Moc. in herb. Lamb.) plant pubes-
cent; leaflets elliptic, acuminate, mucronate; calyx and vexil-
num clothed with rusty down; vexillum a little shorter than the keel; lateral leaflets oblique; peduncles shorter than the leaves; flowers large, racemose. 2. ☉ S. Native of Mexico.

Waved-leaved Dolichos. Pl. tw.

8 D. tuberösus (Lam. dict. 2. p. 296.) stem shrubby, twining; root tuberous; leaflets roundish, acuminate; racemes pedunculate, elongated; legumes straight, pendulous, compressed, torulose, clothed with rufous villi. β. ☉ S. Native of Martinique.—Plum. ed. Burm. t. 220. Both the root and the seeds are eaten when dressed by the inhabitants of Martinique.

Tuberous-rooted Dolichos. Shrub tw.

9 D. hisroctus (Thumb. in Lin. trans. 2. p. 339.) stems twining; tomentose; leaflets broad, ovate, acute, villous on both sur-
faces, lateral ones somewhat 2-lobed; racemes very long; le-

10 D. purecens (Lin. spec. 1021.) stems twining, and are, as well as the leaves, clothed with soft hairs; flowers axillary, 2-3-together, almost sessile; legumes compressed, linear-lan-

Pubescent Dolichos. Pl. tw.

11 D. sessei; plant clothed with soft, woolly, canescence pu-
bescence; leaflets ovate, acuminate, entire; calyce segments lanceolate; vexillum villous, shorter than the keel; flowers disposed in elongated racemes, which are 5 or 6 times longer than the leaves. 2. ☉ S. Native of Mexico. Flowers red, secedul. (v. s. in herb. Lamb.)

Sesse's Dolichos. Pl. tw.

12 D. pluorus (Klein, in Willd. spec. 3. p. 1043.) stem twining, with a few adpressed hairs; leaflets ovate-lanceolate, sea-
brous above, and pubescent beneath; racemes 3-6-flowered; legumes linear, clothed with rusty pili, hooked at the apex. 2. ? ☉ S. Native of the East Indies. Racemes an inch or 1½ inch long. Flowers purple.

13 D. tetraspermus (Willd. spec. 3. p. 1044.) stem twining; leaflets rhomboid, mucronate, glabrous; racemes longer than the
leaves; legumes aciciniform, oblong, eusipate, 4-seeded. \( \varphi \). C. S. Native of the East Indies. Flowers usually twin, almost sessile, small, pale yellow?

14 D. Pavonii; plant smooth, herbaceous; leaflets ovate, acuminate, obtuse, mucronate; peduncles long, few-flowered at the top; legumes flat, puberulous, villous; calyx smooth, green, with ovate ciliate segments, uppermost one broad; vexillum very broad, covering the rest of the petals. \( \varphi \). C. S. Native of Peru. D. pubescens, Ruiz et Pav. in herb. Lamb.

*Purum's Dolichos*. Pl. tw.

15 D. olivínozéa (H. B. et Kunth, nov. gen. amer. 6. p. 410.) stems twining; branches and petioles beset with retrograde pill; leaflets ovate-oblong, obtuse, mucronate, rounded at the base, 3-nerved, strigose; peduncles very long, few-flowered; lobes of calyx acutish, with the upper lip very broad, and somewhat emarginate. \( \varphi \). C. S. Native of Peru, in sandy places near Trujillo. Legume compressed.

*Glycine-like* Dolichos. Pl. tw.

16 D. Capeños (Linn. amen. 6. affr. 22.) stems twining, herbaceous, and are, as well as the leaves, glabrous; leaflets ovate, herbaceous, lateral ones a little lobed; peduncles usually 2-flowered. \( \varphi \). C. G. Native of the Cape of Good Hope. Flowers yellow, ex. Herm. affr. 17. solitary, ex Ths. fl. cap. 590. Legume elliptic, compressed, ex Lin. short, depressed, ex. Herm. aciciniform, attenuated at both ends, an inch long, and glabrous, ex. Ths. Perhaps many species are confused under the name of D. Capeños, and they are probably all species of *Rhegynia*.

17 D. Arbore-sceens; pubescent; leaflets ovate, acuminate, entire, many-nerved; racemes many-flowered, longer than the leaves, spicate; calyces segments lanceolate, lower one inflexed, and longer. \( \varphi \). S. Native of Mexico. A strong shrub, with yellow flowers. (v. s. in herb. Lamb.)

*Arborescent Dolichos*. Shrub 10 to 12 feet.

18 D. Falcatus (Klein, in Willd. spec. 3. p. 1047.) stems twining, pilose; leaflets roundish-ovate, acuminate, glabrous, terminal one 3-lobed, lateral ones with a lobe on the outer side; peduncles 2-flowered, shorter than the leaves; legumes falcate. —Native of the East Indies. Kott. et Willd. nov. act. eur. ber. 1802. p. 211. Flowers probably purple.

*Falcate-podded* Dolichos. Pl. tw.

19 D. Aristátus (Linn. spec. 1021.) stems twining, herbaceous; leaflets ovate-oblong, acuminate, smooth; peduncles 2-flowered; legumes linear, straight, ending in a long awn. \( \varphi \). C. S. Native of South America. A wind nearly an inch long.

*Armed-podded* Dolichos. Pl. tw.

20 D. Geminiflorus; plant herbaceous, quite smooth, middle leaflet sagittate, lateral ones oblique, and only bulged out on one side, all mucronate; stipulas spatulate; bracteas ovate, acuminate, membranous, drawn out at the base; peduncles very long, usually 2-flowered; legumes very long, narrow, compressed, on short pedicels. \( \varphi \). C. S. Native of Mexico. (v. s. in herb. Lamb.)

21 D. Filifórmis (Linn. amen. 5. p. 402.) stems twining, herbaceous; leaflets linear, obtuse, mucronate, glabrous, pubescent beneath; stigma almost naked. \( \varphi \). C. S. Native of Jamaica, among bushes about Old Harbour. P. Browne, Jam. 206. where it is called cat's-claws. It is used as a purgative ingredient in diet drinks, and is said to answer in cases of dropsy.

*Filiform Dolichos*. Pl. tw.

22 D. cilla'ris (Klein, in Willd. spec. 3. p. 1049.) stems twining, filiform; leaflets oblong, obtuse, mucronate, glabrous, but ciliated on the margins; peduncles shorter than the pedicels, usually 4-flowered; legumes aciciniform, glabrous. —Native of the East Indies.

*Clitided-leaved* Dolichos. Pl. tw.

23 D. heteropólyllus (Horn. hort. hafn. suppl. p. 80.) stems twining; leaflets broad, coriaceous, terminal one lanceolate and elongated; legumes racemose, aciciniform, with the back entire. \( \circ \). C. H. Cultivated in the Canary Islands. Perhaps a species of *Lablab*.

24 D. l'utéus (Swartz, fl. ind. occ. 3. p. 1246.) stems twining, herbaceous, glabrous; leaflets roundish or ovate-rhomboid, glabrous; racemes spicate, longer than the leaves; legumes somewhat cylindrical, glabrous. \( \varphi \). C. S. Native of the south of Jamaica, among grass in wet places by the sea-side. Flowers yellow.

25 D. obtusifolius; plant pubescent; leaflets broad, roundish, obtuse, middle one bulged out on both sides, and attenuated at both ends; racemes long; flowers in fascicles; teeth of calyx narrow, lower ones subulate. \( \varphi \). C. S. Native of Mexico. Flowers apparently purple. (v. s. in herb. Lamb.)

*Blunt-leafed* Dolichos. Pl. tw.

26 D. hastátus (Lour. coch. 442.) stems procumbent, herbaceous; leaflets glabrous, somewhat hastate; peduncles erect, many-flowered; legumes linear, rather terete, straight. \( \varphi \). C. S. Native of the east coast of Africa, where it is also cultivated for the sake of the seeds, which are eaten by the natives. Flowers yellow.

Perhaps this and the preceding species are referrible to section II. *Catáqug*.

*Hastate-leafed* Dolichos. Pl. tw.

27 D. ãngulários (Willd. spec. 3. p. 1051.) stem erect, hairy; leaflets rhomboid-ovate, acuminate, lateral ones rather angular; peduncles 2-flowered, shorter than the leaves; legumes linear, nearly terete, torose, acute, pendulous. —Native of Japan. Banks, ico. Kämpf. t. 40.

*Angular-leafed* Dolichos. Pl. 1 to 2 feet.

28 D. biëflórus (Linn. spec. 1023.) stem erect, perennial, smooth; leaflets oval-lanceolate, acute, glabrous; peduncles very short, 2-flowered; legumes erctish, hairy. \( \varphi \). S. Native of the East Indies.—Plak. alm. t. 213. f. 4. Flowers yellow. D. biflórus, Burm. ind. pl. 161, which was collected in Persia by Garcin, is a distinct plant, but the specimen of it which is preserved in the herbarium of Decresset is so incomplete as to be precate giving a description of it.

29 D. uniflórus (Lam. dict. 2. p. 299.) stem erect, woody at the base; branches villous, twining; leaflets oval, acute, clothed with soft villi; flowers solitary, almost sessile in the axis of the leaves; legumes nearly erect, falcate, 3-seeded, pubescent. \( \varphi \). C. S. Native of the East Indies. Flowers yellow.

*One-flowered* Dolichos. Shrub tw.

Sect. II. *Catia'ng* (*Cat-jang* is the name of some species in Malabar). D. C. prod. 2. p. 398. Legumes cylindrical.

*Leaflets entire.*

30 D. Catia'na (Linn. mant. 259.) stem erect, herbaceous; leaflets broad-lanceolate, glabrous; peduncles very long, 2-3-flowered; legumes linear, terete, glabrous, straight. \( \circ \). S. Native of the East Indies, where it is called *cat-jang*.—Rumph. amb. 5. t. 139. f. 1.—Rheed. mal. 3. t. 41.—Lour. coch. 442. Seeds small, brown, black, or pale. There are several varieties of this plant differing in the colour of the flowers and seed, all of which are much cultivated in the places of their natural growth for food.

31 D. monacalis (Brot. fl. hirs. 2. p. 125.) stem herbaceous, erect, twining a little; leaflets ovate, acute, glabrous; peduncles 4-6-flowered, longer than the leaves after flowering; legumes almost terete, a little arched, glabrous, at length pendulous. O. C. H. Native of Portugal, and cultivated in moist valleys for the sake of its seeds, which are dressed and eaten by the inhabitants. Flowers pale yellow striped with purple. Sigastrum ending in a callous spur. Said to be a hybrid between D. Cattianum and D. Sinensis.

33 D. Nutricus (Delil. fl. aegyp. 109. f. 38. f. 1.) stems twining, herbaceous, pubescent; hairs adpressed, reflexed; leaflets ovate, acuminate; peduncles naked at the base; flowers spicate; legumes almost cylindrical, villous, pendulous. O. C. H. Native of Egypt. D. Sinensis, Forsk. descr. 123. but not of Lin. Flowers yellow, with the vexillum painted with lines.

Nile Dolichos. Pl. tw.

34 D. Lubia (Forsk. descr. 133.) stems diffuse, glabrous; leaflets ovate; peduncles very long; flowers disposed in spicate racemes; legumes straight, terete, compressed, sebaceous, 10-seeded. O. C. H. Native of Egypt, and where it is cultivated for the sake of the legumes, which are dressed and eaten by the inhabitants. Flowers yellow. Lubia is the Arabic name of the plant.

35 D. vexillatus (H. B. et Kunth, nov. gen. amer. 6. p. 440.) stems twining, and are, as well as the petioles, clothed with retrorside hairs; leaflets oblong-lanceolate, mucronate, strigose, somewhat 3-nerved; peduncles longer than the leaves; lobes of calyx subulate-acuminate; legumes terete, hairy. O. C. S. Native of South America. Flowers greenish.

Var. a; leaflets acuminate; peduncles 3-4-flowered. O. C. S. Native of Cuba, about the Havana. Phasolus vexillatus, Linn. Spec. 1017. —Dill. Hort. эт. 2. f. 392.

Var. b; leaflets obtuse; peduncles 2-flowered. H. B. et Kunth. l. c. Native of Caracas.

36 D. cylindricus (Hamilt. prod. fl. ind. occid. p. 61.) stems woody, twining, hairy; leaflets oblong, acute, beset with a few rusty pili beneath; pedicels elongated; flowers sub-umbellate; legume cylindrical, elongated, hairy; seed dark, numerous, 15-20, minute. Φ. C. S. Native of Guiana.

Cylindrical-podded Dolichos. Shrub tw.

37 D. re-pens (Linn. amen. 5. p. 402.) stems creeping; leaflets pubescent; ovate; flowers twin, disposed in racemes; legumes linear, terete. Φ. C. S. Native of South America, by the sea-side. The root is a strong purgative.

Creeping-stemmed Dolichos. Pl. cr.

* * * Leaflets lobed.

38 D. lobatus (Willd. spec. 3. p. 1047.) stems twining; lateral leaflets 2-lobed, terminal one 3-lobed, with the middle lobe mucronate; flowers racemose. —Native of the Cape of Good Hope. D. trilobus, Houtt. plst. syst. 8. p. 860. t. 64. f. 1. Thunb. prod. 130? Flowers yellow or purple.

39 D. argenteus (Willd. spec. 3. p. 1047.) stems twining, clothed with rusty villi; leaflets rather angular, clothed with silky villi beneath, terminal one 3-lobed; peduncles 2-flowered, shorter than the petals. Φ. C. S. Native of Guinea. Flowers yellow?

Silverly Dolichos. Pl. tw.

Three-lobed-leafletted Dolichos. Pl. pros.

42 D. palmatilimbus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 2. p. 399.) stem twining, glabrous; leaflets 3-nerved, 3-lobed, rarely 5-lobed; lobes ovate, mucronate; peduncles longer than the leaves; flowers racemose. Φ. C. S. Native of Mexico. Coen or Coentie, Hern. mex. 252. f. 2. Flowers bluish. Legume terately-compressed, straight.

Palmatilimb-ed Dolichos. Shrub tw.

sect. III. Unguicularia (from anguicularis, of a claw or unguis; in reference to the legumes being terminated by an unguicular callous beak). Legumes almost cylindrical, obtuse at the apex, and ending in a depressed, callous, somewhat unguicular beak, which is rather concave beneath. Leaflets entire.

43 D. unguiculatus (Jacq. Hort. vind. 1. t. 23.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing at the apex 2-3 flowers in a kind of umbel; legume ending in a recurved beak. O. C. S. Native of Barbados. Flowers bluish. Seeds ovate, white, or pale brown, with a snow white hyalum.

44 D. Tranquebaricus (Jacq. Hort. vind. 3. t. 70.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 3-4 flowers at the apex in a kind of umbel; legumes ending in a straight beak. O. C. S. Native of Tranquebar. Flowers bluish violet, with a white keel. Legumes more slender than those of the preceding species. Seeds pale brown, but rather blackish around the white hyalum.

45 D. melanophthalmus (D. C. prod. 2. p. 400.) stem twining, and is, as well as the leaves, glabrous; peduncles length of the leaves, bearing 2-3 flowers at the apex in a kind of umbel; legumes ending in a straight or somewhat recurved beak. O. C. H. Cultivated in Vascovna, where it is called Habine, and in Italy, where it is called Fascola à l’occhio nero. D. unguicularis, Thor. chl. lad. 306. Seeds white, but marked with a black circle around the snow white hyalum.

46 D. sesquipedalis (Linn. spec. 1016.) stem twining, glabrous; leaflets broad, ovate; legumes almost cylindrical, smooth, very long, torulose, and ending in a hooked mucron. C. C. S. Native of South America. Jacqu. Hort. vind. 1. t. 67. Flowers of a purplish blue colour. Legumes a foot and a half in length.

47 D. umbellatus (Thunb. in Lin. trans. 2. p. 339.) stems twining, and are villous, as well as the leaves; peduncles flexuous, longer than the leaves; flowers disposed in a kind of un-

**Umbellate-flowered Dolichos.** Pl. tw.

48. *D. spherospérmus* (D. C. prod. 2. p. 400.) stem erect, branched, glabrous; leaflets ovate, acute; peduncles elongated, bearing few flowers at the apex; legumes straight; seeds spherical.  G. Native of Jamaica, where it is called *Callavana* or *Black-eyed pea*.  Sloane, hist. jam. 183. t. 117.  *Planthera* spherospérmus, Lin. spec. 1018.  Flowers white.  Legumes terete according to P. Browne, but compressed according to Sloane.  Seeds white, with a black hymen, and are sweet, and as good for food as any of the kidney-beans.

49. *D. Brunelli* (Zucc. obs. 1. no. 82.) stems erect, much branched, and are, as well as the leaves, glabrous; lateral leaflets lobed on the outside; peduncles 4-6-flowered, longer than the leaves; legumes erect, ending in a spoon-shaped beak.  G. Native country unknown.  Flowers blue, but with the keel white.  Seeds dark blue, with a white hymen.

**Brunelli's Dolichos.** Pl. 1 to 2 feet.

† *Species not sufficiently known.*

51. *D. scabér* (Rich. in act. soc. h. n. paris. p. 111.) twigs rough and woody; leaflets ovate, coriaceous, quite smooth; spike many-flowered; receptacle of flower hooked.  G. Native of Cayenne.

**Scabrous-stemmed Dolichos.** Shrub tw.

52. *D. virgátus* (Rich. l. c. woody; leaves and spikes of flowers hairy; leaflets obovate, abruptly acuminate; spikes of flowers very long and slender.  G. Native of Cayenne.

Perhaps a species of *Macchia*.

**Twitty Dolichos.** Shrub tw.

53. *D. funárius* (Mol. chil. ed. gall. 335.) stems twining, perennial; leaflets pendulous and 5-seeded; leaflet oval, glabrous on both surfaces.  G. Native of Chili, where the inhabitants make ropes of the stems.

**Rope Dolichos.** Shrub tw.

54. *D. gibbosus* (Thunb. fl. cap. 590.) stems herbaceous, twining, and are as well as the leaves glabrous; leaflets acuminate, lateral ones very short, terminal one ovate and gibbous at the base; peduncles longer than the leaves; racemes oblong.  G. Native of the Cape of Good Hope, on the mountains.

**Bulged-leafletted Dolichos.** Pl. tw.

55. *D. decem'vérnis* (Thunb. l. c.) stems herbaceous, decum- bent, hardly pubescent; leaflets ovate, obtuse, glabrous; peduncles length of leaves, bearing an umbel of flowers at the apex.  G. Native of the Cape of Good Hope.  Legume unknown.

**Decumbent Dolichos.** Pl. decumbent.

56. *D. tomentósus* (Roth. nov. spec. 345.) plant clothed with grey tomentum; stem erect; leaflets ovate-roundish, acuminate; racemes axillary, usually solitary, many-flowered; flowers distich; vexillum pubescent.  Native of the East Indies.  Legume unknown.

**Tomentose Dolichos.** Pl. 1 to 2 feet.

57. *D. frutí'scens* (Hamilton in D. Don, prod. fl. nep. 240.) stem shrubby, erect; leaflets rhomboid-ovate, mucronate, gla- bros; racemes axillary, compound, longer than the leaves; calyx teeth roundish, and are as well as the pedicels covered with silky pubescence; carina equal in length to the vexillum.  G. Native of Nipaul.  Leaflets large.  Flowers cream-coloured.

**Shrubby Dolichos.** Shrub.

**Cult.** None of the species are worth cultivating for ornament except the D. lignósus, D. Jacquinii, and D. Curtii. A light rich soil answers all the species, and they are either increased by seeds or cuttings; cuttings planted in a pot of sand root freely, those of the stone species require heat.

**CXCI. T. ENIOCARPUM** (ruana, ruina, a riband, and karpos, karpos, a fruit; shape of pods).  Desv. obs. legum. in Schlecht. Linnaea. 2. p. 512.

1 T. *articulátus* (Desv. l. c.).  G. Native of St. Domingo.—Plum. ed. Burm. t. 222.  Doličhus articulátus, Lam. dict. 2. p. 296.  A frutescent twining plant, clothed with rufous villi, with angularly-toothed leaflets; pedunculate racemes of violaceous-purple flowers, and straight legumes.  Racemes of flowers a foot and a half long.

**Jointed-leguminous T. eniocarpum.** Shrub tw.

**Cult.** A light rich soil will suit this plant, and cuttings will root freely if planted in a pot of sand placed under a glass-house, in heat.

**Lin. syst. Diadelphía, Decádría.** Calyx 4-cleft, upper lip entire, or of two divisions, which are joined to the apex.  Corolla with a broad reflexed vexillum, furnished with converging callosities above the base.  Wings rhomboid.  Stamens diadelphous.  Stipe of ovary sheathed.  Legume terete, incurved.  Seeds nearly globose, without any carunde, but having the umbilicus on the side.  Twining herbs, like *Dolichos*.  Perhaps sufficiently distinct from that genus in the terete legumes.

1 T. *glábra* (Savi, mem. phas. 3. p. 8.) plant twining, smooth; upper lip of calyx obtuse.  G. Native of South America (ex Jacq.) and of North America, in the rice-fields of Georgia (ex Pursh).  Doličhus luteolus, Jacq. hort. vind. l. 39. t. 90.  Leaves pinnately trifoliolate; leaflets ovate, acute.  Peduncles longer than the leaves.  Flowers yellow, disposed in heads at the top of the peduncles.  Seeds black, with a white hymen.  Stigma much bearded.

**Villosa Vigna.** Pl. tw.

**Cult.** The seeds of the species of this genus should be sown in May, in a warm sheltered situation in the open ground.

**CXCVII. LA'BLAB** (Lablab is the Arabic name of Convól- vulus, with which the present genus has no other affinity, unless in the twining habit).  Adans. fam. 2. p. 325.  Monch. math. 155.  Savi, dis. 1821. p. 15 and 19.  D. C. prod. 2. p. 401.—Doličhus, Gaert. fruct. 2. p. 322. t. 150.

**Lin. syst. Diadelphía, Decádría.** Calyx campanulate-tubular, 4-cleft; the segments erect, 3 lower ones acute, superior one broader, entire, composed of 2 joined segments.  Corolla with a spreading vexillum, which is channeled, and furnished with 4 parallel callosities at the base.  Keel so much curved as
to form a right angle. Stamens diadelphous, the tenth one free, and received between the callosities of the vexillum. Stipe of ovary sheathed at the base. Style compressed, bearded beneath. Stigma terminal. Legume flat, aciciniform, muricated from tuberoles at the sutures; the seeds separated by transverse cellular dissepiments. Seeds 4 or fewer from abortion, ovate, a little compressed, with a linear callosity rising from the umbilicus, as well as being margined at both extremities.—

Twinning herbs, with spreading stipules, pinnately-trifoliate leaves, stipitate entire leaflets, pedunculate racemes of flowers, each peduncle bearing a single leaf. Pedicels somewhat verticillate.

Seeds black or brown, with the hynum and callosity white.

1. L. vulgaris (Savi, l. c. p. 19. f. 8. a. b. c.) legumes oblong, ventricose, aciciniform; pericarp easily separated; seeds ovate, somewhat compressed; gland basilar, hemispherical, furrowed. 2. *C. Native of the East Indies, and Egypt; and now cultivated in several of the West India Islands. Dólichos Lálab, Lin. spec. 1019. Sinus, bot. mag. 896. Lam. dict. p. 293. L. niger, Monch. —Rix. tetr. irrt. t. 29. f. 4.—Alp. agypt. t. 71. Leaflets roundish-ovate, ending in a point furnished with a bristle. Stipulas lanceolate. This plant is cultivated for the sake of the legumes, which are cooked and eaten.

Var. a. niger (D. C. prod. 2. p. 401.) flowers violaceous; seeds black. P. Alp. agypt. 74. t. 75.

Var. b. purpureus (D. C. l. c.) flowers purple; seeds blackish-purple. Lin. spec. 1021. Smith, exot. bot. t. 74. Lindl. bot. reg. 830. Dólichos purpureus, Jacq. fragm. 45. t. 55. Steins purplish. Bracteoles equal in length to the tube of the calyx. Wings spreading. The legumes when fresh and young are sapid and salubrious, and are cooked and eaten in the manner of kidney-beans.

Var. y. albiflorus (D. C. l. c.) flowers white; seeds of a pale rust colour. Dólichos Benghalensis, Jacq. hort. vind. 2. t. 124. Willd. spec. 3. p. 1038. Steins pale. Bracteoles shorter than the tube of the calyx. Wings of flower rather adpressed. The legumes are dressed and eaten like those of the last variety.

2. L. Nänkivíccus (Savi, l. c. p. 22. f. 8. d. g.) legumes oblong, ventricose, aciciniform; pericarp easily separated; seeds ovate, turgid; gland basilar, hemispherical, furrowed, acuminate downwards. 2. *C. Native of China, and cultivated in the West Indies for the sake of its legumes, which are dressed and eaten when young in the manner of kidney-beans. Flowers white. Legume 2 inches long, and 10 lines broad. Seeds milk-coloured. This and the former species are called *Tul-Turangi or European-bean by the Egyptians. The inhabitants make pleasant arbours of them. Alpinus says they grow wild in Egypt. Hasselquist is, however, certain that they do not grow wild in Lower Egypt, but are only cultivated there in gardens.

3. L. montaníus (Savi, l. c. f. 9. a. d.) legumes somewhat lanceolate, compressed, torose; pericarp undulate curled, and separated with difficulty; seeds nearly globose; gland basilar, hemispherical, blunt. 2. *C. Native of the East Indies. Dólichos Lálab, Gaertn. fruct. 150. Flowers white, very like those of the preceding species. Legume white, 2 inches long, and 8 lines broad. Seeds black or blackish red.

† Species not sufficiently known.

Cult. A light rich soil will suit these plants, and cuttings will root in sand under a hand-glass, or the plants may be increased by the tubers of the roots, or by seeds.

CXXVI. PAROCHÆTUS (from παρά, para, nigh, and ὄχινος, ochéos, a brook; in reference to the habitat of the 3 A)

**Lan. syst. Dianellia, Decandria.** Calyx 4-cleft, naked. Corolla papilionaceous, with an incumbent 2-lobed vexillum, and an obtuse keel, which is covered by the wings. Stamens diadelphous. Style smooth. Stigma obtuse. Legume gibbons, many-seeded. Seeds roundish.—Perennial creeping herbs, with trifoliate leaves, which stand on long petioles, membranous stipulas, and axillary, shewy, purple, solitary flowers, on long pedicels.

2 P. majus (D. Don, l. c.) leaves obovate, retuse, crenated. P. G. Native of Nipaf, at Narainnethy. Larger than the preceding species, and with the habit of a species of O. xalix. Larger Parochetus. Pl. creeping.

Cult. A light rich soil will answer the species of this genus, and as they are creeping plants, they are easily increased by dividing.

**CXC VII. Dioecia** (in memory of Dioces Carystius, an ancient Greek botanist). H. B. et Kunth, nov. gen. amer. 6. p. 437, but not of Spreng.

**Lan. syst. Dianellia, Decandria.** Calyx half-4-cleft, bracteolate at the base; the segments acuminate, 2 lateral ones narrowest. Corolla with an oblong-obtuse reflexed vexillum, destitute of callosities. Stamens diadelphous, the tenth one sometimes adhering to the others a little. Stigma somewhat clavate. Disk somewhat urceolate. Legume linear, compressed, many-seeded, furnished with a membranous margin on both sides towards the seminiferous suture. Seeds with a linear hyllum.—Twining shrubs, with pinnately-trifoliate leaves, stipitate leaflets, axillary elongated pedicels, and red flowers.

Jacquin's Dioecia. Shrub tw.

2 D. sericea (H. B. et Kunth, l. c. t. 576.) leaflets elliptic, cordate at the base, acute at the apex, pubescent above, but clothed with silky-silvery pubescence beneath; legumes clothed with yellowish yellow down. P. G. Native of New Granada, near Honda. Flowers blue.

Silly Dioecia. Shrub tw.

3 D. apurensis (H. B. et Kunth, l. c.) leaflets elliptic-oblong, rounded at the base, glabrous, acuminately-mucronate at the apex, stipigote on the nerves and veins beneath. P. G. Native on the banks of the Orinoco, at the confluence of the Apheres. Flowers red.

Apheres Dioecia. Shrub tw.

4 D. mollis (D. C. prod. 2. p. 403.) leaflets rhomboid-ovate, acuminate, and are, as well as the branches, clothed with very soft down; peduncles shorter than the leaves, 3-6-flowered. P. G. Native country unknown. Dolichos mollis, Jacq. fragm. 6. t. 88. Flowers pale yellow. Legume unknown. This plant differs from Doliobas in the calyx being 4-cleft, and from Vigna in the vexillum being without callosities.

Cult. The species of this genus will grow well in light rich soil, and they are easily increased by cuttings planted in sand, with a lead-glass placed over them, in heat.

**Lan. syst. Dianellia, Decandria.** Calyx urceolate, unequally bilabiate. Corolla with a roundish reflexed vexillum, bearing 2 cylindrical callosities at the base. Wings stipitate, the stipes received within the margins of the vexillum. Keel oblong, 2-edged. Stamens diadelphous. Legume oblong; furnished with 4 longitudinal wings, 7-8-seeded. Seeds roundish.—A climbing herb, with tuberous roots, pinnately-trifoliate leaves, axillary twin racemes, and blush flowers.

1 P. tetragonolobus (D. C. l. c.) O. G. Native of the Mauritius, where it is cultivated under the name of Pois-carré. Doliobas tetragonolobus, Lin. spec. 1021.—Rumph. amb. 5. t. 133. There is a smaller kind which was gathered along the banks of rivulets in Madagascar by M. Aubert Du Petit Thours. The plant is cultivated in the Mauritius for the sake of its seeds, which are used in the same way as we do peas.

Cult. See Lablab, p. 361, for culture and propagation.

**CXC IX. Canavalia** (Canavali is the name of one of the species in Malabar). D. C. legum. mem. ix. prod. 2. p. 403.—Canavali, Adans. fam. 2. p. 326.—Malabchá, Savi, diss. 1824. p. 15. and 1825. p. 1.—Doliobas species of Lin.
